**NOTE:**

1. THE ABOVE DATA IS APPLICABLE FOR 415V, 4 POLE MOTORS.

2. AMMETERS SHALL HAVE UNIFORM SCALE UPTO C.T. PRIMARY CURRENT AND COMPRESSED END SCALE UPTO SIX TIMES THE C.T. PRIMARY CURRENT.

3. POWER CABLE SIZE SHALL BE SUBJECT TO VOLTAGE DROP CHECK.
NOTE:—

CONTACTORS C1, C2 AND C3 CONTROLS THE LIGHTING FEEDERS FOR NORMAL, EMERGENCY AND D.C. SUPPLY RESPECTIVELY.
NOTES:

1. THE TOP OF TRENCH SHALL MATCH THE FLOOR LEVEL IN PLANT AREA.
2. IN INDOORS INSTEAD OF RCC SLAB, 20MM THICK AL. EXTRUDED PLANK OR 10MM THICK M.S. CHEQUERED PLATE SHALL BE USED AS PER PDS:E 507.
3. PROPER SLOPE TO BE GIVEN IN THE TRENCH FOR NATURAL DRAINAGE.
4. SS—SINGLE SIDE CABLE SUPPORTS.
5. DS—DOUBLE SIDE CABLE SUPPORTS.
6. ALL DIMENSIONS ARE IN mm.

5.0 **COMPLETENESS OF WORK CONTRACT**
GENERAL DESCRIPTION OF SCOPE

This section of the Tender Documents deals mainly with the Scope and Technical Specifications needed for the design, preparation of detailed Drawings and getting the design/ drawings approved by Owner/Consultant, execution and construction of complete Civil, Structural and other Allied Works on turnkey basis.

The scope of Civil Structural and Architectural Works under this Contract shall include carrying out Grading & Leveling, Detailed Design, Drawings, Supply, Procurement of all materials, Construction, Demolitions, Supervision of all relevant Civil and Structural Works including providing all labour, supervision, material, scaffolding, construction equipment, tools, tackles and plants, supplies, transportation, all incidental items though not indicated or specified but reasonably implied or necessary for successful completion of the project. The tentative sizes of various process units, utilities and storage facilities are provided in the Plot Plan. Scope of the CONTRACTOR shall include but not limited to the following:-

a) Engineering related to site leveling & preparation.
b) Soil Investigation, if required.
c) Preparation of concept notes for design, engineering & construction.
d) Structural Analysis and design calculations as per specifications laid down in Civil Engineering Design Basis, enclosed in the tender. for all Civil works including but not limited to pile, pile-cap, foundation, plinth beam, RC superstructure, steel super structure, trenches, drains, pits etc.
e) Architectural design and drawings including details for doors, windows, partitions, false floor, false ceiling, toilet, finishes etc.
f) General Arrangement and detail design drawings for pile, pile-cap, foundations, plinth beams etc, based on the soil investigation carried out by the bidder for the proposed site.
g) General Arrangement and structural drawings at grade level showing foundations, extent of paving, trenches, drains, pits etc.
h) General Arrangement and detail design drawings for superstructure (RCC and structural steel) at all levels.

i) RCC drawings showing all necessary details for all foundations and structures.

j) Structural steel detail drawings for all steel structures.

k) General Arrangement and detail drawings for access roads, storm water drains, effluent drains, cable trenches, sewerage, manholes, pits, sumps with all necessary details.

l) Effluent Treatment Plant (having zero liquid discharge) and Sewage treatment plant within battery limit.

m) Bar Bending Schedules for all RCC works.

n) Fabrication drawings with all details for steel structures.

o) Coordination with OWNER / PMC for various activities including approvals of design basis, concept note, drawings, material samples, laboratory test results etc.

p) Procurement of all items necessary for completion of scope of work.

q) Construction of all units / structures, items of work included in scope of work.

r) Preparation of as built drawings & final documentation.

s) Obtaining Statutory Approvals.

t) Adherence to Quality Assurance Plan

1. DETAILED SCOPE OF WORK

1.1. Soil Investigation

1.1.1 The CONTRACTOR shall carryout detailed soil investigation for the proposed plant afresh.

1.1.2 The CONTRACTOR shall adopt pile foundation, open type isolated, raft foundations as per foundation requirements of structure, loads, settlement & other design criteria.

1.1.3 The CONTRACTOR shall design and construct all foundations as per requirements with no extra cost to OWNER / Project Management Consultant (PMC).
1.2 **Topographical / Contour Survey**

The Topographical Survey report of plant area is attached with the Tender for reference. However, the CONTRACTOR may carry out his own Topographical investigation afresh if required.

Before commencement of work / Contour Survey, the CONTRACTOR shall clear the site from all the debris lying on the site.

At bidding stage, the CONTRACTOR shall visit the site and study the existing site conditions & existing structures if any.

1.2.1 **Site Conditions**

Levels like Finished Ground Level (FGL) and Highest Point of Paving (HPP) shall be finalized by the CONTRACTOR in consultation with OWNER / PMC based on contour survey of the unit, levels of adjacent units and levels of adjacent roads.

1.3 **Grading**

Fairly graded land site shall be provided to the CONTRACTOR. However, micro grading works shall be in CONTRACTOR’s scope. The CONTRACTOR shall establish the finished grade levels of buildings after studying the existing site conditions, high flood level so as to maintain proper efficient drainage of the plant area at no extra cost to OWNER / PMC. These grade levels shall be approved by the OWNER / PMC.

Wherever filling / cutting is involved stone pitching should be provided as slope protection to protect the areas.

1.4 **Disposal of surplus earth**

The CONTRACTOR shall dispose-off all surplus and unserviceable earth (if any), outside the plant in accordance to local Governing authority, at his own cost.

Disposal shall be done at a place outside the plant, with the consent of the OWNER. Location of disposal area shall be decided by the CONTRACTOR and the required necessary approvals from the local bodies shall be the CONTRACTOR’s responsibility.

1.5 **Site cleaning**
During construction and on completion of construction (inclusive all internal and external finishes), cleaning all the debris, waste materials scattered in and around the site and disposal of the same shall be in the scope of the CONTRACTOR with the consent of the OWNER.

1.6 **Roads**

The CONTRACTOR shall be responsible for complete planning and construction of the roads for access to all buildings and units of the plant (under his scope) from the existing roads including necessary tie-in connections. All works associated with shifting of Roads and related services (e.g. all type of drainages, culverts etc.) as required, for the proposed site, shall be in the scope of contractor.

1.7 **Surface Drainage**

The scope of work includes also providing all internal services such as water supply, sanitary sewerage, drainage and storm water drains etc. and connection to external prevailing facilities complete in all respects. All the above work shall be carried out strictly in accordance with the "Technical Specifications (ES-2517)" enclosed with the tender.

The CONTRACTOR shall ensure proper drainage of all components of the Plant. For the purpose of drainage the Contractor’s scope is not limited only up to the Unit Battery Limit but shall extend up to the adjacent drainage network around the unit. The CONTRACTOR shall provide proper drainage system for all roads mentioned in the above Para 1.6. Storm Water Drains shall be connected to the existing drainage system by providing suitable tie-in points.

The CONTRACTOR shall study the existing drainage system as per actual site conditions. Tie-in points for drainage & sewer shall be manhole / chamber (under bidder’s scope) may be located at the outer boundary of bidders battery limit as per direction of Owner/PMC. The CONTRACTOR shall decide tie-in points for storm water drain based on existing drainage system in consultation with OWNER and PMC during detail engineering.

The drainage system shall be by gravity. Storm water drains shall be sized for the peak discharge arising discharge arising out of either rain water or fire fighting water.
1.8 **Contaminated Rain Water System and Oily Water Sewer (OWS) System**

The CONTRACTOR shall provide proper underground drainage system for contaminated rain-water and OWS. These shall be as per the philosophy mentioned in this tender document or in consultation with PMC/OWNER. The treated oily water shall be pumped to Owner's Guard Pond. Details of Tie-in points at battery limit shall be provided during detail design stage.

1.9 **Sewage Disposal Scheme**

The CONTRACTOR scope is to provide proper underground drainage system for sewage disposal and its connection to Common Sewage treatment plant for whole complex.

1.10 **Paving**

The CONTRACTOR shall provide RCC pavement for the complete area of the plant as job specific requirement. For the purpose of paving the Contractor's scope is not limited only up to Battery Limit, but shall extend up to the adjacent roads around the unit.

1.11 **Structures buildings etc.**

Contractor's scope shall include various technological structures steel & R.C.C. structures, pipe rack, buildings, equipment foundations, pits, cable trench, sheds, etc. as per the approved Plot Plan or mentioned in this tender document, required for the complete execution and commissioning of the plant.

1.12 **Surface Finishing's**

The CONTRACTOR shall be responsible for complete planning and detailing of all surfaces finishes viz. painting, flooring etc as per specifications given in the Tender.

1.13 **Acid / Alkali Proof Lining**

The CONTRACTOR shall be responsible for surface treatment of floors, exposed portion of foundations, pits and basins against acid / alkali as per process requirement.

1.14 **Anti-termite Treatment / Damp proof course / Water proofing**

The CONTRACTOR shall provide anti-termite treatment, damp proof course and water proofing as per design basis. Water proofing (for all open terraces) of all
buildings shall be done by water proofing PU coating with treatment also, of approved Brand and make.

1.15 Miscellaneous
These shall include local platforms, pipe sleepers, local foundations, local supports, etc. as per requirement.

1.16 Engineering and construction
Preparation of detailed design, drawings, supply and construction of all civil, structural, architectural, plumbing & sanitary and building works shall be in the scope of contractors work.

1.17 Removal of Underground and Above Ground Structures
All above ground and underground structures will be demolished by the Owner. Underground facilities/structures, if any, demolished/ removed by the Contractor should ensure removal of former will not disturb the functions of existing plant, if any.

Demolition/Removal/Rerouting of cables / pipes, etc. encountered during excavation in the plot shall be in Bidder’s scope of work. Existing piles if any, needs to be adjusted while making new piling/foundations.

1.18 Transfer of benchmark
The Benchmark will be made available inside plant premises. However, it may be verified by CONTRACTOR.

1.19 Sizing of various facilities
Sizing, nos., location etc. of various facilities viz. buildings, pipe rack, structures, equipments, etc. shall be in the scope of the bidder.

Any change of sizing, addition of any structure / facility, indicated by Owner/PMC during design stage, based on functional requirements and as well as local rules and regulations, etc, shall be in the Contractor’s scope, at no extra cost to OWNER / PMC.

1.20 Scope of work in outside battery limit (OSBL) Area
Scope includes work in OSBL area, if required, such as pipe racks, local platforms, local supports, road crossings / culverts from tie-in points to new units.
1.21 **Rules and regulations**

All the facilities shall conform to all Local Rules and Regulations, Factory Inspector, Rules, TAC rules etc. whichever is more stringent.

Getting the approval of the various documents through the various authorities shall be in the Contractor’s scope at no extra cost to OWNER / PMC.

2.0 **DETAILED ENGINEERING**

2.1 **General**

2.1.1 The CONTRACTOR shall carryout Analysis and Design of the structures required for this document and shall prepare all the required Architectural, Civil and Structural drawings needed for correct and accurate construction as per the Design Specifications given in this document.

2.1.2 The CONTRACTOR shall submit a Detailed Schedule for release of documents and drawings for review / approval to PMC/OWNER, within 2 weeks/or mutually period of date of award of the Contract. Such a schedule shall be made in line with the overall Project Schedule given in the document. The CONTRACTOR shall strictly adhere to the approved schedule.

The Format of Submission of the above mentioned schedule shall be mutually discussed and finalized after award of the job.

2.1.3 Construction of various structures / facilities, whose designs and / or drawings are specially identified in the Document Control Index or Project Schedule for approval by PMC/OWNER, shall not be taken up for construction at site till they are approved by PMC/OWNER and comments given are incorporated.

For other structures / facilities, the CONTRACTOR shall directly submit the Approved for Construction (AFC) drawings to PMC for information before, taking up construction.

2.1.4 It shall be the responsibility of the CONTRACTOR to accommodate all the functional requirements such as access, cutouts, clearances, interference etc. while designing / detailing of various structures / facilities.

2.1.5 Complete analysis, design and all drawings (including all soft files of drawings & design sheets) of each independent structure / facility shall be submitted in one lot so as to facilitate overall systematic review by PMC.
2.1.6 Only after the necessary architectural drawings are approved by the OWNER / PMC to their satisfaction, then the design drawings shall be reviewed and approved by PMC.

2.1.7 The CONTRACTOR shall keep the OWNER / PMC informed of any major design revisions simultaneously in progress.

2.2 Design calculations

The CONTRACTOR shall prepare the design calculations based on the standard accepted practice and guidelines from PMC / OWNER.

All design calculations shall be written systematically, legibly and submitted for approval as per standard accepted practice.

For structures, analysis and design shall be done on latest version of STAADPRO SOFTWARE.

For other miscellaneous works Excel and Word shall be used. Design calculations shall be done on A4 size sheet only.

2.3 Drawings

The CONTRACTOR shall prepare

- Civil & structural design & construction drawings, architectural drawings based on the standard accepted practice and guidelines from PMC / OWNER.

- Bar bending schedules.

- Fabrication drawings.

- As-built drawings.

- Detailing / drafting shall be done on AUTOCAD Latest Version only. Drawing size used shall be preferably of A1 size only. For foundation layout, drainage plans and paving plans, A0 size drawings can be used if necessary.

3.0 CONSTRUCTION

3.1 General

3.1.1 Construction of all civil and structural works including all material, labour,
Supervision, tools and tackles etc. shall be carried out by the CONTRACTOR

3.1.2 Procurement and supply of all materials viz. cement, reinforcement, structural steel etc. shall be in the scope of CONTRACTOR.

3.1.3 All materials shall be procured in consultation with the Owner or as per the approved vendor list given elsewhere in this document. All materials of construction must be of ISI approved brand.

3.1.4 All materials and construction shall confirm to the specification given elsewhere in this document.

3.1.5 Materials of construction, construction methodology etc. shall be such, so as to protect the structures and foundations against the harmful effect of chemical, fumes etc. present in the plant, its vicinity, in ground and / or subsoil water.

3.1.6 The CONTRACTOR shall be responsible for obtaining the statutory approval from local authorities such as Inspector of Factories, Development Authorities, Municipal Corporation and other concerned authorities before starting the work.

3.1.7 The CONTRACTOR shall ensure that the facilities are constructed in accordance with the APPROVED FOR CONSTRUCTION drawings and specifications.

3.1.8 The CONTRACTOR shall maintain and operate an adequate system of control of availability of latest drawings and specifications, at all the places where work is performed.

3.1.9 Construction shall include excavation in all types of soils / rock inclusive of necessary dewatering as applicable.

3.1.10 The CONTRACTOR shall redo / repair all the existing facilities viz. roads, paving, drainage etc. which are damaged during transportation, construction and erection activities performed by him.

3.1.11 Rain water harvesting is mandatory for buildings. like control room, operator room, view room, change room & check room, security building, maintenance building, canteen, laboratory building etc.
4.0 Quality Assurance Plan

Contractor shall ensure the quality of civil works by engaging a third party supervision/inspection and provide test results to Owner/PMC for information. The Quality Assurance Plan is attached for reference as Annexure VIII and the contractor is obliged to follow it.

5.0 COMPLETENESS OF WORK/CONTRACT

5.1 The scope of work mentioned in the contract/NIT is not the comprehensive one, but gives total idea/outline of the scope of work; however contractor shall be responsible for completeness of the job for the purpose indicated elsewhere to make the system fully functional and operational.

5.2 In case there is any conflict in the specifications appearing in different contractual documents then the specification whichever is stringent shall be applicable without any technical or commercial implications.

5.3 The work furnished shall be complete in every respect with all mounting, fittings, fixtures and standard accessories etc. normally provided for such item/equipment and or needed/required for erection, completion and safe operation of the item/equipment/system as required by applicable codes though they may not have been specifically detailed in the respective specifications, unless included in the list of exclusions.

5.4 Any additional items and materials which are not specifically mentioned but are required to complete the system offered, in every respect in accordance with the technical specifications and required for safe operation and guaranteed performance shall also be deemed as included in the scope of work of this tender. Contractor shall not be eligible for any extra payment in respect of such mountings, fittings, fixtures, accessories etc. which are needed/required for safe operation of the item/ equipment/system, as required by applicable codes of the country though they may not have been explicitly spelt out in the NIT/Contract.
ANNEXURE - I

DESIGN PHILOSOPHY – ARCHITECTURAL
CONTENTS

1.0  GENERAL
1.1  SCOPE
1.2  UNITS OF MEASUREMENT
1.3  DEFINITION
1.4  CODES & STANDARDS

2.0  DESIGN PHILOSOPHY / CRITERIA - GENERAL
2.1  ARCHITECTURAL DESIGN
2.2  BUILDING REQUIREMENT
2.3  BUILDING SERVICES
2.4  AESTHETICS
2.5  BUILDING ELEMENTS

3.0  BUILDING STRUCTURE

4.0  ARCHITECTURAL TRADES
4.1  EXTERNAL FINISHES
4.2  INTERNAL FINISHES
4.3  DOORS, WINDOWS & VENTILATORS
4.4  SANITARY FITTINGS & FIXTURES

5.0  MISCELLANEOUS
5.1  DRAWING
5.2  DESIGN
5.3  BUILDING REQUIREMENTS
1.0 GENERAL

1.1 SCOPE
The design philosophy defines the minimum design requirements and procedures for carrying out architectural design and engineering of buildings covered under this project. Relevant criteria shall be taken into consideration to achieve satisfactory and trouble free performance of the facilities.

1.2 UNITS OF MEASUREMENT
Units of measurement in design shall be in metric system.

1.3 DEFINITIONS

Owner              Talcher Fertilizers Limited (TFL)

PMC                To be selected

LSTK Contractor    Successful LSTK bidder of the tender (To be selected)

CCE                Chief Controller of Explosives

TAC                Tariff Advisory Committee

NFPA               National Fire Protection Association

IS                 Bureau of Indian Standards
1.4 CODES AND STANDARDS

The design shall be in accordance with established codes, sound engineering practices and shall conform to the applicable statutory regulations.

The main codes, standards and statutory regulations considered as minimum requirements are as follows. Latest revision of these shall be followed.

1.0 National Building Code of India
2.0 Factories Act of State
3.0 Local Municipality or any other Authority’s Bye-laws as applicable.
4.0 Bye-Laws applicable of Town & Country Planning Organization.
5.0 Code of practice for building bye-laws IS : 1256
6.0 TAC (Tariff Advisory Committee) Rules
7.0 Indian Electricity Rules
8.0 Bureau of Indian Standards

Note: The above list is suggestive and not exhaustive. Apart from the basic codes any other related codes shall also be followed wherever required.

1.4.1 Order of Precedence

In case of any conflict / deviations amongst various documents, the order of precedence shall be as follows:

- Statutory Regulations
- Job Specifications
- Engineering Design Basis
- Standard Specifications
2.0 DESIGN PHILOSOPHY / CRITERIA – GENERAL

2.1 ARCHITECTURAL DESIGN

Architectural design of buildings / sheds shall be in accordance with this design basis and references as stated herein, to facilitate the intended functions. The various types of requirements to be considered are described further. In Plant Area no underground/ basement shall be provided in the building.

2.2 BUILDING REQUIREMENTS

2.2.1 Spatial Requirements

Spatial requirements inside a building / shed shall be decided based on activities to be performed in the building and consequent occupancy pattern, equipment layout etc. Spaces can be generally classified as functional spaces, circulation spaces, amenity spaces, utility spaces. They are elaborated further.

2.2.1.1 Functional Spaces

Functional areas of any building / shed is constituted by the main activity for which the building is required. Various spaces/rooms shall be judiciously sized and shall be integrated logically to generate the total building plan taking into account the following parameters :-

a) Activities, group of activities and consequent work-flow pattern.
b) Site conditions i.e., dimensions, contours etc.
c) Climatic conditions vis-à-vis orientation.
d) Safety regulations.
e) Lighting and ventilation.
f) Green building Concept for non plant buildings
g) Acoustics
h) Services
i) Security
j) Economy
k) Aesthetics
l) Specific requirements pertaining to particular buildings, if any
m) All other established architectural design parameters in practice.

The objective of spatial arrangement shall be to satisfy functional requirements and physical comfort and safety regulations as well as aesthetics which has significant role in creating a favourable working environment.

2.2.1.2 Circulation Spaces

Following spaces are classified as circulation spaces. These spaces shall be provided as per required building services, for integrating various types of spaces and as means of access / exit / escape.

a) Corridors & passages.
b) Staircases
c) Elevator
d) Entrance lobby / Foyer including Reception & waiting.
e) Gangway / walkways.
f) Equipment loading / unloading platforms
g) Emergency Exits

2.2.1.3 Amenity Spaces

Following spaces are classified as amenity spaces:

a) Toilet (Gents & Ladies).
b) Drinking Water Facility.
c) Locker & Change Room.
d) Rest room / Lunch Room.
e) First-Aid Room
Out of the above mentioned areas, a) Toilet, b) Drinking water, c) First Aid enclosures shall be mandatory requirement for all buildings / sheds under bidder’s scope. However, number of male, female & physically challenged person’s toilets will be decided during detailed engineering as per building by-laws.

Other facilities shall be provided as required.

2.2.1.4 Utility Spaces

Utility spaces are space requirements which materialize due to provision of services like air-conditioning, pressurization, fire fighting, electrical, telephone, LAN etc. Following are examples. These spaces shall be provided as per required building services.

i) Air-conditioning plant room.

ii) Air handling rooms.

iii) Pressurization blower plant room.

iv) Electrical distribution panels rooms.

v) Service ducts

vi) Firefighting equipment room.

vii) Telephone exchange equipment room.

viii) UPS room.

ix) Battery room.

2.2.1.5 Sizes of Spaces

Sizes of various type of spaces shall be decided based on occupancy / equipment / Panel / furniture layout, clearance, maintenance & safety requirements & ventilation requirements.

However, following are the limiting sizes / dimensions for various purposes, which shall be adhered to:

a) Minimum area of any habitable room = 9.5 m² with minimum dimension restricted to 2.5 m
b) Minimum height of any habitable room = 3 m which may be reduced to 2.75 m for air-conditioned areas. Due provision / clearance may be made for AC ducts above false ceiling if any. Headroom below beams should be min. 2.4 m.

c) Maximum height of habitable rooms = As stipulated by the local bye-laws

d) Scale of accommodation for industrial work spaces = @ 14 m³ per occupants. Minimum clear height of such workspaces shall be 3.6 m. Heights above 4.25 m shall not be taken into account.

2.2.2 Day Lighting and Ventilation

2.2.2.1 Day Lighting

Established level of illumination shall be maintained for all parts of the buildings by means of windows, ventilators, skylights, etc. Following references shall be adhered to in this regard.

a) National Building Code of India, Part-VIII, Section-1
b) IS:2440: IS 3646 (Part-II) : IS:7662 (Part-I)
c) State Factories Rules
d) Any other relevant rules / code etc.

Following architectural norms shall be adopted:
a) Direct solar illumination shall not be considered and only sky radiation shall be taken as contributing to illumination of the building.
b) Openings shall be provided with shading devices to avoid glare.

For the purpose of illumination, day lighting shall also be supplemented by artificial illumination.
2.2.2.2 Ventilation

A) Natural Ventilation
   Established level of ventilation in terms of air changes per hour shall be maintained for all spaces. Following references shall be adhered to for the purpose.

   a) National Building Code of India, Part-III, Section-1
   b) IS:3101 (industrial buildings), IS:3362 (residential buildings); IS:7662(Part-I)
   c) State Factories Rules
   d) Any other relevant rules / Codes etc.

   Natural ventilation shall also be supplemented by mechanical or electrical means of ventilation in all areas of habitation. Sufficient no of Glazed / Louvered windows / ventilators shall be provided and supplemented by exhaust fans.

B) Mechanical Ventilation
   In addition to natural ventilation, if required mechanical or electrical ventilation shall be provided depending on the type of building and its use. Other relevant design basis shall be referred for its requirement and applications.

2.2.3 Acoustics And Sound Insulation

Specified acceptable noise level and reverberation time shall be maintained inside a building / shed. Following references shall be referred to for the purpose.

   a) National Building Code of India.
   b) State Factory Rules.
   c) Limitations on decibel level stated elsewhere, if any, in the bid document
Required noise level in any space shall be maintained by means of
a) Segregating noise sources by buffer zones
b) Dampening of noise levels by damping devices
c) Providing Acoustic treatment with acoustic material (on walls, ceilings, floors, as required).

2.2.4 Safety Requirements
Safety from fire and like emergencies shall be taken into account in building / shed design. Buildings / sheds meant for human occupancy shall be provided with exits sufficient to permit safe escape of occupants in case of an emergency. The exits shall be in terms of doorway, corridors, and passage ways to internal / external staircase or to areas having access to the outside. Following references shall be adhered to this regard. Max distance to an exit from any point in a building shall not exceed 30 m. Control Room building shall be provided with emergency exit on the other side of entrance.

A minimum of two staircases and two exits per floor shall be provided in each building. Width of passage / corridor shall not be less than 1500 mm. Following references shall be referred to for the purpose design of Control Room building.

a) National Building Code of India, Part-IV
b) State Factories Rules.
c) Any other relevant rules / codes.

2.2.5 Site Planning & Landscaping
Site planning of building shall take into account aspects like inter-relationship of the buildings with the whole system, movement pattern, traffic and road net-work, safety regulations, service network, fire safety, climatic and environmental aspects.
Main and service / maintenance entrances of buildings shall be provided with vehicular access. All exit points shall also be provided with footpath / vehicular access. Truck movement space in accordance with traffic pattern shall be provided for the building as per the location of hoisting bay / loading, unloading platform. Road network and open space around the buildings shall be designed considering movement and functioning of fire tenders and cranes, etc.

Landscaping to be done for areas around control room and technical lab building within bidder’s battery area excluding hard paved area. Such treatment shall generally consist of lawns, road side plantation and beautification of building entrance areas. Standard landscape elements such as earth contours, paving, flower beds, hedges, shrubs, ground cover and ornamental trees shall be incorporated in landscape treatment. Necessary water supply / sprinklers shall also be provided. Wherever required, Grass for landscaping shall be “Selection Grass”.

2.3 BUILDING SERVICES

Following services shall be provided for all building / sheds as essential services.

2.3.1 Water supply, Distribution and Drainage, Sanitary Services.

The service is essential for all habitable buildings / sheds. All buildings with human occupancy shall have toilet and drinking water facility and accordingly water supply, distribution and drainage, sanitary services as per following references.

a) National Building Code of India, Part-IX, Section 1 & 2
b) State Factories Rules.

Drinking water provisions, including one number water cooler per area (of approx 20 m x 20 m) shall be provided within an enclosure separated from the toilets.
Space for janitor shall be provided in the toilets. All service pipes showing on the external wall shall be suitably concealed or shall be provided within a shaft.

Each building shall be equipped with approved PVC overhead water tanks of capacity not less than 2000 litres.

2.3.2 **Electrical Services**

This service shall be provided as essential service for all building / sheds. Electrical services for buildings shall consist of electrical supply and distributions, electrical lighting installations, telephone network, fans, exhaust fans, lighting protection system etc. including all accessories, cabling etc. including emergency power supply, all as per requirement. All electrical switches / sockets shall be of modular type as per the approved makes given separately.

**Air conditioning and Heating**

Areas of control room, spaces housing equipment / machinery / panels etc. which required conditioned environment and certain specified areas like offices, specific office accommodation shall be suitably air-conditioned by window / split / package / centrally air-conditioned type units, as per requirement with respect to other relevant Design Basis.

Accordingly, AC Plant / AHU etc. of the required capacity, whenever required, shall be provided and housed, suitably.

2.4 **AESTHETICS**

Apart from the fulfillment of functional & safety requirement, aesthetic requirement of the buildings / sheds shall be taken care of in the design. As specific guidelines for achieving required aesthetics are difficult to establish, following guidelines shall be followed:
a) Preliminary Drawings including perspective views indicating architectural
treatment minimum three different alternative proposals shall be submitted for
Owner’s approval.

b) Following elements shall be considered as contributory elements to aesthetics
and their design etc. shall be subjected to the Owner’s approval. Any change /
modifications sought for aesthetics improvements with regards to these
elements shall be carried out. Any incidental elements like brickwork, RCC work
etc. required for such changes / modifications shall also be added.
   i)   Building / shed shape and features
   ii)  Canopies, overhangs & shading devices
   iii) Gutters
   iv)  Entrance / exit steps, door
   v)   Window / Ventilator composition
   vi)  External wall location with respect to columns
   vii) Colour scheme, grooves in plaster
   viii) Spatial arrangement
   ix)  Aesthetic of the buildings should match with the surrounding existing
        facilities at the site.

2.5   BUILDING ELEMENTS

2.5.1 Plinth protection

All the buildings & sheds shall be provided with minimum 1000 mm wide plinth
protection around the building / shed. Level wise, it shall be 100 mm high above top
of approach road level. In order to avoid accumulation of water outside the
buildings, requirement of surface drains shall be examined on case to case basis
for individual building and provided if necessary.

2.5.2 Finished Floor Level (Plinth FFL)

In general, Plinth FFL of the buildings, sheds shall be determined with respect to
top of approach road or pavement. Unless noted otherwise on the reference
drawings, following schedule shall be adhered to for FFL of various buildings &
sheds.
<table>
<thead>
<tr>
<th>Category</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>a) Sub Station Building</td>
<td></td>
</tr>
<tr>
<td>&gt; Cable cellar floor</td>
<td>Top level of approach road + 450 mm/or as specified in Electrical section of NIT</td>
</tr>
<tr>
<td>&gt; Transformer bay with pebbles</td>
<td>Top level of approach road + 150 mm/or as specified in Electrical section of NIT</td>
</tr>
<tr>
<td>&gt; Single storey substation with trenches</td>
<td>F.G.L. (+) approx. 1000 mm high from top of road/or as specified in Electrical section of NIT</td>
</tr>
<tr>
<td>b) Transformer bay</td>
<td>Top level of approach road + 150 mm/or as specified in Electrical section of NIT</td>
</tr>
<tr>
<td>c) Vehicle, scooter, cycle shed including fire tender bays, repair shop</td>
<td>Top level of approach road + 300 mm</td>
</tr>
<tr>
<td>d) False floor areas (Control Room)</td>
<td>As specified in the Instrumentation section of NIT</td>
</tr>
<tr>

<td>Top level of approach road + 1100 mm</td>
</tr>
<tr>
<td>f) Electrical rooms</td>
<td>As specified in the Electrical section of NIT</td>
</tr>
<tr>
<td>g) Other Buildings / Shed (Process Operator’s Cabin)</td>
<td>Top level of approach road + 450 mm from surrounding ground level.</td>
</tr>
</tbody>
</table>

**Notes:**

a) In case of approaches with different top levels, the highest top level of approach road/pavement shall be considered.

b) FFL shall be same throughout in a building/shed. Split levels any be considered in exceptional cases due to ground terrain etc.

c) FFL of external loading/unloading bays/platforms, toilet, pantry, kitchen shall be 6 – 12 mm lower than that of the building/shed’s FFL to check ingress/spillage of rainwater.

d) FFL of Warehouses, stores may be kept lower than loading/unloading bays/platforms where forklifts etc. are used for internal movement of items. Adequate arrangement for negotiating the level difference shall be provided in that case.

e) Where applicable, existing levels of building/sheds shall be followed.
2.5.3 Steps / Ramps

Steps / ramps shall be provided for access to the buildings / sheds for pedestrian /vehicular movement, equipment entry, etc. Minimum 1500 mm wide platform shall be provided in between entrance door and steps / ramps. Following dimensions of the steps / ramps shall be adhered to:

<td>b) Riser</td>
<td>175 mm maximum</td>
</tr>
<tr>
<td>c) Slope of ram</td>
<td>Not steeper than 1:10 slope</td>
</tr>
<tr>
<td>d) Ratio of tread &amp; riser</td>
<td>2 Riser + Tread = 600 to 650 mm</td>
</tr>
<tr>
<td>e) Landing width</td>
<td>1500 mm minimum</td>
</tr>
<tr>
<td>f) Flight width</td>
<td>1500 mm minimum</td>
</tr>
</tbody>
</table>

Edge of treads shall be provided with friction grip strips

2.5.4 Wall

Following schedule shall be adhered to for wall material and thickness

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1.  Blast Proof Wall</td>
<td>Min 230 mm thk. RCC wall</td>
</tr>
<tr>
<td>2.  Rain water duct / shaft</td>
<td>Min. 230 mm thk. hollow/ solid concrete block work</td>
</tr>
<tr>
<td>3.  External walls</td>
<td>230 mm thk. hollow/ solid concrete block work</td>
</tr>
<tr>
<td>4.  Fire wall (Around transformers)</td>
<td>240 thk RCC or 355 mm (including plastering) thick hollow/ solid concrete block work wall / OR as per Electrical requirements. (IER/TAC)</td>
</tr>
<tr>
<td>5.  Internal partition wall</td>
<td>230 / 115 mm thk. hollow/ solid concrete block work wall depending on the overall length and height of the wall (refer notes below)</td>
</tr>
</tbody>
</table>
a) 115 mm thick partition walls shall be provided with RCC transoms and mullions for suitability.

b) Wherever conduits or pipes are required to be concealed within partition wall, the local wall thickness shall be increased suitably.

2.5.5 Doors

Doors shall be provided for access, security and safety to all rooms, functional areas in a building. Air tight door shall be provided in pressurized area and in gaseous protection area. Emergency door shall be opened outwards. Sizes of the doors shall be determined on the basis of the following schedule:

<table>
<thead>
<tr>
<th>Category</th>
<th>Size Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Equipment, Panel area</td>
<td>Maximum size of equipment including packing</td>
</tr>
<tr>
<td>Other areas</td>
<td>Volume of movement through door</td>
</tr>
<tr>
<td>Minimum door size at entrance</td>
<td>1500 mm x 2500 mm (masonry opening size)</td>
</tr>
<tr>
<td>W.C. bath Cubicle door</td>
<td>800 mm x 2100 mm (masonry opening size)</td>
</tr>
<tr>
<td>Minimum size of other doors</td>
<td>1000 mm x 2100 mm (masonry opening size)</td>
</tr>
</tbody>
</table>

Notes:

a) Entrance doors shall be provided covering full width of the entrance lobby. In that case the door shall be of composite type consisting of openable shutters & fixed panels. Entrance lobby shall be provided with elaborate canopy.

b) Rolling shutters min 2500 mm wide shall be provided for equipment entry for Switchgear room, Electrical room, A.C. Plant room etc. and also wherever size of opening exceeds 2500 mm x 2500 mm.

c) Mechanically operated rolling shutters shall be provided for main equipment entry opening, and also where opening size exceeds 8 m².

d) Fireproof door shall be with two hours fire rating as per statutory requirements.

e) Blast resistant Control room entry door shall be provided with blast resistant baffle wall in front of entry door and shall have 45 degree / 90 degree overlap on both sides as per relevant standard/codes.
2.5.6 Windows / Ventilators

Windows / ventilators shall be provided in all areas for natural lighting, ventilation, and visibility of working level. For the purpose of ventilation, total openable area of the windows / ventilators shall be as per Factories Act subject to a minimum of 15% of the floor area to be ventilated. However, for control room and in office areas, etc. where visibility from inside is also important, increased window area (as per discussion with Owner/PMC) shall be provided. Areas accommodating panels / equipment shall be normally provided with ventilators at high level for uniformity distributed lighting.

Notes:

a) Requirements of window / ventilation area as stipulated above is for maximum room height of 4000 mm. For heights more than 4000 mm, additional window / ventilator shall be provided in the same manner at every work area / platforms at all levels.

b) Wherever due to limitation of external wall area or other reasons, stipulated area of window / ventilator cannot be provided, suitable mechanical / electrical system shall be employed.

c) Fly mesh shutters shall be provided for windows / ventilators in Kitchen, Pantry, Dining hall etc.

d) Ventilator shall be able to serve as smoke vents in the event of fire.

e) For structures like workshop / warehouse / compressor shed with pre-coated or G.I. roof sheeting, suitable monitor may be added to provide proper ventilation.

f) Fireproof windows shall be provided as per TAC, electrical, process, etc. statutory requirements.

g) External windows shall have P.C.C. (1:3:6) sills, 100 thk.

h) All glasses in windows & doors shall be toughened glass. Outside glasses shall be tinted toughened.

2.5.7 Canopy / Overhang

RCC Canopy / Overhangs shall be provided at all entrances for rain / sun protection, accentuation of the entrances, and pedestrian movement as per the following schedule:
a) For all offices, control rooms, composite buildings / sheds accommodating offices, canopy shall be provided at all entrances. Size of the canopy shall be decided based on vehicle parking & pedestrian movement in addition to aesthetics of the building / shed. Bottom of canopy shall be minimum 2800 from top of drive way.

b) Overhangs shall be provided over all exits. Size of the overhang shall be decided on the aesthetics of the building / shed subjected to minimum of 1000 mm.

Blast proof Control rooms shall not have any projections on outer face of its walls except with false treatment for aesthetics of the building.

2.5.8 Shading Devices
RCC Shading devices shall be provided over all windows, openable ventilators for rain & sun protection. These devices shall be in form of horizontal projections, vertical projected fins or combination of both as per building façade treatment. Minimum projection shall be 600 mm.

2.5.9 Parapet
Parapets shall be of RCC for all buildings with minimum 500 mm high for non-approachable roof and 1100 mm high for approachable roof.

2.5.10 Roof Gutter
Gutter with rainwater pipes shall be provided for all the buildings / sheds for roof water drainage. Sizing of the gutter shall be based on areas to be drained and number of outlets. Gutters shall be of RCC or sheet metal depending on type of structure.

2.5.11 Rain Water Pipes Spouts
PVC rain water pipes shall be provided for roof water drainage. Number of rain water pipes shall be decided on the basis of roof area, slope and rainfall intensity as
per NBC-IX, Section-2. Rain water pipes shall be concealed as far as possible. RCC or GI spouts may be used for drainage of chajja / small canopies of ground floor. Dia of rain water pipe shall be 150 mm minimum.

2.5.12 Entrance Lobby

Entrance lobby shall be provided as a common entrance for all buildings / sheds accommodating separate functional spaces integrated together. Individual entries to such functional spaces shall be from this lobby by means of passages / corridors. Apart from common entry lobby, separate independent entries to these functional spaces shall also be provided if functionally required. Size of the entrance lobby shall be decided on the basis of volume of movement. Air lock lobby shall be provided for all entries with centrally air-conditioned spaces, and pressurized.

2.5.13 Passage / corridors

Passage / corridors shall be provided to integrate various spaces. Width of the passage / corridors shall be as per statutory requirement, subject to a minimum width of 1500 mm.

2.5.14 Service Entry

Separate service entry shall be provided for service areas such as kitchen, air-condition / pressurization plant room, electrical rooms. A common service entry may be provided depending on spatial arrangement.

2.5.15 Emergency Exits

Emergency exits shall be provided for all the building / sheds as per statutory requirements. Emergency exits for individual function spaces such as console area, cable cellar, and switchgear hall shall also be provided. Emergency exits shall be located in such a manner that escape route is unobstructed & without passing through any other function areas. Corridors / staircases shall be provided as escape route.
2.5.16 Staircases

Staircases shall be provided in multi floor buildings for vertical circulation & emergency exits. Number of staircases shall be based on building / shed sizes, emergency exit requirements, and travel distances to exit points as per statutory regulations. More than 500 sq m ground covered area shall have at least two stairs in line with NBC-Part-IV. Emergency exit requirements shall be as per safety distance requirement. At least one staircase shall be provided for access to the flat roof tops for maintenance. Following dimensions for staircases shall be adhered to.

<table>
<thead>
<tr>
<th></th>
<th>Stairs width</th>
<th></th>
<th>1500 mm minimum, (1000 mm minimum for emergency exit)</th>
</tr>
</thead>
<tbody>
<tr>
<td>a)</td>

<tr>
<td>d)</td>
<td>Ratio of tread &amp; riser</td>
<td>:</td>
<td>2 Riser + Tread = 600 to 650 mm</td>
</tr>
</tbody>
</table>

2.5.17 Railings

Railings shall be provided in roofs, stairs and in all unprotected openings in slabs as a safety device. Railings in high level loading / unloading bay of substations shall be of removable type. Parapets shall be given precedence over railings in roofs. All Hand Railings (in buildings only) shall be of SS-304 grade of design as per direction / approved by owner.

2.5.18 Toilets

Toilets shall be provided for all habitable buildings / sheds. Gents & ladies Toilet, drinking water enclosure & janitor space, all shall be provided as required. The fittings / fixtures provided for bath / toilet shall be of luxury / colored type.

2.5.19 Partitions

If required partitions shall be provided for flexible space arrangement in office spaces, Control room etc. The partitions shall be modular, dismantleable type of Godrej or approved equivalent make.
2.5.20 False Ceiling
False ceilings shall be provided for following purposes:-

a) To reduce room volume and hide ducting etc. for air conditioned spaces.
b) To maintain acoustic level inside any space.
c) To reduce habitable room, corridor, lobby, toilet heights located in high ceiling building / shed to a reasonable and satisfactory height of minimum 3000 mm.
d) In fire rated areas where walls and doors are required to be fire rated, false ceiling shall also have complementing fire rating. It is appreciated that false ceiling have limitations in their fire performance due to openings in them for lighting and air conditioning. Therefore alternative systems to prevent puncturing the ceiling must be employed.

2.5.21 Under deck Insulation
Under deck insulation below RCC roof and over false ceiling (both locations) shall be provided for air-conditioned office / space.

2.5.22 False / Cavity flooring
False / cavity flooring, consisting of cement filled flooring sheets with antistatic lamination on the top, of approved make / as directed by Engineer in charge, shall be provided to accommodate under floor cabling in all areas. Extent of false / cavity flooring shall be as per functional requirements.
False flooring shall be fire rated to the level of fire rating of the walls, doors and suspended ceiling in the compartment.
Cavity flooring for Control Room buildings, specifications given in Instrumentation section is to be followed.

2.5.23 Waterproofing on roofs
Water proofing (for all open terraces) of all buildings shall be done by water proofing PU coating with treatment also, of approved Brand and make.
Wherever there is human/machine movement anticipated, it is preferable to use Brickbat waterproofing over roof.
2.5.24 Dash fasteners, if used, shall be of approved make or as directed.

3.0 BUILDING STRUCTURE

The layout of the buildings shall be finalized within 3 months after the effective date of contract.

The design considerations, type of buildings and specifications of various buildings shall be as generally defined under this clause, unless stated otherwise as per plant Requirements:

<table>
<thead>
<tr>
<th>S. No.</th>

</tbody>
</table>

4.0 ARCHITECTURAL TRADES (To be finalized in consultation of OWNER/PMC)

All the buildings shall be provided with Architectural finishes such as floor finishes, plastering & painting on walls & ceilings, doors / windows / ventilators, roof treatment, plinth protection, etc. pertaining to approved make/brand and best quality for industrial usage.
4.1 EXTERNAL FINISHES  (To be finalized in consultation of OWNER/PMC)

4.1.1 External Wall
   a) Substation Room, Operator & Maintenance building - Weather proof Exterior Acrylic Emulsion paint of approved brand, quality, make and shade as per direction of Owner.
   b) Control Room – Sand Stone Cladding

4.2 INTERNAL FINISHES  (To be finalized in consultation of OWNER/PMC)

4.2.1 Floor Finishes
   a) Office area, & Sub station
      Vitrified tiles in glazed or matt finish / Marbo-granite tiles
   b) Toilet, Drinking Water area
      Granite flooring
   c) Circulation area (Corridor / Passage etc. except Entrance Lobby) of Substation - Kota stone flooring
   d) Circulation area (Corridor / Passage etc. except Entrance Lobby) of Control room –Complete flooring (except False flooring area) to be Granite or Vitrified tiles or combination of both as per direction of Owner. Selection of quality, shade etc. for Granite / Vitrified tiles shall be based on good engineering practices and done as per Owner’s direction / approval.
   e) Switch Gear, Cable Cellar, A.C. Plant Room, storage area
      Switch gear Room for substation will have Kota Stone Flooring. Rest of the buildings wil has heavy Duty Decorative Ceramic Tiles. / Hardcrete Floor, as directed by E.I.C
   f) Battery Room
      Acid resistant epoxy coating over IPS-flooring & 2100 high dado.
   g) Entrance lobby, corridor lobby of main building- granite flooring

Note:
Skirting shall be provided in all areas, which shall be of same material as that of flooring. Glass strip panel shall be provided in cement concrete flooring.
4.2.2 Internal Wall Finishes for applicable buildings/structures

a) Entrance lobby, Corridor lobby:
   Granite stone cladding and plastic emulsion paint.

b) Office areas of Buildings:
   Cement plaster, POP punning & plastic emulsion paint

c) Circulation areas (Corridor / Passage etc. excepting Entrance lobby) of Buildings
   Cement plaster, POP punning & plastic emulsion paint

d) Rack Room, Office Rooms, Operators Room
   Cement plaster, POP punning & plastic emulsion paint

e) Switchgear Room / Electrical Room
   Cement plaster & Plastic Emulsion paint (Switchgear Room)

f) Battery Room
   Acid resistant epoxy coating over cement plaster up to 2100 height. Plastic emulsion paint above 2100 height.

g) Toilet, Drinking water area
   Granite stone cladding / Marble / Ceramic tiles as directed by E.I.C

h) Inside surface of Prilling tower:
   Suitable Epoxy coating (like IPN epoxy phenolic coating) of approved Brand, Make and shade as per direction of owner.

4.2.3 Internal Ceiling Finishes

a) Toilet Electric Operator, Rack room, MCC panel room, UPS
   All false ceiling shall be either Gypsum board false ceiling or Armstrong false ceiling or combination of both as per direction of owner. Further, false ceiling shall also have fire rating complying with safety requirements. Also refer Instrumentation and Electrical specifications.

b) Other areas which do not have false ceiling
   Cement plaster & white / color wash, plastic emulsion paint etc., as in the case of wall finish.
4.3 DOORS, WINDOWS & VENTILATORS

4.3.1 DOORS

All frame works shall be in Sal/chap wood in size 125 x 65 mm.

a) All doors in Toilet / WC / Bath
   35 mm flush door laminated with 01mm laminate from both sides.

b) All doors of Electrical Room, A.C. Plant Room, Battery Room
   Pressed steel frame with pressed steel shutter (or as specified in Electrical
   section).

c) Inside Control Room
   Fire check door with 2 hours rating as required in perfect partition wall
   separating various fire zones (or as specified in Instrumentation section)

d) All other doors of Control Room / Satellite Rack Room / Sub station
   Glazed, powder coated Aluminum door with decorative etching (or as specified
   in Instrumentation section).

4.3.2 WINDOWS & VENTILATORS

a) Windows / ventilators
   Glazed, powder coated aluminum window / ventilator.

4.4 SANITARY FITTINGS (Make: Jaquar/Cera/Hindware/Perryware or equivalent)

a) Water Closet for Control Room
   Wall hung type colored European designer type WC.

b) Water Closet for Sub Station
   Pedestal type white European designer type W.

c) Water Closet (Indian)
   Orissa type (Indian) pan white WC.

d) Wash basins for Control Room.
   Round wash basin white / colored housed in granite counter with electronic
   sensors for water control, approved quality mirror. Front portion below the
   counter shall be covered with shutters of laminated boards.

e) Wash basins for Sub Station / Satellite Control Room.
   Wall hung wash basin with pedestal.
f) Plumbing fixtures.
   Stainless steel bib cock, stop cock etc. fittings.

g) Urinals of approved Brand, Make, size, shape and color shall be provided in Control Room with Electronic sensors for water control, along with Glass partitions of approved brand, make size and shape etc.

5.0 MISCELLANEOUS

5.1 ARCHITECHTURAL DRAWING

5.1.1 Plant datum shall always be 100.00 meters and its correspondence to the reduced level with respect to the mean sea level shall be indicated in the “NOTES” (Unless it is already established).

5.1.2 Location co-ordinates shall be indicated on grids.

5.1.3 Reference drawings, notes, holds list, schedule of finishes including painting, door and window schedules, area statement, notes on plastering, key plan, were necessary, shall appear in the first drawing sheet of a building. Subsequent sheets can cover them by a reference to the first sheet.

5.1.4 Elevations shall show siography to highlight features, human figures for scale, automobiles for headroom, trees and foliage for appearance.

5.1.5 False ceiling area shall be shown by hatching suitably.

5.1.6 False flooring area shall be shown by hatching suitably.

5.1.7 Air-conditioned rooms shall be identified suitably.

5.2 DESIGN

5.2.1 Entrances shall be elaborate and well sheltered to accommodate pedestrians and vehicles.

5.2.2 Provision for future extension, vertical and horizontal shall reflect in the work.
5.2.3 Toilet, kitchen and pantry floors with waterproofing and sloped for drainage. The finished floor level shall be 25 mm below the general finished floor level. Tile drops shall be indicated were required. For example from general floor to toilet floor, toilet floor to WC / Shower floor, general floor to pantry, general floor to entrance platforms and so on.

5.2.4 Plumbing works, external drainage, schematic, flow, shall be indicated.

5.2.5 Water tanks, AC plant, cooling tower, Chiller units etc., where required, shall be located on building roof as far as possible and it shall be positioned and supported to transfer its load on to beams and columns and not to the slab. Such facilities should not be visible from outside. Suitable side cladding shall be provided for this purpose.

5.2.6 Access to all roofs via steel ladder. In case of accessible roofs at least one staircase shall go up to the roof.

5.2.7 Plinth beams level shall clear trenches if any.

5.2.8 Vertical ducts for running services must be examined.

5.2.9 Ventilator arrangement shall be provided unless situations strongly prevent or make it unnecessary. In addition to ventilation requirements, ventilators shall have the capacity to vent smoke in the event of fire.

5.2.10 Layout shall take into account the type of air-conditioning and built-in provisions shall be made to accommodate the equipment.

5.2.11 Walls on steel beams shall be constructed after wall below and up to the steel beam is constructed. This shall appear in the ‘Notes’ if applicable.

5.2.12 Gaps in floor cut outs shall be sealed with fireproof material for fire safety.
5.2.13 Openings in wall / cladding for pipes and cables from pipe rack / trays shall be made water tight primarily by means of design features.

5.3 BUILDING REQUIREMENTS

5.3.1 All free edges of chajjas and slab projections shall have drip mould in plaster 50 mm wide and 20 mm drop, unless the need is resolved in some other manner.

5.3.2 Floor slab in WC areas shall be sunk by 500 mm and toilet, pantry, kitchen floor slabs shall be sunk by 200 mm at all levels (including terrace, where future extension is envisaged).

5.3.3 All partition walls within toilet kitchen areas shall be 115 mm thick and 2200 mm high.

5.3.4 All supporting framework members of partition walls within false ceiling areas shall go up to roof level, partitions shall go up to false ceiling level except where there are fire compartment wall where it shall be from floor to ceiling.

5.3.5 All windows and ventilators opening periphery shall have granite embedded in cement mortar 1:3.

5.3.6 Preferably all cut out in slab shall be provided with 200 mm high kerb.

5.3.7 Groove in plaster, 20 wide x 10 deep shall be provided aesthetically to break extensive areas of plaster.

5.3.8 Flooring shall be done in panels, preferably in 3000X3000 mm size with expansion joints provided at 25000 mm c/c.

5.3.9 Flooring contraction joint shall be provided as per design.

5.3.10 Parapet walls shall be at least 1100 mm high.

5.3.11 Roofs of RCC buildings should have mild slope towards rain water gutters.

5.3.12 All Instrument / Electrical cables at the junction of the building (outside) shall be covered with pre-cast RCC slab. Sleeve pipes should be provided for the cable in the masonry wall including its sealing.

5.3.13 All new buildings (except for Blast proof Control Room) shall be designed for vertical extension of one additional storey over and above bidder’s plan to accommodate requirement in future.
ANNEXURE II

DESIGN PHILOSOPHY – GENERAL CIVIL & DESIGN BASIS
# TABLE OF CONTENTS

1.0 GENERAL

1.1 SCOPE
1.2 UNITS OF MEASUREMENT
1.3 DEFINITIONS
1.4 CODES AND STANDARDS

2.0 DESIGN CRITERIA – GENERAL
2.1 SURFACE TREATMENT
2.2 ROADS
2.3 CONCRETE PAVING (WITHIN PLANT AREAS)
2.4 SURFACE TREATMENT
2.5 STORM WATER DRAINAGE
2.6 WATER SUPPLY
2.7 SANITARY SEwers
2.8 CONTAMINATED RAIN WATER SEwers
2.9 OTHER PROCESS DRAINS
2.10 STORAGE TANK FOUNDATION AND DYKE WALLS
2.11 BARRICADE
2.12 TRENCHES
2.13 HARD SURFACES

3.1 REMOVAL / REROUTING OF CONSTRUCTIONS
1.0 GENERAL

1.1 SCOPE

This engineering design basis defines the design criteria that shall form the basis for carrying out design and engineering of items under general civil, viz. roads, paving, drainage, etc.

1.2 UNITS OF MEASUREMENTS

Units of measurement in design shall be metric system.

1.3 DEFINITIONS

Owner            Talcher Fertilizers Limited (TFL)
Consultant       To be selected
LSTK Contractor   Successful bidder of the tender
CCE              Chief Controller of Explosives
TAC              Tariff Advisory Committee
NFPA             National Fire Protection Association
IS                Indian Standards

1.4 CODES AND STANDARDS

The design shall be in accordance with established codes, sound engineering practices and shall conform to the statutory regulations applicable to the country.

1.4.1 The main codes, standards and statutory regulations considered as minimum requirements are as follows. Latest revision of these shall be followed.
IS: 456  Code of practice for plain and reinforced concrete
IS: 800  Code of practice for general construction in steel
IS: 875  Code of practice for design loads (Other than earthquake for buildings & Structures
IS: 1172 Code of basic requirements for water supply, drainage & sanitation
IS: 1742 Code of practice for building drainage
IS: 1905 Code of practice for structural use of unreinforced masonry
IS: 2065 Code of practice for water supply in buildings
IS: 2212 Code of practice for brick work
IS: 8835 Guidelines for design of surface drains.
IRC: 6  Code of practice for road bridges, Section-II Loads and stresses
IRC: 19 Standard Specifications and Code of Practice for Water Bound Macadam
IRC: 37 Design of flexible pavements
IRC: 58 Design of rigid pavements
Factory Rules for State

Note: The above list is suggestive and not exhaustive. Apart from these basic codes, any other related codes shall be followed wherever required.

1.4.2 In case of any conflict / deviations amongst various documents, the order of precedence shall as follows –

- Statutory regulations
- Job specifications
- Engineering design basis
- Standard specification
2.0 DESIGN CRITERIA – GENERAL

2.1 SITE GRADING

2.1.1 The work area shall be cleared and stripped completely of all bushes, roots, trees, Shrubs and other vegetation, organic matter and other objectionable materials. All these should be completely uprooted and removed, and not merely scraped at the surface.

2.1.2 The grading of the area, if required, shall be done by cutting and filling with the following:

   a. Cutting Area : Thoroughly rolled and compacted.
   b. Filling Area  : Compacted in layers not exceeding 20cm to Achieve minimum 95% of maximum dry density.

2.1.3 Site grading philosophy shall be based on following:

FFL of the adjacent paved area is ........m above Mean Sea Level (To be decided later).
However, levels like Finished Ground Levels (FGL) and Highest Point of Paving (HPP) shall be finalised by the CONTRACTOR, in consultation with OWNER / PMC, based on contour survey of the Unit, levels of adjacent units and levels of adjacent Roads.

2.1.4 Slope in Graded Areas

<table>
<thead>
<tr>
<th>Description</th>
<th>Slope</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. General Site Grading</td>
<td>1 in 500 to 1 in 1000</td>
</tr>
<tr>
<td>b. Micro grading, after completion of major construction (for road corridors)</td>
<td>1 in 200</td>
</tr>
<tr>
<td>c. Tanks Farms</td>
<td>1 in 200 to 1 in 300</td>
</tr>
</tbody>
</table>
2.2 ROADS

Contractor shall design cross section of roads, including roads for crane access, as per IRC 37. However, the minimum section to be adopted shall be as given in clause 2.2.7 Ruling gradient shall not exceed 1 in 20. If existing roads are to be used for erection purposes, the same should be strengthened to cater for erection loads. It should be ensured that use of existing roads does not hinder normal activities in existing plants.

2.2.1 ROAD WIDTH

<table>
<thead>
<tr>
<th>Category</th>
<th>Width*</th>
<th>Carriageway Width</th>
</tr>
</thead>
<tbody>
<tr>
<td>i. Road around unit and its Primary access</td>
<td>12.5 m</td>
<td>10.5 m (three lane road or width to suit crane type)</td>
</tr>
<tr>
<td>ii. Roads for high lifts crane 2.0 m+ c.w. width</td>
<td>3 m + outer width of crawlers of required Capacity crane.</td>
<td></td>
</tr>
<tr>
<td>iii. Plant approach road 9.0 m</td>
<td>7.0 m (two lane)</td>

<tr>
<td>vii. Foot path 1.0 m</td>
<td>.......</td>
<td></td>
</tr>
</tbody>
</table>

* Width of the road to be finalised as per site condition/Plot plan requirements in consultation with client / PMC.

2.2.2 Camber 1 in 50

2.2.3 Radius of curve: 12 m for 8 m wide carriage way roads, 8 m for 5.5 m wide Carriage way width & 15 m for roads of higher carriageway width.
2.2.4 **Pavement Type:** Concrete pavement at all roads to be used for crane movement (Requirement of crane movement route and its specification to be finalised in consultation with client /PMC)

2.2.5 **Extents:** As per Plot Plan / Equipment Layout drawing / scope drawing.

2.2.6 **Clearance:** Minimum 8.0 m to underside of pipe racks or as per Design Philosophy (Piping).

2.2.7 **Minimum Cross Section**

i. **Sub base:** The sub base shall be 300 mm layer of crushed / broken size stones on well compacted earth or approved fill.

ii. **Base course:** The base course shall be 225 mm stone size thick water bound macadam consisting of 3 layers of 75 mm each or Wet mix macadam roads.

iii. **Bituminous wearing course / RCC:** The wearing course shall be 75 mm thick for roads with crane duty and 50 mm thick for roads without crane duty. However, roads for crane movement, concrete pavements shall be provided.

2.2.8 **Crossings**

<table>
<thead>
<tr>
<th>Crossing Type</th>
<th>Type</th>
</tr>
</thead>
<tbody>

2.3 CONCRETE PAVING (WITHIN PLANT AREAS)

2.3.1 General

RCC paving to be done for entire battery limit and extend up to the adjacent roads around the unit. The contractor’s scope is limited to units’ peripheral roads. Heavy duty paving shall be designed for heavy vehicular traffic movement as per IRC Loading.

Concrete paving shall be laid in cast-in-situ panels of 3.0 meter X 3.0 meter size, with expansion joints spaced approximately 15.0 m c/c, each panel being cast in a single pour.

Hard stands should be designed and provided by contractor, based on required crane capacity, here called for by Owner, the same shall be demolished after erection, and surface made good.

Provision of trenches, drains, sealing of trench covers, inserts, thickening for pipe / equipment supports etc. shall be made while construction pavements, as detailed in drawings.

Acid / alkali / chemical resistant coating as required shall be applied in areas where such corrosive materials are likely to come in contact with concrete.

Suitable drainage arrangements will be provided within curbed areas around pumps, for drainage leaks. Similarly, suitable drainage arrangement shall be provided at streaming points also.
2.3.2 Joints

Expansion joint of 20 mm shall consist of 20 thick impregnated fibre boards. Filled at top with joint sealing compound 20 x 25.

Equipment / column pedestals will be separated from paving with 20 thick sand fill and Sealing compound 20 x 25.

Contraction joints will be sealed by sealing compound 10 x 40.

2.3.3 Slope: 1 in 100 (minimum)

2.3.4 Minimum requirements of paving in various areas

a. Paving within Process & Utility areas for maintenance compatible to crane movements / dropout / Loading / Unloading areas / Vehicular movement areas: Type – I (200 mm thick RCC)

b. Non vehicular movement areas

i. Unit: Type –II (150 mm thick RCC)

II. Offsite pump station: Type –II (150 mm thick RCC)

II. Bullet Area: Type –II (150 mm thick RCC)

II. Utilities: Type –II (150 mm thick RCC)

c. Pipe rack: PCC 1:3:6 (100 mm thick)

Paving and trenches including covers in process units shall be suitable for Hydra crane movement. Where movement of bigger cranes for maintenance is envisage paving and trenches including covers shall be designed for the loads arising from the same.
### 2.4 SURFACE TREATMENT

The surface treatment for the various areas shall be provided as enumerated in the table below.

<table>
<thead>
<tr>
<th>AREA</th>

'X' Indicating applicable option

**Notes:**

1. Existing services where interfering with the new construction should be located and rerouted as instructed by Owner / Consultant.
2. Micro-grading shall be carried out by the Contractor over graded areas to bring the FGL to indicated levels including provision of required slopes and finishes.
2.5 STORM WATER DRAINAGE

2.5.1 Storm water drains shall be sized for the higher discharge arising out of either rain water or fire fighting water.

2.5.2 Rain water run-off shall be computed by the formula:-

\[ Q = \frac{KIA}{360} \]

K is run-off coefficient given below.
A is area (hectares) contributing to the drain
I is rain fall intensity (mm / hr.)
Q is the discharge.

2.5.3 Design of drains shall be based on Manning’s formula:-

\[ V = R^{2/3} S^{1/2} / n \]

V is velocity of flow m/s,
R is hydraulic radius,
S is slope,
n is roughness coefficient taken as 0.013 for plaster surface, 0.015 for cast-in-situ concrete, 0.017 for brick lined.

The following parameters are to be ensured to be within limits specified while sizing

Minimum velocity of drains : 0.6 m/s
Maximum velocity of drains : 2.4 m/s
Minimum depth of drains : 300 mm
Minimum width of rectangular drains : 300mm (for depth<500mm)
Minimum width of drains : 500 mm (depth > 500mm)

Run off coefficient ‘K’

a. paved area concrete - 1.0
   Bituminous - 0.9

b. unpaved areas - 0.7

c. unusable areas like Green belt - 0.4
2.5.4 Drains within Process Units

Rain water falling on such portion of paved areas of process unit where it is not likely to get contaminated, shall be collected in open rectangular RCC drains. These drains shall be covered by gratings, and shall be generally connected to periphery drains, which at battery limit shall have a double valve chamber. This will permit discharging the rain water either to storm water network, or to the battery limit CRWS manhole. Drains shall be designed for the maximum of rainwater / firewater on same principles as storm water drains.

2.5.5 Culverts and Road/Rail Crossings

Road / Rail and storm water drain crossing shall by RCC box culverts, designed for the Relevant IRC loads for roads, and track loads for rail. The relevant lateral loads due to wheel / track loads on the soil adjacent to wall on crossing shall be considered on the walls. Approval from the rail authorities on culvert design shall be in the scope of LSTK contractor.

Drain to adjacent to roads / pavement where heavy crane movement is anticipated shall be Concrete drains, designed to resist the lateral thrust due to wheel loads.

Pipe culverts, if instructed to use by Owner/PMC, shall comprise of R.C.C. pipes (class NP-3, IS: 458) under roads; and R.C.C. pipes (class NP-4, IS: 458) under rail lines.

2.5.6 Tank Farm Drainage

Tank farm drainage system should be provided in such a way that the storm water discharge shall be either sent to storm water open ditch or to the oily water sewer by providing valve pit outside the dyke wall depending on its contamination.
2.5.7 Disposal of Storm Water

Storm water drains shall not be combined with oily waste sewer / CRWS/combined sewer system, etc. For disposal of storm water references shall be made to the ‘scope’ document.

2.5.8 Oil Catcher

An oil catcher with baffle wall type arrangement shall be provided a storm water ditch before it leaves the battery limit of the unit, & tank farm.

2.6 WATER SUPPLY

Existing drinking water piping shall be extended to new facilities. Adequacy of header branch line etc. shall be ensured; else additional lines shall be run.

2.7 SANITARY SEWEIRS

2.7.1 General

Sanitary sewerage will not be combined with storm water.
Building drainage shall be designed as a dual pipe system with separate soil & waste pipe.

Sewers shall be designed for discharging 3 times average flow flowing half full in case of lateral sewer, and flowing 2/3 full in case of Main sewer. The minimum and maximum clearing velocities shall be 0.75 m/s and velocity 2.4 m/s respectively. Velocity shall be calculated by Manning’s formula with n=0.015

Minimum pipe size shall be 100 mm and all pipes shall preferably be salt glazed stoneware unless abnormal soil conditions or high velocity dictates otherwise.

2.7.2 Sanitary sewer shall be led into the sewerage system leading to waste water treatment plant (WWTP). Where system is not available, septic tank/soak pit shall be provided.
2.7.3 Cover for Sewer Line shall be minimum 600 mm.

Under road, sewer shall be protected by concrete encasement or minimum cushion shall be 1200 mm.
Under railway, the sewer shall be protected as per railway standards.

2.7.4 Material of Construction

b. Material of Construction for Sewer

Sanitary Sewer
i. Toilet block to inspection - CI pipes as per IS: 3486/1729) or UPVC, as directed.

ii. Gravity main & lateral - Salt glazed stoneware / C.I. / R.C.C. Class P1 (as per IS: 458)

iii. Pressure main - C.I. pipes (as per IS: 1536 and IS: 1537)

iv. Offsite Pumping, if any - CPVC pipes/GI as per PMS J2A(as directed)

v. Manholes - R.C.C. M30

2.8 CONTAMINATED RAIN WATER SEWERS

2.8.1 Process Unit

Contaminated rain water / floor wash / fine water shall be collected through catch basins located in the contaminated areas of the process unit and shall be send to the oil catcher / CRWS pit / CRWS header. The continuously contaminated area of all pumps shall be segregated by kerb wall; discharge from such kerbed areas shall be collected in OWS network and not in CRWS network.
CRWS shall be designed for contaminated water due to rain water or Fire water, whichever is more.

The quantities of contaminated rain water shall be worked out based on the contaminated process area in the unit block.

Sewer shall be sized flowing full with peak flows taking future requirements or 2/3 full without future requirements.

CRWS manholes shall be R.C.C. (M30) construction. For trapping of gas or prevention of spread of fire through CRWS from one area to another, a liquid seal of minimum 150 mm shall be provided in manhole along with suitable vents. Location of sealed manholes should be decided accordingly. The vents on the manholes should extend minimum 2.0 m above the pipe rack or 1.0 m above buildings, or if in open areas extending min 3.0 m above FGL with frame arresters.

CRW sewers in process units and tankage areas shall be of mild steel /Carbon steel conforming to IS: 3589

2.8.2 Tank Farm Area

Tank farm areas, not containing tanks for corrosive materials, shall be drained by surface drains. Waste water shall be led to a sand trap and then to a valve chamber which shall either drain the water to storm water drain or oily water drain. Waste water from tank farm areas containing corrosive / hazardous materials shall be drained by chemical sewers to neutralization tank / ETP.

2.9 OTHER PROCESS DRAINS

Other process drains shall be oily water sewers, closed blow down sewers or chemical Sewers. Sizing, layout, material specification, corrosion protection etc will be as per u/g piping design Basis.
Oily water sewer convey water contaminated with oil, e.g. from reflux drums, separators, Cooling / quench water for compressor / pump, process wash water, floor and paving Drains in oily areas etc. These are conveyed either to WWTP or oil separator by means Of U/G steel pipes through sealed manholes.

Blow down are liquid streams containing water / oil / chemicals that are required to be drained from process equipment under different operating situations like start-up, shutdown etc. Blow down systems are closed piped systems in which streams are collected in underground blow down drums and then pumped to respective slop / field tanks.

Chemical sewers carry effluents containing chemicals which require separate treatment from oily water streams. These are generally corrosive and require pipe of materials resistant to corrosion or lined pipes.

Closed blow down sewers shall be closed piping systems as shown in piping drawings. These will lead to underground blow down drum / drums which shall be protected by a concrete pit as detailed in drawings. Before entering the blow down drum, a valve chamber shall be provided for the sewer. Sewer cleanouts will be provided at start / end charges in direction and at 45 m intervals on straight length.

Other aqueous blow downs within process areas will be collected by funnels and routed through oily water sewers to sealed manholes. A common oily water header will route these streams to the plant oily water sewer network leading to waste water treatment plant.

Small neutralization pits shall be provided near battery rooms to treat floor wash in battery rooms. Water from these pits will further be routed to storm water drains.

Dyked areas around emergency booths shall drain into a gully trap which shall be connected to the chemical sewer network.
Oily water & contaminated rain water catch pits / manholes shall be of reinforced concrete to the chemical sewer network with internal coal tar epoxy lining.

Manhole for acid / alkali sewer shall be of reinforced concrete (M30). Exposed steel work shall be provided with coal tar epoxy coating.

### 2.10 STORAGE TANK FOUNDATION AND DYKE WALLS

2.10.1 The storage tank foundations shall be designed to sustain the forces at the tank bottom within permissible settlement, under operating and hydro-test conditions.

Tanks less than 2.5m dia. may rest directly on a concrete pedestal with anticorrosive layer.

Tanks greater than 2.5m dia. but less than 10.0 m dia. may be supported on RCC ring all with sand / murrum fill.

For tanks greater than 10m dia, Tank Pad Foundations shall be provided as per relevant design Codes.

2.10.2 Anticorrosive layer shall be provided as per specifications for tank pads of 50 thick premix Carpet over 50 thick bitumen sand mixed with additions of kerosene / oil as required.

2.10.3 Storage tank Dyke Walls / Fire Walls

Dyke walls / Fire walls shall be provided. Walls shall be plastered brick work conforming to standard relevant Codes. DYKE walls shall be designed for retaining liquid in case of rupture of the largest tank in the farm. It shall be minimum 600mm thick to enable persons to walk on the wall top. If space permits, Dyke walls shall be provided with ramps on both sides at suitable places, for movement of vehicles for tank cleaning purpose. Fire walls shall only be 600 mm high (min.) or as shown in drawings / as instructed. They shall only retain spillages, to prevent fire spread.
2.11 BARRICADE

Contractor shall design a suitable barricading system for protection of existing facilities if required. Barricade shall be of G.I. sheet cladding with suitable supporting system of height and extent shown in drawings or as instructed by Owner / Consultant. Water spray system shall be incorporated where felt necessary by Owner / Consultant. Localized G.I. sheet barricading shall be provided from operational constraint requirements as directed by Owner / consultant.

2.12 TRENCHES

Trenches shall be of RCC with inserts or other suitable arrangement required to support Cables pipes etc. Pre-cast concrete covers with lifting arrangement shall be provided on top. In paved areas, the top will be flush with finished floor level. Covers shall overlap walls and joints with paving shall be sealed to prevent water entry. In unpaved areas, walls shall be raised above ground level by 100 mm. Trench floors shall be provided with a nominal slope to drain pits, where any water entering trenches can collect and be detained to the nearest contaminated rain water sewer / storm water sewer. Trench covers shall be designed for the vehicle load relevant to the area where the trench is located. Cable trench shall be of leak proof construction.

2.13 HARD SURFACES

Hard surface of PCC 1:3:6, (100 mm thick) over suitable bedding (brick / stone soling) Shall be provided below all new pipe tracks and / or extended potion of existing pipe Tracks (if any). This shall extend 600 mm on one side for track width less than 6 m, and 900mm On either side for pipe track having width 6 m or more, end it shall have approach @ 500 M c/c from nearest road.

Hard surface of PCC 1:3:6 (100 mm thick) over suitable bedding (brick / stone soling) of approximate size 1 m x 1 m shall be provided with proper approach near drain point of offsite piping, near drinking water installations, at washing facilities,
etc., with suitable curbing and drainage arrangements as required for the fluid being handled.

2.14 REMOVAL / REROUTING OF OBSTRUCTIONS

All underground or above ground structures / foundations which will cause obstruction to new structures / foundations, and which can be removed without disturbing any functions of the existing structures if any, shall be removed by the Contractor.

All existing underground or above ground facilities requiring rerouting due to fouling with new facilities shall be rerouted by the Contractor in such a manner that rerouted facilities keep on functioning as before.

Before finalizing the route connection to existing system, adequacies of existing system shall be checked by the contactor.

1.0 GENERAL

1.1 SCOPE

This engineering design basis defines the minimum design criteria that shall form the basis for carrying out detailed structural design and engineering of all plant and non-plant structures and buildings. All data required in this regard shall be taken into consideration for acceptable, satisfactory and trouble-free engineering of the structures.

Compliance with this design basis and/or review of any of the contractor documents shall in no case relieve the contractor at the contractual obligations. All structures shall be designed for the satisfactory performance of the functions for which they are being constructed.

1.2 UNITS OF MEASUREMENT

Units of measurement in design shall be in metric system.

1.3 DEFINITIONS

Owner  
Talcher Fertilizers Limited (TFL)

Consultant  
To be selected

LSTK Contractor  
Successful LSTK bidder of the tender

CCE  
Chief Controller of Explosives

TAC  
Tariff Advisory Committee

NFPA

IS  
Indian Standards
1.4 CODES AND STANDARDS

The design shall be in accordance with established codes, sound engineering practices and shall conform to the statutory regulations applicable to the country.

1.4.1 The main codes and standards and statutory regulations considered as minimum requirements are as follows Latest revision of these shall be followed.

1) National Building Code of India : 2005
2) IS: 875 (Part 1) – Code of Practice for Design Loads (Other than Earthquake) for Buildings and Structures (Part 1 – Dead Loads).
3) IS: 875 (Part 2) - Code of Practice for Design Loads (Other than Earthquake) for Buildings and Structures (Part 2 – Imposed Loads).
4) IS: 875 (Part 3) - Code of Practice for Design Loads (Other than Earthquake) for Buildings and Structures (Part 3 – Wind Loads).

1.4.2 STRUCTURAL STEEL

1) IS: 800 – Code of Practice for General Construction in Steel
2) IS: 802 – Code of Practice for use of structural steel in overhead transmission line towers.
3) IS: 1161 – Code of Practice for Circular hollow sections/pipes.
4) IS: 4923 – RHS & SHS sections.
5) IS: 2629 – Recommended practice for hot dipped galvanizing on iron and steel.
6) IS: 2633 – Methods for testing uniformity of coating of zinc coated articles.
7) IS: 6533 – Code of Practice for design and construction of steel chimney.
8) IS: 6745 – Method for Determination of mass of zinc coating.
9) IS: 814 – Covered Electrodes for manual metal arc welding of Carbon and carbon manganese steel.
10) IS: 816 – Code of Practice for use of Metal arc welding for General Construction in mild steel.
11) SP-06 – (Part 1 to Part 7)- Handbook for Structural Engineers.

### 1.4.3 REINFORCED CONCRETE AND MASONRY WORK

1) IS: 456 – Plain and Reinforced Concrete – Code of Practice
2) SP: 16 - Design Aids for Reinforced Concrete to IS: 456
3) SP: 34 – Handbook of Concrete Reinforcement and Detailing.
7) IS: 2950 (Part 1) – Code of Practice for design and construction of Raft foundation.
8) IS: 2974 (Part 1 to Part 5) – Code of Practice for design and construction of Pile Foundations.
9) IS: 3370 – Code of Practice for Concrete Structures for storage of liquids.
10) IS: 4326 – Code of Practice for earthquake resistant design & construction of buildings
11) IS: 13920 – Code of Practice for ductile detailing of reinforced concrete structures subjected to seismic forces.
12) IS: 1172 - Code of basic requirements for water supply, drainage & sanitation
13) IS: 1742 - Code of practice for building drainage
14) IS: 1905 - Code of practice for structural use of unreinforced masonry
15) IS: 2212 - Code of practice for brick work
1.4.4 ROADS AND SANITARY WORKS

1) IS: 2065 - Code of practice for water supply in buildings
2) IS: 8835 - Guidelines for design of surface drains.
3) IRC: 6 - Code of practice for road bridges, Section-II Loads and stresses
4) IRC: 19 - Standard Specifications And Code of Practice for Water Bound Macadam
5) IRC: 37 - Design of flexible pavements
6) IRC: 58 - Design of rigid pavements

Note: The above list is suggestive and not exhaustive. Apart from these basic codes any other related codes shall also be followed wherever required.

In case of any difference between Codes provision and this design basis, the stringent one should govern the design.

1.4.5 In case of any conflict / deviations amongst various documents, the order of precedence shall be as follows.
- Statutory Regulations
- Job Specifications
- Engineering Design Basis
- Standard Specifications

Substation | RCC framed with hollow/solid concrete blocks walls

### 3.0 DESIGN LOADS (DL)

The following design loadings shall be considered:

1. Dead loads including self weight
2. Live load
3. Wind load
4. Seismic load
5. Equipment load
6. Dynamic load
7. Load from lifting appliances
8. Erection loads / maintenance loads
9. Thermal load
10. Earth pressure / Hydrostatic Loads
11. Any other load not mentioned above, but applicable

These loadings shall be applicable to all structures irrespective of the material employed for construction.

### 3.1 DEAD LOADS

Dead load shall comprise of the weight of all permanent construction including walls, fire proofing, floors, roofs, partitions, stairways and fixed services. Unless noted otherwise following unit weights shall be adopted.

- Reinforce Concrete : 2500 kg/m³
- Plain Concrete : 2400 kg/m³
- Structural steel : 7850 kg/m³
- Backfill Soil : 1800 kg/m³
- Operating floor with grating : 100 kg/m²
- Staircase (steel) : 140 kg/m²
- Ladder : 40 kg/m²
3.2 EQUIPMENT LOADS

- **EQUIPMENT CATEGORY I**
The weight of equipment category I such as pumps, compressors, motors etc., shall be derived as far as possible from Manufacturer’s data and shall include controls, auxiliary machinery, piping etc. The equipment load shall be categorized if required for use in various loading combinations as empty and operating.

- **EQUIPMENT CATEGORY II**
This category consists of loads from equipments such as vessels, columns, heat exchangers, condensers, settlers, filters and the like, complete with their piping. In accordance with the various load combinations for the category of equipment, the following weights/loads shall be included in the calculations.

  a) **EMPTY WEIGHT (ELe)**
  This is the dead weight of vessels, columns, etc. completely installed) including platforms and ladders, piping, insulation and fireproofing) and ready for operation, however, without liquid filling. Weights will be derived from manufacturer’s data.

  b) **OPERATING LOAD (ELo)**
  This is the empty weight plus the maximum weight of contents of vessels, columns, etc. during normal operation of the plant, Weight of pipes full of product (liquid/gases) plus the weight of insulation and anchor loads if any.

  c) **HYDROSTATIC TEST LOAD (ELt)**
  When Hydrostatic pressure testing of equipment is required at site and is done after installation, the weight of equipment, completely filled with water shall be incorporated in the design of the supporting structure. Only one biggest system shall be considered to be tested at a given time.

  The empty / operating / test weight of process equipment including contents and all fixtures, platforms, ladders and attached piping etc, shall be considered. If
piping weight is not indicated separately or not included in the weight of the equipment, the same shall be taken as 10% of the weight of the equipment.

3.2.1 Exchangers / Fabricated equipments

When exchangers are supported on structures, the supports shall be designed for vertical and horizontal forces (bundle pulling force or friction forces). The vertical loads shall be categorized into empty weight, operating weight and test weight. Weight distribution over two (2) saddles of an exchanger shall normally be as follows:

<table>
<thead>
<tr>
<th>Exchanger Type</th>
<th>Channel Side</th>
<th>Shell Side</th>
</tr>
</thead>
<tbody>
<tr>
<td>Floating head type</td>
<td>60%</td>
<td>40%</td>
</tr>
<tr>
<td>Fixed tube sheet type</td>
<td>50%</td>
<td>50%</td>
</tr>
<tr>
<td>Kettle type</td>
<td>45%</td>
<td>55%</td>
</tr>
<tr>
<td>U-tube and other type</td>
<td>67%</td>
<td>33%</td>
</tr>
</tbody>
</table>

3.2.1.1 Special Considerations

a. Bundle Pull

Bundle pull forces for different types of exchangers shall be taken as under:

- Fixed type - Nil
- Kettle type - 0.30 x Bundle weight
- All other types - 0.86 x Bundle weight or 30 N/mm of diameter whichever is greater.

Total Bundles Pull shall be considered on fixed pedestal alone

b. Thermal Expansion

Horizontal force due to thermal expansion of horizontal vessels / exchangers shall be relieved by using slotted holes and slide plates and remaining force derived from the product of the sliding saddle ‘gravity load’ and the coefficient of friction shall be applied to each support. The coefficient of friction shall be as under:
c. Non-Static Loading

Foundations and structures supporting vessels subject to surge loading, such as De-aerators shall be designed with sufficient stiffness and rigidity to resist a notional horizontal forces of 10% of those derived from the Vessel’s operating weight or the given surge load whichever is the greater. The forces shall be applied at the vessel’s centre of gravity and act longitudinally OR transversely. Consideration shall be given to bracing these structures.

The design of foundations and structures supporting agitated vessels, centrifuges, reactors and other variable load equipment shall take full account of all the loading data provided by the equipment vendors. Where no loads are available, consideration shall be given to applying force at 10% of operating weight. In addition, for dynamic effect loads will be increased by 50% of steam agitated equipment and 25% for mechanical agitated vessels.

Where two or more similar items of such equipment are supported on a common foundation or structure, the design must be based on the assumption that these items will resonate in phase.

3.3.2 Rotating Equipment

Comprehensive loading data of mechanical equipment, such as, fans, blowers, pumps, compressors, D.G. Sets, turbines, motors engines etc., as furnished by the equipment vendor shall be considered.

3.3 LIVE LOADS (LL)

Live loads shall, in general, be as per IS: 875. However, the following minimum live loads shall be considered in the design of structures to account for
maintenance and erection phases; if equipment layout / vendor drawings indicate loads of greater magnitude, the same shall be adopted.

i. Process Building / Technological Structure (Open / Enclosed type)
   - Operating area: 5.0 kN/m²
   - Maintenance area: 7.5 kN/m²
   - Ground floor: 10.0 kN/m²

ii. Compressor House/TG House
   - Operating area: 10.0 kN/m²
   - Maintenance area: 10.0 kN/m²
   - Ground floor: 10.0 kN/m²

iii. Service Platform
   - Vessel / Tower: 3.0 kN/m²
   - Isolated platform: 2.5 kN/m²
     (For valve operation)
   - Access way: 2.5 kN/m²
   - Cross over: 2.0 kN/m²
   - Piperack walkways: 2.5 kN/m²
   - Gantry girder walkway: 3.0 kN/m²

iv. Substation / Control Room
   - Panel floor: 10.0 kN/m²
   - Miscellaneous partition: 1.0 kN/m²
   - Other areas: 5.0 kN/m²

v. Office building
   - Office area: 3.0 kN/m²
   - Entrance lobby: 5.0 kN/m²
   - Exit way: 5.0 kN/m²
   - Miscellaneous partition: 1.0 kN/m²
vi. Laboratory
   Upper floors - 4.0 kN/m²
   Ground floor - 5.0 kN/m²

vii. Cooling Tower
   Operating platform / cover - 3.0 kN/m²
   Slab of hot water basin & Sump

viii. GT Building / DM Plant / ETP
   Operating platforms - 3.0 kN/m²
   Ground floor - 5.0 kN/m²

ix. Staircase
   Process Building - 5.0 kN/m²
   Technological structure - 5.0 kN/m²
   Office - 5.0 kN/m²
   Substation/Control Room - 3.0 kN/m²
   Laboratory - 4.0 kN/m²
   Service platform - 2.5 kN/m²

Loads on account of equipment and incidental loads shall be taken over and above the loads indicated in the table.

For all other buildings not covered in above Table as well as roofs of various structures, the imposed loads shall be taken as specified in IS: 875 (Part II)

1 KN/m² allowance shall be made for services supported from below the floor.
Live load on various types of roofs shall be as per the requirements given in IS: 875.

3.4 WIND LOADS (WL)

Wind loads shall generally be as per IS-875 (Part-3) except for switchyard structures and transmission towers for which IS: 802 shall be applicable. Basic wind speed shall be as per the Code. As per IS:875 (Part-3), definition of basic wind speed shall be peak gust velocity averaged over 3 second time interval at 10 m height above mean ground level with 50 years mean return period. The design life span of all structures, except temporary structures, and boundary wall shall be taken as per IS 875. Life span of temporary structures and boundary wall can be lesser and shall be as per IS: 875.

Design wind speed and pressure shall be worked as per the latest revision of IS 875 Part-3.

To account for surface area of piping, platforms and other attachments fixed to the equipment, the surface area of the equipment (vessel/column) exposed to wind shall be increased by 20% or as specified in the mechanical data sheets of the equipment.

Wind force on structural elements shall be calculated using design wind pressure multiplied by elements frontal area, normal to wind direction multiplied by force coefficient as per Table 26, IS 875 Part-3.

In calculation of wind force frictional drag shall be considered where applicable.

3.5 SEISMIC LOADS(SL)

Seismic loads shall be as per IS: 1893 (latest version).

3.6 IMPACT AND VIBRATORY LOADS

Structures subjected to impact or vibratory loads shall be designed as per the provision of IS: 875 & IS: 2974. Requirements for monorails and overhead cranes
shall be as per IS: 800, IS: 875 or manufacturer’s data, whichever is more stringent.

3.7 BLAST FORCES

Blast resistant Control Room or any other specified structure, subjected to blast forces generated due to accidental blast from hydrocarbon ignitions should be designed to withstand all such forces. Unless specifically mentioned by the process licensor, design blast loads and blast resistant construction shall be as specified below and shall conform to relevant IS codes and good engineering practices.

Buildings located within 30 m from a potential blast source, shall be designed to withstand the maximum combination of loads resulting from any one of the following:

1) Blast pressure equivalent to static pressure 21KPa acting on all exterior surfaces.
2) Suction blast pressure equivalent to static pressure 7 KPa acting on all extreme surfaces.

Design of blast resistant control building shall be according to the following minimum blast-loading conditions:

Condition 1:
Any of the following combinations:
1A, 1B, 1C whichever is the most critical
21 KPa on walls and roof.
Condition 2:
7KPa on interior wall and roof surfaces.

Control buildings located more than 30 m from a blast source shall be designed to resist maximum combination of loads in accordance with the following table:

### Distance versus Design Pressure

<table>
<thead>
<tr>
<th>Distance from Process Equipment (meter)</th>
<th>Blast Pressure (KPa)</th>
<th>Suction Blast Pressure (KPa)</th>

</tbody>
</table>

### Structural Design Criteria

- Design the structure as a shear wall structure with the roof acting as a horizontal diaphragm that transfers the transverse loads to the side shear walls. External shear walls shall be continued up to 1.5 m below GL or up to founding level whichever is less.
- Design of walls and roof shall be based on the “Yield Line Theory”.
- Provide cast-in-situ reinforced concrete walls and roof of load-bearing type, designed to resist bending and transmit horizontal shear. Precast concrete panels may be used but shall be either mechanically bonded to cast-in-situ reinforced concrete columns or provided with built-in load transmitting steel plates or angles so that the panels can be welded in place.
- Anchor walls to foundations and concrete roof slabs with steel reinforcing bars to provide full moment connections.

Provide roof framing with adequate bearing and good anchorage to the supporting walls. Weld roof form decking if used to the top member of the roof frame.
- Distribute loads on roofs and walls in two directions where possible.
- Consider stress reversals at each member and provide a minimum 20% stress reversal.
- Design reinforced concrete members with good ductile properties. Limit tension steel to 1% of the concrete area and 2% of the concrete area for tension plus compression steel. To allow for stress reversal provides reinforcing steel in both concrete faces and set shear bars perpendicular, not inclined.
- Provide local strengthening of concrete at opening by additional reinforcing without local thickening where possible.

Load combinations with blast loads
- For Flexure
  1.0 (Dead load + Blast load)
- For shear
  1.2 (Dead load + Blast load)
Live load shall not be considered on the roof during blast.

Soil Bearing Capacity
Design bearing pressure shall be taken as equal to twice the allowable static bearing pressure for load combinations with blast load.

Stability Ratio
Factor of Safety in case of load combinations with blast load shall be as follows:
Overturning - 1.2
Sliding - 1.3

Openings:
- Minimize openings in the building enclosure and locate openings to avoid or be shielded from direct blast pressures.
- Windows, if unavoidable shall be limited in size and provided with special glazing.
- Select external doors, louvers and similar items, together with their frames, capable of withstanding the pressures. Do not use glass panels in these doors. Provide for personnel at least for two access doors, located remote from each other and where possible not in opposite walls. The size of equipment doors for maneuvering factory-fabricated control boards into or out of the control room.
3.8 CONTINGENCY LOADS

3.8.1 RCC Structures
All floor slabs and beams shall be designed for a concentrated load of 10 KN acting simultaneously with the uniform live load, but not with actual concentrated loads from equipment, piping etc. This load shall be placed to result in maximum moment and / or maximum shear.
This load shall not be considered for the design of columns, foundations and in overall frame analysis. For floor slabs, the load shall be considered to be distributed over an area of 0.75 m x 0.75 m.

3.8.2 Structural Steel
For process plants, the following contingency additional loading shall be applied to individual beam elements, these shall be applied as point loads to produce worst shear and bending stresses:

- Platform Walkways  3 KN
- Secondary Floor Trimmers  5 KN
- Primary / Grid beams  10 KN

3.9 MISCELLANEOUS LOADS
Apart from the specified live loads, possible overloading during construction / hydro-test maintenance / erection shall also be considered in the design Job specifications shall also be referred to, for any specific loading.

Hydrostatic pressure shall be adequately accounted for, in the design of structures, below ground water table.
All the handrails, parapets, parapet walls, balustrades shall be designed for horizontal load mentioned in Table 3 of IS-875 (Part-2).
3.10 LOAD COMBINATIONS

Structural analysis and design shall take into consideration, worst combination of the above loads under different phases, such as, Erection, Operation, Hydro-test, Shutdown, Maintenance, and Blast for control room, as applicable.

The design shall be governed by worst load combinations as per the procedures of relevant BIS codes.

4.0 DESIGN CRITERIA FOR FOUNDATIONS

4.1 GENERAL

Foundation sizing shall be based on working loads, not on loads which may have been increased by factors for the purpose of concrete design.

4.2 TYPE OF FOUNDATIONS

Type of foundations to be adopted and the pertinent details there of shall be as per provisions of scope and job specifications documents.

Following clauses describe the general guidelines to be followed while designing the foundations; these clauses do not per se stipulate the type of foundations to be followed.

4.3 SHALLOW FOUNDATIONS

4.3.1 For gravity loading, allowable net bearing capacity of soil shall be based on the following settlement criteria:

<table>
<thead>
<tr>
<th>Foundation Type</th>
<th>Allowable Settlement(mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Foundations in unit areas, utility areas and Foundations for plant buildings including substation, Compressor house, control room, technological structures</td>
<td>25</td>
</tr>
<tr>
<td>Machine foundations and critical equipment with interconnected piping</td>
<td>25</td>
</tr>
<tr>
<td>Foundations supporting non-plant buildings</td>
<td>40</td>
</tr>
</tbody>
</table>
4.3.2 For transient loadings, such as wind / seismic, allowable net bearing capacity based on shear criteria may be considered.

4.3.3 For load combinations including wind, the Safe Soil Bearing Pressure may be increased by 25%.

4.3.4 For load combinations including earthquake, the Safe Bearing Pressure of Soil may be increased as permitted in IS: 1893.

4.3.5 Under blast (due to hydrocarbon explosion) load combinations if any, the design bearing pressure of soil shall not exceed twice the allowable static bearing pressure of soil.

4.3.6 Allowable Loss of contact area between underside of foundation and soil (due to resultant Overturning Moment) under different loading conditions shall be as given below.

<table>
<thead>
<tr>
<th>Load Combination description</th>
<th>Allowable % Loss of Contact Area</th>
</tr>
</thead>
<tbody>
<tr>
<td>A Operating Load case (Plant operating, with or without Live Loads, for worst cases)</td>

</tr>
</tbody>
</table>

Where

A = Foundations on Soil
B = Foundations on Rock
4.3.7 Soil and hydrostatic pressure on walls below grade.

In the design of walls below grade, provision shall be made for the lateral pressure of adjacent soil. Due allowance shall be made for possible surcharge from fixed or moving loads. When a portion or whole of the adjacent soil is below a free water surface, computations shall be based on the weight of the soil, diminished by buoyancy, plus full hydrostatic lateral pressure.

The lateral pressure from surcharge loads shall be taken in addition the lateral earth pressure loads.

4.3.8 Stability of foundations

Foundations shall be checked for stability against overturning, sliding & uplift. While checking against uplift, the following shall be considered.

**FOUNDATION DESIGN – FACTORS OF SAFETY**

<table>
<thead>
<tr>
<th>Type of Structures</th>
<th>Minimum factor of safety against overturning</th>
<th>Minimum factor of safety against Sliding</th>
<th>% Weight of Overburden over projected plan area of footing</th>

</tbody>
</table>

*50** means that the surcharge load is considered as 50% of the weight of the soil.
** In case area is paved, overburden shall be based on NGL (for area under filling) or 600 mm below HPP, whichever is lower. In case of unpaved area, it shall be w.r.t. FGL.

Minimum factor of safety against uplift shall be 1.2 for all structures. (Note: In case of sumps, lining weight shall not be included). Beneficial load of backfill can be included on in circumstances where it will never be removed.

Buoyancy from high ground water levels shall be taken into account in investigating stability against uplift.

### 4.4 PILED FOUNDATIONS

Piles shall be designed as per IS: 2911. However, pile capacity shall be proven by a sufficient number of initial load tests before preparing piling plans.

The increase in Safe Working Load permitted as per codal provisions, under load combinations including wind / earthquake shall apply equally to uplift and sheer conditions, subject to confirmations by the piling Contractor with respect to the particular piling system. Pile capacity may be similarly increased in blast condition to 1.5 times the permissible capacity under compression, tension and shear modes.

When any major machinery is to be supported on piles, behavior of the piles under dynamic, loading conditions, as established by necessary field test, shall be considered.

The capacity of pile groups shall be obtained by applying appropriate group efficiency factors. Where piles pass through filed ground, the available pile safe working load shall be suitably reduced to account for negative skin friction caused by settlement of fill. Where suitable, consideration shall be given to reducing drawdown effects by slip coating the piles.

While computing horizontal capacity, piles shall be treated as fixed head or free head depending on the degree of fixity at the top.
4.5 MACHINE/EQUIPMENT FOUNDATIONS:

Machine / Mechanical equipment foundations shall satisfy the requirements of IS: 2974 and any other parameters as per machine vendors.

Generally, foundations and structures supporting rotating machinery shall be so proportioned that their natural frequency shall not fall within the range of 0.8 to 1.2 of normal operating speed of the equipment. Further for major rotating machinery such as main compressor, the amplitude of foundation of structure during normal operation shall not exceed the allowable amplitude specified by the equipment manufacturer. The above consideration may be omitted for centrifugal pumps and fans and other minor rotating equipment weighing less than 1 ton or if the mass of the rotating parts are less than 1/100th of the mass of foundation installed directly on concrete provided that the weight of foundation is not less than 3 times of the equipment weight. In such cases, dynamic analysis is not necessary.

When dynamic analysis is called for, the combined centre of gravity of the machine and foundation system shall, as far as possible, pass through the centre of area of the foundation raft or centroid of the pile group. Wherever unavoidable, eccentricity shall be less than 5% for block foundations and 3% for frame foundations. However, in highly compressible soils, no eccentricity shall be permitted.

Foundations shall be so designed that natural frequency of the foundation system shall not resonate with the following:

a) Operating speed of the motor / turbine  
b) Operating speed of the machine  
c) 2 x Operating speed of the machine  
d) Critical speed of the machine (for centrifugal machines)
It shall be ensured that there is no transfer of vibrations from machine foundations to any part of the adjoining structures. In case such machines are sitting on building floors, approved damping pads shall be used with prior approval of the Owner / Consultant.

Where deviations (resulting from inaccuracies in soil parameter measurements, approximations in design method, etc.) from calculated natural frequencies, leading to amplitudes in excess of specified limits are foreseen, provision for increasing the foundation mass without removal of the machine and without affecting surrounding space availability or connected piping shall be made, if possible.

4.6 CONCRETE GRADE

Grade of concrete to be used in foundation shall in general be as per the philosophy adopted for the entire structure. Minimum cement content, type of cement and any remedial actions, if required for foundations due to aggressiveness of subsoil water, shall be as stated elsewhere in this document. For underground structures, such as, foundations, manholes M30 grade reinforced concrete shall be used.

4.5 FOUNDATION BOLTS

All holding down bolts or threaded rods for non-post tensioned applications shall be out of Mild Carbon steel conforming to IS: 2062 with Fy = 250 MPa unless Noted Otherwise. For scrubbing section and acid storage section, holding down bolts should conform to SS 316.

4.7.1 Minimum cover to Foundation Bolts

Minimum distance between a Standard Holding down Bolt or Anchor Sleeve and the face of Foundation/pedestal shall not be less than 6 x (dia of bolt) mm.
4.7.2 All equipment foundation bolts / templates shall be designed and supplied by equipment vendor. Foundation bolts for steel structures shall be designed and supplied by contractor as per standard drawings or approved equivalent.

4.7.3 Other Inserted And Embedded Items

Unless otherwise specified, all structural steel shall be weldable structural steel “Standard Quality” (Fe 410 WA), in accordance with code IS: 2062.

All embedded steel items (exposed to atmosphere) shall be hot-dip galvanized in accordance with IS: 2629, except if noted otherwise on the design drawings.

All inserted and embedded items shall be accurately placed or template in and be securely anchored prior to placing concrete.

At sliding ends of vessels and horizontal exchangers, sets of plain steel plates shall be provided. In order to reduce the horizontal force due to friction at sliding ends sets to PTFE bonded steel plates may be provided.

4.8 PEDESTAL HEIGHTS

Pedestals for structural columns : As per design requirement
Open paved area : 300 mm (min.) OR as indicated in Equipment Layout drawing
Open unpaved area : 300 mm
Covered area(building etc.) : 300 mm (min.) OR as indicated in drawing
Storage tank foundation : As per equipment layout

All equipment supporting foundations / pedestals

Open area : As required but not less than 300 mm
Covered area : As required but not less than 150 mm
Stair Pedestals : 300 mm (min.) OR as indicated in equipment Layout drawing.
Ladder pedestals : 300 mm

4.9 GROUTING
The minimum thickness of grout shall be 25 mm.
All anchor bolts sleeves / pockets and spaces under column bases, shoe plates etc. shall be grouted with free flow, non shrink (premix type) grout, with 28 days minimum cube crushing strength of 40 N/mm². Ordinary grout consisting of 1 part of OPC and 2 parts of clean, dry well graded sand mixed with water to obtain the required consistency shall only be used under the base plates of cross-overs, short pipe supports (not exceeding 1.5 m height) and small operating platforms (not exceeding 2 m height) not supporting any equipment.
For rotating equipment bases, (above 300 kw rating), grout shall be as per requirements of equipment vendor, as per the approved list / as per the decision of EIC.

5.0 DESIGN CRITERIA FOR REINFORCED CONCRETE STRUCTURES

5.1 GENERAL

a) All buildings, structures, foundations, machine equipment foundations, liquid retaining storage structures, trenches, pits etc. shall be of RCC and designed based on the following IS codes (latest revision with all amendments, issued there to) in general, and other relevant IS codes applicable: IS:456, 875, 1893, 1904, 2911, 2950, 2974, 3370, 4326, 4991, 4998, 5249, 6403, 8009, 13920.
b) Only limit state method as per IS: 456 shall be followed for the design unless otherwise specified elsewhere in this document for special structures.
c) All skeletal structures shall be of frame type construction, and detailing shall be as per provision of IS: 13920.
d) Where the specified design depth of groundwater table so warrants, all underground pits, tunnels, basements, etc. shall be leak-proof R.C.C. construction using water proofing compounds.

5.2 LIQUID RETAINING R.C.C. STRUCTURES AND BASEMENTS
5.2.1 All liquid retaining / storage R.C.C. structures shall be leakproof and designed as uncracked section in working stress method as per IS:3370. However, the parts of such structures not coming in contact with the liquid, shall be designed according to IS:456 except ribs of beams of suspended floor slabs and counterforts of walls (located on the side remote from liquid) and roof of liquid retaining structures which shall be designed as uncracked section. Hot/cold water basin, and other primary framing members of Cooling Towers and similar liquid retaining structures, which remain constantly in contact with water (stored / sprayed) shall be designed as uncracked sections. No increase in permissible stresses in concrete and reinforcement shall be made under wind or seismic conditions for such structures.

5.2.2 All liquid retaining / storage structures shall be designed assuming liquid up to the full height of wall, irrespective of provision of any overflow arrangement. Pressure relief valves or similar pressure relieving devices shall not be considered in underground water retaining RCC structures. Hot water basin in cooling tower shall be designed for the weight of water up to top of parapet wall.

5.2.3 Following conditions shall be also considered for design of liquid retaining structures, basement, trenches and other underground structure:-

a) Only water pressure from inside and no earth pressure, groundwater pressure or surcharge from outside wherever such a condition is likely to exist either in operation or during installation / testing.

b) Earth pressure, surcharge pressure or ground water pressure from outside and no water pressure from inside.

c) Base slab shall also be designed for the empty condition during construction and maintenance stages with maximum ground water table. Pressure Relief Valves shall not be used.

d) Intermediate dividing walls of pump sumps shall be designed considering water in one pump only and the other sump being empty for maintenance.
5.2.4 The walls and base slabs of liquid retaining storage structures shall be provided with reinforcement on both faces for thicknesses greater than 150 mm.

5.2.5 In all liquid retaining structures, PVC water bars (230 mm wide, 6 mm thick) shall be provided at each construction joint. PVC water bars shall be of minimum 150/230 mm width and 6 mm thickness, and generally shall be riffed/serrated type with a central bulb Kicker type PVC water bars shall be used for the base slab and in other areas where it is required to facilitate concreting. Material quality of PVC water stops shall confirm to IS 12200.

5.3 CONCRETE GRADE

All cast-in-situ structural concrete shall be Reinforced Concrete conforming to IS: 456. Minimum grade M30 shall be used for all sub-structures (foundations/ Pile foundations etc) except for grade slabs / paving for which M20 may be used. M25 grade shall be used for all super-structures. For compressor, M30 grade concrete shall be used.

Pre-cast concrete shall be of minimum grade M35.

From durability consideration the minimum cement content and maximum water-cement ratio shall be as follows:-

<table>
<thead>
<tr>
<th>Type of Cement</th>
<th>Plain concrete</th>
<th>Reinforced concrete</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Minimum cement content (kg/m³)</td>
<td>Maximum water-cement ratio</td>
<td>Minimum cement content (kg/m³)</td>
</tr>
<tr>
<td>43 Grade-OPC</td>
<td>240</td>
<td>0.55</td>
<td>shall be as specified in IS 456</td>
</tr>
<tr>
<td>53 Grade-OPC</td>
<td>240</td>
<td>0.55</td>
<td></td>
</tr>
<tr>
<td>PPC</td>
<td>240</td>
<td>0.55</td>
<td></td>
</tr>
</tbody>
</table>

Maximum cement content shall not exceed 450 kg/m³.

If soil investigation report recommends high cement content and / or specified type of cement, the same shall have precedence.
75 mm thick PCC of grade M15 (nominal mix) shall be provided under all RCC foundations except under base slab of liquid retaining structures where 100 mm thick concrete of mix M15 (nominal mix) shall be used.

Concrete for encasing shall be M20 with 10 mm down aggregate.

Plain cement concrete (PCC) of grade M15 (nominal mix) of minimum 150 mm thickness shall be provided under all masonry wall foundations.

Plain cement concrete of grade M20 of minimum 40 mm thickness shall be provided as damp proof course, at plinth level of all masonry walls and to be coated with 3 mm thick bitumen emulsion.

Lean concrete of grade 1:5:10 shall be used as filler material wherever loose sub-grade exists by removing the loose soil/fill.

Any specific requirement regarding grade and thickness of PCC to be provided shall be incorporated in the drawing.

5.4 REINFORCEMENT BARS

HYSD Fe500 corrosion resistant bars confirming to IS: 1786 shall be used in foundations, piles and pile caps and super structures. The Minimum dia. used shall be 8mm. All structural steel and reinforcements shall be procured from SAIL / TISCO /RINL or Owner’s approved Vendor List.

Binding wire of 16 Gauge GI shall be used for tying the reinforcement conforming to IS: 280 unless specifically mentioned herein or in engineering drawings or other engineering design basis prepared for the individual units/structures.

5.5 MINIMUM THICKNESS OF STRUCTURAL CONCRETE ELEMENTS

For structural concrete elements, the following minimum thickness shall be followed:

<table>
<thead>
<tr>
<th>Footings (All types with or without beams)</th>
<th>300 mm</th>
</tr>
</thead>
<tbody>
<tr>
<td>Note: Tapered footings shall not have thickness less than 150 mm at the edges. Minimum average thickness shall not</td>
<td></td>
</tr>
</tbody>
</table>
### MINIMUM COVER TO REINFORCEMENT

The following minimum clear cover shall be provided to all steel reinforcement including links.

| Slab (roof & floors, canopy, cantilever, waist slab) | 30 mm |
| Beam (roof, floor tie, & lintel) | 30 mm or dia. of bar whichever is greater |
| Column, Pedestal | 40 mm above FGL, 50 mm below FGL |
| Retaining wall, Basement and Pit Wall |
| a. Face in contact with earth | 50 mm |
| b. Free face | 30 mm or dia. of bar whichever is greater |
| Liquid retaining structure |
| a. Face in contact with liquid | 30 mm or dia. of bar whichever is greater |
| b. Face away from liquid but in contact with earth | 50 mm |
| c. Free face | 30 mm or dia. of bar whichever is greater |
| Foundation slab, base slab, plinth beam | 50 mm |
Pile Cap

<td>100 mm</td>
</tr>
<tr>
<td>b. Top face</td>
<td>50 mm</td>
</tr>
</tbody>
</table>

5.7 **EXPANSION JOINTS**

Expansion points in concrete structures shall be provided at 30-35 m centers. The expansion joint shall be provided preferably by way of twin columns on a common foundation. Sliding joints shall be avoided as far as possible.

5.8 **DEFLECTIONS**

5.8.1 Deflections in concrete structures shall in general be limited by adherence to the limits on span by depth ratio for beams and slabs and length to lateral dimension ratios for columns as prescribed in IS: 456. Where special functional / serviceability requirements or large spans demand actual deflections and / or crack widths shall be calculated and the following limits adhered to:

<p>| | |</p>
<table>
<thead>
<tr>

</tr>
<tr>
<td>Total horizontal deflection between two floors</td>
<td>Storey height/200</td>
</tr>
</tbody>
</table>

5.9 **MISCELLANEOUS APPLICATIONS**

5.10.1 **Admixtures**

Admixtures shall conform to IS: 9103 and to be mixed with concrete (if required) strictly as per manufacturer’s recommendations.

5.10.2 **Water for Construction**

Water used for mixing and curing shall be clean and free from injurious amounts of soils, acids, alkalis, salts, sugar, organic materials or other substances that may
be deleterious to concrete or steel. Portable water is generally considered satisfactory for mixing concrete. It should meet the requirement of IS: 456-2000.

5.10.3 Aggregates

These shall conform to IS: 383, specification for Coarse and Fine Aggregates from Natural resources.

5.10.4 Plinth protection

Each building shall be provided with 1.0 m wide concrete M10, 100 thick laid on 75 mm thick M7.5 concrete with 8 Tor @ 250 c/c both ways Reinforcement bars all round as plinth protection. A surface drain to be provided along-with plinth protection which shall be connected to the drainage system.

5.10.5 Ramps

Ramps for building entrance shall be cast in situ R.C.C. designed as a grade slab and the slope of ramps shall not be less than 1 in 10. Minimum thickness of the slab shall be 150 mm.

5.10.6 Hot Bitumen Paint

All underground structures including top surface of foundations shall be painted with two coats of hot bitumen paint of grade 20/30 with quantity of bitumen at least 1.2 kg/m² per coat.

5.10.7 Masonry Wall

a. All masonry walls from ground floor shall be placed on R.C.C. grade beams. However, light internal partitions may be placed on ground floor slab.

b. All brick masonry (M 7.5 MPa) grade walls shall be considered as 230 mm thick, except for partition walls which will be 115 mm thick. However, for fire barrier walls minimum thickness shall be considered as 350 mm.
c. All in-filled brick (M 7.5 MPa grade) panels shall be designed to transfer horizontal loads from wind and seismic to the structural frameworks without damage and the extent of brick panel dimensions shall be as per the recommendations in IS. All brickworks shall be provided with reinforcement consisting of 2 Nos. of 6 mm diameter bars at every fourth layer.

5.10.8 Anti-termite treatment

Anti-termite treatment shall be provided under all buildings as per IS:6313. Materials shall be as per IS: 8944.

5.10.9 Building Slabs on Grade

The specifications given in Table below are based on minimum requirements and shall be followed after proper design and requirement.

TYPE I: Plant buildings such as Sub-stations, Control Rooms, Process Operators’ Room, Pump Houses, Utility Compressor Houses, D.M. Plant, E.T.P., Parking Areas, Stores, Porches.

TYPE III: Non Plant Buildings (viz. Administration, Laboratory, Canteen, Time Office, Gate House, Training Centre, Guest House, Residential Building)

Note: 1. Reinforcement steel shall be as per clause 5.5

5.10.10 Insulation

For equipment with temperatures over 200° C, or sub zero temperatures, insulation shall be provided between equipment base / lugs and concrete / steel structure.

6.0 DESIGN CRITERIA FOR STEEL STRUCTURES

6.1 GENERAL / DESIGN METHODS

6.1.1 Design fabrication and erection of the above work shall be carried out in accordance with the following IS Codes as applicable to the specific structures, viz, IS: 800, 801, 802, 806, 814, 816, 875, 1893, 6533, 9595, etc. Basic consideration of structural frame work shall primarily be stability, ease of fabrication/erection and overall economy, satisfying relevant Indian Standard Codes of Practice. Steel structures adequately braced in vertical and horizontal planes, consistent with functional requirements, shall be preferred over structure having moment connections. Moment connections, if adopted, shall be fully rigid as per IS:800. Where fully rigid joints are adopted they shall generally be confined to the major axis of the column member. Flare stack supporting structure shall be adequately braced on all four faces.

Structural elements, continuously exposed to temperatures above 200° C, shall be designed for reduced stress as per Table-4 of IS: 6533 (Part-2). The expected temperature of steel components shall not be allowed to exceed 400 ° C. The structures connected to column, heater vessels working at high temperatures shall not be rigidly connected with staircase and adjoining structures, which are on ambient temperatures.
6.1.2 Crane gantry girders shall generally be of welded construction and of single span length. Chequered plate shall be used for gantry girder walkway flooring.

6.1.3 Monorails shall be provided for all pumps and motors located in buildings, sheds and in open areas having rating more than 55 KW. For pumps and motors of smaller ratings, monorails shall be provided if directed by Owner / PMC.

6.1.4 Steel staircases shall have channels provided as stringers with minimum clear width of 750 mm and maximum slope of 41 degree. The vertical height between successive landings shall not exceed 4.0 meters. Treads shall be minimum 230 mm wide made of grating (with curved chequered plate nosing) spaced equally so as to restrict the rise to maximum 200 mm. If relevant local by-laws or applicable Factory Act Rules stipulates more stringent requirements in this regard, the same shall be adhered to.

6.1.5 Hand rails, 1000 mm high, shall be provided to all walkways, platforms, staircases. Toe plate (100 mm x 5 mm) shall be provided for all hand railing (except for staircases). Spacing of uprights shall be 1500 mm (maximum). Two types of hand railing shall be provided.

a. For walkways, platforms (except platform around/on circular & horizontal vessels), and staircases: Top rail, mid rail and upright shall be 32 mm dia. (NB) galvanized MS tubes.

b. For platforms around circular vessels: Top rail shall be 32 mm dia. (NB) galvanized MS tubes, but mid rail and upright shall be of structural steel.

6.1.6 Electro-forged/Welded hot dip galvanized MS gratings shall be minimum 25 mm deep. The maximum size of voids in the grating shall be limited to 30 mm x 55 mm. The minimum thickness of galvanizing shall be 120 microns. Gratings shall be suitable for the operation and maintenance loads for the floors.
6.1.7 Welded connections shall be adopted as far as practicable, except for cases where bolted connections are required viz. (Galvanized) electrical switchyard structures and transmission towers. Structural connections shall have minimum two bolts of 16 mm dia. unless otherwise limited by the size of members.

6.1.8 Lock nuts shall be provided for anchor bolts of tall structures, tall process columns, vibrating equipment, etc.

6.1.9 Minimum two nuts shall used for all anchor bolts except for ladder, stair and hand rail.

6.2 EXPANSION JOINTS

Expansion joints shall be provided at 80 – 100 m centres, where possible, column bracing shall be provided at the center of a longitudinal frame, rather than at the ends so as to avoid constraints on free expansion.

6.3 STEEL GRADE

Structural steel shall be of yield stress of 250 Mpa conforming to grade A of IS: 2062.

Tubular steel shall conform to Yst 310 of IS: 1161 & IS: 4923. Structural pipes shall be either seamless or mild welded. Spiral welded pipe is not acceptable.

6.5 LIMITING PERMISSIBLE STRESSES

- Permissible stresses in structural members shall be as specified in:
  - IS: 800 Hot rolled sections (excluding transmission towers and Switchyard structures).
  - IS: 801 Cold formed light gauge sections
  - IS: 802 Transmission towers & switchyard structures
  - IS: 806 Tubular Structures
- Permissible stresses in bolts shall be as specified in :-
  - IS: 800 Hot rolled sections
- IS: 801 - Cold formed light gauge sections
- IS: 802 - Transmission towers & switchyard structures
- IS: 806 - Tubular Structures

- Permissible stresses in welds shall be as specified in :-
  - IS:801 - Cold formed light gauge sections
  - IS: 806 - Metal Arc Welding

6.6 LIMITING DEFLECTION

a. The limiting permissible vertical deflection for structural steel members shall be as specified below :- (Where “L” represents the span)

<table>
<thead>
<tr>
<th>Structural Component</th>
<th>Limiting Deflection</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gantry girder for electric overhead crane (Capacity up to 50T)</td>
<td>L/750</td>

<td>L/200</td>
</tr>
<tr>
<td>Other structural components</td>
<td>As specified in relevant IS Code</td>
</tr>
</tbody>
</table>

b. The limiting permissible horizontal deflection for multistoried steel structure/building including flare stack shall be Height/325.
6.7 MINIMUM THICKNESS

6.7.1 Structural Components

The minimum thickness of various structural components (Rolled Steel sections) shall be as given:-

a. General Construction

<table>
<thead>
<tr>

<tr>
<td>Grating</td>
<td>5 mm</td>
</tr>
</tbody>
</table>

b. Transmission tower and Switch yard structure

The minimum thickness of various structural components shall be as per IS: 802.

The minimum thickness for rolled beams and channels shall be mean flange thickness regardless of the web thickness.

The minimum thickness of tubes shall be as specified in IS: 806.

For structural members exposed to marked corrosive action, corrosion allowance shall be added as specified elsewhere, or otherwise suitably protected against corrosion.

The minimum thickness of structural components (except gratings & chequered plates) which are directly exposed to weather and inaccessible for repainting shall be 8 mm.
6.8 ELECTRICAL SWITCHYARD STRUCTURES AND TRANSMISSION TOWERS

All electrical switchyard structures and transmission towers shall have bolted connections, and designed on the basis of IS: 802.

6.9 PAINTING

Painting including shop primer to structural steel shall be Epoxy as per the painting specification for this project, included elsewhere in Technical Specification.

6.10 GROUTING

For structural columns : As required but not less than 25 mm
For equipment : As required but not less than 25 mm

6.11 CLADDING AND RAINWATER GUTTERS

All roof and cladding sheets should be galvalume sheet of 0.5 mm total coated thickness with 550 MPA grade steel confirming to AS 1397 with AZ150 grade coating.

Translucent sheets shall be provided, in non-process areas only, intermittently where day lighting is required. Rainwater gutters of Galvanized / Zinc coated sheets and UPVC rainwater pipes shall be provided for proper roof drainage.

7.0 CRITERIA FOR MASONRY WORKS

7.1 GENERAL

All masonry works shall be designed in accordance with IS: 1905, IS: 1597, IS: 2185, IS: 4326 and other relevant IS Codes as applicable. All external brick, stone and hollow concrete block masonry walls shall be of minimum 230, 350 and 250 mm thickness respectively. Hollow concrete blocks shall conform to IS: 2185. Masonry shall be plastered with CM 1:6, 12 mm thick on inside surfaces and 20 mm thick on outside surfaces.
7.2 CEMENT MORTAR

All masonry work shall be constructed in 1:6 cement sand mortar except half brick partition walls which shall be constructed in 1:4 cement sand mortar with two numbers of 6 mm diameter MS bars provided a every fourth course properly anchored with cross walls or pillars.

7.3 FIRE WALLS

Thickness of all masonry firewalls shall be as per Electricity Rules but not less than 345 mm.

8.0 DESIGN REQUIREMENTS FOR SPECIFIC APPLICATIONS

8.1 PIPERACK

For designing the pipe rack superstructure and foundation the following loads shall be considered:

8.1.1 Vertical Loading

Actual weights of pipes coming at each tier shall be calculated. In calculating the actual weight of pipe, the class of pipe, material content and insulation, if any, shall be taken into consideration. Insulation density shall be taken as 2600 N/m³ minimum. In case of gas / steam carrying pipes, the material content shall be taken as one-third volume of pipe filled with water. The total actual weight thus calculated, shall then be divided by the actual extent of the span covered by the pipes to get the uniformly distributed load per unit length of the span. To obtain the design uniformly distributed load, over the entire span, the u.d.l. obtained as above, shall be assumed to be spread over the entire span. However, minimum loading for any piperack shall not be less than 1.25 kN/m². In case, the calculated loading is higher than 1.25 kN/m², this shall be rounded off to the nearest multiple of 0.25 (i.e., 1.50, 1.75 kN/m²)
Vertical loads of flare pipe shall be taken as one third full of water for piping within units & one sixth full for outside unit battery line. All flare line independent support shall be of four legged braced open lower type construction.

In addition to piping load, gravity loads due to encasement, if any, shall be considered.

8.1.2 Friction Force (Longitudinal & Transverse)

Where the pipes are of similar diameter and service conditions, the friction force at each tier on every portal both in longitudinal and transverse directions, shall be 10% of the design vertical loading of the pipes for four or more pipes supported on a tier and 30% of the design vertical loading of the pipes, for single to three pipes supported on a tier. Longitudinal friction force shall be considered as uniformly distributed over the entire span of the beam at each tier and transverse friction force shall be considered as a concentrated load at each tier level. Friction forces on T-supports and trestles shall be taken as 30% of the vertical loading. Both longitudinal and transverse friction forces shall be considered to be acting simultaneously.

For two-phase fluid flow/transfer lines frictional force shall be minimum 50% of the weight of pipe including contents & insulation, acting simultaneously in transverse & longitudinal direction.

8.1.3 Anchor and Guide Force (Thermal Load)

Anchor and guide force (thermal load) in transverse and longitudinal direction shall be as per piping data.

8.1.4 Loading on intermediate Beam at Tier Level

Intermediate beam at tier level shall be designed for 25% of load on main portal beams in transverse direction. A reduction of 10% in vertical loading shall be considered for main portal beams, if intermediate beams are provided.
8.1.5 Loading on Longitudinal beams

Longitudinal beams connecting portal columns shall be sufficiently strong to sustain 25% of the load on the transverse beams. The total load shall be assumed as two equal concentrated loads acting at 1/3rd span. Other longitudinal axial forces coming on it from the design of the supporting system shall also be simultaneously taken into account in the design of the longitudinal beam. Friction & anchor forces, if specifically given by the Piping Specialist, shall also be catered for in the design. Loads from monorails, when supported from these beams, shall also be considered to be acting simultaneously along with all other loads mentioned above.

8.1.6 Cable Tray and Walkway Loads

The estimated actual load from electrical, instrumentation trays shall be considered at the specified locations, together with walkways, platforms for valve operation, wherever provided.

8.1.7 Wind Force

Transverse wind loading shall be calculated depending on the width of the piperack as per the following table. This force shall be considered irrespective of the height between two tiers.

<table>
<thead>
<tr>
<th>Width of Piperack</th>
<th>Wind Force at each Tier level (N)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Upto 4 m</td>
<td>1.25 x p x s</td>
</tr>
<tr>
<td>Above 4 m but upto 6 m</td>
<td>1.50 x p x s</td>
</tr>
<tr>
<td>Above 6 m but upto 10 m</td>
<td>2.00 x p x s</td>
</tr>
<tr>
<td>Above 10 m</td>
<td>projected height x p x s</td>
</tr>
</tbody>
</table>
Where \( p \) = Horizontal wind pressure as per IS:875 (N/m²)

\( s \) = Spacing of portals (m)

For pipe racks of width greater than 10 m, the projected height shall be lesser of the following two:

i) \( 0.8 \times (\text{diameter of largest pipe including insulation (m)} + \tan 10^\circ \times \text{(width of rack (m))} \)

ii) \( \text{height between consecutive tiers} \)

8.1.8 For flare header or any other line supported on extended leg of piperack, the wind force shall be considered separately.

8.1.9 Seismic Loads

8.1.10 Seismic loads shall be as per IS: 1893 (latest version). Pipe racks should be adequately braced in all possible directions, consistent with function requirements.

8.1.11 Limiting permissible horizontal deflection for piperack shall be height / 325.

8.1.12 PLATFORMS BELOW AIR COOLERS

If handling pumps or other equipment is located below air coolers located on piperack or technological structures, blind floors shall be provided below air coolers, else, 2 m wide center platform with 3 m wide local extension below motors shall be provided.

8.2 RCC AND STEEL CHIMENY

RCC and steel chimneys shall be designed as per IS: 4998 and IS: 6533 respectively.
8.3 CULVERTS

Culverts shall be designed as per the following IRC codes of practices and manual. Where crane access is specified, the culverts shall be designed for the crane loads.

1. Standard specifications and code of practice for Road Bridges IRC 5
   (Section – I - General features of design)
2. Standard specifications and code of practice for Road Bridges IRC 6
   (Section-II – Load and Stresses)
3. Guidelines for Evaluation of Load Carrying Capacity of Bridges SP 37

Note: The above list is suggestive and not exhaustive. Apart from these basic codes any other related codes shall also be followed wherever required. This list is to be read in conjunction with the list of codes given in Civil Structural job specifications.
ANNEXURE- IV

GENERAL DESCRIPTION OF

STRUCTURES / FACILITIES
SCOPE
The dimensions & elevations of various units shall be furnished by LSTK contractor. All dimensions shall be finalized by the contractor during detail engineering phase & shall be got approved by Owner / PMC.

It is the contractor’s responsibility to design safe, sturdy and robust structures, foundations etc. to withstand all static and dynamic forces in accordance with design specifications and engineering specifications laid down in the document. The contractor should make suitable choice of foundations, e.g. isolated footings, raft foundation, pile foundation etc. depending on soil data, loads, settlement criteria.

The general description of structures / facilities shall be read in conjunction with the technical requirements & specifications given elsewhere in this document.

a) Compressor House
Structural steel shed with RC foundation, steel roof with monitor, S type louvers, G.I. pre-coated sheets roofing, eaves gutter with rain water down take pipes, G.I. pre-coated sheet cladding below eaves level, gantry girder for crane with walkway having handrail on one side with access ladders & open steel staircases for access at appropriate places.

RC deck mounted foundations for compressors with structural steel operating platform having HDG grating floor & handrail all-round, RC grade slab with flooring of type mentioned elsewhere, RC cable trench & RC floor drains at ground level.

b) Cooling Towers
The structure will be water retaining RCC structure and all construction joint shall be provided with PVC water stop, entire construction to meet relevant Indian Standard Codes requirement of water retaining structures.

Before the cooling tower is commissioned for use, it shall be tested for water tightness by filling it with water and allowing it to stand for 24 hours. It shall be topped up, if necessary and allowed to stand for a further period of 24 hours, during which the fall level shall not be more than 1.5 cm.
Inside wall shall be painted with two coats of coal tar epoxy over one coat of primer.

All nuts and bolts supporting the structure shall be of stainless steel.

All wooden structure/members of cooling tower shall be chemically treated must be conforming to relevant Indian Standard (IS) Codes for physical properties and for chemical properties.

Also the Process engineering specification should be followed.

c) Technological Structure

Open steel structure with RC foundations, structural steel platforms & floors at different levels with HDG grating, handrails all-round, supporting arrangement for equipments. Approaches to various levels shall be through structural steel staircases. Open steel staircase from ground to top level with handrails on both sides.

RC foundations for equipments, RC grade slab with RC cable trenches & RC floor drains at ground level.

The foundations of all equipments / structures shall be as per requirement.

d) Control Room

Control Room building shall be designed as RCC framed structure.

Besides housing of control panel/ operator’s consoles, rack area for marshalling cabinets, Engineering console room, process operator’s room, HVAC/ Air handling room(s), UPS and UPS battery room, toilet, rest rooms etc. shall be accommodated in the control room building in general.

Also the instrumentation engineering specification for Control Room should be followed.

e) Pipe-rack

Structural steel pipe-rack with RC foundations having multiple tiers for supporting pipes with suitable platforms for control valve operations and walkway, having HDG grating, MS handrails on both sides with local ladders.

In case, air cooler structures are required, it shall be suitably supporting over pipe-rack. Structural steel platforms be provided with HDG grating, handrails and ladders.
for the entire width of rack below air coolers. Operating platform at top of air coolers with ladder for approach to the same. Open steel staircase for operation & maintenance at required places to be provided from ground to top level with landing at appropriate locations.

Endeavour shall be made to utilize the unoccupied space of the existing pipe rack (if any), after checking the adequacy of the system. Modification/strengthening, if required shall be carried by the contractor.

There should be RC paving below pipe-rack for entire width where crane movement/vehicular traffic is anticipated. There should be PCC paving below pipe-rack located in plants.

f) Pipe Sleepers

The suitable arrangement of concrete supports shall be used to support pipes. The top of concrete of pipe sleepers shall be minimum 300mm above the highest paving points. MS steel insert plates with 20mm bar shall be provided on the sleeper top for pipe fixing depending on requirements. Suitable road crossing arrangement shall be provided for pipe sleepers wherever required.

g) Substation

The Sub-Station building shall be a RCC framed building with Hollow/solid block work side covering and flat roof at top. The ground floor shall be utilized as cable cellar for installation of cable trays. The first floor will have LT/HT panels, UPS & battery room, operator’s room & toilets. The access to first floor shall be provided through two nos. of R.C.C. staircases, each located on either side of building. Transformer bay will be on the rear side of the building, provided with Chain link fencing & gates. Separating walls shall be provided between transformers. The separating walls between sub-station and outdoor transformer bays shall have four hour fire rating.

Also the electrical engineering specification for Substation should be followed

h) Stack Structure and Foundation;

R.C.C. foundation having steel structure/RCC super structure with intermediate platform and accessible cat ladders with cage.
i) **Miscellaneous**

i) Lifting beams / monorails of required capacity for maintenance and / or erection purpose at various locations as per requirements mentioned elsewhere in this document shall be provided. Statutory provisions shall be applicable for all electrically driven monorails.

ii) Miscellaneous local platforms, pipe sleepers, local foundations, local supports etc. as per requirement.

1.0 General

1.1 Specifications of materials and workmanship shall be as described in the Central Public Works Department Specifications Vol. I & II (latest) include latest amendments, unless otherwise specified. These CPWD Specifications shall be deemed to form part of this contract. The CONTRACTOR shall procure and maintain copies of the latest CPWD Specifications at site for reference.

1.2 These technical Specifications shall be supplementary to the specifications contained in the CPWD specifications, wherever at variance, these Particular Specifications shall take precedence over the provisions in the CPWD Specifications.

2.0 Reference Codes & Standards

2.1 Wherever reference of IS Specifications/ or IS Codes of Practice are made in the Specifications/ Schedule of Rates or Preambles, reference shall be to the latest edition of IS (Bureau of Indian Standards).

3.0 Earthwork

3.1 Excavation

3.1.1 Excavation shall be carried out in soil of any nature and consistency, in the presence of water or in the dry, met on the site to the lines, levels and contours shown on the detailed drawings and CONTRACTOR shall remove all excavated materials to soil heaps on site or transport for use in filling on the site or stack them for reuse as directed by the Engineer-in-Charge.

3.1.2 Surface dressing shall be carried out on the entire area occupied by the buildings including plinth protection as directed without any extra cost. The depths of excavation shown on the drawings are the depths after surface dressing.

3.1.3 The site around all buildings and structures to a width of 3 metres beyond the edge of plinth protection, ramps, steps, etc. shall be dressed and sloped away from the buildings.

3.1.4 Black cotton soil, and other expansive or unsuitable soils excavated shall not be used for filling in foundations, and plinths of buildings or in other structures including manholes, septic tanks etc. and shall be disposed off within the contract area marked on the drawings, as directed, levelled and neatly dressed.

3.1.5 In case of trenches exceeding 2 metres depth or where soil is soft or slushy, the sides of trenches shall be protected by timbering and shoring. The CONTRACTOR shall be responsible to take all necessary steps to prevent the sides of trenches from caving in or collapsing. The extent and type of timbering and shoring shall be as directed by the Engineer-in-Charge.

3.1.6 Where the excavation is to be carried out below the foundation level of adjacent structure, the precautions to be taken such as under pinning, shoring and strutting etc. shall be determined by Engineer-in-Charge. No excavation shall be done unless such precautionary measures are carried out as per directions of Engineer-in-Charge.
3.1.7 Specification for Earth work shall also apply to excavation in rock in general. The excavation in rock shall be done such that extra excavation beyond the required width and depth as shown in drawings is not made. If the excavation done in depth greater than required /ordered. The CONTRACTOR shall fill the extra excavation with concrete of mix 1:5:10 as the foundation concrete at his own cost.

3.1.8 CONTRACTOR shall make all necessary arrangements for dewatering / defiling as required to carry out proper excavation work by bailing or pumping out water, which may accumulate in the excavation pit from any cause/ source whatsoever.

3.1.9 CONTRACTOR shall provide suitable draining arrangements at his own cost to prevent surface water entering the foundation pits from any source.

3.1.10 The CONTRACTOR is forbidden to commence the construction of structures or to carry out concreting before Engineer-in-Charge has inspected, accepted and permitted the excavation bottom.

3.1.11 Excavation in disintegrated rock means rock or Boulders including brickbats which may be quarried or split with crow bars. This will also include laterite and hard conglomerate.

3.1.12 Excavations in hard rock - meant excavation made in hard rock to be done manually, or by blasting using only explosives and / or pneumatic hammers. In case of blasting, control blasting should be adopted depending on site conditions. For using explosives CONTRACTOR shall follow all provisions of Indian Explosives Act / Rules 1983, corrected / revised up to date.

3.1.13 In case of hard rock excavation to be carried out using explosives the, CONTRACTOR shall obtain the written approval in advance.

3.1.14 The measurements for excavations shall be restricted and limited to minimum excavation line as per drawing for payment purposes.

3.1.15 Adequate protective measures shall be taken to see that the excavation does not affect or damage adjoining structures. The CONTRACTOR shall take all measures required for ensuring stability of the excavation and safety of
property and people in the vicinity. The CONTRACTOR shall erect and maintain during progress of work, temporary fences around dangerous excavations at no extra cost.

3.1.16 Excavation in ordinary soil means excavation in ordinary hard soil including stiff heavy clay, hard shale, or compact moorum, or any materials, which can be removed by the ordinary application of spades, shovels, picks and pick axes. This shall also include removal of isolated boulders each having a volume not more than 0.50m³.

3.1.17 Excavation in soft rock includes limestone, sandstone, laterite, hard conglomerates, etc. or other rock which can be quarried or split with crowbars or wedges. This shall also include excavation of tarred pavements, masonry work and rock boulders each having a volume of not more than 0.25m³.

3.1.18 Excavation in hard rock includes any rock bound in ledges or masses in its original form or cement concrete for which in the opinion of the Engineer-in-Charge, requires the use of compressed air, equipment, sledge hammer and blasting or non-explosive materials viz. Acconex manufactured by A.C.C. Ltd. Specifications and instructions for use shall be as per manufacturer.

3.1.19 In case of any difficulty concerning the interpretation of type of soil as mentioned above, the Engineer-in-Charge shall decide whether the excavation in a particular material is in ordinary soil, soft rock or hard rock and his decision in this matter shall be final and binding on the CONTRACTOR and without appeal.

3.2 Filling

3.2.1 Back filling of excavations in trenches, foundations and elsewhere shall consist of one of the following materials approved by Engineer-in-Charge.

- Soil
- Sand
Moorum
Hard-core
Stone/gravel

All back filling material shall be approved by the Engineer-in-Charge.

3.2.2 Soil filling - Soil material shall be free from rubbish, roots, hard lumps and any other foreign organic material. Filling shall be done in regular horizontal layers each not exceeding 20 cm. depth.

3.2.3 Back filling around completed foundations, structures, trenches and in plinth shall be done to the lines and levels shown on the drawings.

3.2.4 Back filling around pipes in the trench shall be done after hydro testing is done.

3.2.5 Back filling around liquid retaining structures shall be done only after leakage testing is completed and approval of Engineer-in-Charge is obtained.

3.2.6 Sand used for filling under foundation concrete, around foundation and in plinth etc. shall be fine/ coarse, strong, clean, free from dust, organic and deleterious matter. The sand filling under foundation shall be rammed with Mech. compactor. Sand material shall be approved by Engineer-in-Charge.

3.2.7 Moorum for filling, where ordered, shall be obtained from approved pits and quarries which contain siliceous material and natural mixture of clay. Moorum shall not contain any admixture of ordinary earth. Size of moorum shall vary from dust to 10 mm.

3.2.8 Hard-core shall be of broken stone of 90 mm to 10 mm size suitable for providing a dense and compact sub grade. Stones shall be sound, free from flakes, dust and other impurities. Hard core filling shall be spread and levelled in layers, 15 cm thick, watered and well compacted with ramming or with mechanical / hand compacts including hand packing wherever required.

3.2.9 If any selected fill material is required to be borrowed, CONTRACTOR shall make arrangements and procure such material from outside borrow pits. The material of source shall be subject to prior approval of Engineer-in-Charge. CONTRACTOR shall make necessary access roads to borrow areas and
maintain the same, if such access roads do not exist, at no extra cost.

3.2.10 Plinth filling shall be carried out with approved material as described earlier, in layers not exceeding 150mm, watered and compacted with mechanical compaction machines. **Engineer-in-Charge** may however permit manual compaction by hand tampers in case he is satisfied that mechanical compaction is not possible. When filling reaches the finished level, the surface shall be flooded with water, unless otherwise directed, for at least 24 hours, allowed to dry and then the surface again compacted as specified above to avoid settlements at later stage. The finished level of the filling shall be trimmed to the level specified. Compacted surface shall have at least 95% of laboratory maximum dry density. A minimum of one test per 250 sq. meters of compacted area shall be done.

3.2.11 Whenever the fill material (earth or soil) is purchased, **CONTRACTOR** shall get the approval of Engineer-in-Charge. The CONTRACTOR shall arrange to determine the following properties of the soil and shall get the approval of **Engineer-in-Charge**.

1. Clay content : 15% to 20%
2. Laboratory dry density : Not less than 1600 kg/m³
3. Plasticity Index : Not more than 20

3.2.12 The fill shall be compacted using a vibrating compactor of not less than 1.5 tonne. The fill shall be thoroughly compacted in layers as directed but not more than 200 mm thick. Adequate water shall be used for compaction and the density after compaction shall be not less than maximum dry density obtained in test of IS: 2720 Part-8. Compacted surface shall have at least 90% of laboratory maximum dry density. A minimum of one test per 250 sq. meters of compacted area shall be done.
3.2.13 The Gravel fill shall be non plastic granular material, well graded, strong, with maximum particle size of 50 mm, with not more than 15% passing a 4.75 mm IS sieve, free of all debris, vegetable matter and chemical impurities.

3.2.14 All clods, lumps etc. shall be broken before compaction.

3.2.15 In case of grading/banking successive layers of filling shall not be placed, until the layer below has been thoroughly compacted to satisfy the requirements laid down in this specification.

Prior to rolling, the moisture content of material shall be brought to within +/-2% of the optimum moisture content as described in IS 2720 Part-7. The moisture content shall preferably be on the wet side for potentially expansive soil.

After adjusting the moisture content as described, the layers shall be thoroughly compacted by means approved by Engineer-in-Charge, till the specified maximum laboratory dry density is obtained.

General, fill shall be placed in layers not exceeding 300 mm thickness and shall be thoroughly compacted to achieve a compaction of at least 90% of laboratory maximum dry density up to a depth of 600 mm below finished grade. Final fill of 600 mm thickness shall consist of preferably natural material in, as dug condition except that stones larger than 100 mm shall be removed. It shall be placed in layers not exceeding 150 mm thickness and compacted to achieve of at least 95% of laboratory maximum dry density. Each layer shall be tested in field for density and accepted by Engineer-in-Charge, subject to achieving the required density before laying the next layer. A minimum of one test per 250 sq meters for each layer shall be conducted.

If the layer fails to meet the required density, it shall be reworked or the material shall be replaced and method of construction altered as directed by Engineer-in-Charge to obtain the required density.

The filling shall be finished in conformity with the alignment, levels, cross-section and dimensions as shown in the drawing.
Extra material shall be removed and disposed off as directed by the Engineer-in-Charge.

4.0 Plain and Reinforced Concrete Work

This specifications deals with cement concrete, plain or reinforced, for general use, and covers the requirements for concrete materials, their storage, grading, mix design, strength & quality requirements, pouring at all levels, reinforcements, protection, curing, form work, finishing, painting, admixtures, inserts and other miscellaneous works.

4.1 Materials

4.1.1 Cement: Any of the following cements may be used as required. If soil investigation report recommends any specified type of cement then same shall have precedence.

<table>
<thead>
<tr>
<th>IS</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IS - 269</td>
<td>Ordinary Portland cement, 33 grade</td>
</tr>
<tr>
<td>IS - 8112</td>
<td>43/53 Grade ordinary Portland cement</td>
</tr>
<tr>
<td>IS - 12269</td>
<td>53 Grade ordinary port land cement</td>
</tr>
</tbody>
</table>

4.1.2 Water: Water used for mixing and curing concrete and mortar shall conform to the requirements as laid down in IS: 456. Sea water shall not be used for concrete work.

4.1.3 Aggregates: Coarse and fine aggregates for cement concrete plain and reinforced shall conform to the requirements of IS 383 and / or IS 515. Before using, the aggregates shall be tested as per IS: 2386.

Coarse aggregate: Coarse aggregate for all cement concrete work shall be broken or crushed hard stone, black trap stone obtained from approved Quarries or gravel.

Sand: Fine aggregate shall consist of natural or crushed sand conforming to BIS 383 and conforming to test as per BIS 2386 parts I to IV.f. Grading of coarse sand shall be within grading zones I, II or III as laid down in IS: 383, table 4. If
required the aggregates (both fine and coarse) shall have to be thoroughly washed and graded as per direction of Engineer-in-Charge.

4.2 Mixing

All cement concrete plain or reinforced shall be machine mixed. Mixing by hand may be employed where quantity of concrete involved is small, with the specific prior permission of the Engineer-in-Charge. 10% extra cement shall be added in case of hand mixing as stipulated in IS-456.

For large and medium project sites the concrete shall be sourced from ready-mixed concrete plants or from on site or off site batching and mixing plants (IS 4926)

4.3 Water Cement Ratio, Laying & Curing

Water Cement Ratio, Laying & Curing shall be done as per IS: 456.

4.4 Grades of Concrete

4.4.1 Grades lower than M 25 shall not be used in reinforced concrete super structures.

4.4.2 A sieve analysis test of aggregates shall be carried out as and when the source of supply is changed without extra charge notwithstanding the mandatory test required to be carried out as per CPWD specification.

4.4.5 All tests in support of mix design shall be maintained as a part of records of the contract. Test cubes for mix design shall be prepared by the CONTRACTOR under his own arrangements and at his costs, but under the supervision of the Engineer-in-Charge.

4.5 Design Mix Concrete

4.5.1 Design mix shall be allowed for major works where it is contemplated to be used by installing weigh batch mixing plant as per IS 4925. At the time of tendering, the CONTRACTOR, after taking into account the type of aggregates, plant and method of laying he intends to use, shall allow in his tender for the design mix i.e., aggregate/cement and water/cement ratios which he considers will achieve
the strength requirements specified, and workability for concrete to be properly finished.

4.5.2 Before commencement of concreting, CONTRACTOR shall carry out preliminary tests for design mix on trial mixes proposed by him in design of mix to satisfy the Engineer-in-Charge that the characteristic strength is obtained. In this regard, CONTRACTOR may consult govt. approved/reputed institute to get design mix done as per IS 10262 at his own cost. The concrete mix to be actually used shall be approved by the Engineer-in-Charge.

4.5.3 Notwithstanding the above, the following shall be the maximum combined weight of coarse and fine aggregate per 50 kg of cement.

<table>
<thead>
<tr>
<th>Grade of Concrete</th>
<th>Maximum weight of fine &amp; coarse aggregates together per 50 kg of cement (for nominal mix only)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. M - 10</td>
<td>480 kg</td>
</tr>
<tr>
<td>2. M - 15</td>
<td>350 kg</td>
</tr>
<tr>
<td>3. M - 20</td>
<td>250 kg</td>
</tr>
</tbody>
</table>

4.5.4 The workability of concrete produced shall be adequate, so that the concrete can be properly placed and compacted. The slump shall be as per IS 456.

4.5.5 The minimum consumption of the cement irrespective of design mix shall not be less than the following:

<table>
<thead>
<tr>
<th>Grade of Concrete</th>
<th>Consumption (kg/cu m)</th>
</tr>
</thead>
<tbody>
<tr>
<td>M 7.5 (1:4:8)</td>
<td>170</td>

<td>330</td>
</tr>
<tr>
<td>M 25</td>
<td>350</td>
</tr>
<tr>
<td>M 30</td>
<td>400</td>
</tr>
</tbody>
</table>
4.6 **Testing of Concrete**

4.6.1 Testing of concrete, sampling and acceptance criteria shall be in accordance with IS 456.

4.7 **Proportioning**
Mixes of cement concrete shall be as ordered. Where the concrete is specified by grade, it shall be prepared by mixing cement, sand and coarse aggregate by weight as per mix design. In case the concrete is specified as volumetric mix, then dry volume batching shall be done, making proper allowances for dampness in aggregates and bulking in sand. Equivalent volume batching for concrete specified by grade may however be allowed by the Engineer-in-Charge at his discretion.

4.8 **Pre Cast Concrete**
The specifications for pre cast concrete will be similar as for the cast in situ concrete. All pre cast work shall be carried out in a yard made for the purpose. This yard shall be dry, properly levelled and having a hard and even surface. If the ground is to be used as a soft former of the units, shall be paved with concrete or masonry and provided with a layer of plaster (1:2 proportion) with smooth neat cement finish or a layer of MS sheeting. The casting shall be over suitable vibrating tables or by using form vibrators as per directions of Engineer-in-Charge.

The yard, lifting equipment, curing tank, finished material storage space etc. shall be designed such that the units are not lifted from the mould before 7 (seven) days of curing and can be removed for erection after 28 (Twenty Eight) days of curing. The moulds shall preferably be of steel or of timber lined with G.I .sheet metal. The yard shall preferably be fenced.

Lifting hooks, wherever necessary or as directed by Engineer-in-Charge shall be embedded in correct position of the units to facilitate erection, even though they may not be shown on the drgs. and shall be burnt off and finished after erection.
Pre cast concrete units, when ready shall be transported to site by suitable means approved by Engineer-in-Charge. Care shall be taken to ensure that no damage occurs during transportation. All adjustments, levelling and plumbing shall be done as per the instructions of the Engineer-in-Charge. The CONTRACTOR shall render all help with instruments, materials and staff to the Engineer-in-Charge for checking the proper erection of the pre cast units.

After erection and alignment the joints shall be filled with grout or concrete as directed by Engineer-in-Charge. If shuttering has to be used for supporting the pre cast unit they shall not be removed until the joints has attained sufficient strength and in no case before 14 (fourteen) days. The joint between pre cast roof planks shall be pointed with 1:2 (1 cement : 2 sand) mortar.

5.0 STEEL REINFORCEMENT

5.1 Steel reinforcement shall comprise:

1) CRS bars

5.2 All joints in reinforcement shall be lapped adequately to develop the full strength of the reinforcement as per provision of IS: 456 or as per instruction of Engineer-in-Charge.

6.0 Form Work

6.1 The shuttering or form work shall conform to the shape, lines and dimensions as shown on the drawings and be so constructed as to remain sufficiently rigid during placing and compacting of the concrete and shall be sufficiently tight to prevent loss of liquid from the concrete. The surface that becomes exposed on the removal of forms shall be examined by Engineer-in-Charge or his authorized representative before any defects are made good. Work that has sagged or bulged out, or contains honey combing, shall be rejected. All shuttering shall be plywood or steel shuttering.

6.2 The CONTRACTOR shall be responsible for sufficiency and adequacy of all form work. Centering and form work shall be designed & detailed in accordance with IS 14687 and approved by the Engineer-in-Charge, before placing of reinforcement and concreting.
6.3 **Stripping Time**

Forms shall not be struck until the concrete has reached strength at least twice the stress to which the concrete may be subjected at the time of removal of form work. The strength referred to shall be that of concrete using the same cement and aggregates, with the same proportions and cured under conditions of temperature and moisture similar to those existing on the work. Where possible, the form work shall be left longer as it would assist the curing.

Note 1: In normal circumstances and where ordinary Portland Cement is used, forms may generally be removed after the expiry of the following periods:

<table>
<thead>
<tr>
<th></th>
<th>Walls, columns and vertical faces of all structural members</th>
<th>24 to 48 hours as may be decided by the <strong>Engineer-in-Charge</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Slabs (props left under)</td>
<td>3 days</td>
</tr>
<tr>
<td>3</td>
<td>Beam soffits (Props left under)</td>
<td>7 days</td>
</tr>
<tr>
<td>4</td>
<td>Removal of props under slabs</td>
<td></td>
</tr>
<tr>
<td>4.1</td>
<td>Spanning up to 4.5 m</td>
<td>7 days</td>
</tr>
<tr>
<td>4.2</td>
<td>Spanning over 4.5 m</td>
<td>14 days</td>
</tr>
<tr>
<td>5</td>
<td>Removal of props under beams &amp; arches:</td>
<td></td>
</tr>
<tr>
<td>5.1</td>
<td>Spanning up to 6 m</td>
<td>14 days</td>
</tr>
<tr>
<td>5.2</td>
<td>Spanning over 6m</td>
<td>21 days</td>
</tr>
</tbody>
</table>

For other types of cements, the stripping time recommended for ordinary Portland Cement may be suitably modified.

Note 2: The number of props left under, their sizes and disposition shall be such as to be able to safely carry the full dead load of the slab, beam or arch as the case may be together with any live load likely to occur during curing or further construction.
7.0 Cement Concrete Block

Cement concrete block shall be machined made in the proportion of such that mix shall not be leaner than one cement to twelve combined aggregates (by volume) but having minimum strength of 7.5 MPa. Combined aggregate shall be graded as near as possible to IS: 383. The fineness modules of combined aggregate shall be between 3.6 and 4. The concrete block shall be properly cured as per IS-456. The surface of conc. block shall have even face without any honeycomb and free from cracks.

7.7.1 Mortar

Cement and water shall confirm to the requirements laid down for cement concrete work.

7.7.2 Sand for concrete block masonry mortars shall be coarse sand generally conforming to IS: 2116. Maximum quantities of clay, fine dust, shall not be more than 5% by weight. Organic impurities shall not exceed the limits laid down in IS: 2116.

7.7.3 Mix of mortar for building concrete block shall be as specified in the item of work.

7.7.4 Mixing of the mortar shall be done in a mechanical mixer. When quantity involved is small hand mixing may be permitted by Engineer-in-Charge. Any mortar remaining unused for more than 30 minutes after mixing shall be rejected.

7.8 Concrete Block Masonry

The thickness of joints shall be 10 mm +- 3mm. Thickness of joints shall be kept uniform. In case of foundation and manholes etc. joints up to 15 mm may be accepted.

7.9 Half Concrete Block

All courses shall be laid with stretchers. Reinforcement comprising 2 nos. 6 mm dia MS bars shall be provided over the top of the first course and thereafter at every fourth course.
7.10 **Fixtures**

All iron fixtures, pipes spouts, hold fasts of doors and windows which are required to be built into the wall shall be embedded in cement concrete blocks 1:2:4 mix (1 cement :2 coarse sand :4 graded stone aggregate. 20 mm nominal size) of size indicated in the item.

7.11 **Curing**

Concrete block masonry shall be protected from rain by suitable covering when mortar is green. Masonry work shall be kept constantly moist on all faces for a minimum period of seven days.

8.0 **STRUCTURAL STEEL WORK**

This specification covers the technical requirements for the preparation of shop drawings, supply, fabrication, protective coating, painting and erection of all structural steel rolled sections, built up sections, plates and miscellaneous steel required for the completion of the work.

**Steel**

All structural steel used in construction within the purview of this contract shall, comply with one of the following Bureau of Indian Standard Specifications, whichever, is appropriate or as specified.

- IS – 2062 Hot rolled sections and plates
- IS – 1079 Cold formed light gauge sections
- IS – 1161 Tubular sections
- IS – 4923 Hollow sections (rectangular or square)

**Fabrication**

Fabrication of steel structure shall be carried out in conformity with the best modern practices and with due regard to speed with economy in fabrication and erection and shall conform to IS-800. All members shall be so fabricated as to assemble the members accurately on site and erect them in correct positions. Before dispatch to site the components shall be assembled at shop and any defect found rectified. All members shall be free from kink, twist, buckle, bend,
open joints etc. and shall be rectified before erecting in position. Failure in this respect will subject the defective members to rejection.

**Fabrication Drawings:**

Connections, splices and other details shall be suitably designed based on good Engineering practice.

**Electrodes:**

Electrodes used for welding shall comply with IS-814 or IS - 815.

8.1 **MS Black/High Strength Bolts and Nuts**

M.S.Black or high strength bolts, nuts and washers etc. shall be as per IS-800, IS-1363 and IS-1367. Manufacturer's test certificate shall be made available to the Engineer-in-Charge. For bolted joints, shanks and threaded bolts are to be used to ensure that threaded length do not encroach within the thickness of connected members of dimension beyond the following limit:-

1. 1.5 mm for connected members of thickness below 12 mm and
2. 2.5 mm for connected member of thickness 12 mm and above and that adequate shearing and bearing values required as per design are achieved.

Every portion work shall have its erection mark or numbers stencilled on the member for guidance in erection and bear all necessary marks of erections as directed by the Owner / Consultant.

7.13 No part of the work is to be oiled, painted (except contact surfaces ) packed, bundled, crated or dispatched until it has been finally inspected and approved by the Owner / Consultant or his authorized representative. The whole steel work before being dispatched from the Contractor's shop shall be dry and after being thoroughly cleaned from dust, mills scale, rust etc., and shall be given two coats of primer and one coat of final paint as per painting specification attached in this enquiry. Unless otherwise specified, all surfaces inaccessible after welding shall be given two coats of primer and two coats of paints as per painting specification attached in this enquiry.
7.14 The Owner / Consultant or his authorized representative shall have free access at all reasonable time to all places where the work is being carried out, and shall be provided by the Contractor at his own expenses all necessary facilities for inspection during fabrication and erection. The Owner / Consultant or his authorized representative shall be at liberty to reject the work in whole or in part if the workmanship or materials do not conform to the terms of the specifications mentioned herein. The Contractor shall remove, replace or alter any part of the work as ordered by the Owner / Consultant or his authorized representative.

9.0 PAINTING ON STRUCTURAL STEEL

Painting on structural steel shall be as per Painting specification given elsewhere with this Tender. However, the following specification may be considered and used for painting of structural steel work.

9.1 Scope

This specification covers the technical requirements for shop and site application of paint and protective coatings and includes; the surface preparation, priming, application, testing and quality assurance for protective coatings of structural steelwork, plate work, handrails and associated metal surfaces, which will be exposed to atmospheric for industrial plants.

9.3 Safety Regulations
Protective coatings and their application shall comply with all national, state, and local codes and regulations on surface preparation, coating application, storage, handling, safety, and environmental recommendations.

Sand or other materials producing silica dust shall NOT be used for any open-air blasting operations.

9.4 Material Safety Data Sheets

The latest issue of the coating manufacturer’s product datasheet, application instructions, and material safety data Sheets shall be available prior to starting the work and shall be complied with during all preparation and painting / coating operations.

9.5 Materials

All paints and paint materials shall be obtained from the company’s approved manufacturer’s list. All materials shall be supplied in the manufacturer’s containers, durably and legibly marked as follows.

Specification number
Colour reference number
Method of application
Batch number
Date of Manufacture
Shelf life expiry date
Manufacturer’s name or recognised trade mark.

9.6 CODE AND STANDARDS:

Without prejudice to the provision of Clause 1.1 above and the detailed specifications of the contract, the following codes & standards shall be followed. Wherever reference to any code is made, it shall correspond to the latest edition of the code.
9.7 Indian Standards:

IS-5: 1994    Colors for ready mixed paints and enamels.
IS-2379: 1990  Color codes for identification of pipe lines.
IS-2629: 1985  Recommended practice for hot-dip galvanizing on iron and steel.
IS: 110    Specification for Ready Mixed Paint, Brushing, Grey Filler, for Enamels, for Over Primers
IS: 101    Methods of test for ready mixed paints & enamels.

9.8 Other Standards:

(Surface preparations standards for Painting Steel Surface).

This standard contains photographs of the various standards on four different degrees of rusted steel and as such is preferable for inspection purpose by the Engineer-in-charge.

9.9 The paint manufacturer's, instructions shall be followed as far as practicable at all times. Particular attention shall be paid to the following:

a. Instructions for storage to avoid exposure as well as extremes of temperature.

b. Surface preparation prior to painting.

c. Mixing and thinning.

d. Application of paints and the recommended limit on time intervals between coats.
9.10 Surface Preparation

9.10.1 Safety

All work in adjacent areas, which may negatively affect the quality of blast cleaning, and/or impose safety hazards, must be completed or stopped before the blasting operation starts.

9.1.2 Pre-Cleaning

Prior to surface preparation all weld spatter shall be removed from the surface, all sharp edges ground down and all surfaces cleaned free of contaminants including chalked paint, dust, grease, oil, chemicals and salt. All shop primed surfaces shall be water washed by means of suitable solvent, by steam cleaning, with an alkaline cleaning agent if necessary or by high-pressure water, to remove contaminants prior to top-coating.

9.1.3 Surface decontamination

Surface decontamination shall be performed prior to paint application when uncoated surface is exposed to a corrosive environment or existing paint work is to be repaired. Existing coatings shall be removed by abrasive blast cleaning, and then high pressure potable water shall be used to clean steel surfaces. Prior to application of coatings, the surface shall be chemically checked for the presence of contaminants. A surface contamination analysis test kit shall be used to measure the levels of chlorides, iron salts and pH in accordance with the kit manufacturer’s recommendations.

Swabs taken from the steel surface, using cotton wool test swabs soaked in distilled water shall not be less than one swab for every 25m² of surface area to be painted.

Maximum allowable contaminant levels and pH range is as follows:

- Sodium chloride, less than 50 microgram / cm²;
- Soluble iron salts, less than 7 microgram / cm²; and
- pH between 6 – 8
If the results of the contamination test fall outside the acceptable limits, then the wash water process shall be repeated over the entire surface to be painted, until the contaminant test is within the specified levels.

9.1.4 Abrasive blasting

All C.S materials shall be abrasive blast cleaned in accordance with relevant IS Codes. To reduce the possibility of contaminating S.S., blasting is not usually specified. However, for coatings which require a blast-cleaned surface for proper adhesion, S.S. may be blast cleaned using clean aluminium oxide or garnet abrasives (Free from any chloride or Iron / Steel contamination). When hand or power tool cleaning is required on S.S., only S.S. wire-brushes (including 410 S.S.) which have not been previously used on C.S. surfaces may be used.

The surface profile of steel surfaces after blasting shall be of preparation grade Sa 2-1/2 of Swedish Standards SIS-05-5900 (Latest Revision) or better according to ISO 8501-1 and shall be measured using the replica tape method or the comparator method.

The roughness (profile) of blast-cleaned surfaces shall be Medium (G) according to ISO 8503-2: 1988 (appendix 1) unless otherwise specified. Medium defines a surface profile with a maximum peak-to-valley height of 60-100 microns, and G indicates that the surface profile is obtained by grit blasting. For the evaluation of surface roughness Comparator G shall be used.

Abrasive blast cleaning shall NOT be performed when the ambient or the substrate temperatures are less than 3 Degree Celsius above the dew point temperature. The relative humidity should preferably be below 50% during cold weather and shall never be higher than 60% in any case.

Abrasive blast cleaning shall be performed with a clean, sharp grade of abrasive. Grain size shall be suitable for producing the specified roughness. Abrasives shall be free from oil, grease, moisture and salts, and shall contain no more than
50ppm chloride. The use of silica sand, copper slag and other potentially silica containing materials shall not be allowed.

The blasting compressor shall be capable of maintaining a minimum air pressure of 7 kPa at the nozzle to obtain the acceptable surface cleanliness and profile.

The blast cleaning air compressor shall be equipped with adequately sized and properly maintained oil and water separators. The air supply shall be checked to ensure no oil and water contamination at the beginning of each work shift.

Blast cleaning abrasive shall be stored in a clean, dry environment at all times. Recycling of used abrasive is prohibited.

After blast cleaning, the surfaces shall be cleaned by washing with clean water (Pressure 7kg/cm² using suitable nozzles. During washing broom corn brushes shall be used to remove foreign matter.

Assessment of the blast cleaned surfaces shall be carried out in accordance with reference code.

Blast cleaned surfaces which show evidence of rust bloom or that have been left uncoated overnight shall be re-cleaned to the specified degree of cleanliness prior to coating.

All grit and dust shall be removed after blasting and before coating application. Removal shall be by a combination of blowing clean with compressed air, followed by a thorough vacuum cleaning with an industrial grade, heavy duty vacuum cleaner.

All cleaned surfaces shall have protection from atmospheric corrosion as per IS8629:1977

9.1.2 **Painting system to be used is indicated below:**

1. **Epoxy Painting:**

   a) Primer P 1-2 coats + finish paint FP1 (2 coats) where P1 is epoxy polyamide cured zinc chromate primer having DFT of 35 micron per coat and FP1 is epoxy polyamide cured finish paint having DFT (Dry Film Thickness) of 35 micron per coat.
Equivalent product chart for approved paint manufactures for primer P1 finish paint FP1 indicated above is enclosed.

2. For PU painting:
   i) P1 – One coat of Ethyl silicate inorganic zinc primer having DFT of 70 microns per coat.
   ii) IP1 – One coat of Epoxy MIO having DFT of 70 microns per coat.
   iii) FP1 - One coat of finish epoxy paint using two pack Polyamide cured epoxy having DFT of 40 microns per coat.
   iv) FP2 - One coat of Aliphatic Acrylic Polyurethane paint having DFT of 40 microns per coat.

Equivalent product chart for approved paint manufactures for P1, IP1, FP1 & FP2 indicated above is enclosed.

9.1.3 All the surfaces must be abrasive blasted and 2 coats of primer plus 1 coat of finish paint applied in the fabrication shop before the same are shifted to site for erection. All the members must be suitably match marked for facilitating proper assembly.

After erection is over all surfaces shall be washed up as follows:

- Washing with clean water (pressure 7 kg/cm²) using suitable nozzles. During washing broom corn brushes shall be used to remove foreign matters.
- Solvent washing if required to remove traces of oil grease etc.

After washing the surface as indicated above, the surfaces shall be suitably touched up to the extent required so that all the damages to the premiered surfaces caused during erection are done up.

b) The surfaces affected by welding and / or gas cutting during erection shall also be suitably touched up. Before touch up is taken up surfaces shall be prepared by mechanical means such as grinding, power brushing etc. to achieve surface finish to ST-3.
c) After touch up work is over as indicated above, all the surfaces shall be given one coat of finish paint to the required specification.

9.1.4 The following points must be observed for painting work:

1. Primer and paint shall be compatible to each other and should be from the same manufacturer.

2. The recommendation of the paint manufacturer regarding mixing, matching and application must be followed meticulously.

3. Technical representative of paint manufacturer should be available at site as and when required by Engineer-in-Charge for their expert advice as well as to ensure that the painting work is executed as per the instruction of paint manufactures.

d) Paints and primers shall be supplied at site in original container with factory seal otherwise such paints and primers shall not be allowed to be used. Mode of application i.e. by spray, brush or roller shall be strictly as per recommendation of paint manufacturer.

e) Painting materials must be used before the expiry date indicated on the containers.

f) Number of coats and DFT per coat must be strictly followed as indicated above. If the desired DFT is not achieved for primer and finish paints in two coats (each), CONTRACTOR shall be required to apply extra coat (s) to achieve the desired DFT without any extra cost to Engineer-in-Charge.

g) Color shade for each coat of primer and finish paint must be different to identify the coats without any ambiguity.

h) Shade for the final finish coat shall be decided by Engineer-in-Charge at site.

i) All painting materials must be accompanied by manufacturers test certificates. However, Engineer-in-Charge has any doubt regarding quality of materials, he shall have the right to direct CONTRACTOR to get the doubtful material tested or and provided (by CONTRACTOR) testing agencies for which no extra payment shall be made to the CONTRACTOR and the charges shall deemed to be covered in the unit rates quoted for fabrication and erection of structural work.
j) DFT for paint shall be measured at least 20 points and mean DFT shall not vary by more than 10% than specified in DFT.

k) Reliable and calibrated Instrument for measurement of DFT shall be arranged and provided by CONTRACTOR at his cost.

l) Thickness of each coat shall also be checked regularly to ensure uniformity in DFT.

9.1.5 Abrasive blasting and painting works, being a specialized job must be carried out through the approved agencies only.

### 10.0 Steel / Aluminium Doors, Windows and Ventilators

10.1 The Steel doors, windows and ventilators shall be of the size and type as per IS-1361 and IS-1038. Fixing and glazing shall be done as per IS-1081 and as per manufacturer’s instructions. The putty of approved make such as special gold size or equivalent conforming to IS-419 shall be used.

10.2 Aluminium doors, windows and ventilators shall be manufactured from wrought aluminium and aluminium alloy extruded round tube and / or hollow rectangular / square sections conforming to IS: 1285 & IS : 6477 or equivalent as approved by Engineer-in-Charge.

### 11.0 ROOFING & CLADDING

All roof and cladding sheets should be galvalume sheet of 0.5 mm total coated thickness with 550 MPA grade steel confirming to AS 1397 with AZ150 grade coating.

Translucent sheets shall be provided, in non-process areas only, intermittently where day lighting is required.
12.0 FLOORING AND PAVING

12.1 Sub Base of floor

12.1.1 The area to be paved shall be divided into suitable panels. Form work shall be provided. The boarding / battens shall be fixed in position with their toe at proper level, giving slope where required. Alternatively base concrete may be deposited in the whole area at a stretch.

12.1.2 Before placing the base concrete the sub-base shall be properly wetted and rammed. The concrete of the specified mix shall then be deposited between the forms where provided, thoroughly tamped and the surface finished level with the top edge of the forms. The surface of base concrete shall be spreader uniformly. The surface shall be finished rough to provide adequate bond for the topping. Two or three hours after concrete has been laid the surface shall be brushed with wire brush to remove any scum or Latinate and swept clean so that coarse aggregate is exposed.

12.2 Cement Concrete Floor Finishes

12.2.1 The surface of base concrete shall be thoroughly cleaned by scrubbing with coir or steel wire brush. Before laying the topping, the surface shall be soaked with water at least for 12 hours and surplus water mopped up immediately before the topping is laid.

12.2.2 The forms shall be fixed over the base concrete dividing into suitable panels. Where glass dividing strips are provided, thickness of glass dividing strips shall be 4 or as indicated. Before placing the concrete topping, neat cement slurry at the rate of 2 kg/sq.m shall be then thoroughly brushed into the base concrete just ahead of the finish. The topping shall then be laid, thoroughly compacted by using screed board/plate vibrator. The surface floated with a wooden float to a fair and even surface shall be left for some time till moisture disappears from it. Junctions with skirting / dado or wall surfaces shall be rounded off using cement mortar 1:2 curing shall be carried out for a minimum of 7 days.
13.0 PLASTERING

13.1 Sand for plastering shall be 50% fine sand and 50% coarse sand from approved sources.

13.2 Preparation of surface shall be done as per CPWD specifications.

13.3 Cement mortar shall be of the mix as indicated in the items and shall be mixed as specified in the CPWD specifications.

13.4 Joints in walls etc. shall be raked to a depth of 12 mm, brushed clean with wire brushes dusted and thoroughly washed before starting the plaster work.

13.5 The surface shall be thoroughly washed with water cleaned and kept wet to saturation point before plastering is commenced.

13.6 Cement mortar as indicated, shall be firmly applied to the masonry walls in a uniform layer to the thickness specified and will be pressed into the joints. On concrete surfaces rendering shall be dashed to the roughened surface to ensure adequate bond. The surface shall be finished even and smooth. Hectoring wherever required shall be done as per directions of Engineer-in-Charge. Nothing extra shall be paid on this account.

13.7 All plaster work shall be cured for at least 7 days.

13.8 Integral water proofing compound shall be mixed with cement in the proportion recommended by the manufacturer. Care shall be taken to ensure that the waterproofing material gets well and integrally mixed with cement. All other operations are the same as for general plaster work.

13.9 For sand face plaster undercoat of cement plaster 1:4 (1 cement : 4 sand) of thickness not less than 12 mm shall be applied similar to one coat plaster work. Before the under coat hardens the surface shall be scared to provide for the top coat. The top coat also of cement mortar 1:4 shall be applied to a thickness not less than 8 mm and brought to an even surface with a wooden float. The surface shall then be tapped gently with a wooden float lined with cork to retain a coarse surface texture, care being taken that the tapping is even and uniform.
14.0 Exterior Painting or Apex

14.1 Exterior painting shall be Apex.

14.2 Where shown on drawings for external surfaces of sand faced plaster, or any other surface, two coats of cement paint shall be applied of tint and shade as approved by the Engineer-in-Charge.

14.3 The surfaces shall be prepared as specified for white washing. Before applying cement paint the surface shall be thoroughly wetted to control surface suction. The surface shall be moist but not dripping wet, when the paint is applied. Not less than 24 hours shall be allowed between the two coats. In hot weather the first coat shall be slightly moistened before applying the second coat.

14.4 On external plastered surfaces (one coat primer + minimum 3 coat of paints), sand faced or plain plastered and concrete surfaces, apex weather proof paint shall be vigorously scrubbed on to work the paint into the voids and provide a continuous paint film free from pin holes and other openings.

15.0 GLAZING

15.1 Sheet glass glazing of doors, windows etc. shall be of selected quality glass conforming to IS: 2835. Toughened splinter proof industrial safety glass shall confirm to IS: 2553. No cracked chipped or disfigured glass shall be accepted. Glass shall be in one piece for each pan.

15.2 Glazing shall be fixed with timber or steel / aluminium beading as called for. Glass shall be back puttied and fixed with beading for a water tight and rattle free installation. Sizes of timber/ steel / aluminium beading shall be as directed.

16. PROTECTIVE COATING AND LINING SYSTEM

16.1 ACID PROOF TILES:

MATERIAL

1) TILES

These tiles shall be made of clays, feldspar, quartz, talc and vitrified at high temperature in ceramic kilns and kept unglazed so as to prevent from slipperiness. Tiles shall not absorb more than 2% of their own dry weight when soaked in water.
Compression strength: 700 Kg/cm² Min. & Flexural strength: 200 Kg/cm² Min. It shall not lose more than 1.5% of its weight when soaked in acid.

Chemical compositions of tiles:

- $\text{Al}_2\text{O}_3$: 22-24%
- $\text{SiO}_2$: 60-65%
- $\text{Fe}_2\text{O}_3$: 1.0-2.0%
- Alkaline: 10-12%

2) K-BASED SILICATE MORTAR

Acid proof cement KSC is a potassium silicate based corrosion cement. Acid tile linings carried out with KSC cement are not subject to crystal formation in the pores of cement. Besides Bitumastic surface is joint-less, hence there is no danger of Acids percolating through the surface.

Characteristics of K-based Silicate mortar:

- Colour: White
- Density (lbs/Cub. ft.): 130
- Water Absorption: 2-5%
- Tensile Strength (Psi): 400
- Compressive strength (Psi): 2800
- Bond Strength (Psi): 180
- Coefficient of thermal expansion: $6.0 \times 10^{-6}$

3) BITUMASTIC MORTAR

It shall consist of an acid proof inorganic filler and blended bitumen. It shall be trowelled to concrete having total thickness of 10 mm.

Characteristics of Bituminous compounds:

- Density (Kg/m$^3$): 2200
- Water content by mass percent (max): 0.5
4) BITUMINOUS PAINT

This is generally of heavy grade bituminous corrosion resisting paint. 2 coats of the paint shall be given, and drying time between the 2 coats shall not be less than 5 hours. Also, its drying time after second coat shall not be more than 8 hours. Its finish shall be smooth, glossy and elastic.

The primer shall confirm to the following requirements:

- Viscosity by standard tar viscometer, 4mm orifice at 25°C: 4 to 24
- Penetration at 25°C, 100g, 5sec in 1/100 cm: 20 to 50
- Water content percent (max): 0.2

16.2 **EPOXY COATING**

**A. MATERIAL**

1) **EPOXY COATING**

Characteristics of coated surfaces (after application)

- Compressive strength : min. 90 N/mm²
- Tensile strength : min. 10 N/mm²
- Abrasion resistance : as per Amsler 1.5 mm after 3000 revol.
- Bonding (joining) factor : 1

</table>
16.3 ACID RESISTANT BRICK LINING

A. MATERIAL

These bricks are made of raw materials such as clay or shale of suitable composition with low lime and iron content, feldspar, flint or sand and vitrified at high temperature in ceramic kilns. Bricks shall not absorb more than 2% of their own wt. when soaked in water. Compression strength:  > 700 Kg/cm². Bricks shall not lose more than 1.5% at their own weight when tested for acid resistance.

Chemical compositions of bricks are

a) Al₂O₃  22-24%
b) SiO₂  60-65%
c) Fe₂O₃  1.0-2.0%
d) Alkalies  10-12%

1) K-BASED SILICATE MORTAR

Acid Proof cement KSC is a potassium silicate based corrosion cement. Acid brick linings carried out with KSC cement are not subject to crystal formation in the pores of cement. Besides Bitumastic surface is joint-less, hence there is no danger of Acids percolating through the surface.

Characteristics of K-based Silicate mortar:

17.0 CULVERT WORK

17.1 Pipe Culverts

17.1.1 Reinforced concrete pipes shall be provided between the drain pits of storm water drains to cross the roads. These pipes shall be non-pressure type conforming to IS: 458 and class as specified in the nomenclature of the item. The pipes shall be laid between the drain pits with a uniform slope and with proper bedding, if required, as per approved drawings. The reinforced concrete pipes shall be manufactured by centrifugal process. All pipes shall be true to shape, perfectly straight, sound and free from cracks. The pipes shall be free from defects resulting from imperfect grading of the aggregate mixing or moulding.

17.1.2 Reinforced concrete pipes shall be laid, jointed and tested as per IS: 783. Pipes shall be laid true to alignment and gradients over cement concrete bed of 1:2:4 mix and / or encased, if required, as per approved drawings or as directed by Engineer-in-Charge. No deviations from the lines, depths of cuttings or gradients shall be permitted without approval in writing by Engineer-in-Charge. The joint between concrete drain pit wall and concrete pipe shall be done properly to make
it water-tight. The pipe joints shall be spigot and socket joint (rigid type) for pipes of 600 mm. diameter and below and collar joint (rigid type) for pipes over 600 mm. diameter. For both types of joints, the annular space shall be filled up with cement and sand mortar 1:2 mix which shall be rammed with caulking tools. After the day's work, any extraneous matter shall be removed from inside of the pipes. Joints shall be cured properly as per IS: 783. Reinforced concrete pipes shall be tested hydraulically as per IS: 783. Refilling of trenches shall not be commenced until the entire length of the pipe has been tested and approved. The excavation of earth in trenches for laying the concrete pipes and refilling shall be done as per IS: 783.

17.2 **Box Culverts**

17.2.1 The box-culverts are to be provided across the roads joining the storm water drains on both sides of the road. These box-culverts shall be of either complete reinforced cement concrete construction or brick masonry and reinforced cement concrete construction as specified in the schedule of items. The box-culvert construction shall be carried out as per the approved drawings.

1.0 Scope

1.1 This Specification Covers

The supply, laying and installation of pipes / open surface drains for draining off rain / surface water, fire water, sewage, plant effluent / blow down / floor washings etc., with all fittings and fixtures including jointing.

The supply, laying and installation of pipes for supply of water with all fittings and fixtures including jointing.

The supply and installation of sanitary fixtures like water closets, urinals, wash basins, sinks etc., with all fittings and fixtures.

The supply and installation of toilet accessories like mirrors, shelves, towel rails, liquid soap containers etc., with all fittings and fixtures.

The supply and installation of overhead water tanks with all fittings and fixtures.

The supply and construction of ancillary works like manholes, drop connections, gully chambers, oil traps, soak pits etc., with all fittings and fixtures.

2.0 GENERAL REQUIREMENTS

2.1 The Contractor shall furnish all skilled and unskilled labour, plant, equipments, scaffolding, men, materials, etc., required for complete execution of the work in accordance with the drawings and as described herein and / or as directed by the Engineer.

2.2 The Contractor shall make his own arrangements for locating the coordinates and positions of all works and reduced levels (RL) at these locations based on two reference grid lines and one bench mark which will be furnished by the owner. The Contractor has to provide at site all the required survey instruments etc., to the satisfaction of the Engineer so that the work can be carried out accurately according to the specification and drawing.

2.3 The Contractor shall make good to the satisfaction of the Engineer all cuttings / damages resulting from his operations during the installation.
2.4 Only tentative Plant layout shall be furnished by the Owner. Detailed working drawings showing the layout, installation and other details will be prepared by the Contractor and got approved from the Engineer.

2.5 The Contractor shall dispose of all unserviceable materials at least 50 m away from the plant boundary, unless otherwise directed by the Engineer. All serviceable material shall be stacked within a lead of 500 m as directed by the Engineer.

2.5 In case of any contradiction between the provisions stipulated in this module of technical specification and those of other modules like Excavation and Filling, Cast-in-situ Concrete and Allied works etc., the former shall govern.

All works shall be carried out by qualified / licensed plumbers.

3.0 CODES AND STANDARDS

3.1 All standards, specifications, acts, and Codes of practice referred to herein shall be the latest edition including all applicable official amendments and revisions.

3.2 In case of conflict between this specification and those (IS Standards, codes etc.) Referred to herein (in para 3.3) the former shall prevail.

3.3 Some of the relevant Indian Standards, Acts and Codes referred to herein are given below:

   IS  :  458  :  Precast concrete pipes.
   IS  :  554  :  Dimensions for pipe threads, where pressure tight joints are made on threads.
   IS  :  651  :  Salt glazed stoneware pipes and fittings.
   IS  :  771  :  Glazed fire clay sanitary appliances.
                  (Part-1 to 7)
   IS  :  774  :  Flushing cisterns for water closets and urinals.

SP : 35 : Hand book on water supply and drainage.

4.0 MATERIAL

4.1 All pipes, fittings, fixtures, appliances and accessories shall conform to the relevant Indian Standards as listed under Clause No. 3.0. These shall be obtained from an approved reputed manufacturer, and shall be approved, the Engineer. Wherever indicated by the Engineer, the Contractor shall submit samples of materials. These may be retained by him for subsequent comparison when bulk supplies are received at site. Ultimate choice of type lies completely with the Engineer.

4.2 The material brought to the site shall be stored in a separate secured enclosure, away from the building materials. Pipe threads, sockets and similar items shall be specially protected till final installation. Brass and other expensive items shall be kept under lock and key. Fragile items shall be checked thoroughly when received at the site and item found damaged shall not be retained at site.

4.3 Chromium plating fittings and appliances shall be of grade-2. (10 micron thickness), conforming to IS: 4827.

4.4 Pipes
Unless otherwise specified, following types of pipes shall be used:

For water supply to buildings, fittings CPVC pipes conforming to IS 15778 shall be used.
For inlet connecting pipes to appliances / fittings, C.P. brass pipe of 15 mm N.B. with union of approved make shall be used. Standard length of 300 mm to 450 mm pipe shall be used to suit the site requirements.

For building sanitary work above ground, UPVC pipes, fittings and accessories conforming to IS: 13592/relevant IS Codes shall be used. Pipes shall be coated with coal-tar by hot dipping process for both inner and outer surfaces.

Glazed stoneware pipes used for sewer and drain shall conform to Grade A of IS: 651. RCC pipe used for sewer and drain shall conform to IS: 458. Class NP2 pipe shall generally be used. However, for road or railway crossing higher class of pipe or concrete encashment shall be provided to take care of higher load.

For drain and sewer line work in bad or unstable ground condition and under building, centrifugally cast (Spun) iron pressure pipes conforming to IS: 1536 shall be used. Class LA pipe with spigot and socket ends shall be used. Pipes shall be coated with coal tar.

PVC rain water pipes shall be used for roof drainage.

4.5 **Above Ground Level**

1) **Galvanised mild steel pipes for water supply**

For work above ground level, the galvanised mild steel pipes and fittings shall run on the surface of the walls, ceiling or in chase as specified or shown on the drawing. The fixing shall be done by means of standard pattern holder bat clamps, provided at no more than 90 cm and keeping the pipes about 1.5 cm clear of the wall. To conceal the pipes, chasing may be adopted or pipes fixed in the ducts or recess etc. Provided there is sufficient space to work on the pipes with the common tools. The pipes shall not ordinarily be buried in walls or solid floors. Under unavoidable situations, pipes may be buried for short stretch after providing adequate protection against damage. Union joints shall be provided for all required locations to facilitate maintenance.

Where directed by the Engineer, a M.S. tube sleeve shall be fixed at a place the pipe is passing through. In case the pipe is embedded, it should be painted with anti-corrosive bitumastic paints conforming to IS: 158. The pipes
shall be oiled and rubbed over the white lead and a few turns of spun yarn wrapped round the screwed end of the pipe. The end shall then be screwed in the socket, tee etc., with the pipe wrench. All pipes and fittings shall be properly jointed and made complete water tight. Burr from the joint shall be removed after screwing.

The pipes and fittings shall be checked under working pressure. Any joint found leaking, shall be rectified and all leaking pipes removed and replaced. The pipes and fittings shall be tested to a hydraulic pressure of 6 kg/sq.cm. All pipes used for water supply should be thoroughly and efficiently disinfected before being taken into use. The method of disinfection shall be subject to the approval of the Engineer.

The storage tanks and downtake distribution pipes shall be disinfected together as specified under clause no. 13.2 of IS: 2065-1983, using disinfecting chemical.

2) UPVC pipe above ground for Buildings Sanitary work

For sanitary pipe work above ground for Buildings, 1S:5329 shall be followed for general guidance. Proper ventilation shall be provided in the piping system. The single stack system shall not generally be provided.

Plain pipes shall be secured to the walls at all joints with M.S. holder bat clamps. The clamp shall be made from 1.6 mm thick M.S. sheet of 30 mm width, bent to the required shape and size so as to fit tightly on the socket of the pipe, when tightened with screw bolts. It shall be formed out of two semicircular pieces, hinged with 6 mm dia M.S. pin on one side and provided with flanged ends on the other side with holes to fit in the screw holt and nut, 40 mm long. The clamp shall be provided with a hook made out of 27.5 cm long, 10mm diameter M.S. bar, riveted to the ring at the centre of one semicircular piece. C.I. brackets can also be used. The clamps shall be fixed to the wall by embedding their hooks in cement concrete block 10 x 10 x 10 cm (1:2:4 mix) for which necessary holes shall be made in the wall at proper places. The clamps shall be kept about 25 mm clear of finished face of wall.
All soil pipes shall be carried up above the roof and shall have sand PVC terminal guard. The pipes above parapet shall be secured to the wall by means of clamps.

The pipes shall be fixed perfectly vertical or to the lines as directed. The spigot of the upper pipes shall be properly fitted in the socket of the lower pipe such that here is a uniform annular space for filling with the jointing material. The interior of the socket and exterior of the spigots shall be thoroughly cleaned and dried. The spigot end shall be inserted into the socket right up to the back of the socket and carefully jointed using solvent as per recommendation of manufacturer.

Floor trap shall be ‘Nahni’ or ordinary type and shall conform to IS:1729. The floor shall be suitably lowered to accommodate the trap and the top of the floor shall be properly sloped towards the trap for effective drainage. A chromium plated/galvanised grating shall be provided on the trap. The sunken floor slab shall be filled with light weight materials like cinder mixed with cement. Sunken slab shall be made watertight by means of Sika water proofing compound as recommended by the manufacturer.

**Rain Water Downcomers**

Rain water downcomers and fittings shall be standard PVC rainwater downcomers shall run along and be secured to walls, columns etc. Where desired by the Engineer, these may have to be installed in chases cut out in the structure. All pipes shall be well secured to the walls and supported by adequately strong brackets. The brackets may be wrought iron clevis type, lip-ring type or perforated strap iron type, as approved by the Engineer. Suitable spacer blocks shall be provided against the vertical surface on which the pipe is fixed.

All bends and junctions shall be supplied with water tight cleaning eyes. For improving the aesthetic appearance of the portion of building carrying rain water downcomers, the pipes may have to be concealed by encasing them with brick masonry, concrete, etc.
Galvanized M.S. pipes shall be joined by using standard sockets or by welding. For welding of pipes, IS:11906 shall be followed. After welding, the welded area shall be coated with zinc rich paint after proper cleaning and preparation of the surface. Joints between successive lengths of pipe can be by collars according to provision of IS:1742-1983. All rainwater downcomers shall be provided with roof drain head of the shape and type as shown on the drawing. Unless otherwise specified, dome type drain head shall be used.

3) **Khurra**

The khurra shall be constructed before the brick masonry work in parapet wall is taken up, and it shall be 45x45cm in size, unless otherwise specified and be formed of cement concrete 1 :2:4 (1 cement: 2 sand: 4 graded stone aggregate of 20 mm nominal size).

A PVC sheet 1 mx1 mx400 micron shall be laid under khurra and then cement concrete shall be laid over it to a minimum thickness of 3cm with its top surface lower than the level of adjoining roof surface by not less than 50mm.

The concrete shall be laid to a size greater than the stipulated size of khurra in such a way that the adjoining terracing of brick tile overlaps the concrete on its 3 edges by not less than 7.5 cm. The concrete shall slop e uniformly from the edges to the rainwater outlet. The concrete shall be continued at the same slope through the width of the wall into outlet opening to ensure a water tight joint.

The khurra and the sides of outlet shall then be rendered with 12 mm coat of cement plaster 1:3 (1 cement: 3 sand). This shall be done when the concrete is still green and shall be finished with a floating coat of neat cement. The sides of khurra and the sides of openings shall be well rounded. The size of finished outlet opening shall be 10cm wide by 20cm high or as directed by the Engineer.

Iron grating shall be provided at the outlet to prevent chocking. The grating shall be 20×25cm with an outer frame of 15mm x 3mm MS flat, to which 4
nos. - 10mm dia MS bars shall be welded in vertical direction, keeping an equal clear spacing of 2.5cm.

4) Rainwater Spout

No spout shall be less than 80 mm in diameter. The spacing of spouts shall be arranged to suit the position of openings in the wall.

The spouts shall be of PVC, 60 cm long. These shall be perfectly sound, free from cracks, imperfections of glazing etc. These must be straight, cylindrical and of Standard nominal diameter, length and depth of socket. Full length of pipes shall be used on the work. These must be salt glazed and shall generally conform to IS: 651.

These shall be provided at the mouths of khurras and shall be fixed in cement mortar 1: 4 (1 cement: 4 sand) with the socket embedded in the masonry and the spigot end projecting outside. The masonry around the pipe and socket shall be thoroughly wetted and the hole shall be given a coat of cement mortar around. The pipe shall then be inserted and fixed with a surround of mortar. In case the hole is made much larger than the size of the pipe. Cement concrete 1: 2: 4I (1 cement: .2 sand: 4 graded. stone aggregate of 12.5 mm nominal size) shall be used to fill in the annular space.

The spouts shall slope downward at a slope of 1 in 6. The projection outside the wall shall be uniform and not less than 40 cm. The entrance with the pipe shall be smoothly rounded to meet the internal bore of the pipe to facilitate easy flow. Care shall be taken to ensure that the vertical plane through the centre line of the spouts in a row shall be true to line.

4.6 Below Ground Level:

1) Trenches and other Excavation:

Except as mentioned hereunder, all work for earthwork shall be done as specified in relevant chapter of Excavation and Filling. The trenches shall be so dug that the pipe may be laid to the required alignment and at required depth. The cover shall be measured from top soil or other surface of the ground. Turf, top soil or other surface material shall be set aside, turf being
carefully removed and stacked for use in reinstatement. The bed of the trench, if in soft or made up earth, shall be well watered and rammed before laying the pipes and the depressions, if any, shall be properly filled with earth and consolidated in 20 cm layers.

If the trench is extremely hard or rocky or loose stony soil, the trench shall be excavated at least 150 mm below the trench grade. Rocks, stone or other hard substances from the bottom of the trench shall be removed and the trench brought back to the required grade by filling with selected earth and compacted so as to provide smooth bedding for the pipe. The last 7.5 cm. of excavation shall be trimmed and removed as separate operation immediately prior to the laying of the pipe on their foundations. The width of the trench shall be such as to provide not less than 20 cm clearance on either side of the pipe. Excavation in road shall be so arranged as to cause minimum obstruction to traffic.

2) Laying of Pipes:

In no case, pipes shall be rolled and dropped into the trench. After lowering, the pipes shall be arranged so that the spigot of one pipe is carefully centered into the socket of the next pipe and pushed to the distance that it can go.

The pipe shall be laid with socket facing the direction of flow of water. The connection to an existing sewer shall as far as possible be done at the manhole.

3) Filling of Trench

Filling of the trench shall not be commenced until the length of pipes therein has been tested and passed. Special care shall be taken to pack under and sides of the pipes thoroughly with selected material. At least 300 mm over the pipe shall also be filled with selected earth.

5.0 MANHOLES

5.1 Wherever applicable manhole should be suitably designed & constructed.

1.0 SCOPE

1.1 The specifications cover the installation of bored cast-in-situ reinforced concrete Vertical Piles.

1.2 This specification also covers the technical requirements for load test (Initial and Routine tests) on reinforced concrete single vertical piles of specified diameter to assess their vertical, horizontal and pull-out load carrying capacity.

1.2.1 Load tests on piles shall conform to IS : 2911 (Part – IV).

2.0 GENERAL REQUIREMENTS

2.1 The work shall include mobilisation of all necessary equipment, kentilege, reaction piles, or combination of reaction piles, providing necessary engineering supervision through qualified and technical personnel, skilled and unskilled labour, etc. as required carrying out the complete piling work, load tests and submission of records/reports as per schedule.

2.2 The Bidder shall guarantee the “safe load” capacity of piles for various modes i.e., vertical, lateral and pull-out tests for piles installed by him.

2.3 Consequent upon award of work and prior to installation of piles, the Bidder shall submit design of piles in terms of allowable capacity, length, diameter, termination criteria, reinforcement, etc. for OWNER’S/CONSULTANT’S approval. OWNER’S/CONSULTANT’S approval on pile design in no way absolves the Bidder for his responsibility to carry out all the initial (vertical, lateral and pull-out) load test of piles prior to installation of the job piles. The pile capacity to be used in design shall be arrived at from the initial load test of piles.

2.4 The Bidder shall make his own arrangement for locating the co-ordinates and position of piles shown in approved drawings and for determining the Reduced Levels (R.L) of these locations with respect to the single Bench.
Mark indicated by the Engineer-in-Charge. Two established reference lines in mutually perpendicular direction shall be indicated to the Bidder. The Bidder shall provide at site all the required survey instruments to the satisfaction of the Engineering–in–Charge so that the work can be carried out accurately according to specifications and drawings.

2.5 In case of working piles, if the pile is rejected due to any other reasons, the Bidder shall install extra piles at no extra cost to OWNER/CONSULTANT. Further, the extra cost due to the increase in the pile cape size, if any, on account of extra piles shall be borne by the Bidder.

2.6 It is essential that all equipment and instruments are properly calibrated both at commencement and immediately after the tests so that they represent true values. Certificates to this effect from an approved institution shall be furnished to the Engineer-in-Charge. If the Engineer-in-Charge so desires the Bidder shall arrange for having the instruments tested at an approved laboratory at his own cost and the test report shall be submitted to the Engineer-in-Charge. If the Engineer-in-charge desires to witness such tests Bidder shall arrange to conduct the test in his presence.

2.7 The complete jacking system including the hydraulic jack, hydraulic pump and pressure gauge shall be calibrated as unit. The complete unit shall be calibrated over its complete range of travel for increasing and decreasing load same as that of test loads. The calibration certificate shall be submitted to the Engineer-in-Charge.

2.8 The reaction load to be made available for the test shall be at least 25% greater than the maximum jacking force. The reaction system as relevant shall be designed for the total reaction load. All reaction loads shall be stable and balanced during all operations of testing. During testing, stability of reaction system shall be ensured.
2.9 The load applied on the pile shall be measured by a calibrated pressure gauge mounted on the jack.

2.10 The displacement of the pile (in vertical, horizontal and uplift) shall be measured using dial gauges having a least count of 0.01 mm.

2.11 Load test shall be conducted at pile Cut of Level (COL). If the water table is above the COL the test pit shall be kept dry throughout the test period by suitable dewatering methods.

2.11.1 In case initial vertical load test where the water table is higher than the COL BIDDER may use reaction piles for testing purpose in each case. Engineer-in-charge may at his discretion to decide to raise the COL above water table.

2.12 Full details of the equipment proposed to be used and the test set-up with detail sketches shall be submitted to the engineer-in-charge, before making arrangement to carry out the tests, for his approval. Approval of Engineer-in-charge shall also be obtained after the test set up is complete prior to commencement of loading.

2.13 All operations in connection with pile load test shall be carried out in a safe manner so as to prevent the exposure of people to hazard.

2.14 If any test has to be discontinued, which in the opinion of the Engineer interferes with the load test results, and he decides to abandon the test, BIDDER shall install another pile for the purpose and repeat the test after correcting the fault and the cost of all such operations, including the cost of test pile, shall be at the BIDDER’S expenses.

2.15 After completion of piling work Bidder shall submit four copies of the following documents for OWNER’s record and future reference:
a. Initial load test data for all tests done along with the pile data and the analysis of the Initial load test results.

b. Pile data along with concrete mix design detail (Note: pile data shall contain details as per requirement of Annexure – A)

c. Routine load test data for all tests done.

d. A full record giving all details of test in the performa shown in Annexure–B shall be submitted in triplicate to the Engineer-in-charge immediately on completion of each test. The record shall also include the plots of:
   i. Load vs. Settlement
   ii. Time vs. Settlement
   iii. Characteristic of the piles and the interpretation of the pile load test curve as per the criteria for safe loads as mentioned in the specification.

2.16 Before commencement of the work, the bidder shall submit Quality Assurance Plan to OWNER / CONSULTANT for their approval.

3.0 CODES AND STANDARDS.

3.1 All standards and code of practice referred to herein shall be the latest editions including all applicable revisions issued.

3.2 All works shall be carried out as per the relevant latest Indian Standard Codes. In case of conflict between the specification and the IS codes referred to herein, the former shall prevail. Some of the applicable Indian Standards and codes are referred to here below.
IS : 432(part-I&II) Specifications for mild steel and medium tensile steel bars and hard drawn steel wire for concrete reinforcement.

IS : 1786 Code of practice for twisted steel high strength deformed bars for concrete reinforcement.

SP-34 Handbook on concrete reinforcement and detailing

IS : 5121 Safety code for piling and other deep foundations.

IS: 10262 Recommended guidelines for concrete mix design.

4.0 MATERIALS

4.1 GENERAL

All materials viz. cement, steel, aggregate, water etc., which are to be used for pile construction shall conform to relevant IS codes specifications for properties, storage and handling of common building materials. However, aggregate more than 20 mm shall not be used.
5.0 CONCRETE

5.1 Enclosed Technical Specification for cast-in-situ concrete and allied works along with IS: 2911 (Part-I/Sec.2) – Code of Practice for Design and construction of pile foundations (Bored cast-in-situ piles) shall be applicable to concrete works for piles. Use of plasticizer to control the water-cement ratio shall be permitted on specific approval from Engineer-in-charge.

5.2 GRADE AND MINIMUM CEMENT CONCRETE

5.2.1 Cement concrete of M-30 as per IS 456 shall be used. Cement content shall be as per mix design conforming to IS: 10262. However, the minimum cement content shall be 400 kg per cubic metre of concrete. In case of piles subsequently exposed to free water or in case of piles where concreting is done under water or drilling mud using methods other than the tremie, 10% extra cement over that required for the design grade of concrete at the specified slump shall be used subject to minimum cement specified above.

5.2.2 For the concrete, water, aggregate, cement, reinforcement etc., specification laid down in 9338-PSCV-0000-946 & IS: 456 shall be followed in general. Natural rounded shingle of appropriate size may also be used as coarse aggregate. It helps to give high slump with less water cement ratio.

5.2.3 The concrete for piles in aggressive surroundings due to presence of Sulphates, etc, should have a concrete mix of appropriate type of cement in suitable proportion.

a. If the concentration of sulphates (measured as SO₃) exceeds one percent in soil or 2500 parts per million (ppm) in water, a mix using 400 kg/Cu.m. of super sulphated cement conforming to IS: 6909 or Sulphate resisting Portland Cement conforming to IS : 12330 shall be used. For soils with 0.5 to 1 percent of sulphates or ground water with 1200 to 2500
ppm, the mix should be minimum 400 kg/Cu.m. of super sulphated or sulphate resisting Portland cement. For concentrations less than above, concrete mix with 400 kg/cu. Pozzolona/ blast furnace slag cement shall be used.

b. For bored compaction piles rapid hardening cement shall not be used. To facilitate construction, admixtures for retarding the setting of concrete may be used in consultation with the Engineer-in-charge.

5.3 **SLUMP OF CONCRETE**
The slump of concrete shall vary between 150 mm to 180 mm for concreting in water–free unlined boreholes. For concreting by tremie, a slump of 150 mm to 200 mm shall be used.

6.0 **REINFORCEMENTS**

6.1 Kindly refer clause 5.4 (page 96) for longitudinal and lateral reinforcement in piles. The provision of reinforcement will depend on nature and magnitude of loads, nature of strata and method of installation. It should be adequate for vertical load, lateral load and moments, acting individually or in combination.

6.2 The minimum area of longitudinal reinforcement shall be 0.4 percent of the sectional area calculated on the basis of outside area of casing or pile shaft where casing Is not used, whichever is more. The minimum number of longitudinal reinforcement shall be 6 (Six) and its minimum diameter shall be 12 mm. The stipulated minimum reinforcement shall be provided for full length of pile. Adequate reinforcement shall be provided to take full uplift loads.

6.3 Longitudinal reinforcement shall project 50 times its diameter above cut off level unless otherwise indicated.
6.4 The minimum diameter of the links or spirals bar shall be 8.0 mm and the spacing of the links or spiral shall not be more than 150 mm. The laterals shall be tied to the longitudinal reinforcement to maintain its shape and spacing.

6.5 Reinforcement cage shall be sufficiently rigid to withstand handling and installation without any deformation and damage. As far as possible number of joints (laps) in longitudinal reinforcement shall be minimum. In case the reinforcement cage is made up of more than one segment, these shall preferably be assembled before lowering into casing tube / pile bore by providing necessary laps as per IS : 456.

6.6 Laps shall be staggered as far as practicable and not more than 50% bars shall be lapped at a particular section. Lap joints shall be staggered by at least 1.3 times the lapped length (centre to centre).

6.7 Proper cover and central placement of the reinforcement cage in the pile bore shall be ensured by use of suitable concrete spacers or rollers cast specifically for the purpose.

6.8 Minimum clear cover to all main reinforcements in piles shall not less than 50 mm unless otherwise specified.

7.0 PILE INSTALLATION

Installation of piles shall be carried out as per pile layout drawings, installation criteria and the direction of the Engineer-in-charge.

7.1 EQUIPMENT AND ACCESSORIES

7.1.1 The equipment and accessories for installation of bored cast-in-situ piles shall be selected giving due consideration to the sub-soil conditions, ground water conditions, and the nature of the excavation.
condition and the method of casting etc. These shall be of standard type and shall have the approval of the Engineer-in-charge.

7.1.2 List of details of equipment and accessories proposed to be used for the job shall be submitted along with the bid.

7.1.3 The capacity of the rig shall be adequate so as to reach the specified founding level.

7.2 CONTROL OF POSITION AND ALIGNMENT

7.2.1 Piles shall be installed as accurately vertical as possible at the correct location and truly vertical. Great care shall be exercised of a single pile or piles in two piles groups under a column. The permissible limits for deviation with respect to position and alignment (inclination) shall conform to IS : 2911 (Part-I/ sec-2 ), which is reproduced below for ready reference:

a. The maximum deviation of vertical piles shall not exceed 1.5% in alignment.

b. Piles shall not deviate more than 75 mm (their designed position at cut off level). In case of single pile, this tolerance should not exceed 50 mm. In case of piles deviating beyond these limits, the pile shall be replaced or supplemented by one or more additional piles without any extra cost to NER/CONSULTANT.

7.3 BORING

7.3.1 Boring operation shall be done by rotary or percussion type drilling rigs using direct, reverse mud circulation (DMC or RMC) method or grab method. In soft clays and loose sand, bailer method, if used, shall be used with caution to
avoid the effect of suction. Boring operations by any of the above method shall be done using drilling mud.

7.3.2 Bidder shall satisfy himself about the suitability of the method to be adopted for site. If DMC or RMC is used bentonite slurry shall be pumped through drill rods by means of high pressure pumps. The cutting tool shall have suitable ports for the bentonite slurry to flow out at high pressure. If on mobilisation, Bidder fails to make a proper bore for any reason, the bidder has to switch over to other boring methods as approved by the Engineer-In-charge at no extra cost to OWNER.

7.3.3 Working level shall be above the cut of level. After the initial boring of about 1.0 to 2.0 m temporary guide casing shall be lowered in the pile bore. The diameter of guide shall be of such diameter to give the necessary finished diameter of concrete pile. The centre line of guide casing shall be checked before continuing further boring. Guide casing shall be minimum 1.0 m length. Additional length of casing may be used depending on the condition of strata, ground water level etc.

7.3.4 Use of drilling mud (bentonite suspension/slurry) for stabilising the sides of the pile bore is necessary wherever is likely to collapse in the pile bore. Drilling mud to be used shall meet the following requirement:

7.3.4.1 Liquid limit of bentonite when tested in accordance with IS : 2720 (Part-V) shall more than 300 percent and less than 450 percent.

7.3.4.2 Sand content of the bentonite powder shall not be greater than 7 percent.

7.3.4.3 Bentonite solution should be made by mixing it with fresh water using pump for circulation. The density of the freshly prepared bentonite suspension shall be between 1.034 and 1.100 gm/ml depending on the pile dimensions and type of soil in which the pile is to be cast. However, the density of bentonite
suspension after mixing with deleterious materials in the pile bore may be up to 1.25 gm/ml.

7.3.4.4 The marsh viscosity when tested by a Marsh cone shall be between 30 to 60 seconds.

7.3.4.5 The differential free swell shall be more than 540 percent.

7.3.4.6 The pH value of the bentonite suspension shall be between 9 and 11.5.

7.3.5 The bentonite slurry and the cuttings, which are carried to the surface by rising flow of slurry shall pass through settling tanks of adequate size to remove the sand and soils from the slurry, before the slurry is recirculated to the boring. The bentonite slurry mixing and recirculation plant shall be suitably designed and installed.

7.3.6 The bentonite slurry shall be maintained at 1.5 m above the ground water level during the boring operations and till the pile is concreted. When DMC and RMC method is used the bentonite slurry shall be under constant circulation still start of concreting.

7.3.7 The size of cutting tools shall be not less than the diameter of the pile by more than 75 mm. However, the pile bore shall be of the specified size.

7.3.8 Socketing shall be done as per Geo-technical Report/ pile design requirement point of view wherever required.

7.4 CHISELLING

7.4.1 Chiselling may be restored with the permission of the Engineer-in-charge below the socketing horizon. The chiselling tool or bit shall be of adequate size and weight so as to reach the desired depth.

7.5 CLEANING OF PILE BORE

7.5.1 After completion of the pile bore up to the required depth, the bottom of the pile bore shall be thoroughly cleaned. Cleaning shall ensure that the pile bore is completely free from sludge / bored materials, debris of rock/ boulder etc. Necessary checks shall be made for pile bore as described in the subsequent clauses to confirm thorough cleaning of the pile bore.
7.5.2 Pile shall be cleaned by fresh drilling mud through tremie pipe before start of concreting and after placing reinforcement.

7.5.3 Pile bore spoil along with the used drilling mud shall be disposed off from site as directed by the Engineer-in-charge.

7.6 ADJACENT STRUCTURES

7.6.1 When working near existing structures care shall be taken to avoid any damage to such structures.

7.7 CONCRETING

7.7.1 Concreting shall not be done until the Engineer-in-charge is satisfied that the pile termination level is reached and the pile bore is cleaned properly and thoroughly.

7.7.2 The time interval between the completion of boring and placing of concreting shall not exceed 6 hours. In case the time interval exceeds 6 hours the pile bore shall be abandoned. However, the Engineer-in-charge may allow concreting provided the Bidder extends the pile bore by 0.5 m beyond the proposed depth, and clean the pile-bore. The entire cost of all operation and materials for this extra length shall be borne by the Bidder.

7.7.3 Pile bore bottom shall be thoroughly cleaned to make it free from sludge or any foreign matter before and after placing the reinforcement cage.

7.7.4 Proper placement of the reinforcement cage to its full length shall be ensured before concreting.

7.7.5 Concreting shall be done by tremie method, the operation of tremie concreting shall be governed by IS : 2911 ( Part-I/Section-2 ). Drilling mud shall be maintained sufficiently above the ground water level.

7.7.6 Concreting operation shall not proceed if the contaminated drilling mud at the bottom of the pile bore posses density more than 1.25 Te/Cu.M. or sand content more than 7%. The drilling mud bore sample shall be collected from the bottom of the pile bores as mentioned in subsequent clause.
7.7.7 Consistency of the drilling mud suspension shall be controlled throughout concreting operations in order to keep the bore stabilised as well as to prevent concrete getting mixed with the thicker suspension of the mud.

7.7.8 It shall be ensured that volume of concrete poured is at least equal to the theoretically computed volume of pile shaft being cast.

7.7.9 The temporary guide casing shall be withdrawn cautiously after concreting is done upto the required level. While withdrawing the casing concrete shall not be disturbed.

7.8 **CUT OFF LEVEL (COL)**

7.8.1 Cut off level of piles shall be as indicated in drawings released for construction or as directed by Engineer-in-charge.

7.8.2 The top of concrete in pile shall be brought above the COL to remove all laitance and weak concrete and to ensure good concrete at COL for proper embedment in to pile cap.

7.8.3 When the pile cut off level is less than 1.0 metre below the working level, concrete shall be cast to the piling platform level to permit overflow of concrete for visual inspection. In case of COL of pile is more than 1.0 metre below working level then concrete shall be cast to a minimum of one metre above COL.

7.8.4 In the circumstance where COL is below ground water table, the need to maintain a pressure on the unset concrete equal to or greater than water pressure shall be observed and accordingly length of extra concrete above COL shall be determined by the Bidder with prior approval of Engineer-in-charge.

7.9 **SEQUENCE OF PILING**

7.9.1 Each pile shall be identified with a reference number.

7.9.2 The convenience of installation may be taken into account while scheduling the sequence of piling in a group. This scheduling shall avoid piles being bored close to other recently constructed piles.
7.10.0 BUILDING UP OF PILES

7.10.1 If any pile, already cast as per construction drawing, requires any extra casting due to any change in cut off level or cast pile top level is less than the specified level or any other reason, then the pile shall be building up by using M-20 grade concrete with minimum 400 kg/Cu.m. of cement ensuring proper continuity with the existing concrete and to the satisfaction of the Engineer-in-charge. Necessary reinforcement as per design requirement and suitable shuttering shall be provided before casting the concrete. Surrounding soil shall also be built up to the required level by proper compaction to ensure lateral capacity of the pile.

7.11 BREAKING OFF OF PILES

7.11.1 If any pile already cast requires breaking due to lowering in cut off or for any other reason, then the same shall be carried out, not before seven days of casting of, without affecting quality of existing pile such as loosening, cracking etc., to the satisfaction of the Engineer-in-charge.

7.12 PREPARATION OF PILE HEAD

7.12.1 The soil surrounding the piles shall be excavated upto the bottom of the lean concrete below the pile cap with provision for working space sufficient enough to place shuttering, reinforcement, concreting and any other related operations.

7.12.2 The exposed part of the concrete above COL shall be removed/ chipped off and made square at COL not before seven days of casting of piles.

7.12.3 The projected reinforcement above COL shall be cleaned and bent to the required shape and level to be anchored into the pile cap.

7.12.4 The pile top shall be embedded into the pile cap by 50 mm or clear cover to the reinforcement, whichever is high.

7.12.5 At loose material on the top of pile head after chipping to the desired level shall be removed and disposed off upto a lead of 2 Km. as directed by Engineer-in-charge.
7.13 REJECTION AND REPLACEMENT OF DEFECTIVE PILES

7.13.1 The Engineer-in-charge reserves the right to reject any pile which in his opinion is defective on account of load capacity, structural integrity, position, alignment, concrete quality etc. Piles that are defective shall be pulled out or left in places as judged convenient by Engineer-in-charge, without affecting the performance of adjacent piles. The Bidder shall install additional piles to substitute the defective piles as per the directions of Engineer-in-charge at no extra cost to OWNER/ CONSULTANT.

7.14 RECORDING OF PILING DATA

7.14.1 The Bidder shall record all the information during installation of piles. Typical data sheet for recording pile data shall be as indicated in Annexure - A. enclosed and the pile load test data shall also be recorded as per the detailed indicated in Annexure-B enclosed. On completion of each pile installation, pile record in triplicate shall be submitted to Engineer-in-charge within two days of completion of concreting of the pile.

8.0 SAMPLING, TESTING AND QUALITY ASSURANCE

8.1 Facilities required for sampling and testing materials, concrete, etc. in field and in laboratories shall be provided by the Bidder. The Bidder shall carry out all sampling and testing in accordance with the relevant Indian Standards and this specification. Where no specific testing procedure is mentioned the testing should be carried out as per the prevalent accepted engineering practice to the direction of Engineer-in-charge. Test shall be done in presence of Engineer of Engineer-in-charge or his authorised representative. In case the Engineer-in-charge requires additional tests, the Bidder shall arrange to get these tests done and submit to him the test results in triplicate within three days after completion of any test.

8.2 RECORDS

The Bidder shall maintain records of all inspection and testing which shall be made available to the Engineer-in-charge. The Engineer-in-charge at his
discretion may waive some of the stipulations for small and unimportant concreting operations and other works.

**UNSUITABLE MATERIALS**

Materials found unsuitable for acceptance shall be removed and replaced by the Bidder. The work shall be done as per specification requirements and to the satisfaction of the Engineer-in-charge at no extra cost to OWNER.

### 8.3 QUALITY ASSURANCE PROGRAMME

#### 8.3.1

The Bidder shall submit and finalise a detailed Field Quality Assurance Programme within 30 days from the date of award of contract according to the requirements of this specification. This shall include setting up a testing laboratory, arrangement of testing apparatus/equipment, deployment of qualified/experienced manpower, preparation of field quality plan, etc. On finalised field quality plan, OWNER/CONSULTANT shall identify, customer hold points, beyond which the work shall not proceed without written approval from the Engineer-in-charge. The testing apparatus/equipment installed in the field laboratory shall be calibrated/corrected by the qualified persons as frequently as possible to give accurate testing results.

#### 8.3.2

Frequency of sampling and testing, etc. and acceptance criteria are given in Table–1. The testing shall be done at field laboratory or any other laboratory approved by the Engineer-in-charge. However, the testing frequencies set forth are the desirable minimum and Engineer-in-charge shall have the full authority to call for tests as he may deem necessary to satisfy himself that the materials and works comply with the appropriate specifications. The materials shall be tested to all the specified requirements as per relevant IS codes before acceptance at manufacturers premises or at independent Government laboratory. Tests indicated in the Table–1 are for cross checking at site the conformity of the materials to some of the specifications.

### 8.4 TESTING OF CONCRETE

#### 8.4.1

a. Concrete and other materials shall be tested for quality and strength and other properties as per relevant IS codes.
b. One sample consisting of six test cubes shall be made from the concrete used in each test pile, 3 to be tested after 7 days and 3 after 28 days.

8.4.2 For working piles testing should be done as per IS specifications.

8.4.3 In preparation of test cubes/ specimens vibrators shall not be used.

8.4.4 Concrete shall be tested for slump at every one hour interval.

8.4.5 Other materials like aggregate, reinforcement, etc. shall be tested as per relevant IS codes.

8.5 TESTING FOR POSITION AND ALIGNMENT

8.5.1 Each pile shall be checked for its position with respect to specified location. Each pile bore shall be checked for its alignment.

8.5.2 Permissible limits for deviations shall be as specified elsewhere in this section of specification.

8.7 PROPERTIES OF DRILLING MUD

8.7.1 Properties of drilling mud shall be checked as per requirements specified in clause No. 7.03.4 of this specification. Prior to use in piling work and thereafter minimum once in a week or as found necessary by Engineer-in-charge one sample consists of 3 specimens shall be tested.

8.7.2 Density and sand content of the drilling mud shall be checked at least in each pile for the first 10 piles before concreting. In case of satisfactory results the frequency of sampling shall not less than one in 25 piles.

8.8 CHECK FOR PILE BORE

8.8.1 On completion of boring and cleaning the bottom of each pile bore shall be checked by the methods as approved by Engineer-in-charge to ensure that it is free from pile bore spoil/ debris and any other loose material before concreting. Concreting shall be done only after the approval of the Engineer-in-charge.

8.8.2 For sampling of drilling mud from the pile bore the following method or any suitable method shall be adopted.
8.8.2.1 A solid cone shall be lowered by a string to bottom of pile-bore. A sampler tube closed at top with a central hole (hollow cylinder) is lowered over the cone, then a top cover shall be lowered over the cylinder. Care shall be taken for proper fittings of assembly to minimise the leakage while lifting the cone assembly to the ground surface. The slurry collected in the sampler tube shall be tested for density and sand content.

9.0 LOAD TEST ON PILES

9.1 TYPE OF TESTS

9.1.1 BIDDER shall carry out two categories of load tests i.e. Initial Load and Routine Load Tests in accordance with IS: 2911 (Part-IV).

9.1.2 Initial load test shall be conducted to assess the safe load carrying capacity of pile before start of installation of working piles. This shall include the following type of tests.

a. Cyclic compression load test to assess safe vertical load capacity.

b. Lateral load test to assess safe horizontal load capacity.

c. Tension load test to assess safe pull out load capacity.

The above tests shall be performed in accordance with IS: 2911 (Part-IV)

9.1.3 The minimum number of Initial Load Test for each diameter of pile proposed shall be as under.

b. Lateral : 2 Nos.

9.1.4 Routine load tests of piles as per IS: 2911 (Part-IV) shall be conducted to verify the load capacity of working piles. This shall include the following types:

a. Direct compression load tests for vertical load capacity.

b. Lateral load test for horizontal load capacity.

9.1.5 The minimum number of routine load test for each diameter and type shall be 1.5 percent of the total number of working piles or minimum 2 no.’s of
piles whichever is higher. The number of tests may be increased up to 2 percent as decided by the Engineer-in-charge in a particular case depending upon the nature, type of structure and strata condition.

9.2 TEST OF PILE

9.2.1 The test piles for routine load test shall be identified by the Engineer-in-charge

9.2.2 A minimum time period of four weeks shall be allowed between the time of pile casting and testing. Test pile head shall be prepared for testing purposes only one week after casting the pile.

9.2.3 The test pile shall be cut off at the proper level and provided with a proper cap so as provide a plane bearing surface for the test plate and for proper arrangements for seating of the jack and dial gauges.

9.3 VERTICAL LOAD TEST

9.3.1 EQUIPMENT AND TEST SET-UP

I. A steel plate of sufficient thickness not less than 50 mm shall be centred on the pile head to prevent it from crushing under applied load. The size of plate shall not be less than the pile size nor less than the area covered the base of the hydraulic jack(s).

II. The datum bars shall be supported on the immovable supports preferably of concrete pillars or steel sections placed sufficiently far away from the test pile. The distance shall not be less than 3 times the diameter of test pile and in no case less than 2 meter from the edge of test pile. These supports shall be placed at a sufficient depth below ground to be unaffected by ground movements.

9.3.2 LOADING SYSTEM

The test load on the pile shall be applied in one of the following way as approved by Engineer-in-charge.

a. By means of hydraulic jack(s) which obtain reaction from kentledge heavier than the required test load. While using this method care shall
be taken to ensure that the centre of gravity of kentledge is on the axis of the file. The load applied by the jack shall also be coaxial with the pile. The nearest edge of the crib supporting the kentledge stack shall not be closer than 1.5 m to the edge of the test pile.

b. By means of hydraulic jack(s) which obtained reaction from anchor piles and/or suitable loading frame. While using this method all anchor piles shall be at a centre to centre distance of at least three times the test pile shaft diameter from the test pile and in no case less than 2 meter. Care shall be exercised to ensure that the datum bar supports are not affected by heaving up the soil.

c. By means of hydraulic jack(s) which obtain reaction from suitable rock anchors. When this method is adopted the anchor transferring the load to the ground shall not be closer than two times the test pile shaft diameter to the test pile and in no case less than 1.5 m.

d. By means of combination of kentledge anchor pile and rock anchors.

9.3.3 MEASURING SYSTEM

Settlement of the pile shall be recorded by four dial gauges placed at diametrically opposite locations and suspended from the datum bar around the pile.

9.3.4 TEST PROCEDURES

The test shall be carried out by Direct Loading Method in successive increments for routine load test and by the Cyclic Loading Method for initial load test as detailed below and as directed by Engineering-in-charge.

9.3.4.1 DIRECT LOADING METHOD

The test shall be carried out as per the procedure out lined below:

a. The load shall be applied to the pile top in increments (step) of about 20% of the rated capacity of the pile or as directed by Engineer-in-charge. Each increment of load shall be applied as smoothly and expeditiously as possible. Settlement regarding shall be taken before and
immediately after the application of next increment and at 15, 30, minutes and thereafter at every half an hour until application of the next load increment.

b. Each stage of loading shall be maintained till the rate of movement of the pile top is not more than 0.2 mm/hour. Or until two hours have elapsed whichever is earlier.

c. The rate of movement of pile shall not be permitted to be extrapolated from period of test less than one hour.

d. Loading on pile shall be continued till one of the following takes place:

   - In case of Initial load test applied load reaches three times the assumed safe load or settlement of pile exceeds a value of 10% of bulb diameter in case of under-reamed piles.

   - In case of Routine load test, applied load reaches one and half time the safe load or maximum settlement of test loading in position attains 12 mm.

e. Where yielding of soil does not occur, the full test load shall be maintained on the pile head for a minimum period of 24 hours. After the last increment of load and settlement shall be recorded of 6 hours interval during this period.

f. Unloading shall be carried out in the same steps as loading. A minimum period of 30 minutes shall be allowed to elapse between two successive stages of load decrement. The final rebound shall be recorded 6 hours after the entire test load has been released.

9.3.4.2 CYCLIC LOAD TEST

The test shall be carried out to find out separately skin friction and point bearing capacity of single pile. However, this test is not applicable for under-reamed piles. The test procedure shall be given below:

a. In general this test shall be conducted on similar lines as mentioned in Direct Loading Method. In addition, alternate loading and unloading up
to zero load shall be done in steps at each stage of loading. The load increment/decrement for each steps shall be 20% of the rated capacity. The reading of all the dial gauges shall be recorded at the end of each step and the total and net settlement for each stage shall be calculated.

b. For each stage, the loading of each step shall be maintained for 15 minutes before reaching the maximum load. The maximum load for each stage shall be maintained on the pile head for 24 hours.

c. Each step of unloading shall be maintained for 15 minutes and the subsequent rebound in the pile shall be measured accurately.

d. A period of 15 minutes shall be allowed to pass the successive unloading and loading operations.

e. To find out separately skin friction and point bearing capacity of pile the procedure as given in Appendix-A of IS: 2911 (pat-IV) shall be followed.

9.3.5 ASSESSMENT OF SAFE LOAD

9.3.5.1 The safe vertical load on single pile from the load test shall be the least of the following:

a. 2/3 of the load at which the total settlement attains a value of 12 mm unless otherwise specified in tender documents.

b. 50% of the final load at which the total settlement equal 10% of the pile diameter in case of uniform diameter.

9.4 HORIZONTAL LOAD TEST

9.4.4 EQUIPMENT AND TEST SET–UP

a. The test plate shall be set in high strength grout to provide full bearing against the projected areas of the pile. The size of the test plate shall be adequate to accommodate the spherical bearing and transfer the load to the pile.

b. Sufficient clearance shall be allowed between the test pile and the datum bar for the anticipated lateral movement of the pile when
datum bar (for fixing the dial gauge) is located on the opposite side to the point load of application.

9.4.5 LOADING SYSTEM

a. Loading shall be applied by a hydraulic jack of adequate capacity equipped with spherical bearing at the top of ram and bearing plate at the bottom side abutting the pile horizontally and reacting against a suitable system.

b. The reaction may be provided by the wall of the excavated pit when the test is being conducted below ground level or by a neighbouring pile in which case thrust pieces shall be inserted on their end of the jack to make up the gap as approved by Engineering-in-charge.

c. Load shall be applied on the pile at or approximately at cut of level (COL).

9.4.6 MEASURING SYSTEM

9.4.6.1 The deflection shall be measured at a point diametrically opposite to the point of load application. In case such a measurement is not possible the deflection shall be recorded using at least 2 dial gauges keep at a spacing of 30 cm at a suitable height and the displacement interpolated at load point from similar triangles.

9.4.6.2 Deflection of the pile at the level of load application shall be measured by dial gauge fixed to datum bar. The datum bar shall rest on immovable supports as described elsewhere in this specification.

9.4.4 TEST PROCEDURE

9.4.4.1 The test shall be similar to that of vertical load test.

9.4.4.2 Loading on the pile shall be continued till one of the following takes place:
a. In case of initial load test applied load reaches thrice the assumed safe lateral load capacity of deflection pile at the loading point exceeds.

b. In case of routine Load test, applied load reaches one and half times the assumed safe load capacity or a deflection of the loading point exceed 5 mm.

9.4.5 ASSESSMENT OF SAFE LOAD

9.4.5.1 The safe lateral load of single pile shall be the least of the following:

a. 50% of the load for which the total deflection is 12 mm.

b. Load corresponding to 5 mm total deflection.

However, for routine test(s) above is not applicable.

Note: The deflection of the pile is at the cut of level of pile.

9.5 PULL OUT TEST

9.5.1 EQUIPMENT AND TEST SET-UP

Uplift force may be applied by means of hydraulic jack(s) using suitable pullout set up as approved by Engineering-in-charge.

9.5.2 LOADING SYSTEM

a. Load shall be applied along the longitudinal axis of the pile using an approved reaction system. Uplift forces on the pile may be applied directly to the test pile or through a lever system.

b. The reaction may be provided by neighbouring piles or blocks constructed for this purpose.

c. The reaction supports/blocks/piles shall be at least 2.5 times the test pile diameter.
9.5.3 MEASURING SYSTEM

Displacement of the pile shall be recorded using two dial gauges placed at diametrically opposite locations and suspended from the datum bar around the pile. Datum bar shall be provided with immovable supports as described elsewhere in this specification.

9.5.4 TEST PROCEDURE

9.5.4.1 The test procedure shall be similar to that for vertical load test.

9.5.4.2 The loading on the pile shall be continued till one of the following takes place.

   a. The loading on the pile top equal three times the estimated safe load.
   b. The load displacement curve shows a clear break (downward trend).

9.5.5 ASSESSMENT OF SAFE LOAD

9.5.5.1 The safe load of the pile shall be the least of the following:

   a. Two third of the load at which the total displacement is 12 mm.
   b. 50% of the load at which the load displacement curves shows a clear break (downward trend).

   c.

10 RECORDING OF DATA AND PRESENTATION

10.1 The pile test data essentially concerns three variables, namely load, displacement and time. These are to be recorded sequentially for the tests under consideration and shall be recorded in a suitable tabular form along with the information about the pile as per Annexure–A, Annexure–B and Table-1

10.2 The data may be suitably presented by curves drawn between the variables and safe loads shown on the graphs. Load displacement curve should be an essential part of presentation.

Note: Parameters/guidelines fixed for the quality control in accordance with the contract document, IS Codes/Technical Specification etc. are just the synopsis of the whole constructional activities in a bid to visualise the total involvement at a glance. Mere compliance of the QAP does not relieve the contractor from overall responsibility to render best quality of work in conformity with all the relevant documents and the best engineering practices. In order to minimise the size of QAP, only salient/important features have been taken into account and other small/minor involvement will be dealt with individually as per the provision of contract.

1.0. INTRODUCTION

The Joint Venture of four major Public Sector Units – M/s Rashtriya Chemicals & Fertilizers Ltd. (RCF), M/s GAIL (India) Ltd. (GAIL), M/s Coal India Ltd. (CIL) and M/s Fertilizers Corporation of India Ltd. (FCIL) has decided to build a world class Coal based fertilizer complex. The fertilizer complex will consist of Coal Gasification based Ammonia Synthesis Gas Plant and Urea Plant, and is to be built at Talcher, Angul District, Odisha (India).

To cater the requirement of steam for the above plants, Talcher Fertilizers Limited intends to set up “Steam Generation Plant based on coal feedstock” under one LSTK package.

Projects and Development India Limited (PDIL) has been retained as Consultant by TFL to provide services for the selection of LSTK CONTRACTOR.

LSTK CONTRACTOR is advised to visit and examine the site conditions and obtain for itself on its own responsibility all information that may be necessary for preparing the bid and entering into the Contract. Claims of any kind due to variation or ignorance of site conditions and environmental conditions will not be eligible in any circumstances.

1.1. General

This Lump-sum Turnkey package has been prepared as a Bidding Package to the extent enumerated in various sections and documents enclosed.

Detailed scopes of work and discipline-wise technical requirements are provided in respective sections of this Tender Document.

The Contractor will execute the project on Lump-sum Turnkey basis, in accordance with and supported by Process Engineering Procedures, Procurement Procedures, Construction Management Procedure, Project Controls and Computer System to be developed to affect the maximum efficiency of quality of the project. To achieve this goal and requirements of the Owner/PMC, Contractor will establish his project organization giving due consideration to the following aspects:

- Effective execution and timely completion of each phase of the project.
- Maintaining high quality in each phase of the project.
- Good relation and coordination between the Owner/PMC and the Contractor.
• Assignment of experienced resources and personnel for immediate and smooth launching of the project.

1.2. Engineering

Contractor’s scope of work includes detailed engineering, preparation of engineering drawings and datasheets, making use of standard specifications, standards, design guides and technical documents enclosed in this Tender Document. Technical requirements, technical documents, standard specifications, PMC standards and guides to be followed for different type of works shall be as provided in this Tender document.

Contractor to carry out the Detailed Engineering defined above. Commissioning of the project in totality is a part of Contractor’s scope. Engineering required to be done by the Contractor may arise singularly or in combination due to Manufacturing, Fabrication, purchased items, Construction, Commissioning, Statutory requirements, Government regulations, Safety requirements, site conditions, resultant total procurement and Construction, Installation and Testing, Insulation, Painting and Commissioning, etc.

1.3. Procurement

Contractor’s scope includes ordering, all import formalities, fabrication/purchase of equipment and materials, port clearance, packaging and transportation to site, stores management which includes preservation and storage of equipment and materials, uncovered storage. Items contemplated for fabrication at site to be submitted along with the bid although both these aspects would be covered under the Contractor’s responsibility.

Vendor manuals relating to installation, operation and maintenance and test certificates should be necessarily sent along with equipment. Please also refer Final Documentation Submission requirement spelt out in this Tender Document, in this regard.

Before ordering, clearances for technical portion would be taken from Owner / PMC in respect of the Critical Equipments (Special Equipments) comprising of Mechanical Static and Rotary Equipments, Electrical and Instrumentation items. Any ordered items which do not confirm to the contractual requirement identified at any stage of the project shall be rejected. Replacement / modification and project delay arising out of this shall be to the Contractors account.

Whenever clearances are to be taken, it would be necessary to submit details of technically acceptable offer.

Procurement of spares shall be as per spare part philosophy detailed in the scope of supply. Commissioning spares are also in the Contractor’s scope.
1.4. **Construction and Installation**

Contractor's scope covers detail engineering including barricading of the allocated area complying with statutory norms, construction, installation and commissioning of the unit as per P&IDs, datasheets, drawings, standards, specifications, codes, statutory and state regulation. Supply of construction materials, labour, labour supervision, tools, tackles, consumable materials and accessories not specifically mentioned herein but nevertheless necessary, as per the PMC for the construction, installation, testing and commissioning of the complete system including cranes or any other material handling equipment is also part of Contractor's scope.

1.5. **Commissioning**

Contractor's scope covers supply of all initial fill such as lubricants, seal oils, chemicals, consumables, spares required for start-up, pre-commissioning and commissioning of the project. Contractor shall arrange necessary loading / unloading equipments for undertaking this activity. The scope also includes providing manpower (skilled as well as unskilled) and organisation for commissioning and is to be indicated along with the bid.

1.6. **Quality Assurance**

The desired quality is to be met for different activities at various stages of the project. The quality checks by Owner and PMC could be of audit type / involvement at all stages of project execution by the Contractor and details of the quality plans will be furnished along with the bid. Contractor is required to submit detailed Quality Control (QC) measures to be adopted by him for all stages/types of activities. A notice period of six weeks is to be given for imported items and one week for indigenous items for association with respect to witness QC steps by Owner / PMC. Detailed methodology is enclosed in Tender Document for compliance. Facilities at shops / site / Engineering office for carrying out quality checks by Owner/PMC shall be provided /organised by Contractor.

1.7. **Statutory Approvals/State Regulations**

Statutory regulations as required during pendency of the contract will be adhered to for engineering, preparation of drawings/documents, fabrication, manufacturing, purchased items, construction and commissioning. Documents as required will be generated and submitted for the approval of statutory authorities. Follow up and obtaining clearances shall be responsibility of the Contractor.

State regulations as and when applicable for different phases of the project shall be adhered to by the Contractor. Statutory approval from any authority as per statutory rules and regulations of Central/State Government shall be the Contractor's responsibility unless otherwise specified in bid documents. The application on behalf of Owner/PMC for submission to relevant authorities along with copies of required certificates complete in all respects shall be prepared and submitted by the Contractor well ahead of time so that the
actual construction / commissioning of the work is not delayed for want of approval or inspection by concerned authorities. The inspection of the works by the authorities shall be arranged by the Contractor and necessary coordination and liaison work in this respect shall be the responsibility of the Contractor. Statutory fees paid, if any, for all inspections and approvals by such authorities shall be borne by Contractor.

Any changes/additions required to be made to meet the requirements of statutory authorities shall be carried out by the Contractor free of charge. The inspection and acceptance of the work by statutory authorities shall however, not absolve the Contractor from his responsibilities under this contract.

1.8. Project Management

The project management services will include Planning, Scheduling, Monitoring, Progress Reporting, Quality Assurance and Quality Control and Overall Project Management functions. Contractor shall nominate a Project Manager who will be responsible for the total scope of work under this contract and shall respond to Owner and PMC’s Project Managers on all matters relating to this contract.

The Contractor is expected to execute the Work/Services under this contract on Task Force concept with a dedicated team of specialists who will be responsible and respond to the Project Manager.

The Task Force shall be so organized as to give effective management and control of various services to the Project Manager.

1.9. Organization

The organisation up to working level including period envisaged for different phases of the project engineering, ordering, follow up for manufacture of equipment, clearances, transportation, inspection of equipment and materials, warehousing, safety, construction, commissioning coordination with statutory authorities and government authorities and project management will be submitted along with the bid. Bio-data of key personnel will also be submitted with the offer.

1.10. Safety

All measures required for safe constructions are to be taken and the schemes are to be approved by Owner/PMC before commencement of works. Besides, all personnel employed on the job are to follow safety requirement of Owner/PMC and state regulations as applicable from time to time. A list of safety implements/equipment proposed to be used by the Contractor, are to be indicated along with the bid. At least one safety engineer in each shift, for the project, shall be provided by the Contractor.
Safety report generation for different situations as per rules and required by Owner/PMC are to be adhered to. Copy of safety practices to be followed during construction is enclosed in this Tender Document. Contractor shall comply with the provisions of this document. This document specifies broad guidelines on safe practices to be adhered to during construction activities. However, before commencing any job, specific hazards and its effects should be assessed and necessary corrective/preventive action should be taken by the Contractor. This document shall supplement the prevailing statutory requirements, which shall also be followed as applicable.

1.11. Sequence for Decisions

Along with bid submission, it is necessary for the Contractor to bring out variation, if any, in related data sheets, drawings, specifications, standards, codes, scope, any other contractual clauses and seek clarifications from PMC/Engineer-In-Charge. The decision of the PMC shall be final and binding on the bidder in such cases. For those such items, which arise during execution of the project, the stringent specification/standards will be applicable, and shall be binding on the Contractor. However, the decision of the PMC/Engineer-in-Charge shall be final and binding on the Contractor.

1.12. Vendor List

All items required for project are to be purchased through approved vendors of Owner/PMC, wherever such details are not available, vendor list to be proposed by Contractor and clearance to be obtained from Owner/PMC before initiating the ordering process.

1.13. Waste Disposal / Scrap etc.

All waste generated which could be surplus earth after use and or surplus construction materials will be disposed off from time to time as directed by Owner/PMC.

1.14. Environmental Management System

Bidders should comply with the latest relevant elements of the International Standard for environmental protection, as applicable to their scope of work.

2.0. PROJECT MANAGEMENT AND EXECUTION

2.1. Project Management

Plot plan, detailed technical requirements along with the detailed scope of work and overall proposed implementation schedule is issued by Owner / PMC. These will form the basis for formulation of the Overall Project Master Schedule of the plant by Contractor. The Contractor is required to organise his services in a systematic manner to ensure execution and completion of the unit as per the schedule. The bidder is required to submit along with
his bid the methodology/procedure proposed by him for this unit together with the organisational set up proposed and bio-data of key personnel.

In order to achieve uniformity in execution of various activities of the project, PMC has developed engineering design basis and project procedures/methodologies to be adopted by the executing agency. The Contractor is required to carry out detailed engineering, procurement, tendering, construction supervision and management, planning scheduling, monitoring, reviewing, reporting, and overall project management activities. All activities to be performed and services to be rendered by the Contractor under this contract shall be monitored by Owner / PMC and will be subject to periodic reviews by PMC. The Contractor shall facilitate such reviews/monitoring by Owner / PMC.

Immediately after the award of job, a Kick-Off Meeting will be held to finalise and establish the modalities and procedures to be adopted for execution of the contract based on the enquiry document, commitments made by Contractor and subsequent agreements reached between Owner/PMC and Contractor during negotiations. The Kick-Off Meeting will be attended by key members of Owner/PMC and Contractor. This will address all necessary details and arrangement between Owner/PMC and the Contractor.

The Contractor’s service for Engineering, Procurement, Tendering, Construction, Supervision and Management, Planning, Scheduling, Monitoring, Reporting, and Overall Project Management shall meet the requirements given in this section.

English language and Metric Units shall be used in all documents, drawings, reports, correspondences etc. under this contract.

### 2.2. Detailed Engineering Services:

The Contractor shall provide the detailed engineering services for the project as mentioned in this bid document furnished by the Owner/PMC. The services shall cover the detailed engineering required for execution and completion of the project along with the utilities to be provided inside the battery limit of the Plant.

All critical drawings / documents to be prepared by Contractor/sub-contractors/vendors as per given in the bid document for review and approval by Owner / PMC. Obtaining all such approvals shall be the responsibility of the Contractor and the same is included in his scope of work. Such review and approval by Owner/PMC shall, however, not relieve the Contractor of his responsibilities.

For achieving the project schedule, it may be necessary in some cases to prepare the drawings in stages and release it for construction so as to take up simultaneous execution of detail engineering and construction. Any revision involved for the above is included in the scope of work of the Contractor. Also any change required to meet site conditions/statutory requirements shall have to be carried by Contractor at no extra cost.
The Contractor is required to organise a Task Force of dedicated specialists from each discipline under a Project Engineering Manager who will be assisted by engineering Coordinator. An engineering schedule will be prepared and submitted to Owner/PMC for approval. This approved schedule shall be used for all engineering activities. The engineering coordinator shall coordinate all design and engineering activities and interact with purchase, inspection, expediting, C&T, tendering, planning, construction and project groups. His responsibilities shall include.

(a) Engineering coordination for procurement involving:

- Preparation of Material Requisitions (MRs).
- Technical evaluation of offers received (which may involve technical discussions with vendors and concerned specialists may have to be deputed to vendors works or to Owner/PMC’s offices as per requirements) and preparation of recommendations.
- Preparation of Technical Purchase Requisition (PRs) on selection of vendor.
- Review/approval of vendor drawings/documents. (This may call for arranging specialist visits to vendor’s works for timely approvals of critical items.)

(b) Engineering coordination for sub-contractors involving:

- Preparation of schedule of quantities and specifications for various contracts.
- Technical evaluation and recommendation of offers received. This may involve arranging technical discussions with Tenderers at Owner/PMC’s office if called for due to job requirements.
- Preparation of technical-agreed variations for incorporation in contracts for the selected Contractor.

In any case, Contractor has to take owner approval for sub-contractors list prior to scrutiny and award.

(c) Engineering coordination for construction involving:

- Timely issue of approved construction drawings including drawings duly approved by Owner/PMC as per requirements.
- Providing/arranging clarification on drawings and specifications wherever called for including specialists visits to site.
- Making regular periodic visits to project site for review of site requirements in respect of engineering activities.
• Attending/arranging for discussions with statutory authorities such as Chief Electrical Inspector, Chief Inspector of Boiler, Tariff Advisory Committee, etc. to arrive at design basis/documents acceptable to them wherever required for obtaining statutory approvals and any other local approvals.

(d) Monitoring progress of engineering activities and advising Project Manager on shortfalls and corrective actions needed. He will also attend the review meetings.

Detailed engineering and construction shall be based on sound engineering practices. List of applicable codes, standards and mandatory rules to be used in design is also mentioned in bid document.

Drawings/Documents/MRs etc., which are to be generated by Contractor shall be numbered as per the Documents Numbering Procedure of Owner/PMC.

Head Office engineering support of Contractor shall be provided to site during construction including deployment of engineering specialists for field engineering as and when required by Contractor.

2.3. Procurement

The procurement services to be provided by the Contractor shall cover the purchasing, inspection, expediting, custom clearance and transportation activities

(a) Purchase

The purchase activities will cover all equipments and materials required for completion of the project. The purchase group shall consist of adequate number of experienced and qualified Purchase Officers commensurate with the number of material requisitions to be handled and the time schedule for ordering. A procurement schedule will be prepared and submitted to Owner/PMC for approval. This approved schedule will be followed for all procurement activities.

Purchasing activities shall be coordinated by an experienced purchase coordinator who shall be responsible for:

• Coordinating with engineering group regarding preparation of material requisitions (MRs), evaluation and clarifications on offers of vendors, technical discussions, negotiations with vendors, technical recommendations preparation of purchase requisitions to form part of purchase requisitions selected vendors purchase order.

• Coordination for processing of change orders as required during execution of the project on account of additions/modifications as well as transit losses/damages.
• Before ordering, clearance for technical portion for rotating, instrumentation and electrical items as indicated in technical details would be taken from PMC.

• Preparation and issue of status reports on purchasing activities.

• Attending review meetings with Owner/PMC on all purchase activities.

(b) Inspection and Expediting

The Contractor is required to organise a proper inspection and expediting system so as to ensure timely delivery of all the items/equipment meeting the specified quality criteria. This function has to be carried out by appropriate deployment of qualified personnel who have wide experience in their respective fields. Owner/PMC will reserve the right to inspect items deemed necessary by them without any additional cost to Contractor/sub-contractor/vendor/third party.

Expediting is one of the vital activity of successful and efficient procurement system which enables timely execution on the project. Such expediting has to be carried out by deployment of expediting coordinator located at Contractor's Head Office who would be assisted by expediters located in various regional offices. To enable this function to be very effective and fruitful, following functions are to be carried out as a minimum.

Expediting Coordinator

Expediting Coordinator located at the Contractor’s HO will liaison with various departments such as purchase, projects, engineering, transportation etc. on one hand and regional inspection/expediting offices and vendors on the other. The basic functions of such expediting coordinator would be:

• Maintain effective communication link between various departments of the Contractor including his regional offices and vendors on whom the orders are placed.

• Status maintenance of all the orders.

• Analyzing the order status in detail after identifying the critical order and initiation of suitable remedial measures.

• Acting as an effective instrument in final delivery of the item within CDD.

• Preparation of order close out reports of each order.

• Expediting coordinator shall be a person who is highly communicative and has sound technical knowledge; he must be highly analytical, alert, quick in gathering up-to-date information of the various orders.
Responsibility of Expediting Coordinator

- Attending periodical review meetings with Contractor’s project department and Owner/PMC.

- Distribution of Fax of Intent/Letter of Intent and status maintenance.

- Liaison with regional offices to obtain order to generate acknowledgement of Fax of Intent/Letter of Intent.

- Intimate Owner/PMC of reservations (if any) from the vendor in purchase order acceptance.

- Distribution of POs / PRs to vendors and regions.

- Expediting of vendor’s drawings and other related documents.

- Expediting of approval of drawing by respective engineering department and timely return of the same to the vendor.

- Ensure receipt of periodical expediting reports and preparation of monthly status report against each order as per the requirement of Owner/PMC.

- Identification of critical orders/issues and initiate of remedial action.

- Expediting of decision on deviation sought by the vendor.

- Follow up actions with various concerned departments regarding all the issues discussed in the review meetings.

- Prompt despatch of material after inspection with the assistance of transportation department.

- Follow up of despatch particulars after despatch.

- Ensure preparation of order close out report for each order giving complete details of the order including ordered quality, contractual delivery date (CDD).

- Date of completion, delay, if any and reasons for delay, status of final documents etc.

- Ensure receipt/distribution of vendor documents including final documents as per PR.

- Preparation of final procurement closing report. The order close out reports shall be accompanied with two sets of complete documents in respect of each order bound/put together in a folder comprising of: purchase order, purchase requisition, change orders (if any), inspection certificates, material test certificates, final vendor drawings (if applicable), operation/maintenance manuals, any other document as specified in PR.
Expeditor

Expeditor’s responsibility commences from the time he receives the intimation of placement of TOI/LOI/order on vendor located in his region till the time he furnishes the despatch particulars of the item under a particular PO. During this process expeditor shall monitor and maintain all activities of the vendors such as:

- Vendor’s understanding of the order.
- Submission of design drawing documents for approval.
- Sub-ordering, planning and scheduling.
- Manufacturing testing and despatch.
- Delays, power cuts, strike lock out etc.
- Submission of final documents as per PR.

Above functions may be possible only by frequent visits to vendor’s office and shops including their sub-vendor’s establishments as the case may be. Expeditor shall be able to visualise the problems in advance and suggest timely corrective measure. In nutshell, expeditor is not a mere progress reporter but a vital catalyst for successful completion of the job. Expeditor’s responsibilities are as below:

- Ensure order acknowledgement from the vendor.
- Communicate the person concerned the reason for vendor’s inability to accept the order (if so).
- Progress reporting of various orders located in the region.
- Communication with the vendors whenever he finds lack of efforts on their part.
- Raise alarm report at an appropriate time on possible serious delay or vendor’s inability in meeting with scheduled date of delivery and also to suggest action plan.
- Liaise with inspection department for timely inspection, including third party inspection/statutory inspection as specified/required.
- Liaise with engineering department for approval of drawing, acceptance of deviation etc. through the expediting coordinator.
- Liaise with transportation department for sound and quick despatch of material.
(c) Inspection Quality Assurance System

The objective of the quality assurance scheme of the Contractor shall be to ensure the conformity of equipment, material, site construction (if any) to various standards, specifications, drawings and technical requirements that are being mutually agreed between the Contractor and Owner/PMC. Quality Assurance System should clearly indicate the organisational approach for quality control and quality assurance of the various equipment/construction activities (if any) and also provide a verifiable evidence of the Contractor having carried out all the activities laid down in the bid document and the procedure. Such conformity to quality level shall be ensured by controlling the quality level of purchased items at vendor's/sub-vendor's shop/site and shall cover from source surveillance to final inspection. The Contractor to submit a detailed inspection and testing plan for various shop/site activities as a part of his Procurement Manual which shall be duly approved by Owner/PMC. The Procurement Manual shall as a minimum include:

In house Inspection Programs

- Inspection procedures consistent with mandatory codes.
- Procedures for material identification and transportation.
- Certification of non-destructive testing.

Inspection responsibility shall include but not be limited to the following:

- Single or multiple visits to the vendor's shop/site as per the requirement.
- Pre-inspection liaison meeting with the vendor for vendors correct understanding of the inspection requirements.
- Approval of quality assurance/quality control plan procedure clearly indicating stages of inspection with specific reference to witness and review.
- Ensure submission of quality control procedure and approval of the same for critical sub-orders.
- Inspection of various equipment/items as per relevant codes, specifications/drawings including witnessing of final acceptance test at vendors works/site.
- Maintenance of inspection reports periodically highlighting hold, deviation etc.

As indicated for expediting coordinator, Contractor should nominate an inspection coordinator with similar responsibility who will liaise various inspection offices/vendors for proper coordination.

Inspection through an Approved Third Party Inspection Agency
Inspection requirements shall be fulfilled through Owner/PMC approved Third Party Inspection Agency. The payments to be made to the Third Party Inspection Agency shall be the responsibility of the Contractor. Further, the responsibility for inspection/testing as per specification approved documents and agreed Quality Assurance procedure and plans shall be that of the Contractor. Inspection activities of the Third Party Inspection Agency shall be coordinated by the Inspection Coordinator of Contractor.

(d) Customs Clearance and Transportation

The Contractor is required to organise a custom clearance and transportation (C&T) system to ensure prompt clearance of imported equipments from customs and transportation of equipments/materials to project site from ports/vendors works. This function shall be carried out by deployment of qualified and experienced personnel. C&T functions shall include, but not be limited to the following:

Appointment of Contractors

- Clearing forwarding of imported equipments/materials.
- Collection and transportation of bulk materials by road from vendor’s works.
- Transportation of consignments from port to site by road.
- Handling of consignments at project site.
- Transportation of general cargo and over dimensioned consignments by road/rail wherever applicable.
- Clearing and handling of air consignments, if applicable.
- Any other contracts relating to C&T services.

Supervision of Contractors

Supervision, monitoring and coordination of above contracts for import clearance and transportation as detailed below by Contractor. EC (Essentiality certificate) shall be provided by Owner to main Contractor of Indian origin. Essentiality certificate is not applicable to foreign Contractor.

Import Clearances

- Monitoring and coordination with clearing agents, customs, ports, steamer agents, airlines, railways and transport agencies for clearance of imported consignments.
• Registration of contracts with customs under project imports.

• Control of payment of import duty to customs, payment of port dues, etc.

• Conducting surveys with various agencies for imported consignments landed in damaged condition and corrective action for timely replacement of items.

Despatch of Indigenous Project Goods

• Coordination with inspection/expediting group and all indigenous suppliers for expeditious despatch of consignments.

• Monitoring movement of consignments from vendors works to project sites.

• Collection, transportation and delivery of bulk-material to project site.

(e) Monitoring Movement of Consignments

Total monitoring of movement of all consignments dispatched to project site from various points of despatch. A chaser has to be deployed from Contractor, for transportation of all ODC Consignments as well as important consignments (imported and indigenous) as and when advised by Owner/PMC.

(f) Reporting

Preparing and issuing Weekly, Fortnightly and Monthly Status Reports on clearance of imported equipments/materials and movement of equipments/materials from various despatch points to project site.

Monthly Reports on Over/Short Rejected/Damaged (OSRD) items. It shall be Contractor’s responsibility to arrange for timely replacement of OSRD items.

(g) Tendering

Tendering activities of the Contractor shall be properly organised to ensure award of various contracts in line with the project schedule. The tendering group shall consist of sufficient number of contract engineers/officers who are having adequate professional experience and qualifications.

Contractor shall prepare a Tender schedule for carrying out different works such as civil and structural equipment erection, piping, electrical, instrumentation, painting etc. All tendering activities shall be carried out in accordance with this approved tender schedule. The Contractor shall deploy a contract coordinator for coordination of tendering activities. The contract coordinator shall be responsible for:
• Coordinating with the Resident Construction Manager during execution of the contracts regarding clarifications on contract terms and conditions as required.

• Preparation and issue of status reports on contracting activities.

• Attending review meeting with Owner/PMC on all contracting activities.

• Preparation of tender documents, issue of enquiry to approved Contractors through receipt of bids, techno-commercial evaluation of offers for award of contract will be carried out by Contractor.

All major tenders will be handled by the Contractor from his Head Office. However, tenders for certain minor construction will be handled by Contractor’s site office.

The Contractor is required to institute and maintain a proper planning, scheduling and monitoring system and employ professionally qualified and experienced planning engineers for the project. The system shall have latest state of the art technique. To this effect, Contractor shall implement this system through the Prima Vera Project Planner. The system developed should be capable to support and enforce proper control mechanism in the project. It should be based on hierarchical breakdown of works with elaborate level of detailing and control. The levels of controls should be such that it supports and fosters controls at activity level, function level and management level with greater emphasis on target, scope and commitment at various stages of contract for accountability and action planning, such multi-level/multi-tier system of planning, scheduling and monitoring, supports, effective information generation, assimilation, summarisation and reporting in proper and adequate manner.

The system shall be predictive type and should constitute pre-warning mechanism to diagnose and anticipate the problem well in advance and provide preventive features/measures. It is required that work breakdown structure should consist of details of systems, work packages, functions, work items and activities from monitoring point of view at micro level and summarisation at higher levels. It is expected that the work breakdown structure coding system or methodology to be followed shall be informed/discussed with the successful bidder during the kick-off meeting.

2.4. Kick-Off Meeting

On award of job, the Contractor is required to submit the following documents which will be discussed during the kick-off meeting to establish planning requirements, inputs and outputs for overall schedule, monitoring and progress reporting.

• List of work package/areas.

• List of critical drawings.

• Breakdown of work packages to work items level.
• Input requirements of each work item/activity.

• Schedule start and finish dates of all milestone/activities in line with overall schedule of the project.

• Procedure for Project Planning, Scheduling, Monitoring & Control System including all reporting formats.

• Progress Measurement Methodology and Unit, Function, Discipline and Deliverable wise weightages breakdown. Overall system-wise, discipline-wise weightages for each item/activity.

• Procedure/presentation on proposed Bulk material control system

• Three month Front-End Schedule within a week of award.

In this kick-off meeting, it will be endeavoured to reach complete understanding with Contractor on activities, inputs and logic to establish planning documents for monitoring. Venue of the kick-off meeting to be held between the successful Bidder, PMC and the Owner, shall be either at PMC Office or Owner Office.

2.5. Early Planning Document / Look Ahead Schedule

Immediately after the award of contract and pending finalisation of overall project schedule, detailed activity chart/network, functional schedules etc., the Contractor in consultation with PMC shall prepare a look ahead schedule as a guideline for the activities to be performed during the relevant periods.

2.6. Overall Project Schedule

The Contractor shall submit within 30 days of Fax of Intent / Award of Work, the Work Breakdown Structure (Plant wise / Facility wise) showing project work load, that is, preparation of tenders, material requisitions, construction drawings equipments etc. alongwith a sufficiently detailed overall project schedule in the activity network form, clearly indicating the major milestones, inter relationship/interdependencies between various activities such as process, engineering, procurement tendering, manufacture, delivery, construction etc. together with computer analysis of critical path and floats as well as quantum of work for major activities.

The time and the date of completion of the works as stipulated in the CONTRACTOR's proposal and accepted by the OWNER shall be deemed to be of utmost importance. The CONTRACTOR shall so organise his resources and perform his work as to complete it not later than the date agreed to.
The CONTRACTOR shall submit The detailed Primavera Level 4 Project Master Schedule within thirty (30) days or as specified elsewhere after effective date of the CONTRACT.

The Primavera Level 4 Project Master Schedule shall be for OWNER / PMC review and be based on a Proposal Schedule as attachment to the CONTRACT. Such Proposal schedule shall show the execution periods for (i) Engineering, (ii) Procurement & Delivery of Equipment and Materials, (iii) Construction & Erection and (iv) Commissioning, Testing.

Bidding consortium shall be contractually obliged to issue a Primavera Level 4 Project Master Schedule, provided that such schedule shall not (i) accelerate the OWNER obligations (to be agreed upon prior to Contract award) (ii) change the agreed GUARANTEED COMPLETION DATE (date to be agreed upon prior to Contract award).

The above Primavera Level 4 Project Master Schedule shall be periodically updated,& reviewed and reports shall be submitted by the CONTRACTOR as directed by the OWNER / PMC.

The schedule will be reviewed and approved by Owner/PMC and the comments if any shall be incorporated in the network issued for implementation within two weeks from receipt of comments. The network thus finalised shall form part of the Contract and will become the basis for developing further detailed activity network. This schedule shall not be revised without the prior permission from the Owner/PMC during the entire period of contract. The changes made during revision of the contract shall be approved by Owner/PMC.

2.7. Detailed Activity Network

The Contractor should develop Detailed Activity Networks for various systems of the project, based on approved Overall Master Project Schedule. Such networks would be computerised for further monitoring and reporting.

2.8. Functional Schedules

The Contractor should prepare resource-based detailed functional schedules in line with detailed activity networks for functional monitoring, scheduling and control. This should clearly reflect strategies and philosophy of execution. Owner/PMC reserves the right to check the functional schedule and status of activities at anytime and at any location of performance/execution. Further, the functional schedules shall be submitted by the Contractor on demand by the Owner/PMC.

2.9. Progress Measurement Methodology

The Contractor is required to submit during the Kick-Off Meeting, the detail Methodology of Progress Measurement of Engineering, Procurement, Manufacturing, Delivery,
Computation of total Service/Physical Progress at the unit-wise level and on the overall basis. The progress basis shall be physical realisation of work such as in terms of deliverables and construction quantity/volume accomplished. The amalgamation of such output across the project to compute overall progress shall be suitably established with proper rational and norms and maintained throughout the project. Owner/PMC reserves the right to modify the methodology in part or in full.

2.10. Vendor Scheduling and Monitoring

The Contractor shall establish schedules for Pre-Ordering and Post Ordering for follow up. The vendor monitoring preferably should be on logical networks and commitments at least on critical items in order to monitor them on regular basis for effective control. Owner/PMC may demand such follow up procedure and logical networks for various Critical Equipment at any time during the course of order execution. The manufacturing schedule shall be established and agreed with the vendors and acceptance shall be brought to the notice of Owner/PMC in time.

2.11. Construction Network

The Contractor shall prepare and submit a Detailed Construction Network with full consideration of logistics, construction studies and method for Owner/PMC approval. The Contractor shall describe the resources required and special construction equipments, Tools and tackles to be mobilized. The network shall be developed subsequent of substantial progress of engineering and ordering with fairly known construction workload and quantities.

2.12. Construction Worksheets

The Contractor shall further detail out the construction network into area-wise details in terms of work, quantity and schedule, to firm up basis for area control. The construction schedule should be worked out based on work front generation criteria which will call for availability of input like drawings, materials and access for each/group of activity to be performed. It may be in the form of resource loaded bar chart with ‘S’ curve. Owner/PMC reserves the right to access the same.

2.13. Construction Contractor Schedule

The Contractor shall agree upon the construction schedules with sub-contractors for proper mobilisation, monitoring and control. Owner/PMC reserves the right to ask for such programme and status of any time as may be required.

2.14. Computerisation

Contractor should follow proper computerised control for the following project modules:
- Activity network
- Engineering (Residual)
- Purchasing, delivery and expediting
- Tendering
- Construction planning and control
- Materials control at head office.
- Material allocation and control at field office
- Proper warehousing control
- Project documents and construction drawings

The above distinct but integrated components of project should be monitored as deliverable and quantum level. To perform such elaborate level of input-output control at each deliverable, the packages used should forecast resources based on recovery plan in dynamic manner for adequate control.

As indicated earlier, Project Schedules as above shall be developed/evolved using the Latest Version of the Primavera (P6) Project Planner Software Package.

2.15. Project Review Meetings

Contractor shall present programme and status at various review meetings as required.

**Monthly Review Meeting**

**Weekly Review Meeting**

| Level of participation | Contractor / PMC’s site in-charge / Project Manager and Job Engineers |
2.16. Progress Reporting

The Contractor shall submit the following Progress Reports on a regular basis for Owner / PMC review.

**Monthly Progress Report**

This report shall be submitted on a monthly basis within seven calendar days from cut-off date, or as agreed upon, covering overall scenario of the project. The report shall include, but not limited, to the following:

- Executive summary or summary of major events/activities.
- Schedule v/s actual percentage progress and progress curves for engineering, ordering, manufacturing, delivery, contracting, construction, commissioning, overall.
- Areas of concern/problem/hold-ups, impact; recovery action plans/catch-up plans.
- Activities executed achievements during months and targets for the following month.
- Analysis of critical activities and impact on overall completion.
- Chronological achievements of key events indicating schedules and actual date.
- Annexure giving status summary for drawings material requisitions, equipment and materials delivery, contracting and construction.
- Resource requirement deployment status.
- Statutory requirements / compliance status
- Change order status.
- Invoice status.
- Construction photographs.
- Updated Project Schedule
Weekly Reports

This report will be prepared for Head Office and construction site in summarized fashion and submitted on every Tuesday taking status as of Sunday by the Contractor on weekly basis and will cover following items:

- Activities completed (engineering, procurement, contracting, construction, etc.)
- Programme for subsequent week.
- Resource deployed – man and machine.
- Quantities and productivity achieved in key areas of work.
- Progress on procurement activities including material requisition status reports.
- Constraints, if any.

The report/information may be transmitted preferably through fax to Owner / PMC HO.

Daily Reports

- Important activities for the day at site.
- Engineering Deliverables Status
- Material/equipments receipts for the day.
- Labour deployment report.

2.17. Material Control

It is essential that the Contractor follow an integrated material control system for the project. In the system, material identification in the drawing office, procurement and allocation, are all channelized and controlled in an orderly manner. The Contractor should follow a system for material identification like system-wise or area-wise/zone-wise, and should give construction orientation to material control. The Contractor, right from the beginning, at the drawing office stage will start identifying materials system-wise or area-wise. The system will be based upon backing of material from the material take off stage through material requisitioning, placement of purchase order, manufacturing at vendor’s shop up to receipt at site for making the material available for performing planned and sequential construction work.
At the construction site, the Contractor will develop and implement a system of inspection, receipt and effective utilisation of materials received by re-examining the work front availability and priority between and amongst various systems and areas.

In the case of multiple agencies carrying out construction at site, the Contractor must adopt methodology of allocation and de-allocation and timely issue of the materials thereby preventing possible idle storage of items at the Contractor’s level. Contractor must follow proper warehousing procedure at project store to maintain various planned and unplanned issues and dynamic stock status records. Through periodic reviews, the Contractor will have a system of generating hold up reports well in advance to identify exception on material availability and to track such material by the expeditery through a systematic follow up procedure from the vendors.

Owner/PMC may introduce checkpoints at procurement, allocation and construction stages to know the development, status and behaviour of the system and the Contractor shall submit the following reports on monthly basis: bulk material status report, and material hold up/shortage report.

2.18. Project Time Control Methodology

2.18.1. The time for completion of the complete scope of work shall be strictly as per the time schedule given in the tender document.

2.18.2. The CONTRACTOR shall furnish the following documents along with the bid:

(a) An overall schedule in the form of network, clearly indicating all important milestones in design, engineering, fabrication, procurement construction, testing, commissioning, etc. for the plant commensurate with the overall time schedule.

(b) Resource deployment schedule indicating mobilisation of all critical resources including manpower and machinery for the smooth execution of the job at engineering offices, fabrication shops and construction site. The resource schedule shall also contain various construction aids envisaged to be deployed for execution.

(c) Organisation structure for effective project management and control, clearly indicating the responsibility centre as well as bio-data of the key personnel, who are permanent employees of the Contractor.

2.18.3. Within 30 days of issue of fax/letter of intent, the Contractor shall finalise the following as detailed earlier:
(a) Overall Project Schedule

Overall project schedule in line with the agreed milestone and detailed to adequate work breakdown structure level covering all phases of the work such as detailed engineering, procurement, manufacturing, shipment, tendering and field erection. This schedule shall also include the interface activities to be provided by the Owner/Engineer-in-Charge and the dates by which such facilities are needed. Contractor shall get the schedule reviewed by Owner/Engineer-in-Charge and the agreed schedule shall form part of the Contract monitoring document based on which performance would be reported and evaluated. This document shall be signed by both the parties. The Owner/Engineer-in-Charge shall also review the weightage allotted to various activities and method of reporting to be adopted by the Contractor. During the progress of the contract if in the opinion of Owner/Engineer-in-Charge, desired progress as physically/sequentially is not maintained, it would be obligatory on the Contractor to re-programme the work schedule in order to accommodate the backlog and/or provide work front to other agency, without any obligation to the Owner/PMC.

(b) Functional Schedules

- **Engineering Schedule**

  This shall indicate list of drawings, specification and sketches to be prepared discipline wise for each plant and scheduled date of issue of each document.

- **Ordering, Manufacturing & Delivery Schedule**

  This will be in the form of bar chart and shall indicate item-wise all the major activities regarding ordering, shop fabrication/manufacturing and delivery of materials.

- **Construction Schedule**

  This will be in the form of a detailed bar chart showing all the construction activities (civil structural, piping, equipment erection, electrical, instrumentation, insulation, painting, etc.) at site with their durations and workload and highlighting the inputs namely drawings, materials availability, etc., compatible with the related functional schedule. The Contractor shall provide on request key construction net work of any work module for critical review and control.

- **Resource Deployment Schedule**

  A detailed deployment schedule indicating manpower, machinery, construction, equipment in line with the overall project schedule.
• Pre-commissioning and Commissioning Schedule

Contractor shall develop this schedule in the form of a bar chart and submit the same to OWNER / PMC for review.

• Any other document required for monitoring.

2.18.4. In line with the construction schedule, the Contractor shall submit a monthly programme for site activities and the target set in shall be strictly adhered to. In all matters concerning the extent of targets set out in the monthly programme and the degree of achievement, the decision of PMC shall be final and binding. The monthly programme shall be further broken into weekly programmes. At the end of each week, a report shall be submitted by the Contractor indicating the achievement during the week against the targets, reason for shortfall if any and the construction programme for the following week. Contractor shall also attend weekly/monthly review meeting conducted by PMC or by his representative to review project status.

2.18.5. The Contractor shall regularly submit a detailed progress report in respect of:

- Release of drawings
- Sub-ordering of materials
- Manufacturing
- Delivery of equipment/material status report
- Construction
- Other features like mobilisation, safety etc.
- Report indicating the critical activities governing the timely completion of the project and actions to overcome the same to be submitted every month.

This report will be issued every month on an agreed cut off date and shall include the following brief description of the progress achieved during the month. Reason for short fall if any and action plan to make up short-fall.

- Scheduled and actual percentage progress discipline-wise/system-wise as well as overall physical progress.
- Job completion trend in the form of updated overall schedule.
- Progress photograph highlighting major achievement.
2.18.6. The Contractor at any point of time of operating would be permitted to revise the accepted schedule/control documents with the Owner/Engineer-in-Charge without changing the contractual completion date.

2.18.7. The review of the performance of work would be made at different levels of management and Contractor is expected to ensure proper participation for effective reviewing and action plan.

2.18.8. The Contractor should ensure availability of professionally qualified planning engineer both at HO and site deemed adequate by the Owner/Engineer-in-Charge.

2.18.9. The Contractor at his own cost should maintain a control room at site highlighting all the features, schedule and achievements of the project.

2.18.10. Weighted percentage of each discipline/group of work shall be mutually agreed to between the Contractor and Owner/Engineer-in-Charge after the award of contract to facilitate compilation of progress.

3.0. CONSTRUCTION, CONSTRUCTION SUPERVISION AND MANAGEMENT

3.1. Construction

3.1.1. The Contractor will carry out the construction works in accordance with all relevant codes, standards, specifications, his documents and drawings, and based on the most efficient use of local resources. The Contractor will act as principal employer on the labour employed for construction activities and will follow Indian Labour Act, and all statutory regulations in this regard. The Contractor will have total responsibilities for the following:

- Construction, erection and installation of all equipment, machinery, piping and materials supplied by the Contractor.

- Site supervision, planning and coordination at site.

3.1.2. Major categories of construction work performed by the Contractor will comprise of but not limited to the following:

- Civil work: Aboveground structure work; refractory, brick and castable work.

- Civil foundation work shall be done by the bidder.

- Machinery: Installation of machinery and equipment; assembling of large size equipment, if any
The Contractor is required to organise and mobilise construction management services in a systematic and sequential manner to ensure that the plant installation is carried out in accordance with the approved engineering drawings, specifications, standards, QA/QC procedures etc. and its mechanical completion is achieved within targeted time schedule. For this purpose, the Contractor shall deploy a construction management team headed by a Resident Construction Manager (RCM) at site.

The construction management team shall include engineers/specialists in QA/QC, project control (planning, scheduling, monitoring), contracts, construction supervision, progress measurement/billing, safety, warehousing, purchasing etc.

Construction supervision, coordination and management activities shall be carried out by Contractor in accordance with the approved construction procedures by PMC. Contractor will prepare construction schedules based on the overall project schedule of the plant and submit to Owner/PMC for approval. Monitoring and control of the construction activities will be carried out as per the approved construction schedule and procedure.

A construction management team headed by a Resident Construction Manager will be deployed at site by Contractor. The Contractor shall ensure delegation of adequate and sufficient power to his RCM for effective and smooth functioning of the field management. HO support shall be provided to the RCM at site during construction as and when required on all matters of project execution including the following:

- Field engineering
• Vendor specialists required during construction

• Rectification/replacement of defective supplies, if any, noticed during construction

• Inspection/expediting of replacement orders/field purchase order for ordered items placed by field purchase

• Expediting replacement of imported items found short/damaged.

3.1.4. The Contractor shall establish and maintain a material testing laboratory for carrying on field tests during execution of contracts under different disciplines by Sub-contractors, at no extra cost to owner. Also, all material handling equipment shall be subjected by the Contractor to required load test initially and then periodically to ensure safe/stable operation including witnessing and maintaining records of such tests.

3.1.5. The construction organisation will include the following for effective execution, monitoring and control: planning, scheduling, monitoring reporting, construction supervision, quality assurance and quality control, warehouse management and material control, field engineering/purchase, safety personnel administration.

(a) Quality Assurance and Quality Control (QA/QC):
QA/QC personnel will be responsible for ensuring quality of construction carried out by different Sub-contractors in accordance with the approved QA/QC procedures and management of material testing laboratory.

(b) Warehouse Management and Material Control:
This discipline will be responsible for carrying out the warehouse management and material control in accordance with the warehousing procedure and material control procedure. The material control plan and warehousing procedure shall be Contractor for Owner/ PMC’s review/approval. The activities of the contractor will include:

• Transport Liaison, filing of insurance claims and follow up.

• Receipt, handling, identification, inspection, and acceptance of materials including free issue materials to be supplied by owner.

• Documentation for control and accounting of materials.

• Materials control and issue

• Inventory checks

• Field requisition and purchase

• Spare and tools
• Material appropriation and handing over

• Security

• Taking with suppliers on short supplied items and placing replacement orders for lost/damaged items.

• Intimating HO regarding short, lost, damaged items and taking up with suppliers and taking replacement action when applicable.

• Perform material reconciliation and identification of surplus material and its handing over to the Owner after certification by the PMC.

• Contractor will generate and issue following reports: fortnightly statement of consignments in transit; daily report of material received; report on over, short, reject, and damage receipts against each consignment on receipt at warehouse; weekly status of consignments, material receipt report; monthly status of field purchase; monthly status of excess, shortage rejected and damage settlement.

(c) Field Engineering:

This discipline will be responsible for controlling and issue of technical drawings and documents, preparation of field sketches, field modifications, checking/preparation of as-built drawings, technical assistance for field purchase and field tendering etc. Specialist engineers from Vendor HO will also be deployed at site as per requirements.

• Field tendering will be responsible for carrying out field tendering activities if required.

• Field purchase contractor will be responsible for carrying out field purchase activities if required. The bulk of procurement action will be done from HO. Field purchase items are restricted to those required for running and maintenance of the field offices, items required for field, items required to expedite construction work and items found short, missing or damaged against the main order when received at the site.

(d) Safety:

It is the responsibility of the Contractor to ensure that safe construction procedures are complied with. They will also ensure that adequate first aid medical facilities are available for emergency purpose and that safety procedures as per the approved safety procedure are followed by the different Contractors. To assist in the development of an effective safety programme, a safety checklist for various jobs shall be developed and the same shall be reviewed by the Contractors Site Incharge.
The responsibilities will include the following: coordination and supervision of the details of the job safety programme; initiation and supervision of the use of accident report and investigation form; preparation of periodic accident summaries; tallying safety inspection of the job site and submission of summary inspection report to site PMC in charge.

3.2. Quality Assurance/Quality Control

All work/services to be performed by the Contractor under this contract shall be of specified/approved quality and Contractor shall have a quality assurance/quality control (QA/QC) system during the performance of various activities such as engineering, procurement, tendering, construction etc. Review/approval of activities by Owner/PMC shall not however dilute the responsibility of Contractor for maintaining quality.

(a) QA/QC Procedure:
Contractor shall submit the QA/QC procedure to be adopted for engineering procurement and construction activities of plant for review and approval to Owner/PMC. The QA/QC procedure shall cover all activities to be performed by Contractor. Some important activities and procedures to be evolved are listed below:

- **General:**
  Document control, coordination, non-conformance report of Sub-contractors, output identification and traceability, QA system review

- **Procurement/Inspection:**
  Incoming material control, welding qualification and repair, manufacturing or fabrication process control, applicable non-destructive examination, coating/lining, preservation, post-weld heat treatment wherever applicable, packaging and despatch control, transportation, inspection/test plans for all specific and mandatory tests (as per drawings and codes) with clear indication of witness, verification and hold points.

- **Construction:**
  Pre-construction activities, job construction, welding qualification and repair, inspection/test plans for all specified tests (as per drawing and codes) with clear indication of witness, verification and hold points. Contractor shall prepare construction QA plans for review of the Owner/PMC and the same shall cover as minimum the areas as under, and shall confirm their compliance to approved codes/standards/specifications, etc.

- **Site Preparation:**
  Tie-ins, structures, incorporation of all witness tests/hold points of construction work, clean-up testing, instrumentation installation and construction.
(b) As a part of Construction and Quality Assurance, the Contractor shall also comply with the following activities:

- Stage-wise inspection of quality of work as per approved QA plan and contract specifications.
- Develop welding procedures and welders qualification procedures for their work.
- Ensure compliance of various statutory rules, regulations and safety measures and to arrange and co-ordinate site inspection, testing etc. as required under local statutory rules and regulations prevalent in India.
- Take all necessary precautions to protect construction work and material from damage by climate, outside elements and construction activities.
- Ensure that materials used are in accordance with drawings/project specification.
- Review safety procedures prepared by the Contractor for compliance with applicable codes, regulations and Owner requirements.
- Prepare schemes for heavy/critical equipment's erection/lifts/rigging before and submit the same for PMC review/approval.
- Ensure alignment (hot/cold) of all critical rotary equipment/machinery and their upkeep/maintenance as per suppliers’ recommendations.
- Perform housekeeping activities, which include maintaining sanitary facilities, sweeping clean up, removal of excess materials/temporary facilities, scaffolding, as necessary.
- Conduct periodic quality/technical audits for ensuring quality and conformance with the contract.
- To take immediate appropriate corrective actions as and when such discrepancy arises to fulfil quality, safety obligations.

(c) QA/QC procedure shall also include quality plans, mostly in tabular formats defining the specific quality practices and flow of every identifiable activity of a discipline. All disciplines concerned with the performance of work are to be covered. These quality plans should indicate the following:

- For Design and Engineering: Activity description; preparation, checking, review and approval requirements; code of conformance (applicable standard specification number); applicable procedure number; QA data/records produced.
• For Procurement and Construction: Activity description; procedure number, inspection and test plan number, conformance code, testing and inspection code

(d) QA/QC procedure and quality plans will be discussed during kick-off meeting. Hold, witness and verification points and Owner/PMC review/audit requirements will be finalised between Contractor and Owner/PMC.

(e) During the performance of the contract, the Contractor shall:

• Implement approved quality assurance programme including but not limited to:

  (i) Performance of internal quality audits, preparation of audit reports and submission for review of PMC. Contractor shall evolve a comprehensive system of planned and documented audit to verify whether various performed activities comply with detailed procedures, specifications, guidelines etc. and to determine the effectiveness of quality system. Scope of such internal audits shall be furnished to PMC for review. Verification documents shall be generated during audit and submitted periodically to PMC for review. Throughout all stages of the scope of contract, the Contractors procedures, documents, activities, products and services and those of his Sub-contractor's shall be subject to Owner/PMC review/approval. Such surveillance and audit are optional and shall not relieve the Contractor of his contractual obligations and liabilities.

(ii) Generation of QA records (mostly inspection and test plans) as per quality plan and submission for review by Owner/PMC. The Contractor shall submit all quality records (generated during activity execution) and audit results on well laid formats/performance for Owner/PMC review. The rights of such review are reserved by Owner/PMC. Owner/PMC may review it in full, parts or selectively. However, complete correctness of the QA records shall be the sole responsibility of the Contractor irrespective of its review by Owner/PMC.

• Facilitate Owner/PMC in the quality audit at works.

• Certify QA Programme documents of Contractors and submit to Owner/PMC for review.

• Carry out audits/inspection at Contractors works as per approved QA programme and submit the reports for review by Owner/PMC

• Get similar QA system implemented at his Sub-contractor's works/office. QA records from the Contractor shall be reviewed and certified for compliance by the Contractor before submitting to Owner/PMC for information.
• Carry out audits at Contractors’ office/works and submit the report to Owner/PMC for information.

• Ensure that all personnel shall be assigned tasks commensurate with their qualification. Specialized workmen shall be qualified and certified.

• Handle non-conformance brought out by internal and external sources as follows:

  (i) Non-conformance brought out by Contractor's own review/audit shall be resolved by Contractor himself. One level higher than those responsible to carry-out the activity shall resolve the non-conformance. Such resolution shall be in full knowledge of Departmental Manager. Corrective action shall be initiated at the earliest. Report of such resolution shall be submitted to Owner/PMC for information.

  (ii) Non-conformance brought out by Owner/PMC through any of the following shall be resolved by the Contractor. Such corrective actions shall be submitted to Owner/PMC for review. However, corrective action shall be initiated at the earliest for: technical reviews, QA review and surveillance, inspection, external audit (Owner / PMC)

3.3. Construction Equipment

The Contractor is required to organize and mobilize the construction equipment and other tools tackles in a sequential manner to ensure that plant installation is carried out in a mechanized manner and its mechanical completion is achieved within targeted time schedule. The Contractor shall without prejudice to his responsibility to execute and complete the work strictly as per the specifications and other laid down procedures by mechanizing the construction activities to the maximum extent by deploying all necessary construction equipment/machinery of adequate capacities and numbers. For this purpose, the Contractor shall deploy a rigging team headed by a rigging foreman reporting to Area Engineer responsible for equipment erection.

Area Engineer should be well conversant with various erection techniques and shall be responsible for preparing erection schemes in accordance with the approved procedures and based on crane manuals suiting to plan layout. Area Engineer will have to foresee various other constructive activities in the surroundings while planning erection schedules including safety aspects of man and machinery also.

Contractor will prepare erection schedule based on the overall project schedule of the plant in phased manner with erection schemes of various equipments, vessels and submit to Owner/PMC for approval, monitoring and control of erection schedule. Erection activities will be carried out as per the approved construction procedures.
For efficient working and maintenance of construction aids, Contractor shall establish and maintain crane yard/workshop equipped with regular maintenance facility for various construction aids for carrying out routine field maintenance during performance for the contract. Temporary approach road, wherever required for the movement of the crane and other vehicles for equipment erection and transportation of material shall be properly planned and be made by the Contractor for quick mobilisation of the transportation system. The proper padding for the crane movement shall be done to avoid any delays of erection schedule. Weekly/fortnightly maintenances shall be planned in such a way that it should not hamper the erection schedule.

Contractor shall ensure the timely augmentation of the plant, equipment and machinery depend upon the exigencies of the requirement to meet the overall project schedule. During performances of the work, Contractor must ensure that structures, materials or equipments are adequately braced by guys, struts or otherwise approved means which shall be supplied and installed by the Contractor as required till the erection works is satisfactorily completed. Such guys, shoring, bracing, strutting, planking supports etc. shall not interfere with the work of other agencies and shall not damage or cause distortion to other works executed by him or other agencies. Contractor to submit the construction equipment schedule along with the bid.

3.4. Construction Manpower

The Contractor is required to organise and mobilise construction staff in a sequential manner to ensure that plant installation is carried out in accordance with the S curve defined with other chapter of the Bid package. Mobilisation of construction staff should be such that ‘S’ curve based on the time schedule and progress achieved in the phased manner should match with the overall project time schedule. For this purpose, the Contractor shall clearly indicate in his construction methodology that work shall be done departmentally or by engaging such Sub-contractor or the combination of both.

Contractor will prepare detailed methodology for the work to be carried out departmental as well as by Sub-contractor clearly defining the scope and responsibility of main Contractor and Sub-contractor.

In case, Contractor proposes to engage Sub-contractor for the erection of various activities, he must enter into an agreement of Memorandum of Understanding and same shall be furnished along with their credential with the bid. Sub-contractor’s credential will be evaluated along with the offer. Contractor shall not be permitted to change the Sub-contractor after the award of work under any circumstances. Non-compliances of the above will be strictly dealt with relevant provisions of the contract.

During the execution of works at site, if the principal Contractor engages Sub-contractors for execution of works at site as per approval obtained from Owner/PMC in line with contract provisions and in the event Sub-contractor complains in writing to the Owner with regard to the non-payment of their dues from the principal contractor for the works
executed by them and site (excluding final payments and payments due after termination of Sub-contractors' services by the main contractor), Owner reserves their right to make such payment to the Sub-contractors based on approved measurement with due notice to the principal Contractor. Owner shall release such payments to Sub-contractor at the cost and risk of the main Contractor in order to ensure smart execution of work at site.

The above such payment made by Owner to the Sub-contractor shall be adjusted in the running account bills or any other payment due to the concerned principal contractor. Contractor to submit the construction manpower schedule.

All Sub-contractors will be managed by the main Contractor construction staff who will perform the duties of construction management and will administer, coordinate, and inspect the work of the Sub-contractor and be responsible for the quality.

The contractor will establish the prerequisite for successful construction of sub-contractor work. However, by deploying the Sub-contractors as approved by Owner/PMC for any discipline, does not absolve the principal Contractor for his total responsibility under the subject contract.

The Contractor to ensure that in case of Sub-contract failure to execute the works as per standards/specifications/drawings and negligence and disobedience in carrying out any order or instruction of Owner / PMC will be viewed very seriously and dealt with appropriately in accordance with provisions of the contract. Contractor to submit the construction manpower schedule along with the bid.

4.0. QA SYSTEM / INSPECTION REQUIREMENTS FOR BOUGHT OUT ITEMS & DURING CONSTRUCTION

4.1. General

Contractors are required to follow a well-documented quality assurance and quality control system covering all phases of project viz. engineering, procurement, installation, testing and commissioning. Similarly, Contractors are required to develop their own resources for inspection of all bought-out items supported by third party inspection services for specific cases. Supervision of construction activities is the responsibility of turnkey contractor; Owner/PMC role during construction phase is for quality surveillance.

4.2. Specification for Turn-Key Bidder's Quality Assurance System

(a) Introduction

This specification establishes the quality assurance requirements to be met by the turnkey bidder during execution of contracted services. In case of any conflict between the requirements of this specification and other documents such as technical specifications,
contract conditions etc., the contractor shall notify Owner/PMC of all such conflicts for final resolution.

(b) **Scope of Work by Contractor**

Prior to the award of contract, the following documents shall be submitted along with the bid for evaluation:

- Quality policy
- Quality objective
- Company quality manual
- Project quality plans
- Copy of certificate of approval of quality management system

After the award of contract, within four weeks after the award of the contract, the Contractor shall participate in the pre-start meeting with Owner/PMC to finalize ‘Project Quality Plans’ as regards to the following:

- Standard practices specified by the Contractor
- Hold, witness and verification point
- Owner/PMC’s review/audit requirements

During job execution, implement approved project quality plan including but not limited to:

- Performance of internal quality audits, preparation of audit reports and submission for Owner/PMC’s review.
- Generation of QA records as per quality plan and submission for Owner/PMC’s review.
  - Records of management review of quality system
  - Contract review records
  - Design review, verification and validator’s records
  - Assessment records of acceptable vendors/sub-vendors
  - Records of nonconformity
  - Records of external quality audit
  - Records of training
  - Inspection reports
  - Test data/inspection and test plans
  - Qualification reports
  - Material review reports
- Calibration data
- Quality cost report
- Schedule control and progress reports

- Facilitate Owner/PMC in the quality audit at his works.
- Certify QA Programme documents of sub-contractor and submission for review to Owner/PMC.
- Carry out audits/inspection at sub-contractor's works as per approved QA programme and submit the reports for Owner/PMC's review.

(c) Quality Assurance System Requirement

- Requirements stipulated in this specification shall be fulfilled by the Contractor/Sub-contractor. All other features of QA System shall be as per Contractor’s standards.

- The Contractor shall ensure that the quality system is clearly understood and faithfully implemented at all levels in his organisation.

- The Contractor shall develop quality consciousness’ among all personnel working for the contract.

- Non-conformances brought out by Contractors/Sub-contractors’ own internal review/audit shall be resolved by Contractors’/Sub-contractors, themselves. One level higher than those responsible to carry out the activity shall resolve the non-conformances. Such resolution shall be in full knowledge of Departmental Manager. Corrective action shall be initiated at the earliest. Report of such resolution shall be submitted to Owner/PMC for information.

- Non-conformances brought out by Owner/PMC through any of the following: technical reviews, QA reviews and surveillance, inspection, external audit (Owner/PMC), post construction quality audit (by Owner/PMC) to be carried out immediately after declaration of mechanical completion by the Contractor. Non-conformances brought out due to the above, shall be resolved by the Contractor/Sub-contractor. Such corrective actions shall be submitted to Owner/PMC for review. However, corrective action shall be initiated at the earliest.

- The Contractor shall evolve a comprehensive system of planned and documented audit to verify whether various performed activities comply with detailed procedures, specifications, guidelines etc. and to determine the effectiveness of quality system. Scope of such internal audits shall be furnished to Owner/PMC for review. Verifiable documents shall be generated during audit and submitted periodically to Owner/PMC for review. Audits shall be carried out by independent engineers not responsible for execution of the activity to be audited.
• Throughout all stages of the scope of contract, the Contractor's procedures, documents, activities, products and services and those of his Sub-contractors' shall be subjected to quality surveillance and audit by Owner/PMC. Such surveillance and audit are optional and shall not relieve the Contractor of his contractual obligations and liabilities.

• The Contractor shall submit all quality records (generated during activity execution) and audit results on well laid formats/proforma for Owner/PMC's review. The rights of such review are reserved by Owner/PMC. Owner/PMC may review it in full, parts or selectively. However, completeness correctness of the QA records shall be the sole responsibility of the Contractor irrespective of its review by Owner/PMC.

• The Contractor shall get similar QA system implemented at his Subcontractors’ works/office. QA records from the Subcontractor shall be reviewed and certified for compliance by the Contractor before submitting to Owner/PMC for information.

• Contractor shall carry out audits at Subcontractors, office/works and shall submit the report to Owner/PMC for information.

• All personnel shall be assigned tasks commensurate with their qualification. Specialized operators shall be qualified and certified. The Contractor shall have a system for identifying personnel training needs in line with the latest ISO guidelines.

• Immediately after submitting written declaration of mechanical completion by the Contractor, Owner/PMC will carry out post-construction quality audit. Contractor shall extend all help and cooperation to carry out this audit including providing all necessary resources to Owner/PMC and shall implement all corrective measures, based on the post-construction quality audit findings and observations at no cost to the Owner/PMC.

• A pre-startup safety review (PSSR) checklist is a tool used by a PSSR team during a safety review of a new facility before commissioning. This checklist helps ensure that a facility will be safe for employees and that equipment will operate according to design specifications. This may be added here to ensure safety aspect before pre-commissioning. All the points in the PSSR has to be complied by LSTK contractor before start up of the unit.

4.3. Inspection Coordination Methodology for Turnkey Package

4.3.1. All equipment and materials are to be procured from vendors listed in the approved Vendor List enclosed in this Bid, or from other reputed vendors after obtaining specific approval of the Owner/PMC. In this regard, no difference is made between the equipment and materials purchased by the contractor directly or by his contracted agencies.

4.3.2. After finalisation of purchase order, a detailed QA/QC plan shall be developed by the vendor, duly reviewed by the Contractor and shall be submitted for approval of the
Owner/PMC. It is envisaged that QA/QC plans for the critical items shall be reviewed/approved by the Owner/PMC and for the balance items QA/QC plans shall be submitted for records. The management of quality control system is to be developed generally based on the categorisation of various equipment and materials. Preliminary categorisation of various items involved is enclosed. For items not included here, categorisation shall be decided during detailed engineering and Owner/PMC may change inspection category based on final information and quantities. For indigenous items, Contractor shall employ an approved third party inspection agency to carry out inspection on his behalf, whose involvement must be brought out in the detailed QA/QC plans. For imported items, contractor should engage Owner/PMC approved Third Party Inspector (TPI). Each stage of inspection by the TPI, must define whether it is a hold point, witness point, verification point or internal inspection point by the vendor. Contractor shall make independent QA Plans through the approved Third Party Agency which shall be having a confirmation of meeting the minimum inspection requirements spelt out. All inspection stages where Owner/PMC desires to participate (which shall be preferably only for critical items) shall be marked on the QA/QC plan and these stages must necessarily be attended by the Contractor in addition to the other stages being attended by him. In case the QA/QC plans are not submitted in sufficient detail, the Contractor may be asked to re-submit the plans.

4.3.3. The personnel to be deployed by the third party inspection agency must have adequate qualification and experience for the type of work involved and the owner may ask for approval of the personnel employed for the job and his replacement, if required.

4.3.4. The Contractor shall submit a detailed vendor's inspection schedule for the coming two months at the beginning of each month as well as notify owner's involvement at the appropriate inspection stage, giving a clear notice period of 15 days. The contractor shall submit monthly inspection and expediting reports of the inspection agency regularly to the Owner/PMC.

4.3.5. PMC's inspector shall witness the test on a mutually agreed date according to contractor's inspection notification, wherever applicable.

4.3.6. Submission of category-wise inspection plan by Contractor at PMC HO for review. It is envisaged that the QA/QC plans shall be submitted to the PMC in accordance with the clauses as defined above.

4.3.7. After finalisation of the vendor, the copy of PO or technical specification for sub-ordered items along with QAP will be submitted by Contractor to PMC covering the location where the sub-ordered items are manufactured. The QAP is to be duly approved by the PMC.

4.3.8. Contractor will be totally responsible for furnishing the complete and correct technical document/specifications to his sub-vendor. It is responsibility of the contractor to ensure that relevant specifications indicated in the tender documents are incorporated in the sub-
order/sub-order specification. Each PO shall categorically indicate involvement of various agencies for inspection.

4.3.9. Contractor shall forward the approved copy of relevant drawings/documents to the TPI before giving inspection call. The final inspection will be done by the TPI, based upon drawings/documents reviewed by TPI/PMC in Code ‘AP’ (Approved) wherever applicable.

4.3.10. Contractor will ensure presence of their inspection engineer at sub-vendor's works during inspection by TPI or Owner/PMC inspection engineer (wherever applicable).

4.3.11. Contractor shall expedite to ensure delivery of all the materials as per CDD.

4.3.12. All correspondence by contractor to the PMC for submission of documents and inspection calls shall also be intimated to Owner.

1 General scope of Work and services - Construction/Erection

LSTK CONTRACTOR shall be responsible for construction and erection of the Plant/Unit including but not limited to the following:

1.1 Construction and erection of Plant/Unit and perform all other activities required to be performed for implementation of the WORK.

1.2 Provide and supply in due course all construction Equipment and Materials, tools, and temporary facilities necessary for implementation of the WORK.

1.3 Establish and operate adequate material control system in site for receipt, unloading, inspection, maintenance, handling, storage and utilization to ensure all Equipment and Materials are preserved and available as necessary for completion of the Plant/Unit.

1.4 Provide and supply all staff, tradesmen and labours for implementation of the WORK.

1.5 Establishment of overall construction policy and procedures for the Plant/Unit.

1.6 Provision of overall management and control of construction phase of the Plant/Unit.

1.7 Ensuring that all parts of the Plant/Unit are constructed and tested strictly in accordance with the specifications and applicable codes and standards asked for in the project documents.

1.8 Ensuring that construction is accomplished in accordance with the schedules.

1.9 Provide transportation of all Equipment and Materials to be provided and supplied by LSTK CONTRACTOR under the CONTRACT either from inside or outside to Site.

1.10 Construct, operate and maintain all temporary facilities required for its personnel involved in the WORK.

1.11 Provide transportation in the area of the Site and between Site and temporary facilities for all its personnel involved in the implementation of the WORK, including field labour, administrative staff, etc.

1.12 Recruit field and organize, manage and supervise its Sub Contractors and field labour for the WORK.

1.13 Provide liaison with OWNER, Sub Contractors, Licensors and Vendors to ensure that the Plant/Unit is constructed in accordance with the respective standard and specifications, set forth in the CONTRACT.
1.14 Establish with OWNER adequate procedures, control and reporting systems to provide close control of the progress of the WORK.

1.15 Provision of labour and facilities for loading, unloading and transportation of the Equipment within the site area.

1.16 Performance and/or provision of all other works and/or services required for performance of the WORK.

1.17 Execution of the whole civil, structural and building works of the Plant/Unit and/or utilities and off-site facilities.

1.18 Prefabrication of piping spools in a shop on the Site.

1.19 Erection and installation of EQUIPMENT and auxiliary facilities associated with the Plant/Unit.

1.20 Erection and field fabrication of structural steelwork, cladding ladders, handrails, stairs and platform of the Plant/Unit and/or utilities and off-site facilities.

1.21 Installation of pipe work including field fabrication at site.

1.22 Installation and testing of all instrumentation network and equipment of the Plant/Unit.

1.23 Installation and testing of electrical system and equipment of the Plant/Unit.

1.24 Installation of rubber lining, refractory brick lining & C-Brick lining, FRP/PVC/HDPE lining, as required for the Plant/Unit.

1.25 Painting of steelworks, piping, Equipment and building of the Plant/Unit.

1.26 Maintenance of construction equipment, vehicles and tackles of the Plant/Unit, during construction and erection period.

1.27 Pre-commissioning, Commissioning and Start-up of the Plant/Unit.

1.28 Carrying out Mechanical Completion.

1.29 Perform all material identification as per application codes and standards.

1.30 Provide winterization during construction.

1.31 Provide drawings and documents as required.

1.32 Supply to OWNER complete test records within three (3) days after completion of actual testing.

1.33 Installation and testing of all underground piping, if any.
2.0 General scope of WORK and Services- Pre-commissioning

LSTK CONTRACTOR shall be responsible for the pre-commissioning phase of the Plant.

LSTK CONTRACTOR shall provide at SITE an adequate number of qualified pre-commissioning engineers to direct and control pre-commissioning activities.

LSTK CONTRACTOR shall also ensure that all special tools and test equipment required for pre-commissioning are available at its own cost.

LSTK CONTRACTOR shall provide adequate construction labour, construction tools and equipment for pre-commissioning.

Pre-commissioning which shall be performed by LSTK CONTRACTOR shall include, but not limited to the following:

2.1 Cleaning, flushing, draining blowing out, steaming out, drying and purging of Equipment and their linings and piping systems, including the installation and removal of temporary blinds, strainers, screens etc., and the replacement of all permanent items removed while the WORK is in progress.

2.2 Chemical cleaning wherever required, including but not limited to compressor suction piping and lube and seal oil piping, heaters, supply of chemical and disposal of wastes.

2.3 Chemical cleaning of feed water systems, and steam systems. Supply of chemical and disposal of wastes.

2.4 Chemical cleaning of any other parts, which have corroded to an extent, which, will detrimentally affect Plant/Unit performance or run length for such reasons as increased fouling due to rust. Supply of chemical and disposal of wastes.

2.5 Checking, Testing, calibration simulation test and adjustment of instruments, equipment and systems including control valves and safety devices, and installation and checking of orifices plates and other sensor devices in so far as this can be done before actual operation of the item concerns of complete system and loops.

2.6 Function test and checking out of electrical systems including substations, transformers, cables and switchgear, checking of all interlocks and setting of all relays. This shall include drying out operations, filtering of oil if required.

2.7 For motor driven equipment, amperage checking of motors and removal of temporary safety screens.
2.8 Cleaning of screens and filters replacement and adjustment of packing and seals and tightening of flanges.

2.9 Introduction of fuels.

2.10 Introduction of lubricants and oil flushing for machinery.

2.11 Introduction of chemical into and initial operation of treatment plant.

2.12 Boiling out, bringing up to pressure and performing all required code tests on steam generation facilities and associated instrumentation.

2.13 Drying out of stacks and all refractory lined equipment.

2.14 For all piping systems, installation and removal of temporary blinds as required, circulation and commissioning of systems including process systems, services, effluent and drainage, utilities distribution, relief and blow down and interconnecting lines.

2.15 Test running of all other rotating equipment for 24 hours wherever possible.

2.16 Adjustment of all piping expansion and support devices.

2.17 Air-drying of Plant/Unit, which is required to be water-free.

2.18 Testing (including running, tightness and vacuum) of systems, as necessary to ensure that the sections and components of Plant/Unit are ready for operation.

2.19 All such further works which LSTK CONTRACTOR judges to be necessary or in the reasonable opinion of OWNER is necessary to bring the Plant/Unit to a state of readiness for the introduction of feedstock into Process Plant/Unit for processing requirements and for safe commencement of operation.

3.0 Basic Plan For Temporary Services

Temporary Construction Facilities
The LSTK shall arrange following facilities at his own cost for Construction/Erection purpose. Demolition and cleaning of temporary facilities developed for construction purpose shall also be under LSTK Contractor’s scope.

1. 1 No. 11 kV Feeder (rated for 2 MVA) at Existing Substation near 132 KV Switchyard shall be made available. Tapping of Construction Power (on chargeable basis) from this feeder (including supply & erection of all required materials like structural supports for cable tray, cable trays, power cables, control cables, protection & metering, cable termination etc. as well as underground cabling work) and further distribution shall be in LSTK Contractor’s scope.

2. Construction Water (on chargeable basis) shall be made available

3. Construction sheds

4. Construction offices

5. Temporary Communication facilities
6. Office furniture
7. Labour colony during construction.

3.1 Sewage & Refuse Disposal

All temporary building like site office, canteen etc. shall be provided with individual septic tanks and soak pits for treatment and disposal of sanitary sewers. Construction site shall be provided with a network of temporary drain for disposal of rain water.

4.0 Mechanical Completion

Mechanical Completion means the time when all construction, erection & installation work per finally approved P&ID after HAZOP study and pre-commissioning related to the Plant is completed in accordance with the Project drawings and specifications, and all mechanical and pressure tests, including but not limited to hydro-testing, non-operating adjustments, cold alignment checks, final cleanup, hot bolting, refractory drying, field calibration of safety valves, calibration of all instruments, instrument loop checking and testing, monitoring / control / safety systems checking and testing, and all pre-commissioning activities have been completed, all incoming & outgoing services and utilities have been connected to each unit of the PLANT, interconnections of process lines and interconnection are completed and the Plant/Unit is ready in every respect for commissioning and for the first introduction of feed materials.

When OWNER is satisfied that Mechanical Completion of the plant has been achieved, OWNER shall issue certificate of Mechanical Completion to OWNER in accordance with the CONTRACT for Owner's Approval.

In order to meet this, LSTK CONTRACTOR shall perform all necessary mechanical works, tests and checks.

5.0 COMMISSIONING

5.1 Schedule for Commissioning

LSTK CONTRACTOR shall prepare a schedule for commissioning, start-up, and performance testing and initial operation in conjunction with OWNER. This shall be issued at least three months before pre commissioning of the first facility.

This schedule shall include all activities as detailed herein and any other special activities, which require to be performed during commissioning.

5.2 Commissioning

LSTK CONTRACTOR shall be responsible to perform commissioning of the Plants and to provide necessary facilities during commissioning of the Plant including the Performance Tests. LSTK CONTRACTOR shall provide commissioning engineers and supporting staff and adequate commissioning labour. LSTK Contractor shall associate OWNER’s engineers and operating staff with the commissioning work.
6.0 START UP

LSTK CONTRACTOR shall be responsible to perform start-up of the Plant/Unit. LSTK CONTRACTOR shall provide necessary facilities and for Start Up of the PLANT.

NOTE:
Detail CONTRACTOR’S scope of work in relation with the construction / erection, and pre-commissioning, commissioning and start-up from the point of scope of execution as well as performing way are described in detail in the following Sub-Annexes of Section-7.0.
Sub-Annexures:

Annex 7 - 1 : LSTK Contractor’s Work Definition

Annex 7 - 2 : Detail Technical Scope

Annex 7 - 3 : Quality Control Procedures and Inspection Requirement

Annex 7 - 4 : Schedule Progress Evaluation and Progress Reporting

Annex 7 - 5 : General Notes
LSTK CONTRACTOR'S WORK DEFINITION

LSTK CONTRACTOR shall perform/provide the following activities but not limited to:

1. LSTK CONTRACTOR scope of work shall broadly consist of construction / erection, refurbishing, pre-commissioning, commissioning and Start Up of the Plant under the management of commissioning team it includes but not limited to civil works, fabrication & erection of structural steelwork, field assembly, mechanical erection and / or assembly and installation of all equipment and machinery, piping, electrical systems and network, instrumentation, insulation, painting, etc., except in so far as "Contract" otherwise provides, the provision of all temporary facilities, staff, tradesmen, labour, tools, tackle, construction equipment and materials, insurance, consumables and everything whether of temporary or permanent nature necessary and required in and for the work, so far as the necessity for providing the same is specified or reasonably inferred in or from the contract.

2. Perform all civil and building works as per Annex 7 - 2A, titled civil and building works.

3. Perform all structural steel works as per Annex 7 - 2B, titled structural steelwork.

4. Perform all piping fabrication and erection works as per Annex 7 - 2C, titled piping fabrication and erection work.

5. Perform all equipment erection works as per Annex 7 - 2D, titled equipment erection work.

6. Perform all electrical works as per Annex 7 - 2E, titled electrical work.

7. Perform all instrumentation works as per Annex 7 - 2F, titled instrumentation works.

8. Perform all insulation works as per Annex 7 - 2G, titled insulation works.

9. Perform all painting works as per Annex 7 - 2H, titled painting Specification/work.

Supply the materials in order to execute WORK as per CONTRACT.

10. LSTK CONTRACTOR shall be responsible for providing services and materials for construction of all temporary facilities, which are essential for successful completion of construction and erection.

The LSTK CONTRACTOR shall establish, operate and maintain all temporary facilities, such as, but not limited to:
a) Labour camp/officers camps

b) Fabrication shops/yard

c) Workshop for maintenance of construction/testing equipment.

d) Field drawing office

e) Temporary warehouses, including open storage yards.

f) Construction offices (including facilities for photocopying, drawing reproduction, etc.)

g) First aid along with ambulance

h) Lab facilities, including NDT, for testing calibration, etc.

i) All temporary or approach roads for carrying out the WORK including temporary approach roads for access to LSTK CONTRACTOR’S site office/workshop/camp, etc. ground preparation for heavy lifts including approaches to cranes for heavy lifts. OWNER does not take any responsibility for making temporary roads.

j) Canteen & catering facilities for all LSTK CONTRACTOR’S work force.

k) All drainage around the facilities created for his WORK, and sewage disposal arrangements for labour camps/officers camps, site offices, etc.

l) Necessary transport for movement of its personnel, construction Equipment and Materials, consumables, etc.

m) Watering of roads through water tankers for dust suppression.

o) All temporary lighting for working during night.

p) All temporary hutments, sanitary & potable water and domestic sewerage requirements of LSTK Contractor’s work force.

11. Supply to OWNER complete survey report within three (3) working days after completion of any survey.

12. All excess soil shall be disposed of by LSTK CONTRACTOR outside the premises in a location designated by OWNER representative.

13. Perform all nondestructive, hydrostatic and precommissioning testing required.

14. Supply to OWNER complete test records within three (3) days after completion of actual
15. Perform all welding including radiography required.

16. Provide drawings and documents as required.

17. Provide mobilization and demobilization, temporary material and temporary facilities and utilities required executing work.

18. Provide winterization during construction.

19. Provide scheduling, planning and reporting as per CONTRACT.

20. Keep complete administration and control of work, specified in CONTRACT.

21. Provide maintenance on all construction and permanent plant material as required during the CONTRACT period.

22. Perform all material identifications as per CONTRACT.

23. Perform all transportations as required.

24. Perform quality assurance, control and supply quality control documentation.

25. Perform all pre-commissioning activities as defined in the CONTRACT.

26. Provide and supply all procedures for execution of the work in accordance with drawings specifications, and applicable codes and standards.

27. Perform all other works and activities and supply all other materials which are required for completeness of the Work either mentioned in the CONTRACT or they are necessary for completeness of the work, in compliance with highest available standards and good quality.
ANNEXURE- 7 - 2

DETAIL TECHNICAL SCOPE

See accompanying by discipline

Annexure-7 - 2A  Civil and Building work
Annexure-7 - 2B  Structural steel work
Annexure-7 - 2C  Pipe prefabrication and Erection
Annexure-7 - 2D  Equipment erection
Annexure-7 - 2E  Electrical work
Annexure-7 - 2F  Instrumentation work
Annexure-7 - 2G  Insulation work
Annexure-7 - 2H  Painting work (For detail refer TS-2001)
ANNEXURE- 7 - 2A

CIVIL AND BUILDING WORK

1.0 SURVEYING

1.1 Base line and base elevation will be furnished to LSTK CONTRACTOR. LSTK CONTRACTOR will furnish all surveys from this base line and elevation.

1.2 OWNER shall have the authority at anytime to determine, in accordance with the drawings or written directives, the correctness on completeness of the lines in use by LSTK CONTRACTOR.

1.3 Any erroneous WORK shall be corrected to OWNER’S satisfaction at LSTK CONTRACTOR’S expense.

2.0 SITE

Finish grading elevation to be as shown on drawing. LSTK CONTRACTOR’S access to the WORK areas shall be via existing roads. Any other roads required by LSTK CONTRACTOR are to be developed by LSTK CONTRACTOR.

3.0 EXCAVATION AND BACKFILL

3.1 Excavation

- Provide all excavation by machine or by hand according to the specifications.

- Excavation is to be executed by LSTK CONTRACTOR in a manner that will provide adequate space for performance, inspection and timely completion of the WORK. Supply dewatering as required. The method of dewatering shall be subject to Approval by OWNER.

- Temporary water drainage routing requires prior Approval by OWNER.

3.2 Backfill

All backfills shall be according to the specifications.

All excavations shall be kept dry and workable prior to and during backfiring and compacting.

Material that LSTK CONTRACTOR excavates in the course of WORK and which can be used for backfill, must be approved by OWNER prior to use. All other backfill material as required in this scope of work, drawings and specifications, shall be supplied by LSTK CONTRACTOR.

Back filling shall be to ground level as shown on drawing. The placing of backfill may only
start after approval by OWNER.

LSTK CONTRACTOR will inform OWNER to arrange for the required proctor tests. Tests shall be done by OWNER on his account.

4.0 PILES AND CONCRETE FOUNDATIONS

4.1 Install Piles and major and minor concrete foundations in accordance with the specification and drawings.

4.2 Blinding to Underside Foundation Work

Prior to placing a blinding layer of concrete, LSTK CONTRACTOR shall supply, place, compact and prepare the surface of excavated area. After this LSTK CONTRACTOR shall supply a blinding layer of concrete. Blinding layer to be in accordance with specifications and drawings.

4.3 Reinforcement of Concrete

Cut and bend to bar bending schedules, all type of reinforcing bars.

Store and protect all reinforcing bars against corrosion and any other deleterious effects prior to placing.

Installation of reinforcement including installation of spacers, supports, tying, wire in accordance with the specifications and drawings.

4.4 Anchor Bolts

Install all anchor bolts, in accordance with the specifications and drawings.

The following WORK is included but not limited to LSTK CONTRACTOR’S scope for installation of anchor bolts:

- Deliver of all templates.
- Store and protect against corrosion and any other deleterious effects.
- Place anchor bolts accurately in formwork or by templates, if required, or in pockets.
- Clean and grease anchor bolts threads after Concrete pour and protect bolts after greasing with plastic covers.

4.5 Inserted and Embedded Item

Install all concrete inserts and embedded items, including but not limited to the following items in accordance with the specifications and to the detail drawings to be furnished by LSTK CONTRACTOR:

- Cement - In sockets.
- Cinch anchors.
- Steel sleeves, various size angle.
- Channel shapes with anchors. Curb angles and steel plates.
- Anchor rails.
- Pipe sleeves of heavy duty PVC pipe.

The WORK shall include but not limited to:

Store and protect against corrosion and damage placed accurately in Formwork or by templates, if required, or by temporary bars for proper positioning.

4.6 The following WORK is included but not limited to LSTK CONTRACTOR’S scope for installation of major and minor foundations:

- All excavation, including sheet piling, if required, backfill, compacting and the transportation of surplus material, neatly stockpiled at a location, chosen by LSTK CONTRACTOR and approved by OWNER. The supply, installation and maintenance of a complete concrete batch plant, including concrete testing laboratory. Installation of selected backfill material, if required. Supply and delivery and installation of all formwork, assembly and disassembly of all reusable formwork, inclusive if any and all required supporting, bracing, pockets, cutouts, recesses, etc.

- Bending and installation of concrete reinforcement bars to the requirements and supply of items as defined in 4.3 above.

- Installation of all anchor bolts (including fabrication of templates), to the requirements and supply of items as defined in 4.4 above.

- Installation of embedded and inserted items, to the requirements and supply of items as defined in 4.5 above.

- Installation of construction and expansion joints where required.

- Mixing, delivery and pouring of concrete in accordance with specifications. Stripping of formwork and removal of all surplus material to LSTK CONTRACTOR'S yard or locations designated by OWNER.

- All temporary storage of formwork at SITE shall be of an orderly nature. In case storage does not comply with the above-mentioned rule, OWNER shall have the right to remove formwork from SITE within forty eight (48) hours after first warning and back charge LSTK CONTRACTOR for all related costs. OWNER shall not be held responsible for any of LSTK CONTRACTOR’S losses.

- The finishing of concrete, where required to a finish in compliance with the specifications.

A copy of all-concrete mix truck delivery slips if applicable.
Concrete composition analysis of the concrete batch plant.

All scaffolding required.

All required dewatering to keep the excavations / backfill dry for the WORK.

5.0 CONCRETE STRUCTURES AND ELEVATED SLABS

Install concrete structures, in accordance with the specifications and drawings.

6.0 The following work is included but not limited to LSTK CONTRACTOR’S scope for installation of concrete elevated slabs:

See 4.6; however with -following exceptions: No-excavation, no backfill and- no dewater

7.0 YARD PAVING AND FINAL SURFACING

7.1 Excavation

Setting out and grading by machine and/or by hand for yard paving to the shape and depth in accordance with the specifications and drawings.

Disposal of all excavated material and neatly stock piling to a location chosen by LSTK CONTRACTOR and approved by OWNER.

7.2 Concrete Yard Paving

- Mix and install concrete for heavy duty paving areas, in accordance with the specifications and drawings.

- Mix and install concrete for light and medium duty paving areas in accordance with the specifications and drawings.

- The following work is included but not limited to LSTK CONTRACTORS scope for installation of concrete yard paving: See 4.6 above

- Surface preparation, including the supply and placing of waterproof building paper or similar waterproof material, well lapped at joints, laid on top of the well compacted sand layer and before pouring concrete.

- Reinforcement for heavy duty paving at top and bottom face and for light duty paving at top face only, with square mesh fabric reinforcement including protection against corrosion, the cutting, the bending and placement.

- Mixing and pouring of concrete in accordance with specifications, sufficient vibrating. Stopping clear from bases, plinths and piers and forming around surface and lay to give levels and falls.

- Installation of construction / expansion joints.
7.3 Unpaved Areas

Install gravel, tiles or crushed stone on leveled unpaved areas, all in accordance with the specifications and drawings.

7.4 Concrete Tiles for Walkways

Install well compacted sub-base layer and install the tiles on the sub-base all in accordance with specifications and drawings.

8.0 CONCRETE PIPE SLEEPERS

Fabricate and install reinforced concrete sleepers for pipe, complete with foundations in accordance with the specifications and drawings.

9.0 MANHOLES AND CATCH BASINS, TRENCHES

9.1 Fabricate and install pre-cast or formed and poured in situ concrete manholes and catch basins and trenches in accordance with the specifications and drawings.

9.2 The following work is included but not limited to LSTK CONTRACTOR’S scope for installation of manholes and catch basins. All excavation including sheet piling of required, backfill, compacting and the transportation of surplus material, neatly stockpiled at a location, designated by LSTK CONTRACTOR and approved by OWNER.

For Poured in Site

- Delivery and installation of all formwork, inclusive if any and all required supporting, bracings, pockets, cutouts recesses etc.
- Bending and installation of concrete reinforcement bars to the requirements and supply of items as defined in 4.3 above.
- Fabrication and installation of embedded and inserted items, if any, to the requirements and supply of items as defined in 4.5 above.
- Mixing and pouring of concrete in accordance with specifications.
- Stripping of formwork and removal of all surplus material to LSTK CONTRACTOR'S yard or locations designated by OWNER.
- All required dewatering to keep the excavations / backfill dry for installation work.
- Install cast - iron manhole frames and solid cover and fabricate and install steelwork catch basin grating and frames in accordance with specifications.

10.0 COLLECTION BASINS, PITS, SUMPS, RETAINING WALLS AND CULVERTS

10.1 Fabricate and install concrete collecting basins in accordance with the specifications and drawings.

10.2 Fabricate and install concrete sumps and pits in accordance with the specifications and drawings.
10.3 Fabricate and install concrete walls around tanks and other retaining walls in accordance with the specifications and drawings.

10.4 Fabricate and install concrete pipe and bridge culverts including head walls in accordance with the specifications and drawings.

11.0 DITCHES AND TRENCHES

11.1 Fabricate and install earthen and concrete ditches and trenches including connection pipes and boxes in accordance with the specifications and drawings.

12.0 STEEL SLIDING PLATES AND PTFE SLIDING PLATES

12.1 Steel Sliding Plates

- Fabricate and install steel sliding plates in accordance with specifications and drawings.

- The following work is included, but not limited to LSTK CONTRACTOR'S scope for fabrication and installation of steel sliding plates:
  - Pick up materials, storage and protection against corrosion and any other deleterious effects.
  - Fabricate, place in pockets, level and grout, protect against possible damage and corrosion.

12.2 PTFE Sliding Plates

- Install sliding plates, in accordance with the specification and drawings.

The following work is included but not limited to LSTK CONTRACTOR'S scope for installation of sliding plates pick up materials, transport, store and protect:

- Place in pockets, level and grout, protect against possible damage.

13.0 GROUTING

13.1 Mix and install grouting in accordance with the specifications and drawings.

13.2 LSTK CONTRACTOR shall grout under all structural steel columns and under all equipments, as specified.

13.3 The following work is included but not limited to LSTK CONTRACTOR'S scope for installation of grouting:

- Prepare top surface of base and/or plinth, pockets, sleeves etc., prior to placing grout.

- Mix and install grout mortar in accordance with specifications.
- Grout mortar shall be used between steel base plate and concrete foundations.

- Mix and install non-shrink grout between reciprocating rotary equipment base frame including the filling of the equipment steel frame, if required, and concrete foundation in accordance with manufacturer specifications and project specifications.

13.4 Grouting of equipment shall proceed only when equipment setting has been accepted by OWNER.

14.0 ASPHALT PAVING

14.1 Mix and install asphalt paving over base courses installed by LSTK CONTRACTOR, in accordance with the specifications and drawings.

- Roads/ Driveways/ Parking areas/ Sidewalks/ Tank pads

14.2 The following work is included but not limited CONTRACTOR'S scope for installation of asphalt paving to.

- Installation of all materials necessary to make a complete installation.

- Installation of sub-grade, sub-base and base courses all properly compacted.

- Delivery and installation of all formwork, inclusive if any and all required supporting, bracing, pockets, cutouts, recesses, etc.

- Installation of expansion joints where required and/or construction joints

- Stripping of formwork and removal of all surplus material to LSTK CONTRACTOR'S yard or locations designated by OWNER.

- Mixing, delivery, installation, spreading and compaction of asphalt paving mixture in accordance with specifications.

- Any and all measures for proper asphalt paving installation and curing.

15.0 ROAD REPAIR AND MAINTENANCE

15.1 Supply and deliver necessary materials, equipments and labour to repair and maintain all plant roads, as necessary.

- Repair work shall be in accordance with the specifications.

- LSTK CONTRACTOR shall be responsible for repair of roads, all on the indication of OWNER due to the damage to the roads, caused by LSTK CONTRACTOR'S activities and construction operations, or due to faulty construction by LSTK CONTRACTOR. LSTK CONTRACTOR is not entitled for compensation for such repair work.
16.0 REPAIR OF DYKES, SLOPES AND DITCHES

16.1 Supply and deliver necessary materials, equipment and labour to effect repairs on dykes, slopes and ditches as necessary.

- Repair WORK shall be in accordance with the specifications.

- LSTK CONTRACTOR shall be responsible for repair of dykes, slopes and ditches all on the indication of OWNER’S representative, due to damage to the dykes, slopes and ditches caused by LSTK CONTRACTOR’S activities and construction operations, or due to faulty construction by LSTK CONTRACTOR.

- LSTK CONTRACTOR is not entitled for compensation for such repair work.

17.0 UNDERGROUND SEWERS AND PIPING SYSTEMS

17.1 Install the underground piping systems, in accordance with the specifications and drawings.

17.2 The following work is included but not limited to LSTK CONTRACTOR’S scope for installation of underground piping systems.

- Excavation including sheet piling, if required, backfill, compacting and the transportation of surplus material, neatly stockpiled at a location designated by LSTK CONTRACTOR and approved by OWNER.

- Installation of sand backfill if required

- Receiving unload, inspect and transport LSTK CONTRACTOR’S supplied materials and store and protect.

- Installation of piping materials necessary for a complete installation.

- The installation of above ground fire hydrants, fire monitors and standpipe as well as the underground firewater system.

- The fabrication and installation of supports and thrust blocks for the piping as required.

- Surface preparations and installation of coating and wrapping of the underground piping, if required as per Technical specification Mentioned in Annexure- 7 - 2C

- Installation of glass fiber reinforced epoxy piping in accordance with manufacturers instructions as well as the specifications.

- Hydrostatic pressure testing of the underground piping systems including test apparatus, test piping, test blinds, bolts and gaskets in accordance with the specifications.
17.3 **Hydro Testing of Sewers and Underground Lines**

- Tests all sewers and underground piping systems as per test instructions. Testing is to be witnessed and approved by OWNER. A test schedule by test system shall be prepared by LSTK CONTRACTOR. Testing and completion shall be in accordance with project system priorities.

- Piping systems shall be tested with suitable water.

- Develop test system procedures and follow priorities established by OWNER. LSTK CONTRACTOR shall prepare detailed schedules based on this data for submittal to OWNER for his approval.

- The water for testing purposes is to be provided by LSTK CONTRACTOR.

- Inexpensive temporary gaskets shall be used in place of permanent gaskets where test blinds are located for hydrostatic testing. On successful completion of a test, the permanent gasket shall be installed when the blinds are removed.

- After hydro testing, LSTK CONTRACTOR shall perform the following activities:
  - Flushing
  - Remove temporary blinds
  - Install permanent gaskets.
  - Flange connection bolts tightened.
  - Coat and wrap welds.
  - Holiday testing and coating repairs.
  - Backfill and compaction.

18.0 **CIVIL PART FOR UNDERGROUND ELECTRICAL GROUNDING SYSTEM**

18.1 Excavation of the routing for the direct buried cables, for the road crossing and for the branch conduit and sleeves in accordance with layout and detail drawings.

18.2 Transport of the excavated soil, neatly stockpiled to location chosen by LSTK CONTRACTOR and approved by OWNER.

18.3 Installation of all protection conduits and installation materials in accordance with the specification, and design and detail drawings.

18.4 Transport of excavated soil and backfill including compacting of the round up to finished plant level.

19.0 **CIVIL PART FOR UNDERGROUND CABLE TRENCHES (AND CABLE) CIVIL PART**
19.1 Excavation of the routing for the concrete cable trenches for the direct buried cables, for the crossings and for the branch conduit and pipe sleeves by machine or by hand as dictated by local conditions.

19.2 Transport the excavated soil, properly stockpiled to a location off chosen by LSTK CONTRACTOR and approved by OWNER.

19.3 Installation of the concrete cable trenches in accordance with the specification and the design and detail drawings.

19.4 For scope of installation of concrete cable trenches see item 11.

19.5 Installation of the road culverts, protection sleeves and cable ducts at road crossing in accordance with layout and detail drawings. For scope of installation see item 10

19.6 Transport of the excavated soil and backfill of the surrounding area of the concrete trenches up to finished plant level.

19.7 Transport of the excavated soil and backfill of road crossing up to road including the supply and installation of the repair of the paving and / or asphalt road covering.

19.8 Transport and backfill of the trenches with a layer of clean sand, free from stones equalized up to the bottom level of the first (bottom) cable layer.

19.9 Transport and backfill of the layer of clean sand between cable. Layers and above top cable layer.

19.10 Transport of excavated soil and backfill including compacting of the ground up to the layer of concrete tiles or trench covers.

19.11 Installation of the cable protection covers and/or trench covers and /or cable routing colored marking tape.

19.12 Transport of the excavated soil and backfill including compacting of the ground above the layer of concrete tiles up to finished plant level.

19.13 Installation of the cable route designated, trench markers.

20.0 STORAGE TANK PADS AND DYKES

20.1 Install tank pads as specified and as quantified on the specifications and drawings.

20.2 Install tank dykes and ramps as specified and as quantified on the specifications and drawings.
20.3 Install impervious clay layer inside the dyked tankage areas in accordance with specifications and drawings.

21.0 PERMANENT PLANT FENCING

21.1 Install permanent plant fencing, including personnel gates and truck gates as located, specified and quantified in the specifications and drawings.

22.0 SCAFFOLDING

22.1 Supply and erect all scaffolding for WORK.

22.2 Scaffolding shall be supplied, erected and maintained in strict accordance with local and governmental regulations as well as OWNER’S safety requirements. If there are conflicts, the more stringent shall prevail.

LSTK CONTRACTOR shall dismantle all its scaffolding at the completion of its WORK.

23.0 TESTING

23.1 All necessary tests in order to control the quality of the field works shall be done and all such test certificates should be kept in record, such as but not limited to

- Soil compaction tests.
- Concrete testing
- Asphalt testing
- Reinforcing bars testing

23.2 If any test fails LSTK CONTRACTOR shall replace those items, which do not meet the requirements.

All costs for replacements shall be borne by LSTK CONTRACTOR.

24.0 WELDING PROCEDURES SPECIFICATIONS AND WELDING PROCEDURE QUALIFICATION RECORDS

24.1 Provide within two months before starting the construction execution, its welding procedures (for A.G, U.G piping and any structural steel) for comment and approval. Approval of welding procedures by OWNER is required before the start of welding.

24.2 Prior to start of filed welding LSTK CONTRACTOR shall submit one (1) copy of all welders’ qualification paper and applicable welding procedures approved and stamped by regulating authorities to OWNER.

25.0 DRAWINGS AND DOCUMENTS

25.1 LSTK CONTRACTOR will carry out all construction activities directly from the AFC construction drawings and specifications.

25.2 LSTK CONTRACTOR shall submit reports of each test or inspection within three (3) days
after actual test or inspection. Failure to comply with the above rule may result in OWNER arranging for additional tests or inspections. Costs of which will be back charged to LSTK CONTRACTOR.

25.3 LSTK CONTRACTOR shall submit material certificates and quality records of the materials, as specified in previous sections and the applicable engineering specifications and standards.

25.4 LSTK CONTRACTOR shall also furnish a concrete installation record within two (2) weeks after completion of the WORK indicating, date of installation and quantity of concrete of each foundations, floor slab, elevated slab, frames, columns, etc.

This concrete installation record shall also show a reference with the concrete compression test certificates of the respective concrete pours and the concrete delivery slip numbers.

Failure to comply with the above time may result in the preparation of the documents by OWNER in which case all related costs will be back charged to LSTK CONTRACTOR.

26.0 MISCELLANEOUS

26.1 LSTK CONTRACTOR shall be fully responsible for the correct and accurate setting out of all elevations, positions, dimensions, alignments, profiles, etc. of all parts of the WORK and for the provision of all necessary instruments, appliances and labour in connection therewith. The checking of any such matter by OWNER shall not relieve LSTK CONTRACTOR of its responsibility for the correctness thereof.

26.2 If during the construction or maintenance of WORK, any error is discovered in WORK, LSTK CONTRACTOR shall at its own cost rectify such error to the satisfaction of OWNER. LSTK CONTRACTOR shall in such case take all necessary actions such as overtime, etc. in order not to endanger the agreed upon time schedule.

26.3 All dimensions shown on the plans and drawings are given in the SI system, unless otherwise stated.

26.4 All costs for setting out the earthwork and for assisting OWNER in checking the various points, lines, levels, profiles, etc. shall be deemed to be included in the price.

26.5 LSTK CONTRACTOR shall under no circumstances extend its operations outside the limits of the area appropriated for WORK. LSTK CONTRACTOR will ensure that its operations shall not interfere in any way with properties of others.

26.6 No excavation work shall be started before the exact positions of the WORK have been marked by means of stakes controlled and approved by OWNER.
26.7 OWNER shall notify LSTK CONTRACTOR of all known existing underground pipes, cables, drains, manholes, etc., in current use, together with the approximate locations and hazards involved and LSTK CONTRACTOR shall ensure that they will not be broken or damaged in any way by the execution of WORK. Hand labour shall be used for excavation within a horizontal distance of 1.5 meters from existing utilities.

26.8 Any damage as referred to above shall be reported by LSTK CONTRACTOR. LSTK CONTRACTOR shall repair the damage.

26.9 The discovery of any unregistered pipes, drains, cables, etc., shall be promptly reported to and dealt with as directed by OWNER. Excavation, as required to determine the exact location of existing underground pipes, drains, cables etc. shall be considered as a part of WORK.

26.10 LSTK CONTRACTOR shall take precautions i.e. mats, lining with timber, etc. not to cause damage to permanent plant roads curbing and sidewalks with its construction equipment.

26.11 LSTK CONTRACTOR shall provide and be responsible for the construction of all temporary dewatering. Drainage, sheet piling, timbering etc. to ensure the stability of slopes, trenches, embankments, etc. during excavation work and that all areas are adequately drained to the satisfaction of OWNER.

26.12 LSTK CONTRACTOR is responsible for all soil slides that may occur during the execution of the WORK and for any detrimental effect of the same. LSTK CONTRACTOR shall as directed by OWNER either correct or repair the damage to the satisfaction of OWNER at its own expense or pay for the cost of repair by others of all damage caused to the WORK or adjacent property. No additional payments shall be made to LSTK CONTRACTOR to compensate the financial consequences of soil slides.

26.13 Collapse, cave-in, or movement of excavations, trenches, or the like shall be the responsibility of LSTK CONTRACTOR. LSTK CONTRACTOR acknowledges this responsibility and instructions of the OWNER.

26.14 Trenches, excavations, and the like shall be maintained in strict accordance with the requirements of the applicable national and local regulations.

26.15 LSTK CONTRACTOR shall be held entirely responsible for any effect or damage, which the execution of any of the earthwork may have upon, or which may be caused to any portion of WORK or any of the surrounding property.

26.16 Excavation will proceed until all unsuitable material is removed.

26.17 LSTK CONTRACTOR is responsible for the excavation required to installing bottom of footings at elevations as shown on drawings. The removal of a poor soil below the intended bottom of excavation is included in the CONTRACT. Any unnecessary over excavation will be in LSTK CONTRACTOR'S account.
26.18 Backfill shall be to the elevation shown on the approved drawings or as directed in writing by OWNER.

26.19 Special care must be taken in compaction operations over underground pipelines.

26.20 LSTK CONTRACTOR shall furnish all field engineering, surveying, layout, and checking to properly install all foundations to meet all requirements of the drawings and specifications. On completion of each foundation LSTK CONTRACTOR shall mark all foundations with a clear center line, locating both North, South, East and West and a bench elevation mark. LSTK CONTRACTOR shall stencil or by other means, paint equipment and column designation and coordinates, to all foundations installed by LSTK CONTRACTOR. All markings shall be located above high point of paving. These markings shall be preserved for use by others.

26.21 LSTK CONTRACTOR shall design concrete mix specification and furnish by means of reports from OWNER'S laboratory, proof that the materials and mixes for concrete conform to the specifications and codes prior to pouring the first concrete on SITE. LSTK CONTRACTOR shall furnish all field labour to make concrete tests and fill cubes. Quality of concrete aggregates and mix design will be checked by OWNER'S laboratory regularly.

26.22 All aboveground concrete for supports for steel structures must be smooth finished, and exposed edges of concrete to have a chamfer.

The top of the foundations shall be poured so as to ensure true surfaces and designated slopes in all cases. LSTK CONTRACTOR is to avoid damage or movement of already installed reinforcement and/or other structures, formwork, etc., when pouring concrete.

26.23 All concrete pours for a given element must be monolithic, except where noted on the drawing or approved by OWNER.

25.24 If pouring cannot be finished within normal working hours, necessary actions shall be taken, sufficiently in advance for requesting permits for overtime. All pouring must be continued until the element is complete. OWNER shall be informed at least twenty-four (24) hours in advance.

26.25 Damaged formwork must be repaired in such a way as not to mark the concrete finish. All formwork must be braced adequately and be of a rigid construction. Gravel nests, surfaces crack, honeycombs, etc., and shall be repaired to the satisfaction of OWNER.

26.26 LSTK CONTRACTOR shall use immersion-vibrating equipment but it needs to be of a type approved by OWNER prior and also during use. Vibration of formwork and fresh concrete WORK is not allowed. OWNER will have the right to require replacement of inadequate during all phases of the WORK. A must condition shall be maintained after pouring as set forth in specifications. The WORK involved in this is to be included in the pricing.

26.27 OWNER reserve the rights to reject any WORK already poured which is not in accordance
with drawing and specifications and of adequate quality.

Serious inclusions appearing in concrete shall be reason for the rejection of WORK and LSTK CONTRACTOR requested to repair or replace at his own expense.

26.28 All costs involved in demolition, removal and replacement of rejected WORKS shall be the responsibility of LSTK CONTRACTOR all materials, equipment or auxiliaries not accepted by OWNER shall be removed immediately from the OWNER'S property.

26.29 Ready - mixed concrete shall be delivered without segregation. The concrete batch plant has to be approved by OWNER. Small quantities of concrete may be made at SITE after approval of OWNER.

26.30 The pouring of any reinforced concrete may only start after having obtained Approval of OWNER.

26.31 LSTK CONTRACTOR shall provide, during the period of this CONTRACT, temporary drainage ditches in WORK so that water will not be pended and so that all areas are adequately drained to the satisfaction of OWNER.

26.32 LSTK CONTRACTOR shall provide, during the period of this WORK, systems for the dewatering of all its WORK areas as required to properly execute the WORK. All dewatering methods shall be subject to the approval of OWNER.

26.33 All excavated boulders will be removed from SITE by LSTK CONTRACTOR.

26.34 Manholes are to be marked with M.H. Number.

26.35 Underground service lines have to be marked at their installation limits to aboveground piping, indicating line size, and service and line number.

26.36 Prefabricated concrete -items are to - be marked with date of fabrication, size, Length, identification code and installation north arrow.

27.0 BUILDINGS

27.1 LSTK CONTRACTOR shall do the construction of the buildings, including all activities and installations as specified, in drawing and specifications including the fabrication of all items that are not standard hardware components.

28.0 Quality of all civil and building materials shall be approved by OWNER before usage in the PLANT.
ANNEXURE- 7-2B

STRUCTURAL STEELWORK

1. Delivery of all materials and fabricated structural steel to SITE, including all required transport, storage, intermediate storage, etc., including loading and unloading of materials.

2. LSTK CONTRACTOR will carry out all construction from the AFC construction / erection drawings and specifications.

3. LSTK CONTRACTOR shall be held entirely responsible for any effect or damage, which the erection of the structural steel may have upon, or which may be caused to any portion of WORK or any of the surrounding property.

4. Erect Structural Steel-Structure Frames

This item covers all activities required to erect prefabricated structural steel framing for single and multilevel structures.

It includes, but is not limited to, the following:

- Provision of all tools, equipment and consumables used in the course of the work.
- Shimming of foundations and joints.
- Erecting.
- Cutting, drilling, welding and bolting to achieve fitment.
- Rectification required, if any.
- Final levelling, aligning and bolting (including torquing).
- Grouting of components and areas supplied unpainted or requiring finish coats, as per specifications.
- Touch up painting of damaged areas.
- Also included in this item are all clips plates, stiffeners, gussets, and connection material supplied loose for field installation.
5. **Fabricate and Erect Structural Steel-Structure**

This item covers all activities required to fabricate and erect structural steel framing for single and multilevel structures, from raw steel, if any, sections, plates, rounds, etc. It includes, but is not limited to the following:

- Provision of all tools, equipment and consumables used in the course of the work.
- Preparation of detailed fabrication drawings and getting them approved from Owner.
- Shimming of foundations and joints.
- Measuring, cutting, bending, bolting and / or welding.
- Erecting.
- Cutting, drilling, welding and bolting to achieve fitment.
- Final levelling, aligning, bolting and /or welding (including torquing).
- Grouting of support piers.
- Painting as per specifications.

6. **Fabricate and Erect Ladder and Safety Cages**

This item covers all activities required to fabricate, assemble and erect ladders and safety cages in steel structures, from raw steel (unpainted) sections, plates rounds, etc. It includes, but is not limited to, the following:

- Provision of all tools, equipment and consumables used in the course of the work.
- Preparation of detailed fabrication drawings and getting them approved from Owner.
- Measuring, cutting, bending, bolting and / or welding.
- Assembly and erecting including cutting, drilling, bolting, welding to achieve fitment.
- Cutting, drilling, welding and bolting to achieve fitment.
- Final Bolting and / or welding in position.
- Fabrication and installation of safety barrier rail and gate.
- Installation of raw bolts and forming of concrete pads, or connecting to a lower platform.
- Painting as per specifications.

7. **Fabricate and Erect Platform and Walkways**

This item covers all operations required to fabricate erect platforms and walkways on vessels, towers, structures, etc or on the ground from raw steel (unpainted) sections, plates, rounds, etc. It includes, but is not limited to, the following:

- Provision of all tools, equipment and consumables used in the course of the work.
- Preparation of detailed fabrication drawings and getting them approved from Owner.
- Measuring, cutting, bending, bolting and / or welding.
- Erecting including any, cutting, drilling, welding for fitment.
8. **Fabricate and Erect Welded Handrail**

This item covers all operations required to fabricate and erect double rail handrail and toe plate of all welded construction, from raw steel (unpainted) sections, plates rounds, etc.

It includes, but is not limited to, the following:

- Provision of all tools, equipment and consumables used in the course of the work.
- Preparation of detailed fabrication drawings and getting them approved from Owner.
- Fabrication including cutting, bending, welding, etc.
- Erecting of posts, top and middle rails toe plate including any cutting, trimming for pigment and welding.
- Grinding smooth of all cut edges and welds.
- Painting as per specifications.

9. **Fabricate and Erect Galvanized Tubular Handrails**

This item covers all operations required to fabricate and erect double rail tubular galvanized hand railing including all standards, fittings, bends, etc., from raw steel (unpainted) sections, plates, tubes, etc.

It includes, but is not limited to, the following:

- Provision of all tools, equipment and consumables used in the course of the work.
- Fabrication including cutting, trimming edge stripping to required size & shape.
- Erecting into position.
- Bolting and/or welding.
- Trimming to suit platform structure and providing openings for pipe or cable, etc.
- Making good edges, and touch up painting including cold galvanizing of cut or welded parts.
- Painting of unpainted steel sections.
10. **Fabricate and Install Floor Grating**

This item covers all activities required to fabricate and install galvanized floor grating from large sheets ready for cutting, trimming, etc., to platform shapes.

It includes, but is not limited to, the following:

- Provision of all tools, equipment and consumables used in the course of the work.
- Fabrication including cutting, trimming, edge stripping to required size & shape.
- Erecting into position.
- Bolting and/or welding.
- Trimming to suit platform structure and providing openings for pipe or cable, etc.
- Making good edges, and touch up painting including cold galvanizing of cut or welded parts.

11. **Fabricate and Install Chequer Plate Flooring**

This item covers all activities required to fabricate and erect chequer plate flooring, from sheets.

It includes, but is not limited to, the following:

- Provision of all tools, equipment and consumables used in the course of the work.
- Fabrication including cutting, trimming edge stripping to required size & shape.
- Erecting into position.
- Bolting and/or welding.
- Cutting to suit platform structure and providing opening for pipe or cable, etc.

12. **Erect Davits**

This item covers all activities required to erect fabricated davits on exchangers, vessels or in structures.

It includes, but is not limited to, the following:

- Delivery of davits and all other materials.
- Provision of all tools, equipment and consumables used in the course of the work.
- Erecting up painting of damaged areas.

13. **Roof and Wall Sheeting**

This item covers all activities required to erect bolting of roof and wall sheeting.

It includes, but is not limited to, the following:

- Provision of all tools, equipment and consumables used in the course of the work.
14. **Down pipes and Gutters**

This item covers all activities required to install metal downpipes and gutters.

It includes, but is not limited to, the following:

- Provision of all tools, equipment and consumables used in the course of the work.
- Erecting including fitting, trimming supporting and jointing.

15. **Roof or Ridge Ventilator**

This item covers all activities required for the erection of roof or ridge ventilators on a steel clouded building.

It includes, but is not limited to, the following:

- Provision of all tools, equipment and consumables used in the course of the work.
- Erecting on roof including any trimming or finial.

16. **Install Gantry Crane Rails**

This item covers all activities required to install rails.

It includes, but is not limited to, the following:

- Provision of all tools, equipment and consumables used in the course of the work.
- Erecting jointing levelling, aligning, and bolting or welding in passion.

17. **Install Gantry/Overhead Travelling Crane**

This item covers all activities required to erect and complete the installation of overhead cranes.

It includes, but is not limited to, the following:

- Provision of all tools, equipment and consumables used in the course of the work.
- Erecting into rails.
- Installing all controls, both mechanical and electrical.
- Testing and running of crane.

18. **Install Travelling Trolleys**

This item covers all activities required for the installation of beam mounted travelling trolley.
It includes, but is not limited to, the following:

- provision of all tools, equipment and consumables used in the course of the work.
- Erecting into position.
- All levelling and shimming of trolley beam as required.
- Marking of all beams and trolley with safe Working Load.
- All testing and running as required.

19. **Inspection and Testing**

- Inspection of steel structure shall be in accordance with the codes and standards.
- LSTK CONTRACTOR shall provide NDE services acceptable to OWNER. NDE inspection shall be carried out in accordance with standards, codes and specifications.
- LSTK CONTRACTOR shall be responsible for the repair of faulty welds and for all required extra radiography and inspection of the faulty welding work. In case of a faulty weld, 100% radiography on LSTK CONTRACTOR'S account can be done as per code.
ANNEXURE- 7 – 2C

PIPE PREFABRICATION AND ERECTION

1.0 PIPING

1.1 Magnitude of Piping

LSTK CONTRACTOR shall prefabricate, install and test all piping as shown on the plan drawings and isometrics.

2.0 PIPING FABRICATION AND ERECTION

2.1 Piping systems and pipe supports shall be designed, fabricated, inspected, and tested in accordance with rules, codes, specifications and drawings.

2.2 Miscellaneous piping materials for vents, drains, instrument connections, etc. on equipment shall be installed using P & ID’S and equipment drawings.

2.3 The fabrication and erection of piping includes field welds. It is LSTK CONTRACTOR’S responsibility to choose the number and location of field welds to ensure efficient transportation and handling during erection. Furthermore LSTK CONTRACTOR shall locate the field welds in such a way that final adjustment for fit-up purposes will be possible.

For alloy piping that has to be stress relieved after welding the number of filed welds shall be kept to a bare minimum. LSTK CONTRACTOR shall thoroughly evaluate the need for each field weld in alloy piping he deems necessary.

2.4 LSTK CONTRACTOR will furnish OWNER with a marked up set of isometrics identifying all spool pieces, and weld numbers. All piping spools shall be clearly identified, per isometric by means of stainless steel tags affixed with wire.

2.5 LSTK CONTRACTOR shall erect all prefabricated and straight run piping as required by the drawings and specifications.

The erection and installation of the piping shall include but not be limited to the following
- Control valves.
- Safety valves
- Rapture disks.
- Level instrument and gauges.
- External level displacers.
- Special fittings.
- Breaching of vents, drains, instrument connections, etc.
- Rota meters.
- Orifice flanges.
- Orifice plates.
- In-line instruments.
- Steam tracing.
- Steam traps.
- Extension stems. Valve operators.
- Bellows, expansion joints and similar specialty items.
- Thermowells (flanged, screwed and weld Ins.).
- Sample coolers.
- Instrument connections (up to and including the first block valve).
- Spring hangers and spring supports.
- Installation of miscellaneous piping and instrumentation supplied by equipment vendor.
- Temporary piping for drying, flushing and hydrostatic testing if necessary.
- Connection of piping to equipment.
- Connection of aboveground piping to underground piping.
- Pipe supports.

This shall include any necessary work to the piping to correct equipment misalignment.

2.6 Fastening of floor supports on concrete will be done with expansion type foundation bolts, if no anchor bolts are provided.

2.7 LSTK CONTRACTOR is responsible for the installation of steam tracing of piping, valves fittings and instruments where required, in accordance with the specifications and drawings. In general steam and condensate headers will be indicated on the piping plans. Lines to the traced will be indicated on P&ID'S and lines lists. Details of steam and condensate headers will be shown on separate drawings. Identification of steam tracers shall be by aluminum tag noting circuit number. Each end of system should be tagged.

A method of identification and tagging of the other various systems shall be established, subject to approval by OWNER and is for account of LSTK CONTRACTOR.

2.8 LSTK CONTRACTOR is responsible for the fabrication and erection of pipe supports, hangers, anchors and guides, as required by the drawings and specifications.

Spring pots and spring hangers, which shall be provided by LSTK CONTRACTOR as will be assembled, installed, adjusted and unlocked by LSTK CONTRACTOR after hydrostatic testing of the line. The required angle iron, will be decided in the field and supplied by LSTK CONTRACTOR.

2.9 LSTK CONTRACTOR shall install and remove all temporary strainers required for WORK defined herein. The removal of these items will be directed by OWNER. OWNER may decide to leave temporary strainers in during commissioning.
2.10 LSTK CONTRACTOR shall be responsible for the fabrication, installation and dismantling of temporary spool pieces and blinds required for control valves, safety valves and in-line instruments during testing and cleaning. Requirements for these shall be minimized. Requirements for these will be prescribed by OWNER.

In general, in-line instruments, safety valves and control valves may be installed for fit-up purposes if available to avoid the use of temporary spool pieces. They shall be removed for flushing and testing and reinstalled as directed by OWNER. In the case of safety valves these must be installed for fit-up, taken down for calibration by LSTK CONTRACTOR, and reinstalled before mechanical completion. All open flanges and valves shall be blinded or plugged off.

2.11 LSTK CONTRACTOR is responsible for the installation and testing of all piping and steam, electrical tracing and all materials including all items necessary to completely close the systems in strict accordance with the established test system procedures and priorities as directed by OWNER.

2.12 Wrapping & Coating:- Surface preparations and installation of Wrapping & Coating of the underground piping with Cold tape (Materials for line coating and wrapping shall be of Tape coating system (Polyethylene backed tape with butyl rubber based adhesive system), if required

2.12.1 Protective coating shall consist of a coating system employing Primer, Inner Wrap and Outer Wrap.

2.12.2 The coating system shall be mechanically applied by an approved type of wrapping machine utilizing constant tension brakes except at tie-in welds, repair patches and at other locations where mechanical application is not practicable.

2.12.3 Coating and wrapping materials shall be handled, transported, stored and applied strictly in accordance with the manufacturer's instruction.

2.12.4 Wrapping Coating material is Cold tape type from Polyken/Denso/Atla shall be used.

2.13 Flushing and Cleaning Of Piping Systems

i) Sections fabricated in LSTK CONTRACTOR'S workshop shall be fitted with plastic end caps to seal pipe ends, and jointing surfaces shall be suitably protected.

These caps shall not be removed until sections are in the course of erection after delivery at SITE and then shall be removed for refuse.

ii) During fabrication and erection the sections shall be inspected or internal cleanliness.

iii) The water which will be used for testing and flushing of the piping system shall be recollected per instruction given by OWNER.
v) Piping systems shall be flushed with suitable water as supplied by LSTK Contractor unless designated for nitrogen or air testing or otherwise specified by licensor. OWNER'S approval is required before start of flushing.

v) LSTK CONTRACTOR shall supply all equipment, pumps, gauges, etc. required for flushing and testing of the piping systems.

vi) For hydro testing and flushing the piping LSTK CONTRACTOR shall weld and caps and install drain plugs, remove end caps after successful hydro test.

3.0 HYDRO TESTING

3.1 Inspection and hydro testing of the piping systems shall be in accordance with the drawings and specifications and in strict witness by OWNER representatives.

3.2 Atmospheric pressure systems shall be:
- Visually inspected that all joints are properly made.
- Filled with water for a 24 hours leakage test under atmospheric conditions.

If any leakage occurs in the system during testing, repairs must be made without extra costs to OWNER.

3.3 LSTK CONTRACTOR shall test all piping systems as per the project test diagrams. Testing is to be witnessed and approved by OWNER and where applicable by the appointed (independent inspection authority) filed inspector. A test schedule by test system shall be prepared by LSTK CONTRACTOR and shall be submitted to OWNER for Approval.

3.4 Testing and completion shall be in accordance with project system priorities.

3.5 All equipment, pumps, gauges, pressure recorders temporary piping and fittings, test gaskets and bolting, required for testing of the piping systems and part of LSTK CONTRACTOR'S supply. Before testing LSTK CONTRACTOR shall calibrate its testing equipment.

3.6 LSTK CONTRACTOR shall supply and install blind flanges when required to enable testing of the lines.

3.7 Inexpensive temporary gaskets supplied by LSTK CONTRACTOR, shall be used instead of permanent gaskets where test blinds are located for hydrostatic testing. On successful completion of a test the permanent gasket shall be installed when the blinds are removed.

3.8 Piping systems shall be tested with suitable water. Extreme care shall be taken that suitable water is used for stainless steel systems. For stainless steel the water must be approved by OWNER and shall have a content of chlorides ≤ 50 mg/L

3.9 The water for testing purposes will be furnished by LSTK CONTRACTOR.
3.10 LSTK CONTRACTOR is to perform the testing in a sequence so as to allow sufficient time for insulation and/or painting to complete within the time frame of the project schedule.

3.11 A formal system of documentation will be developed by LSTK CONTRACTOR and approved by OWNER for use by LSTK CONTRACTOR to certify this testing phase of the piping erection. This system will also include a section for supplying OWNER'S "But list" comments.

3.12 Erected piping shall be hydrostatically tested in test systems, but not through equipment, control valves etc. except where piping is welded to equipment.

3.13 LSTK CONTRACTOR remains responsible for ensuring that no item of equipment, or instrument, is damaged by the test pressure or the test fluid. Suitability of test fluid to be Approved prior to testing by the OWNER.

3.14 It is emphasized that the installation of temporary strainers prior to testing shall be part of WORK. OWNER shall be contacted concerning installation of temporary strainers.

3.15 When lines are pressure tested, valves at the end of the lines must be covered with a test blank for safety reasons. A record, preferably on the test diagrams, shall be kept by LSTK CONTRACTOR indicating which sections have been completed.

Note: Testing against closed valves is not allowed (spades to be used)

3.16 All material damaged during tests shall be replaced on LSTK CONTRACTOR'S account. All joints broken after testing for installation of strainers, orifice flanges, safety valves, etc. must be remade tightly; labour is for LSTK CONTRACTOR'S account.

3.17 After testing the piping systems, they shall be completely flushed and drained. OWNER will approve when a line is considered flushed and drained by LSTK CONTRACTOR.

3.18 When each section or circuit has been pressure tested and passed, a certificate prepared by LSTK CONTRACTOR on LSTK CONTRACTOR'S furnished forms showing details must be signed by LSTK CONTRACTOR and OWNER, when the test has been completed and the system drained, test blanks must be removed by LSTK CONTRACTOR.

3.19 The following activities by LSTK CONTRACTOR are included for the reinstatement of piping after hydrotesting:

- LSTK CONTRACTOR installed temporary testing blinds to be pulled.
- Temporary spool pieces taken out.
- Gaskets renewed, temporary replaced with permanent.
- Flange connection bolts tightened.
- Post hydro punch list items corrected.

- Temporary strainers installed.

- Chemical cleaning performed.

- Supports and hangers checked if in final position.

- Rotating equipment cold alignment checked.

- Reinstallation of control and safety valves and in-line instruments which LSTK CONTRACTOR has removed for hydro-testing.

3.20 Nondestructive testing of welds and systems is to be performed in accordance with standards, codes and specifications prior to perform any hydro-test.

3.21 Wrapping Coating material for Under Ground piping is Cold tape type of Polyken or equivalent cold Tape to be used.

4.0 PIPING MATERIAL IDENTIFICATION AND PAINTING

4.1 All piping materials are supplied by LSTK CONTRACTOR and shall be properly stamped and color-coded to ensure that the correct materials are used as required by the drawings, specifications, codes and regulations.

4.2 All materials will be adequately marked as to its specifications. Should LSTK CONTRACTOR be required to cut same or otherwise render piece(s) to have no marking, LSTK CONTRACTOR'S transfer or replacement of proper identification marking to the pieces involved, must be done according to approved stamping method and to be counter stamped by LSTK CONTRACTOR. Paint alone is unacceptable.

4.3 The governing principle shall be that in the installed piping systems, all components can be identified and their origin and complete specifications can be determined. The method for identification and stamping or tagging of the various components of the system shall be worked out in coordination with OWNER and only be implemented after approval.

LSTK CONTRACTOR shall be held responsible for this requirement as a minimum, and any other requirements of local codes and regulations as to identification and documentation of materials.

4.4 Surface preparation and paint application of piping system by LSTK CONTRACTOR, shall be per paint specification.

4.5 LSTK CONTRACTOR shall assure that no welds are covered by prime coats prior to acceptance of hydrotest.
4.6 LSTK CONTRACTOR must ensure that all stamping such as code stamps, registration spool identification, charge numbers etc. shall be visible after paintwork.

5.0 WELDING
5.1 All welding shall be carried out according to codes and specifications.

5.2 Welder's qualification

5.2.1 All welders including those with valid qualifications will be required to submit a test conducted by OWNER prior to start of welding.

Welders that have a certificate which is still valid for the type of material and in accordance with ASME IX will not be tested by OWNER.

5.2.2 A current list of qualified welders must be maintained by LSTK CONTRACTOR and a copy furnished to OWNER each time a revision is made.

5.3 Welders' identification stamps shall be provided by LSTK CONTRACTOR. Each weld shall be clearly stamped with welders identification. All welding including tack welding shall be carried out by qualified welders. Unstamped welds shall be removed and replaced at LSTK CONTRACTOR'S expense.

5.4 Job SITE fabrication shall be carried out under cover where possible.

5.5 Weld spatter shall be knocked off around all welds leaving a smooth clean surface.

5.6 Where openings for branches are cut in run of pipe, all material, which may drop inside the pipe, shall be completely removed before the branch line is welded in place.

6.7 The interior welds of orifice flanges shall be ground smooth.

5.8 Electrodes, Rods, Wires and Fluxes

Electrodes shall be stored in the makers' airtight containers until required for use. Electrode heaters shall be used on Job SITE, for low hydrogen types of electrodes.

Electrodes and filler wires to be used at site in this job shall be procured from the approved vendors only. Electrodes and filler wires shall be D&H, Advani Orlikon or ESAB, Mailam and Bohler group make only

5.9 Open Air Welding

Where welding in the open air is unavoidable, WORK must be discontinued where the quality of the weld may be impaired by weather conditions. Including but not limited to airborne moisture, sand or high winds. After rain the metal surfaces shall be dried. For metal temperature below 5 °C joints to be preheated.

5.10 Welding Procedure Qualification
LSTK CONTRACTOR shall supply welding procedure specifications and qualification in accordance with the rules as set by OWNER.

5.11 Fees for inspection required for welding procedure and welders qualifications, supply of equipment required for the qualification test of welders and welding procedures are for account of LSTK CONTRACTOR.

5.12 **Inspection and Testing**

5.12.1 Inspection of welds shall be in accordance with the instructions of OWNER and/or the requirements of codes and standards.

5.12.2 LSTK CONTRACTOR shall be responsible for the repair of faulty welds and for all the required extra radiography and inspection of the faulty welding work. In case of a faulty weld, 100% radiography, on LSTK CONTRACTOR’S account, shall be done on the weld performed as per code.

OWNER shall have absolute discretion in the selection of the welds, which are to be radiographed.

5.12.3 LSTK CONTRACTOR shall provide NDE service, acceptable to OWNER.

NDT inspection shall be carried out in accordance with codes for all lines as indicated in the piping specification.

6.0 **STRESS RELIEVING**

6.1 LSTK CONTRACTOR shall provide stress-relieving service acceptable to OWNER. Spool pieces shall be stress relieved in an approved furnace equipped with thermostatic control and temperature recorder. Field welds to be stress relieved with electric resistance heaters. Temperature cycles to be monitored with portable temperature recorder.

6.2 Stress relieved welds shall be hardness tested by approved procedure and must meet criteria spelled out in specifications.

7.0 **TRANSPORTATION**

The following various categories of transportation of pipe, pipe fittings and prefabricated pipe spools will be performed by LSTK CONTRACTOR. All categories include loading and unloading materials. Categories will consist of but not limited to:

- From LSTK CONTRACTOR’S warehouse to LSTK CONTRACTOR’S pipe prefab shop.
- From LSTK CONTRACTOR’S pipe prefab shop to LSTK CONTRACTOR’S painting shop.
- From LSTK CONTRACTOR'S pipe prefab or painting shop to LSTK CONTRACTOR'S storage area or working area located on site or any other location on SITE.

- All transportation required performing nondestructive testing of prefabricated pipe spools.

8.0 **LIFTING, LIFTING EQUIPMENT AND GEAR**

8.1 Rigging and hoisting shall be executed as per construction specification and local requirements and safety rules, as manufacturer's instructions. If there are stringent one shall prevail.

8.2 **Testing And Certification**

All LSTK CONTRACTOR furnished cranes, lifting appliances and lifting gear must be properly tested, examined and/or inspected before being used on SITE, and at the intervals specified in the applicable regulations. Copies of the relevant certificates must always be available on SITE for inspection on request by OWNER or other authorities.

8.3 **Operation**

8.3.1 LSTK CONTRACTOR shall not permit a lifting appliance to be operated otherwise than by a person trained and competent to do so.

8.3.2 LSTK CONTRACTOR shall take express steps to ensure that all personnel employed by LSTK CONTRACTOR are competent and experienced for their assigned tasks.

9.0 **DRAWINGS AND DOCUMENTS**

LSTK CONTRACTOR shall fill in checklists as required by OWNER.

10.0 **MISCELLANEOUS**

10.1 LSTK CONTRACTOR shall furnish all field engineering surveying layout, and checking to properly install all above ground piping to meet all requirements of the drawings and specification. OWNER is authorized to reject any WORK already installed, which is not in accordance with drawing and specifications and of adequate quality.

10.2 All costs involved in demolition, removal and replacement of rejected works shall be the responsibility of LSTK CONTRACTOR. All materials equipment or auxiliaries not accepted by OWNER shall be removed immediately from SITE.

10.3 Underground service lines are marked at their installation limits to above ground piping, indicating line size, service and line number.

10.4 During storage, fabrication and erection, care must be taken to ensure that sand, scrap materials, welding rods, items of clothing and other foreign bodies are not allowed to enter piping.
10.5 All connections which are left open by LSTK CONTRACTOR shall be well protected, so that no sand, dirt or any foreign object come into the system.

10.6 In certain instances special bolting torques might be required on critical connections. LSTK CONTRACTOR will arrange WORK in accordance with these requirements.

10.7 Flanged piping connections to vessels or equipment shall be aligned and shall be properly fitted before bolting up. Piping may be heated to bring it into alignment only when approved by OWNER. Extreme care should be exercised to avoid damage. Heating, welding and flame cutting on equipment will not be permitted.

10.8 No cold springing or pre-stressing of piping will be allowed other than indicated on piping drawings, isometrics and manufacturer's instructions (e.g. for expansion joints).

10.9 Flange faces shall be clean and free from foreign matter before assembly. Damaged flange faces may be dressed with a medium cut file only if the damage does not require new facing. This shall be decided by OWNER.

10.10 During erection care shall be taken to remove all dirt, seals, sand and foreign matters from inside the pipe.

10.11 Since LSTK CONTRACTOR is responsible for both the prefabrication and the erection of all the piping, it is LSTK CONTRACTOR'S sole responsibility to ensure that all piping to be installed fits properly prior to lifting. LSTK CONTRACTOR is to check all equipment and underground piping to be piped to, for proper location and orientation. OWNER will not entertain any claims for extra work for:

i. Taking piping down for rework after it is lifted

ii. Re-lifting piping after it is reworked.

10.12 Final hookup of piping to equipment such as pumps and compressors shall be done together with the final alignment of this equipment and shall include checking of dimensions. Piping must fill these flanges without inducing any strain on equipment.

10.13 In all cases, all designated support and hangers should be in unlocked / cold position before final alignment. LSTK CONTRACTOR will be expected to expedite this critical phase of construction.

10.14 Certain small vessels will be considered to be piping items and shall be fabricated as such by LSTK CONTRACTOR.
ANNEXURE- 7 -2D

EQUIPMENT ERECTION

1.0 SURVEYING

1.1 Baseline and base elevation will be furnished to the LSTK CONTRACTOR. LSTK CONTRACTOR will furnish all surveying from this baseline and elevation.

1.2 OWNER shall have the authority at any time to determine in accordance with the drawings or written directives, the correctness or completeness of the lines in use by LSTK CONTRACTOR.

1.3 Any erroneous WORK shall be corrected to OWNER’S satisfaction at LSTK CONTRACTOR’S expense.

2.0 RIGGING STUDIES AND PLANS

2.1 LSTK CONTRACTOR shall supply rigging studies and plans as specified.

3.0 EQUIPMENT HANDLING

3.1 The handling of all equipment shall include, but not limited to the following activities by LSTK CONTRACTOR:

3.1.1 Submittal to OWNER of detailed rigging studies and plans for lifting, transporting and setting of equipment 4 weeks in advance of work for OWNER to review and approval. Complicated lifts shall be started in the morning and completed the same day.

The transportation plans are to include as a minimum:

Type of equipment to be used to transport each piece.

The planned route of the movement.

The estimated duration of the movement.

The obstructions to the route to be temporarily removed.

3.1.2 Receive, inspect, store, protect and perform preventative maintenance on all equipment in accordance with the specifications and drawings and/or equipment manufacturer’s instructions.

3.1.3 Prepare foundations, pipe sleeves, paving, concrete structures and steel structures for setting equipment.
3.1.4 Transport form warehouse or point of unloading and install equipment on foundations, paving or structures.

3.1.5 Plumb level and align equipment with coordinates in accordance with the specifications and drawings.

3.1.5.1 GENERAL

All of the equipment must be plumbed, leveled and aligned with the coordinates specified on the drawings both in plan and elevation and to the tolerances called out in the specifications, specific manufacturer’s instructions or recommended manufacture’s practices.

- LSTK CONTRACTOR will be required to verify field conditions and will be responsible for final alignment of mechanical items for this project. LSTK CONTRACTOR will check the anchor bolt locations against the equipment. Any deviation must be reported to OWNER in writing.

- LSTK CONTRACTOR will be required to supply and install shims required for all equipment erection. All cinch anchors required for equipment and supports will be supplied and erected by LSTK CONTRACTOR.

Prior to the placement of the equipment on a foundation, the surfaces of the foundation shall be cleaned of oil, grease, excess concrete and foreign matters by LSTK CONTRACTOR.

- Prior to setting the equipment on the foundations, the underside of the equipment base plate or supports will be cleaned free of oil, grease and other loose materials by LSTK CONTRACTOR.

- Anchor bolts shall be checked for damage to the thread and the threaded part shall be properly greased.

- Damaged anchor bolts must be replaced by LSTK CONTRACTOR and brought to the attention of OWNER.

- The openings between the anchor bolts and sleeves have to be cleaned of foreign materials to full depth of the opening by LSTK CONTRACTOR.

- All steel wear plates and guide keys shall be coated by CONTRACT with proper lubrication, prior to setting the equipment.

- Equipment shall be set true to line, at correct elevation and in proper orientation as shown and noted on the drawings.
- Maximum allowable setting tolerances shall be in accordance with manufacturer's requirements or with the specifications, whichever is more stringent.

- All equipment, unless otherwise specified, shall be leveled with shims at each anchor bolt (shim on both sides of each anchor bolt) and at intermediate points as required to prevent distortion of the equipment. Shims shall have square cut edges (not trimmed or sheared) and shall be of various thicknesses to minimize the number of shims required. Shims shall be supplied by LSTK CONTRACTOR.

- The equipment shall be set, leveled, aligned and inspected with precision tools (steel straight edge, graduated machinist levels, dial indicators, theodolites, water level instruments, turbine levels, etc.). Setting, leveling and alignment shall be according to manufacturer's recommended tolerances and specifications.

- There may be a number of items not installed by the manufacturer, i.e. seals, packing, lubricators, gauges, miscellaneous piping and tubing, thermometers, etc. that will come separately packed from the equipment itself that must be identified, stored, preferably inside in accordance with project criteria, and finally installed. LSTK CONTRACTOR is responsible for these activities.

- LSTK CONTRACTOR shall remove all temporary shipping supports or erection materials.

- LSTK CONTRACTOR shall do surface preparation for, and apply coating and wrapping on buried vessels before installation.

   Equipment supported on legs or on saddles shall be set to the tolerances specified in specifications of the required elevation measured on the flange of the largest diameter pipe-connecting nozzle.

- For equipment with sliding type supports, LSTK CONTRACTOR will remove dirt, grease or other foreign matter and will coat with graphite grease supplied by LSTK CONTRACTOR on the support.

- The anchor bolt nuts will be placed so as not to restrict the longitudinal movement of the sliding end.

- Vessels, drums, etc. shall be aligned, where applicable and leveled per shown or drawing.

- Shims shall be placed approximately evenly spaced under the support ring of vessels, drums, tanks.

- Towers with two or more pieces shall be assembled and welded at site by LSTK CONTRACTOR.

- LSTK CONTRACTOR is responsible to check and inspect at these equipments in the
- All costs are included in the lump sum price.

3.1.5.2 Rotating Equipment

- Rotating equipment will be installed in accordance with manufacture’s instructions.

Align drivers with all rotating equipment.

- LSTK CONTRACTOR shall install all ancillary equipment such as, but not limited to, drivers, guards, harness piping and all other interconnecting piping, casing drains, base plate drains and all necessary supports.

- The measurements for the positioning and leveling of mechanical equipment will be made on the suction flange.

- LSTK CONTRACTOR to install permanent packing, seals lubricating oils, greases and circulated oil systems.

- Services of manufacturer’s technical representative by LSTK CONTRACTOR shall be used to the fullest extent.

- Rotating equipment base plates will be supported for positioning and leveling on shims located as follows.

- For bases with four (4) anchor bolts, one set of shims will be placed adjacent to each anchor bolt.

- For bases with six (6) or more anchor bolts, two (2) sets of shims will be placed adjacent to each anchor bolt, one on each side of the anchor bolt.

- In addition shims shall also be placed directly under those parts of the base plate carrying the greatest weight and shall be placed closely enough to give uniform support.

- When the base plate is level in all directions as indicated by an accurate instrument on the machined pads, the anchor bolt nuts shall be brought down evenly, but not too firmly. The unit is now ready for grouting. After the grout has adequately set, pull the anchor bolt nuts down tight and recheck the base for levelness.

- Release for grouting of base plates must be approved by OWNER.

- After completion of the electric installation to the motor, the direction of rotation of the motor will be determined. Prior to checking the direction of rotation, the coupling between the motor and the equipment will be disconnected for the test run of motor by LSTK CONTRACTOR.
- Rough aligning of the centrifugal units and their respective drivers shall take place after the equipment has been put on the foundation.

- Coupling alignment

- Dial indicators shall be used and where possible optical alignment equipment.

Peripheral alignment shall be checked by using one dial reading peripheral differences between coupling halves as they are rotated together.

Face alignment shall be checked using two dials reading face-to-face differences between coupling halves.

- Tolerances shall be in accordance with manufacturer's instructions with and without pipe work connected.

- Manufacturer's representative shall check that the final alignment of equipment is satisfactory before any running takes place. For small equipment. Where it is agreed by OWNER that the services of a manufacturer's representative are not required, manufacturer's written instructions shall be followed.

- The final checks will be supervised by LSTK CONTRACTOR and the results recorded by LSTK CONTRACTOR and signed by OWNER and LSTK CONTRACTOR.

Final alignment shall be carried out in two stages.

- After piping is complete with all bolts removed from the flange connections.

- Final alignment with piping assemblies 100% complete and all flanges bolted up to ensure that no unforeseen vertical or horizontal pipe loading is imposed on the unit.

- The final aligning supervised by OWNER to make sure that the detailed instructions furnished by the equipment suppliers are carried out to the full satisfaction.

LSTK CONTRACTOR to supply qualified personnel in the final alignment activities.

- Prior to putting pumps, etc. into operation, loose equipment such as guards and gauges shall be installed by LSTK CONTRACTOR.

3.1.6 Mount the drivers to the rotating equipment in case of turbines and any large motors that are shipped separately.

3.1.6.1 In case electric motors have to be installed in the field, this shall be done after leveling of base plate, but prior to grouting.

Chrome / nickel shim martial, supplied by LSTK CONTRACTOR shall be used for alignment.
of drivers and pumps and shall be installed under the entire footing of the driver.

3.1.6.2 Equipment and drivers shall be doweled to bed plate if required by manufacturer's instructions.

3.1.7 Assembly whenever required for the items / package unit like Auxiliary Boilers, Waste Heat Boilers, Air - cooled exchangers, furnaces , compressors , Turbo generators etc. units as part of the scope of WORK of installation by LSTK CONTRACTOR.

3.1.7.1 Compressor seal oil and lube oil systems and control panels are included in LSTK CONTRACTOR'S installation of compressors.

3.1.7.2 When equipment is delivered in two or more sections for site welding the weld preparation must match accurately on mating sections before assembling.

3.1.7.3 LSTK CONTRACTOR shall assemble and erect items, whether skid mounted or supplied in individual components as specified in the requisition or indicated on drawings in order to make a completed unit.

3.1.7.4 Installation, assembly and alignment of the various components shall be done by LSTK CONTRACTOR.

3.1.7.5 Installation of air - cooled exchangers includes the erection of structural steel on the pipe rack, which will support the tube bundles must be done by LSTK CONTRACTOR.

3.1.7.6 Walkways, platforms, stairs, ladders shall be installed for the items / package unit like Auxiliary Boilers, Waste Heat Boilers, Air - cooled exchangers, furnaces, compressors, Turbo generators etc. by LSTK CONTRACTOR.

3.1.7.7 Drying out systems, refractory and linings is included in LSTK CONTRACTOR scope of work.

3.1.8 Install ladders, platforms, davits, pipe supports and pipe guides in accordance with drawings and specifications.

3.1.9 Open man ways. Inspect. clean and close man ways of all tanks, towers. vessels and other equipment as directed by specification or manufacturer.

3.1.10 Install all trays and vessel internals and support for same shipped loose. in accordance with drawings, specifications and manufacturer's recommended installation instruction.

3.1.11 Under the supervision of OWNER and respective manufacturer’s representative LSTK CONTRACTOR shall load the first loading of chemicals.

a) There will be certain items of equipment such as filters and package equipment that come with cartridges filled with desiccants, resins, etc. Their items will be installed by LSTK CONTRACTOR if they are shipped separately from the
b) Installations include the pick-up of these chemicals from the place of storage and transportation to point of installation.

3.1.12 Under the supervision of OWNER, LSTK CONTRACTOR install the first loading of catalysts. Installations include the pick-up of these catalysts from the place of storage and transportation to point of installation.

3.1.13 Touch-up of painting on new equipment after erection.

3.2 LSTK CONTRACTOR shall install grout under all equipment as required.

3.3 Grouting will be as per the specification per the equipment manufacturer's recommendation, whichever is more stringent.

3.4 The following work is included but not limited to LSTK CONTRACTOR'S scope for installation of grouting:

3.4.1 Prepare top surface of base and/or plinth, pockets, sleeves etc., prior to placing grout.

3.4.2 Install grout mortar consisting of one part Portland cement and one part of clean sand and sufficient clean water for workability.

This grout mortar shall be used between steel base plate and concrete foundations.

3.4.3 Wherever non-shrinkage grout is specified on the drawings, the same shall be supplied by LSTK CONTRACTOR and installed in accordance with manufacturer's instructing.

3.5 Install non-shrink grout between reciprocating I rotary equipment base frame including the filling of the equipment steel frame if required, and concrete foundation in accordance with manufacturer specifications and project specifications. Type of non-shrink grout to be approved by OWNER. After grouting, shims used in leveling equipment will not be removed except where removal is specifically required by manufacturer's instructions.

3.6 Unless indicated otherwise on drawings vessels supported on skirts and support rings will be grouted using a stiff mix under the support ring so as to obtain full bearing. Grout will be placed within the area of the skirt the high point of ground at the vertical axis of the tower (or vessel), sloping downward to the support ring with four (4) weep holes under the support ring sufficiently large to ensure drainage.
4.0 MATERIAL HANDLING SYSTEM

4.1 ERECTION & COMMISSIONING

4.1.1 The complete material handling system including its all equipment shall erected at site and commissioned in accordance with the best engineering practice.

4.1.2 Packing, forwarding, transportation, unloading and storage at site, safety and protection of various components at site, insurance etc. shall be the responsibility of the LSTK Contractor / supplier.

4.1.3 All men, material and tools required shall be arranged by the LSTK Contractor at his own cost. The LSTK Contractor shall also arrange for the safe handling, storage, protection and security of his good at site.

4.1.4 The purchaser shall be responsible for supplying his part of material only as covered by the clause pertaining to the work to be excluded from LSTK Contractor’s scope of supply.

4.1.5 After erection at site, the belt conveyors and related equipment shall be tested for satisfactory operation for mechanical completion and full-load performance run. The LSTK Contractor shall carry out performance test as per mutually agreed procedure. The details of the procedure shall be submitted by the LSTK Contractor for purchaser’s approval.

4.2 MECHANICAL COMPLETION

4.2.1 Mechanical completion shall be considered as achieved when the system is mechanically complete along with the pre-commissioning activities and is ready for feeding. This shall include but not limited to the following:

1. The installation as per FINAL PROPOSAL is complete in all respects in accordance with the drawings, specifications including any approved changes thereto and in accordance with all applicable codes and laws.
2. The machinery, conveyors and all drives are aligned and run or cycled under no-load conditions.
3. The electrical system is installed and tested in accordance with applicable codes and specifications. All wiring is checked for correct hook-up. Motor rotation is checked and power system protective devices are set.
4. Painting is completed to the extent that the incomplete work does not prevent plant start-up and commissioning.
5. Successful completion of no-load test of all the equipment and the complete system.
6. Temporary construction facilities are removed to the extent necessary to permit the plant start-up and commissioning.
4.2.2 The OWNER shall inspect and certify that the LSTK Contractor executed the job in accordance with drawings and specifications.

4.2.3 When the complete belt conveyors and related equipment have been fully erected at site, LSTK CONTRACTOR shall request OWNER for his agreement to start the No-load Test Run. Owner shall, within 72 hours of receipt of such request, issue his agreement or advise LSTK Contractor in writing of any deficiencies noticed in the equipment.

4.2.4 Omissions / rectifications of minor items, if any, not affecting commissioning shall not withhold MECHANICAL COMPLETION as long as the LSTK Contractor agrees to supply / rectify the same within the specified period. The decision of the OWNER is final in this regard.

4.3 COMMISSIONING AND GUARANTEE TEST

4.3.1 After issue of Mechanical completion certificates by Owner, LSTK CONTRACTOR & OWNER shall mutually decide the date of commissioning of the equipment. From the date of commissioning, the equipment shall be gradually brought up to full load or any other load at the discretion of OWNER, and thereafter the equipment shall be run for a minimum period of 5 days. OWNER shall have the right to reduce this period where deemed necessary because of OWNER’s difficulties. During this period of 5 days of operation or the reduced period, the system shall run at an average of 90% of rated capacity. If the LSTK CONTRACTOR is not able to bring the load to 90% of the rated capacity as mentioned above within 2 (two) months, OWNER shall, without prejudice to any of his rights under the contract, has the right to take over the equipment and to proceed with modifications / rectifications / additions as he considers necessary at LSTK CONTRACTOR’s cost and risk to achieve this sustained load run.

5.0 PREPARE EQUIPMENT FOR OPERATION

5.1 Immediately prior to turnover, LSTK CONTRACTOR will make all the equipment ready for operation. This includes, but is not limited to such activities as:

5.1.1 Removal of preservatives and rust preventatives.

5.1.2 Installation of seals or removal of steel covers.

5.1.3 Removal of moisture absorbing materials.

5.1.4 Draining of oil reservoirs and the flushing and filling of the initial charge.

5.1.5 If required by OWNER for the final inspection the opening and closing of man ways of vessels and tanks.
5.1.6 Assisting equipment manufacturer's representatives by final checkout of equipment.

5.1.7 Remove all temporary supports, bracing, or other foreign objects that were installed in vessels rotating equipment or other equipment to prevent damage during shipping, storage, transport and erection.

5.1.8 Conduct all flushing, blowing and chemical cleaning required by the specifications.

5.1.9 Check and run in all rotating equipment, i.e. compressors, pumps.

6.0 Scaffolding Sufficient amount of scaffolding required for good performance of the WORK shall be supplied by LSTK CONTRACTOR.

7.0 DRAWINGS AND DOCUMENTS

7.1 LSTK CONTRACTOR will carry out all construction and any required procurement activities directly from the AFC construction drawings and specifications and forming part of the CONTRACT. No additional design work or development e.g. completion of drawings will be required from LSTK CONTRACTOR.

However, the plan type drawings called out to be supplied by LSTK CONTRACTOR in previous subsections of this section are included in LSTK CONTRACTOR'S scope of WORK.

7.2 All of LSTK CONTRACTOR'S drawings, calculations, documents, test reports, and test certificates are to be submitted to OWNER for approval in 6-fold. After receiving approval LSTK CONTRACTOR to submit for final approval all of the above and one (1) soft copy in CF format. LSTK CONTRACTOR drawings receiving "Approved as Noted" stamp may be worked on provided all notes are incorporated. It is understood that OWNER'S approval shall not receive in no way LSTK CONTRACTOR from any of his obligations and further more shall not relieve LSTK CONTRACTOR from his obligations to timely complete the WORK according to approved project schedule by OWNER.

7.3 LSTK CONTRACTOR'S drawings shall be clearly marked with titles, equipment numbers or other item identification.

7.4 Approval of drawings and calculations by OWNER in no way absolves LSTK CONTRACTOR from its responsibility for the accuracy or for the design, construction and timely performance of the WORK.

7.5 LSTK CONTRACTOR shall promptly submit reports of each and every test or inspection.

7.6 LSTK CONTRACTOR shall submit quality records of the materials, as specified in previous sections and the applicable engineering specifications.

7.7 LSTK CONTRACTOR shall furnish an equipment installation record indicating date of installation and tag number of each piece of equipment.

7.8 LSTK CONTRACTOR shall furnish an equipment maintenance record indicating date and type or maintenance of each piece of equipment during the LSTK CONTRACTOR period.
7.9 LSTK CONTRACTOR shall fill out checklists as required by OWNER.

8.0 LIFTING, LIFTING EQUIPMENT AND GEAR

8.1 Rigging and hoisting shall be executed in accordance with construction specification local and governmental requirements and safety manuals, as well as specific equipment manufacturer's instructions. If there are conflicts, the more stringent shall prevail.

8.2 LSTK CONTRACTOR shall only perform the lifts and movements in accordance with approved LSTK CONTRACTOR submitted rigging studies and plans.

8.3 Preferably, equipment will be lifted in accordance with manufacturer's instructions, if included, using lifting trunnions, lifting lugs if provided, or by slings attached to or around the equipment, with adequate protective measures to prevent damage to equipment. No temporary lifting lugs shall be used without the written approval of OWNER.

8.4 No nozzles or other appurtenances not intended for lifting shall be used for attachment of slings.

8.5 Equipment shall be handled with sufficient care to prevent damage. Slings shall have adequate protection to prevent marring the surface of equipment. Where necessary, sling spreaders shall be used to prevent crushing or other damage to the equipment.

8.6 Testing And Certification

All LSTK CONTRACTOR furnished cranes, lifting appliances and lifting gear must be properly tested, examined and/or inspected before being used on site and at the intervals specified in the applicable regulations. Copies of the relevant certificates must always be available on site for inspection on request by OWNER or proper authorities.

8.7 Operation

8.7.1 LSTK CONTRACTOR shall not permit a lifting appliance to be operated otherwise than by a person trained and competent to do so.

8.7.2 LSTK CONTRACTOR shall take express steps to ensure that all personnel employed by LSTK CONTRACTOR are competent and experienced for their assigned tasks.

9.0 WELDING

Welding of or on equipment shall only be permitted with the approval or OWNER.

10.0 EQUIPMENT PAINTING & INSULATION TOUCH

Rotating and special equipment to be erected by LSTK CONTRACTOR will be delivered to SITE finished painted. LSTK CONTRACTOR is responsible to apply remedial touch up painting for any damages to paint, or protective coatings on equipment handled by it in connection. With any aspect of this operations such as unloading, transport, handling and erection as per Annexure mention in ITB Section.
ANNEXURE- 7 - 2E

ELECTRICAL WORK

1.0 SCOPE : ELECTRICAL WORK COVERS

1.1 Installation and erection of the following equipment (items) consists of the preparation for installation, connection, testing and pre-commissioning etc. as per specifications and as per drawings.

1.2 Provision of all tools, equipment and consumables used in the course of the work.

1.3 The installation of the following systems (items) shall consist of the connection, testing and pre-commissioning etc., so that the systems are ready for use as per specifications and as per drawings.

1.4 Transport, store and protect supplied materials to the construction location.

2.0 ELECTRICAL ITEMS

2.1 Generators / Motors

2.2 Control panels

2.3 Transformer

Note : Installation of all accessories, tanks, levelling and fixing in place are also considered.

2.4 Switch Gears

Note : Bolting together sections where supplied separately and installation of panels, levelling and fixing in place are also considered.

2.5 Bus Ducting

Note : Jointing and securing the associated switch boards / transformers are also considered.

2.6 Battery charger, battery sets and UPS unit.

2.7 Cables in trench / conduit / tray / Rack.

Note : Following items are also necessary:

a) Measuring and cutting of cable and protection of cut ends.
b) Identification of cables

c) Fixing of cable to tray / rack

2.8 Cable Glands

2.9 Cable terminations

2.10 Earthing cable in trench / conduit / tape on tray / Rack

2.11 Earth cable tape terminations

2.12 Lightening protection

2.13 Lighting/ fittings / supports

2.14 Earth Rod PRT and cover

2.15 Cable tiles

2.16 Trench marker posts

2.17 Air craft warning

2.18 Underground electrical grounding system

Note: All below items are also considered:

a) Pulling of grounding cable in trenches, through culverts, protection sleeves and cable ducts as per grounding cable supplier installation instruction, project specifications and layout and detail drawings.

b) Coil up and clearly designate the final destination of the cable ends, especially if cables have to be continued their routing underground or overhead via cable tray or otherwise to their final destination at a later date.

c) Install, including the provision of the required tools, the required through branch and end connections.

d) Installation of all grounding electrodes including inspection pits as per specification and the layout and detail drawings.

e) Return of the cable drums to the storage area including a clear make up of cable length left on the reels of drums that are not empty.

f) Measure cable resistance for grounding continuity and grounding resistance of ground rods, record data and submit the rest result reports to OWNER prior to commissioning of the installation.
g) Check cables are in proper trenches and ground rods at their location.

h) Perform all test; witnessed by OWNER'S REPRESENTATIVES of the founding installation including the provision of all OWNER approved testing equipment and measuring devices.

2.19 Miscellaneous Electrical equipment

2.20 Earth resistance testing including earth resistance rods for grounding, continuity of grounding, installation resistance testing for electrical cables and HL-POT testing for electrical cables.

3.0 TESTING AND COMMISSIONING

Testing and commissioning consist of the complete testing prior to commissioning, including provision of required testing apparatus and testing documents as requested and as specified in the testing specifications.

- All test results shall be recorded on the test form and submitted to OWNER. Each test record shall include date of test, ambient temperature, climatic conditions, instruments used with serial numbers, names of test personnel and witnesses, identifications of equipment, ground electrode or circuit tested.

- Testing shall be scheduled at least 24 hours in advance and OWNER is to be notified by LSTK CONTRACTOR. LSTK CONTRACTOR will notify all necessary interested parties including manufacturer's representatives.

High potential tests shall not be repeated without authorization by OWNER.

4.0 DRAWINGS AND DOCUMENTS

4.1 LSTK CONTRACTOR will carry out all construction and any required erection activities directly from the AFC construction drawings and specifications.

4.2 LSTK CONTRACTOR shall promptly submit reports of each and every test or inspection.

4.3 For more details LSTK CONTRACTOR shall follow Electrical design philosophy elsewhere mentioned in ITB.
ANNEXURE- 7 – 2F

INSTRUMENTATION WORK

1.0 GENERAL

1.1 Instrumentation symbols and identification of functions shall be based on the current edition of ISA S5.1.

1.2 Specifications for instruments and items of control equipment are shown on data sheets to be issued as they become available.

1.3 All materials and connections for control valves, relief valves, level controllers and similar equipment shall comply with applicable requirements for valves and fittings as noted in the piping specification.

1.4 LSTK CONTRACTOR shall install all shim plates, fixing material such as but not limited to anchors, red heads, etc.

1.5 LSTK CONTRACTOR shall install all instrument equipment tag plates.

2.0 FIELD INSTRUMENT INSPECTION AND CALIBRATION AND INSTALLATION

2.1.1 This item covers all activities and supply of all materials to import calibration of instruments. It includes, but is not limited to, the following:

2.1.1 Provision of all tools, equipment and consumables used in the course of the work.

- Calibration of instruments and provision of all necessary test equipment gauges, materials and ancillary items. All necessary testing instruments to be used must be certified by Govt. recognized testing laboratories.

- Check orifice plates and control valves.

- Protection of instruments to maintain cleanliness at all times.

- Mark instrument to indicate status of calibration.

- Return instruments, after calibration and checking to lay-down areas and / or stores including all packaging.

- Pressure and leak test including the provision of all necessary test equipment gauges materials and ancillary items.

Note: The calibration of all instruments within the packages is also the responsibility of LSTK.
2.1.2 LSTK CONTRACTOR shall install all instruments as listed in the instrument index and further per the relevant installation specifications, documents and drawings.

2.1.3 Field instrument installation includes, but is not limited to:

Mounting of instruments and related equipment, supports protection boxes, manifolds, junction boxes, nameplates, etc.
Installation of measuring elements (probes, sensors, detectors, etc) including their auxiliaries as required (thermowells, supports, valves, etc.) unless done by others

Installation of on-line instruments (by piping)

The following is a typical list of on-line instruments:
- Safety blow down valves.
- Control valves (all types)
- Motor - operated valves.
- Safety shut - down valves (including solenoid valves).
- Safety / relief valves.
- Pressure / vacuum relief valves.
- Self - regulating valves.
- Level gauges.
- Level displacer chambers.
- Orifice assemblies.
- Orifice plates.
- Venturies.
- Turbine meters, annubars, magnetic flow meter.
- Positive displacement meters.
- Variable area meters (rotameters)
- Stilling Wells.
- Thermowells and etc.

- Installation of process connections, impulse lines and capillaries.

- Installation of purge and flushing supply tubing, filter blocks and rotameters.

- Installation of air supply lines.

- Supply and installation of instrument nameplates for field instruments.

2.2 Cable, Supports and Fixing Wire pins, Conduit

LSTK CONTRACTOR shall use for cable installation for indoor and outdoor use the materials such as tubing, cable trays, etc. as called in the specifications.

2.2.1 Cable tray, ladder rack and tubing systems shall be installed to ensure electrical continuity throughout the run and such that water cannot collect or remain in any part of the system.

2.2.2 Pulling of the cables into the trenches, through culverts, protection sleeves and cable ducts as per cable supplier installation instructions and layout drawings, cable lists, trench sections and reel schedules.

2.2.3 Installation of the cable separation tiles, if specified.

2.2.4 Coil up and clearly designate the final destination of the cable ends, especially if cables have to be continued their routing underground or overhead via cable tray or otherwise to their final destination at a later date.

2.2.5 Installation of the sealing shrouds to avoid water ingress after cable cutting.

2.2.6 Installation of the cable markers stamped with cable number by LSTK CONTRACTOR as per cable list.

2.2.7 Installation of cable splicing if required.

2.2.8 Return of the cable drums to the storage area including clear markup of the cable length left on the reels of cable drums that are not empty.

2.2.9 Check if cables are spaced as specified.

2.2.10 Measure cable resistance and cable insulation, record data and submit the test result reports prior to commissioning of installation.

2.2.11 Check whether all cables are installed in the proper trenches.
2.2.12 Perform all tests, witnessed by OWNER of the underground cable installation including the provision of the OWNER'S approved testing equipment and measuring devices.

2.2.13 Record of actual installed cable lengths and location of cable splices.

2.2.14 Where cables required to be installed through or across the edges of tray or other metal work the edge of the lips shall be smoothed, painted and lined with a protective sleeving to avoid cable damage.

2.2.15 Supporting steelwork shall be fabricated and installed by LSTK CONTRACTOR. The material shall be primed in accordance with the painting specification by LSTK CONTRACTOR.

2.2.16 Storage and handling of cable before and during installation shall be carried out with due regard to manufacturer's recommendations. Cable drums shall be rotated only in the direction indicated by drum markings, and open ends of cables are to be effectively sealed immediately after cutting to prevent the ingress of moisture.

2.2.17 At all times, the utmost care shall be exercised to avoid damaging the protective sheathing to cable or of causing excessive bending or twisting which may result in damage to core insulation, sheaths armor and so on.

2.2.18 The bending radius of a cable either during or after installation shall not be less than manufacturer's recommended minimum.

2.2.19 Cables shall be run in continuous unbroken lengths and joints shall not be permitted unless specifically called for in the cable drum-cutting schedule.

2.2.20 Cables installed above ground shall be routed to avoid high-risk areas, e.g. high fire risk areas, and those areas where accidental leakage or spillage may occur and cause damage to cables and supports.

2.2.21 During installation, the ends of cables shall temporarily be protected using compound, tape, heat shrink seals or similar approved methods to avoid damage or entry or moisture until they are permanently terminated.

2.2.22 Pre-cast concrete members should not be drilled for any reason. Fixing shall always be by means of clamping brackets in the most efficient way and in consolation with OWNER.

2.2.23 Under no circumstances shall welding be carried out to any process plant equipment, vessels, pipelines, or structures or to any protected surface unless specifically indicated on the drawings and documentation and then in strict accordance with a procedure subject to Approval of OWNER.

2.2.24 Fixings to the above shall normally be made where brackets and so on, have already been provided or when agreed by the use of purpose built clamps.
2.2.25 On trays horizontal cable runs shall be fastened every 1200 mm, vertical cable runs every 600 mm.

2.2.26 **Grouping**

The cables employed to convey electricity shall be grouped according to the signal kinds. The main group kinds are but not limited to the followings:

a) Intrinsically safe signals.
b) Signal cables not intrinsically safe.
c) Instruments power supply cables.
d) Coaxial cables or telephone cables used as serial data buses.

2.2.27 All cable trays, ladders, tubing and supports and fixing material for indoor and outdoor use shall be installed by LSTK CONTRACTOR.

2.2.28 All cables shall always be installed and connected in such a way that no forces can act on terminals. Further, all instrument and power supply cables inside and outside buildings shall be installed in accordance with both cable lists and drawings by LSTK CONTRACTOR.

Carbon steel coated cable stub ups shall be installed by LSTK CONTRACTOR for all cables from sand trenches to 500 mm above ground, in accordance with electrical connection detail drawings.

2.2.29 **Conduit system**

Single pair cables shall be used to connect field mounted instruments to local junction boxes. Single cables shall be armoured type laid in galvanized carbon steel / aluminium pipes with open ends or on closed cable trays. In order not to damage the cable, a plastic annular cap shall cover the pipe end.

Multipair cables shall be used to connect above said local junction boxes to the control room. Multipair cables shall be armoured type and shall run over head in closed cable trays / ladders supported on the pipe racks.

2.2.30 **Wire Pins**

All stranded cable conductors shall be fitted with crimped taper pins, amp (or equivalent) and all screens with lugs. Installation of all amp wire pins and screen lugs by LSTK CONTRACTOR.

Further, in general, all standby conductors shall be wired to terminals.

2.2.31 **Cable Marking**

All instrument cables, conductors and the instrument screen/earth wires shall be tagged on both sides in accordance with the instrument connection list for local and central control room signals by LSTK CONTRACTOR.
2.2.32 Cable Entry Sealing

- General

After installation of all cables and on direction of OWNER, LSTK CONTRACTOR shall seal off all cable entries and passages.

- Outside walls

All cable entries in outside walls and below grade level shall be watertight sealed. Method of sealing shall be supplied by LSTK CONTRACTOR.

- Separation walls

All cable entries in separation walls of buildings shall be sealed with a fire resistant sealing as described hereafter.

- Control Room Floors

All cable and cabinet entries in floors shall be sealed with polyurethane foam.

- Fire - resistant sealing

All fire resistant sealing shall be class H-30. Small openings in walls shall be sealed with CSD –F (or equal) in luminescent foam.

Large openings in walls and between computer floor and cable basement shall be sealed by inserting CSD-F (or equal) in luminescent plates under between and above the cables. The remaining openings shall be sealed with CSD-F (or equal) in luminescent foam.

2.3 Alarm Systems

2.3.1 LSTK CONTRACTOR shall install the fire alarm including sensors, cabling, local panels, mimic panels and host system. In accordance with:

- Project engineering specification and codes and standards.

- Cabling between panel and detectors, alarms, switches etc. as described above.

- Installation of all junction / terminal boxes, cable terminations and connections, supporting brackets for cabling as described above.

2.3.2 All work related to the fire and gas system, including overall test / loop check as per specifications and drawings, among which the installation, placing and connection of all cables of the fire and gas panel located in the control building and panel in the firehouse shall
be done by LSTK CONTRACTOR.

2.4  **Analyzers Installation**

LSTK CONTRACTOR shall install all analyzers and sampling conditioning systems in the analyzer house as well as in the field consisting of, but not limited to:

- Installation of all vents and drains from analyzers.
- Installation of calibration gas bottles as well as regulators and connecting tubing, as required.

3.0  **LOCAL PANELS**

LSTK CONTRACTOR shall install local panels, consisting of, but not limited to:

a) Mounting, aligning and fixing to the foundation or steelwork. Uncoil, install and terminate underground cable ends. Install and terminate all aboveground cable to / from panels.

b) Install and connect air supply and air signal piping and tubing to ‘from panels.

c) Install cabling and connect alarm horns.

d) Identification / tagging of all equipment, terminals, cables and tubing which is not installed by panel vendor. Tag plates to be installed by LSTK CONTRACTOR.

e) Installation of brackets / supports for cable, etc. and installation material as required to complete the installation.

4.0  **TERMINATION OF CONTROL CABLES FROM THE LV SWITCH ROOM**

The control cables running from the switch room shall be installed and connected in the marshaling cabinet by LSTK CONTRACTOR.

5.0  **CONTROL BUILDING INSTRUMENT INSTALLATION**

5.1  LSTK CONTRACTOR shall install all control building instrumentation in accordance with the relevant installation specifications and drawings.

6.0  **CABINETS AND CONSOLES**

6.1.1  LSTK CONTRACTOR shall install align and anchor all equipment cabinets and consoles in accordance with design drawings and seller's installation instructions.

6.1.2  The false floor shall be completely installed by LSTK CONTRACTOR.
All panels, cabinets, tables, boxes, computers etc. located on the instrument equipment layout shall be place and installed by LSTK CONTRACTOR.

6.1.3 Where cable passage is required according to installation drawings, LSTK CONTRACTOR to indicate locations of holes and passages.

6.1.4 FCS/ESD/PLC cabinets and data base unit:

These groups / cabinets shall be installed in place and bolted together by LSTK CONTRACTOR.

Internal wiring / cabling and / or connections between these groups of cabinets shall be done by LSTK CONTRACTOR in accordance with the instructions of the system vendor's representative.

6.1.5 FCS Consoles

The consoles shall be installed in place and bolted together by LSTK CONTRACTOR, including installation of special table with peripherals.

Internal wiring and cabling and/or connections between consoles shall be done by LSTK CONTRACTOR in accordance with the instructions of the system vendor's representative who will be present during these operations.

6.1.6 Communication racks with the same work description as specified elsewhere in Tender documents.

6.1.7 Main processor cabinets (data base units) with the same work description as as specified elsewhere in Tender documents.

6.1.8 Marshaling Cabinets

Cabinets shall be installed in place and bolted together by LSTK CONTRACTOR.

Cross wiring between these assembled sections shall be done by LSTK CONTRACTOR.

6.1.9 Fire Panel Cabinets.

6.2 Handling and installation. Termination and Connection of Cabling

Cables entering instrument room are installed under false floor. These cable shall be handled, cut to length, stripped and after installation of the cabinets be terminated and connected by LSTK CONTRACTOR.

LSTK CONTRACTOR shall leave slack in the cables and provide markings.
6.3 Installation of System Cables

LSTK CONTRACTOR shall install, plug in and support all system cables. Cable supporting rail in cabinets is installed by cabinet / console vendors, but in any case LSTK CONTRACTOR is responsible.

- System cable shall be installed by LSTK CONTRACTOR under false floor in auxiliary room. System cables are covered by instrument cable list.

6.4 Conduits Cable Tray / Trucking, Support Frames and Brackets

All cable trays, cable trucking, supports / brackets, etc. if required, shall be installed by LSTK CONTRACTOR. For cable tray installation see respective part.

6.5 Auxiliary Cable Installation and Termination.

LSTK CONTRACTOR shall install, terminate, support and connect all auxiliary cables.

Auxiliary cables are all cables covered by instrument cable list and instrument cable layout for control room.

LSTK CONTRACTOR shall open / remove and close parts of the false floor as required for cable installation.

6.6 Communication Cables

LSTK CONTRACTOR shall install and support communication cables. The connection of the cables in the consoles and cabinets shall be done by LSTK CONTRACTOR, under direct supervision of system vendor. LSTK CONTRACTOR shall open / remove and close parts of the false floor as required for cable installation. Communication cables are listed on instrument cable layout for control room and the system cable list.

6.7 Power Supply Cabling

LSTK CONTRACTOR shall install, terminate and connect all power supply cables between power distribution boards and cabinets, consoles, printers and other instrument equipment when listed on the power supply list.

6.8 Earthing System

LSTK CONTRACTOR shall install and connect the insulated earthing cabling / wiring from the earth buses to the cabinets, consoles and all other instrument equipment.

All cabinets and consoles shall be fitted with earthing bus bars and earthing connection bolts by the vendors and under supervision of LSTK CONTRACTOR.
LSTK CONTRACTOR shall install utility, shield and dedicated earth (clean earth) cabling and connections including tags at both ends.

LSTK CONTRACTOR shall check and test earthing system in accordance with relevant documents.

7.0 LIFTING

7.1 Major instrument equipment shall be rigged from points designated or suitable to accept rigging. When available, LSTK CONTRACTOR shall utilize lugs on equipment.

7.2 When establishing hoisting loads, riggings plans and crane capacities, LSTK CONTRACTOR shall adhere to the requirements and instructions as defined in the specifications and as instructed by OWNER.

8.0 TESTING AND PRECOMMISSIONING (FUNCTION TEST)

8.1 Testing and pre-commissioning consist of the complete testing and pre-commissioning prior to commissioning, including provision of required testing apparatus and testing documents, comprising, but not limited to:

8.1.1 Check for completion and conformance to specifications.

8.1.2 Check the accessibility of all instruments and components for field adjustments, routine maintenance and removal for overhaul, and relocate as necessary.

8.1.3 Perform pressure test on all air sub headers as required by the line specifications.

8.1.4 Clean all instrument air sub headers, transmission tubing and control tubing by blowing with dry, filtered air prior to connection of instrument components.

8.1.5 Leak test pneumatic transmission and control tubing, using an approved method acceptable to OWNER.

8.1.6 Perform hydrostatic or, where appropriate, pneumatic pressure tests on all instrument process piping, as required by the respective line specifications. Drain and below free of water, as necessary after test.

8.1.7 Check continuity and identification of transmission and control systems for each instrument to ensure proper hookup. Perform megger and continuity tests for instrument electrical wiring. Check correct source of power, polarity and earthing (take into account intrinsically safe technology of this procedure).

8.1.8 Check the bore of the orifice plates and flow direction during and after installation.
8.1.9 Check (on/off valve and) control valves for direction of flow and proper operation, e.g. travel, action with air failure, etc.

8.1.10 Calibrate all instruments (including the instruments in the fire and gas system) and synchronize transmitter and receiver readings for each instrument loop. Check the orifice plates and flow nozzles. Set air pressure regulators.

8.1.11 Install pressure and temperature gauges after line flushing.

8.2 Check fuses, perform voltage checks and energize all electrically powered instruments, alarm and shutdown system, etc. Maintain power supply.

8.3 Set pneumatic and electronic type switches and local control by simulation of input signals.

8.4 Check thermocouples and resistance thermometer circuits from element to measuring instrument by simulation.

8.5 Check and adjust calibration of all other field and panel mounted instruments.

8.6 Complete loop functional test of all instruments, including the instruments in all package units and in the fire and gas system. Functionally test complete control loops alarm and shutdown systems and partial process sequence, etc., to verify capability to measure, operate and stroke final control elements in the direction and manner required by the process application. All test results shall be recorded and submitted to OWNER. Each test record shall include date of test, ambient temperature, climatic conditions, instruments used with serial numbers, names of test personnel and witnesses, identification of equipment, ground electrode or circuit tested.

Testing shall be scheduled at least 24 hours in advance and OWNER is to be notified by LSTK CONTRACTOR. LSTK CONTRACTOR shall advise OWNER prior to testing, of make, type and accuracy of test equipment used for above-mentioned items. All required test certificates should be of a recent date not exceeding 6 months.

9.0 **PAINTING**

Surface preparation and application of all required paint layers shall be executed in accordance with paint specifications and related standards.

10.0 **WELDING**

LSTK CONTRACTOR shall perform welding in accordance with the normal accepted industrial standards.

11.0 **MECHANICAL COMPLETION**

LSTK CONTRACTOR shall advise OWNER in writing when erection is completed.

Mechanical completion date shall be the date when the activities have been accomplished by LSTK CONTRACTOR as dictated by the construction schedule, which shall be submitted by LSTK CONTRACTOR and approved by OWNER on due time.

12.0 **QUALITY ASSURANCE, QUALITY CONTROL, INSPECTION, CALIBRATION TEST AND MATERIAL CERTIFICATES**
12.1 LSTK CONTRACTOR shall perform quality control, inspect, calibrate required testing, pre-commissioning and supply certificates.

12.2 LSTK CONTRACTOR shall submit reports of each and every test or inspection within three (3) days after actual test or inspection is made.

12.3 Calibration and Testing.

12.3.1 Calibration and testing to be executed by LSTK CONTRACTOR in accordance with respective specifications.

Local instruments such as transmitters, converters, receivers and so on, will be preset by bench testing by LSTK CONTRACTOR in accordance with the specifications before installation on the process, so that no new settings will be necessary for loop acceptance tests.

12.3.2 LSTK CONTRACTOR shall inspect all materials upon receipt for damage and completeness. In case of damage incomplete material, LSTK CONTRACTOR shall modify and immediately inform OWNER.

12.3.3 LSTK CONTRACTOR shall carry out all tests included in this paragraph shall fill out the installation checklists and shall submit all required test certificates and documentation as required.

12.3.4 All tools and test gear necessary to carry out described tests shall be provided by LSTK CONTRACTOR.

12.3.5 Inspection and testing shall be phased with construction and installation in such a manner as to involve the minimum necessary concentration of effort and manpower and the minimum loss of time in reaching the pre-commissioning stage.

12.3.6 All inspection and testing shall be witnessed and approved by OWNER / authorized representative.

12.3.7 LSTK CONTRACTOR shall be responsible for the complete loop continuity check of the field and control room installation, including the parts of the package units, which have been connected by others.

12.3.8 OWNER reserves the rights whenever distinguished package Plant(s)/Unit(s) vendor's representative to be present at site LSTK CONTRACTOR shall be responsible to arrange this WORK.

12.3.9 LSTK CONTRACTOR shall be responsible for the loop continuity checks from the marshaling cabinets or direct connected cabinet cables in the control room (termination point of underground multi core cable). The loop continuity checks shall be performed on a complete loop, including all parts of the loop as indicated on the instrument loop diagrams (ILD’S).
12.3.10 The communication equipment between field and control room building and/or other buildings shall be the responsibility of LSTK CONTRACTOR.

12.3.11 Only complete loops shall be accepted, signed by OWNER after all calibration / function checks have been demonstrated successfully completed and recorded.

12.3.12 For all package units and systems supplied by LSTK CONTRACTOR, installed or partly installed and connected by LSTK CONTRACTOR.

LSTK CONTRACTOR shall perform a normal wiring and loop check of signals and supplies to and from these systems.

The following systems apply:

- Analyzer system
- Bentley Nevada system
- Flow metering system
- Fire, smoke and gas detection system
- Tank gauging
- FCS / ESD / PIC system, etc.

For more details LSTK CONTRACTOR shall follow Electrical design philosophy elsewhere mentioned in ITB.

13.0 Miscellaneous

LSTK CONTRACTOR shall remove all waste and debris from the SITE.
1.0 GENERAL

1.1 SCOPE
This standard covers the requirement for supply and application of materials for thermal insulation of equipment, piping and other items.

1.2 REFERENCE STANDARDS

The design shall be in accordance with established codes, sound engineering practices and shall conform to the statutory regulations applicable to the country. The main codes, standards and statutory regulations considered as minimum requirements are as follows:- (Latest revision of these shall be followed)

- IS 14164 Code of Practice for Industrial Application and finishing of thermal insulation material at temperature -80°C and up to 750°C.
- IS 737 Wrought aluminium and aluminium alloys, sheet, strip
- IS 1254 Specification for corrugated aluminum sheet
- IS 1322 Bitumen felts for waterproofing and damp proofing
- IS 3069 Glossary of terms, symbols and units relating to thermal insulation materials.
- IS 8183 Specifications for bonded mineral wool.
- IS 9743 Thermal insulation finishing cements
- IS 12436 Specification for Preformed Rigid Poly-urethane (PUF) and Poly-isocyanurate (PIR) Foams for Thermal Insulation
- IS 13205 Code of practice for the application of polyurethane insulation by the in-situ pouring method.
ASTM C450  Practice for Fabrication of Thermal Insulating Fitting Covers for NPS Piping, and Vessel Lagging

ASTM C871  Test Methods for Chemical Analysis of Thermal Insulation Materials for Leachable Chloride, Fluoride, Silicate, and Sodium Ions

ASTM C1055  Guide for Heated System Surface Conditions that Produce Contact Burn Injuries

ASTM C1139  Specification for Fibrous Glass Thermal Insulation and Sound Absorbing Blanket and Board

ASTM D1622  Test Method for Apparent Density of Rigid Cellular Plastics

ASTM C680  Standard Practice for Heat Loss or Gain and Surface Temp.

1.3 Deviations:

Should unforeseen difficulties arise to comply with requirements of this standard.

Alternative material and application techniques superior to the requirements of this standard be submitted with complete details for approval of owner.

In case of any conflict / deviations amongst various documents, the order of precedence shall be as follows:

1. Statutory regulations.
2. Job specifications.
3. Engineering design basis.

1.4 LIMITATIONS

Temperature Limits.

This standard deals with insulation applied externally on piping equipments etc. as per the table below:-

<table>
<thead>
<tr>
<th>Maximum Operating Temperature</th>
<th>Type of Insulation</th>
</tr>
</thead>
<tbody>
<tr>
<td>60°C to 750°C for C.S., A.S. &amp; S.S.</td>
<td>HOT</td>
</tr>
<tr>
<td>-180°C to 20°C</td>
<td>COLD</td>
</tr>
</tbody>
</table>

1.5 THICKNESS DESIGN BASIS

Thickness calculation method as per procedure given in ASTM C-680

1. **Hot Insulation**
   - Design Ambient Temperature : 35°C
Design Surface Temperature : 45°C
Permissible Heat Loss : 100 kcal./m2 hr.
Permissible Wind Velocity Outside : 1 m/sec
Permissible Wind Velocity Inside : 0.25 m/sec

2. Cold Insulation

Design Ambient Temperature : 35°C
Design Surface Temperature : 2 °C below ambient/ 0.5 Deg C above the Dew Point
Permissible Heat Gain : 10-12 kcal/m2 hr
Relative Humidity : 85%
Permissible Wind Velocity Outside : 1 m/sec.
Permissible Wind Velocity Inside : 0.25 m/sec.

1.6 GENERAL REQUIREMENTS

1.6.1 Information to be supplied

- Material of construction / dimension of equipments / pipes required to be insulated.
- Temperature
- Location of equipment (Indoor/Outdoor/Elevn.)
- Requirement of removable box type insulation if any
- Special requirements if any regarding type of insulation material and other properties.
- These information shall be supplied in form of insulation schedule.
- Design calculations, drawings and insulation material schedule.
- Material Test certificate’s.
- Insulation works execution schedule.
- Detailed procedure for all types of execution works.
- Bill of Quantities, Initial material take-off, final material take-off and material requisition.
- QA/QC plan.

1.6.2 STORAGE OF MATERIAL

Insulation material shall at no time be stacked directly on the ground; instead it will be stored at a level higher than ground level. It should not only be covered by tarpaulin but other effective protections against weather are also to be provided. The contractor shall provide a properly covered storage to the satisfaction of engineer-in-charge (Refer IS: 10556).

1.6.3 HYDROSTATIC TEST FOR PIPES

Before taking up insulation job on piping or vessels it shall be ensured that hydrostatic test of the concerned equipment / piping is completed. Where it is felt necessary to take up the insulation job before such testing are performed all welded and mechanical joints shall be left un-insulated for a length of at least 150mm on either side of the joint.

1.6.4 PROTECTION OF INCOMPLETE JOBS

Any part of insulation job which is not provided with final weather proofing will be adequately protected by means of tarpaulins and other aids. After the day’s work similar protection should be provided for the partially completed jobs to be continued the next day to avoid any absorption of rain / moisture during the night.
2.0 INSULATION SUPPORTS (CLEATS) TO BE PROVIDED BY EQUIPMENT SUPPLIER

Suitable supports (cleats) in the form of rings, lugs, studs or pins shall be provided on equipment by equipment supplier, however should any additional supports or anchorage be felt necessary for insulation works, the same shall be also considered in LTSK’s scope, including all allied work necessary for the same. These will be installed by the contractor free of any extra cost. Owner shall be informed about the same in advance, so also design/drawings shall be updated accordingly.

3.0 MATERIAL REQUIREMENTS

3.1 INSULATION MATERIALS

3.1.1 General

Whenever reference to any Standard is made it is presumed that the latest revision as on date should be considered unless otherwise specified.

3.1.2 Specification and other requirements

Specification and other requirements will be as per below mentioned table:-

### Hot Insulation:

<table>
<thead>
<tr>
<th>Operating Temperature</th>
<th>Insulation Material</th>
</tr>
</thead>
<tbody>
<tr>
<td>Upto 400 deg.C</td>
<td>Rockwool Mattress of density 120 kg/m³ conforming to IS:8183.</td>

<td>Rockwool Mattress of density 150 kg/m³ conforming to IS:8183.</td>
</tr>
<tr>
<td>451-500 deg.C</td>
<td>1st layer insulation shall be 25mm Ceramic Fibre Blanket of density 128 kg/m³ conforming to IS:15402 and balance layers with Rockwool Mattress of density 150 kg/m³ conforming to IS:8183.</td>
</tr>
<tr>
<td>501-550 deg.C</td>
<td>1st layer insulation shall be 50mm Ceramic Fibre Blanket of density 128 kg/m³ conforming to IS:15402 and balance layers with Rockwool Mattress of density 150 kg/m³ conforming to IS:8183.</td>
</tr>
<tr>
<td>551-600 deg.C</td>
<td>1st layer insulation shall be 75mm Ceramic Fibre Blanket of density 128 kg/m³ conforming to IS:15402 and balance layers with Rockwool Mattress of density 150 kg/m³ conforming to IS:8183.</td>
</tr>
</tbody>
</table>

Bands/Wires for securing insulation shall be of ASTM 8209 Alloy 3003 H16 or 18-737 designation 31000 (old NS3) condition H3 or 18/8 Stainless steel.

For securing cladding on insulation on piping, aluminium band 12mm (min) X 24 SWG thick shall be used. For securing cladding on insulation on equipment, aluminium band 20mm wide X 24 SWG shall be used.

Other insulating materials may be used provided they have the same or better properties and durability aspects.
Insulation thickness of insulating materials shall be based on design calculation of thermal conductivity, insulation class, etc. Same shall be submitted to the Owner with necessary design calculations, drawings, test certificates and durability parameters.

### For Valves, Turbines & Compressors Insulation

Prefabricated factory made Ceramic Fibre pad to be used made out of Ceramic Fibre Blanket of density 128 kg/m³ encased in high temperature resistant cloth. The minimum thickness of the pad shall be –

1. 0 Deg.C to 300 Deg.C = 25mm
2. 301 Deg.C to 400 Deg.C = 50mm
3. 401 Deg.C to 500 Deg.C = 75mm

Removable insulation for flanges and valves, like tailor made jackets or pre formed insulation boxes, shall be suitable for quick removal and reinstallation. All tailor made jackets shall fit the actual valve/flange/equipment and secure adequate overlap to incoming insulated pipes.

Technical data sheet of the Ceramic Fibre Pad is as below:

<table>
<thead>
<tr>
<th>A. Purpose/Application</th>
<th>This Engineering specification is for Fabric jacketed supercera ceramic Fibre insulated flexible reusable covers/pad for application on pipes: pipe fittings, valves, flanges etc vessels &amp; equipments, tubes etc in hot services.</th>

Rockwool Insulation shall be of water Repellent Grade and tested as per BS: 2972 for Water Absorption. Maximum water absorption is 0.5 kg/m² in 48 hours duration.

Precautions must be implemented in the design and fabrication of the insulation jackets to avoid the insulation material from sagging causing reduction of the insulation properties of the jackets.

**Cold Insulation:**

Insulation material and specifications for cold insulation for operating temperatures up to (-) 180°C and dual temperature (cold/hot) service where, upper temperature limit is 125°C shall be as given below for all sizes of piping/equipment:

- **Polyurethane Foam**

  Preformed pipe section’s and radial lags (for higher diameter pipe) of polyurethane foam of self-extinguishing type shall be in accordance with ASTM C591 TYPE-II Grade 2. The physical requirement of bulk density, chloride content, thermal conductivity and PH value of the material shall be as follows:

  - Temp. Limit Bulk density: Upto (-)180°C & 120°C (max) 35.0 to 39.9 kg/m³
  - Chloride content: 20 ppm (max)
  - Thermal conductivity: 0.221 mw/cm°C at mean temp. 10 deg C
  - PH Value: Neutral.
  - Closed cell content: 95% (min)

  High density polyurethane foam block of bulk density more than 300 Kg/m³ shall be used for supports.

- **Polyurethane Foam Cast-in-Situ**

  Cast-in-Situ Polyurethane Foam of density 42±2 kg/m³ conforming to IS: 13205 shall be used. High density polyurethane foam block of bulk density more than 300 Kg/m³ shall be used for supports.

  - Temp. Limit: Up to (-) 45°C and 120°C (max.)
- **Polyisocynaurate**

  Temp. Limit :  Up to (-) 180°C and 125°C (max.)

  Other insulating materials may be used provided they have the same or better properties and durability aspects.

  Insulation material specification/ thickness/application mentioned in this document are the minimum requirements. Insulation specification/ thickness/ application shall be based on design calculation of thermal conductivity, insulation class, relevant IS/ ASTM codes etc. Same shall be submitted to the Owner with necessary design calculations, drawings, test certificates and durability parameters. LSTK shall submit detailed material specifications, durability parameters assured, test certificates and application procedure to OWNER/ PMC approval.

### 3.2 AUXILIARY MATERIALS FOR CLADDING

a) **Aluminium Cladding**

   - **Horizontal Vessels**
     
     Aluminium sheet as per IS-737 (designation 31000, condition H3 for flat sheet & 31500/51300, H4 for corrugated sheets)) shall be used for cladding. Insulation on overall piping, vessel and equipment, cladding will be coated on the side in contact with insulation with 3 mil thick polysurlyn film.

     Specifications for aluminium Cladding material shall be as follows:

     | Material | Reference Code / Standard | Thickness | Application |
     |----------|---------------------------|-----------|-------------|
     | Aluminium sheet with applied moisture barrier of 3 mil thick Polysurlyn coating | IS : 737 / ASTM C-653 | 22 SWG (0.71mm) | For all piping, tanks, vessels, heat exchanger, flanges, valves, equipments etc. upto 24” outside dia |
     | | | 20 SWG (0.91mm) | For piping, tanks, vessels, heat exchanger, flanges, valves etc. above 24” outside dia |

     Removable cover for flanges, valves etc. shall be made out of minimum 18 SWG thickness Aluminium Sheets.

   - **Vertical Vessels**
     
     Cladding material for vessels with insulation O.D. 900 mm and less shall be same as for pipes. For vessels above 900 mm insulation O.D. 22 SWG corrugated aluminium sheet as per IS-1254 or ribbed aluminium sheet 32 mm x 5 mm deep corrugations may be used.

     Aluminium Foil to protect stainless surfaces in Temperature below 0 deg c shall be 0.1 mm (42 SWG) thick per ASTM 8209 alloy 3003 H16 or IS-737 designation 31000 (0IdNS3) condition H3. For securing aluminium foil on stainless steel surface 24 SWG thick x 20mm wide aluminium bands shall be used.

b) **Screws**
Screws used with aluminium sheeting shall be of self tapping type, A No.8x12mm long cadmium plated / SS of high quality at intervals of 150mm.

c) **S-Clips.**
   Aluminium, 20x1.5mm or 25mm wide stainless steel banding bent to form a shape of “S” provide a minimum lap of 50mm.

d) **Bands for securing cladding.**
   Aluminium of dimensions 12mm width x 0.56 mm thick (24 SWG) for pipes. Stainless Steel bands Type 304, 0.4mm thick x 13mm wide for large dia pipes (above 24”) and cylindrical equipment up to outside dia 900mm, 0.5mm thick x 19mm wide for cylindrical equipment above 900mm outside dia meter.

e) **Quick release clips for removable covers.**
   Suitable quick release clips will be made as shown in fig. 7 from 20Cm width x 20 SWG aluminium sheet and some fig.7 from 20mm width x 20 SWG aluminium sheet and some suitable rectangular ring.

f) **Sealant for cladding joints with Foster 95-44 / TIKI F9544.**

g) The vapour barrier mastic shall be Foster 60-38/39 / TIKI M6038/39

h) Adhesive for cold insulation shall be Foster 81-33 / TIKI P8133

i) Vapour Stops at pipe support location shall be Foster 90-66 / TIKI F9066

j) **Rivets:** Aluminium ‘POP’ blind eye type / Stainless Steel 9.5mm long x 5mm dia meter.

k) Filler material shall be PUF dust or mineral wool mixed with specified adhesive shall be placed lightly so as to fill irregular voids and sealant shall be Foster Foam Seal Sealer 30-45. Glass cloth to be used for vapour barrier reinforcement shall be open weave 10 mesh having glass fibre thickness of 5 mils.

Galvanised steel sheets/ Annealed galvanised steel sheets/ Galvanised colour coated sheet are strictly **PROHIBITED** for use in cladding works. Other cladding materials (except G.I.) may be used provided they have the same or better properties and durability aspects, after prior approval from Owner/PMC.

Cladding material / auxiliary material specification/ thickness/ application mentioned in this document are the minimum requirements. Cladding material/ auxiliary material specification/ thickness/ application shall be based on design calculation of thermal conductivity, insulation class, corrosion aspects, durability, relevant IS/ ASTM codes, etc. Same shall be submitted to the Owner with necessary design calculations, drawings, test certificates and durability parameters.

LSTK shall submit material specifications, durability parameters assured, test certificates and application procedure to OWNER/PMC approval.

**4.0 Inspection.**

**4.1 General**

All insulation material shall be subject to inspection by owner before application. In case of doubt, Owner’s representative will have the liberty to get the material tested by the contractor at any approved test laboratory. Any material not meeting specified requirement will be rejected and the rejected material shall have to be replaced by the contractor with material of specified type and quality. Insulation found to be improperly installed shall be removed and reinstalled properly by the contractor.
Contractor shall maintain detailed log of various insulation works and same shall be updated on daily basis. QA/QC checks of work done and materials shall be also registered in the daily logs. Owner will have the liberty to check the logs.

4.2 Inspection

Inspection of materials and/or installation by owner shall not relieve the contractor of his responsibility to ensure that finished insulation conform to specified requirements and is free from defects, contractor shall correct any defects due to poor workmanship. Contractor shall maintain test certificates and other relevant data from manufacturer.

4.3 Test for thickness

Test for thickness shall be carried out after application. Thickness at any point shall not be less than 2mm than the indicated designed thickness and excess thickness up to 115% of the designed thickness is permissible.

4.4 Testing for bulk density

Testing of bulk density of the insulating materials shall be carried out before the application of insulation. This should be within ±15% of the specified value. Test location shall be selected by owner and its repair shall be done by contractor.

5.0 APPLICATION

5.1 General

Insulation thickness shall be as per design calculations as specified in the drawings/insulation schedule/specification/isometric drawings prepared for equipments/piping.

Contractor shall submit detailed calculations and procedure for different insulation works based on relevant IS/ASTM codes.

5.2 No. of Layers

When insulation thickness exceeds 75 mm, the insulation shall be applied in multi-layers with all joints staggered. Each layer will be separately secured with metallic bands/wires.

No. of layers shall be as follows:

<table>
<thead>
<tr>
<th>Insulation Thickness</th>
<th>No. of Layers (Min.)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Up to 75mm</td>
<td>1 Layer</td>
</tr>
<tr>
<td>76 to 150 mm</td>
<td>2 Layers</td>
</tr>
<tr>
<td>151 and above</td>
<td>3 Layers or more</td>
</tr>
</tbody>
</table>

5.3 GENERAL REQUIREMENTS

5.3.1 Surface preparation
- Surface to be insulated shall be cleaned of all dirt. Oil loose scale etc. by wire brushing. Insulation works shall commence only after necessary clearance from QA/QC for painting works as per painting specification. All insulation shall be applied at ambient temperature and both the metal surface and insulation material shall be dry prior to application of insulation.

- The surface for cold insulation shall be then coated with a bitumen emulsion or a mastic coating.

- If the vessel is made of stainless steel, it shall be wire-brushed with stainless steel wire brush.

5.3.2 Expansion / contraction joint

Depending on the type of insulation used the operating temperatures and nature of the material it may be necessary to provide expansion/contraction joints on vessels or pipes to prevent the insulation from rupturing/buckling when the surface expands/contracts. Joints are to be designed as per relevant IS / ASTM codes.

5.3.3 Filling of Voids

All voids, irregularities and joints shall be packed with loose insulation material/insulation cement trowelled smooth whichever is applicable.

6.0 MEASUREMENT OF INSULATION WORK.

6.1 Measurement of insulation works shall be as per IS: 14164.

7.0 GUARANTEE

- There shall be a surface temperature recording as mentioned in the Design Parameter to be performed with the help of Thermography Camera, post the line/ equipment is charged in operating conditions. The same shall be in LSTK’s scope and LSTK shall give a detailed report of the same.

- The guarantee test shall be carried out when plant is fully operative.

- The surface temperature, reading shall be taken at six points per pipe line and at each point it shall be taken on all four sides in top, bottom, left side and right side.

- The above reading shall be taken at 2 hours intervals and shall be taken for 18 hours starting from 11 a.m. in the morning.

- Simultaneously ambient temperature shall be taken as per IS: 14164

- A graph shall be plotted between ambient and surface temperature reading

- From this graph the surface temperature against ambient temperature shall be found out

- The ambient and surface temperature shall be measured by the instrument provided by the contractor. The instrument shall be calibrated to the satisfaction of owner/consultant.

- The contractor is required to guarantee the surface temperature of 60°C (max.) for equipments and piping in case of Hot Insulation. For cold insulation of equipments and
piping, the difference between skin temperature and ambient temperature shall not exceed 2 °C.

- Ambient temperature and surface temperature shall be measured by duly calibrated instruments provided by CONTRACTOR.

- The CONTRACTOR shall undertake immediate replacement of insulation material damaged in transit, storage or application, at no additional cost to Owner.

- LSTK shall produce required number of copies of test certificates as per relevant IS/ASTM Standard. LSTK shall certify/ensure that Test to be done are from NABL approved laboratory, approved by Owner.

- All materials are new and unused and are as per specifications called for in this standard.

- The operating thermal conductivity shall be as specified

- The workmanship shall be in accordance with good practice.

- **Other terms & conditions of the guarantee clause shall be as per NIT / purchase order / Commercial documents of ITB.**
1.0 GENERAL

1.1 Scope
This specification covers the technical requirements for shop and site application of paint and protective coatings and includes; the surface preparation, priming, application, testing and quality assurance for protective coatings of mechanical equipment, structural steelwork, plate work, tankage, guards, pipe work, handrails and associated metal surfaces, which will be exposed to atmospheric for the Project.

1.2 Definitions
- C.S - Carbon steel and low chrome (1-1/4 Cr through 9 Cr) alloys
- S.S - Stainless steel, such as 304,316, 321, 347,
- Non-ferrous - copper, aluminium and their alloys.
- High Alloy - Monel, Inconel, Incoloy, Alloy 20, Hastelloy, etc.
- DFT - Dry Film thickness, the thickness of the dried or curved paint or coating film.

1.3 Safety Regulations
Protective coatings and their application shall comply with all national, state, and local codes and regulations on surface preparation, coating application, storage, handling, safety, and environmental recommendations.

Sand or other materials producing silica dust shall NOT be used for any open-air blasting operations.

1.4 Material Safety Data Sheets
The latest issue of the coating manufacturer’s product datasheet, application instructions, and Material safety data Sheets shall be available prior to starting the work and shall be complied with during all preparation and painting / coating operations.

1.5 Materials
All paints and paint materials shall be obtained from the company’s approved manufacturer’s list. All materials shall be supplied in the manufacturer’s containers, durably and legibly marked as follows.

- Specification number
- Colour reference number
- Method of application
- Batch number
- Date of Manufacture
- Shelf life expiry date
- Manufacturer’s name or recognised trade mark.
2.0 CODE AND STANDARDS:

Without prejudice to the provision of Clause 1.1 above and the detailed specifications of the contract, the following codes & standards shall be followed. Wherever reference to any code is made, it shall correspond to the latest edition of the code.

2.1 Indian Standards:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IS-5: 1994</td>
<td>Colors for ready mixed paints and enamels.</td>
</tr>
<tr>
<td>IS-2379: 1990</td>
<td>Color codes for identification of pipe lines.</td>
</tr>
<tr>
<td>IS-2629: 1985</td>
<td>Recommended practice for hot-dip galvanizing on iron and steel.</td>
</tr>
<tr>
<td>IS:110</td>
<td>Specification for Ready Mixed Paint, Brushing, Grey Filler, for Enamels, for Over Primers</td>
</tr>
<tr>
<td>IS:101</td>
<td>Methods of test for ready mixed paints &amp; enamels.</td>
</tr>
</tbody>
</table>

2.2 Other Standards:

(Surface preparations standards for Painting Steel Surface).
This standard contains photographs of the various standards on four different degrees of rusted steel and as such is preferable for inspection purpose by the Engineer-in-charge.

2.2.1 DIN: 53151 Standards for Adhesion test.

2.3 The paint manufacturer's instructions shall be followed as far as practicable at all times. Particular attention shall be paid to the following:

a) Instructions for storage to avoid exposure as well as extremes of temperature.

b) Surface preparation prior to painting.

c) Mixing and thinning.

d) Application of paints and the recommended limit on time intervals between coats.

3.0 SURFACE PREPARATION

3.1 Metal Surface Preparation

3.1.1 Safety

All work in adjacent areas, which may negatively affect the quality of blast cleaning, and/or impose safety hazards, must be completed or stopped before the blasting operation starts.
3.1.2 Pre-cleaning

Prior to surface preparation all weld spatter shall be removed from the surface, all sharp edges ground down and all surfaces cleaned free of contaminants including chalked paint, dust, grease, oil, chemicals and salt. All shop primed surfaces shall be water washed by means of suitable solvent, by steam cleaning, with an alkaline cleaning agent if necessary or by high-pressure water, to remove contaminants prior to top-coating.

3.1.3 Surface Decontamination

Surface decontamination shall be performed prior to paint application when uncoated surface is exposed to a corrosive environment or existing paint work is to be repaired.

Existing coatings shall be removed by abrasive blast cleaning, and then high pressure potable water shall be used to clean steel surfaces.

Prior to application of coatings, the surface shall be chemically checked for the presence of contaminants. A surface contamination analysis test kit shall be used to measure the levels of chlorides, iron salts and pH in accordance with the kit manufacturer’s recommendations.

Swabs taken from the steel surface, using cotton wool test swabs soaked in distilled water shall not be less than one swab for every 25m² of surface area to be painted.

Maximum allowable contaminant levels and pH range is as follows:

- Sodium chloride, less than 50 microgram / cm²;
- Soluble iron salts, less than 7 microgram / cm²; and

If the results of the contamination test fall outside the acceptable limits, then the wash water process shall be repeated over the entire surface to be painted, until the contaminant test is within the specified levels.

3.1.4 Abrasive Blasting

All C.S. materials shall be abrasive blast cleaned in accordance with Codes (Ref. Clause 2.0). To reduce the possibility of contaminating S.S., blasting is not usually specified. However, for coatings which require a blast-cleaned surface for proper adhesion, S.S. may be blast cleaned using clean aluminium oxide or garnet abrasives (Free from any chloride or Iron / Steel contamination). When hand or power tool cleaning is required on S.S., only S.S. wire-brushes (including 410 S.S.) which have not been previously used on C.S. surfaces may be used.

The surface profile of steel surfaces after blasting shall be of preparation grade Sa 2-1/2 of Swedish Standards SIS-05-5900 (Latest Revision) or better according to ISO 8501-1 and shall be measured using the replica tape method or the comparator method.

The roughness (profile) of blast-cleaned surfaces shall be Medium (G) according to ISO 8503-2: 1988 (appendix 1) unless otherwise specified. Medium defines a surface profile with a maximum peak-to-valley height of 60-100 microns, and G indicates that the surface profile is obtained by grit blasting. For the evaluation of surface roughness Comparator G shall be used.
Abrasive blast cleaning shall NOT be performed when the ambient or the substrate temperatures are less than 3°C above the dew point temperature. The relative humidity should preferably be below 50% during cold weather and shall never be higher than 60% in any case.

Abrasive blast cleaning shall be performed with a clean, sharp grade of abrasive. Grain size shall be suitable for producing the specified roughness. Abrasives shall be free from oil, grease, moisture and salts, and shall contain no more than 50ppm chloride. The use of silica sand, copper slag and other potentially silica containing materials shall not be allowed.

The blasting compressor shall be capable of maintaining a minimum air pressure of 7 kPa at the nozzle to obtain the acceptable surface cleanliness and profile.

The blast cleaning air compressor shall be equipped with adequately sized and properly maintained oil and water separators. The air supply shall be checked to ensure no oil and water contamination at the beginning of each work shift.

Blast cleaning abrasive shall be stored in a clean, dry environment at all times. Recycling of used abrasive is prohibited.

After blast cleaning, the surfaces shall be cleaned by washing with clean water (Pressure 7kg/Cm² using suitable nozzles. During washing broom corn brushes shall be used to remove foreign matter.

Assessment of the blast cleaned surfaces shall be carried out in accordance with reference code.

Blast cleaned surfaces which show evidence of rust bloom or that have been left uncoated overnight shall be re-cleaned to the specified degree of cleanliness prior to coating.

All grit and dust shall be removed after blasting and before coating application. Removal shall be by a combination of blowing clean with compressed air, followed by a thorough vacuum cleaning with an industrial grade, heavy duty vacuum cleaner.

All cleaned surfaces shall have protection from atmospheric corrosion as per IS8629:1977

### 3.1.5 Alternate Methods of Surface Preparation

When open air blasting is not permitted on site, or when space limitations or surface configurations preclude blasting, the alternate cleaning methods listed below may be used with prior approval. Alternate cleaning methods shall consider the degree of surface cleanliness and roughness profile required by the specified coating system.

- Vacuum or suction head abrasive blast-cleaning,
- Wet jet abrasive blast-cleaning,
- Compressed-air wet abrasive blast cleaning,
- Pressurized liquid blast-cleaning,
- Power tool cleaning,
- Hand or power tool cleaning,

Hand and/or power tool cleaning shall only be used for spot repair where abrasive blasting is not permitted or is impractical, and on items which could be damaged by abrasive blasting. Power tool cleaning shall not be carried out with tools which polish the surface, e.g. power wire brushes.
The surfaces of equipments and prefabricated piping etc. which are received at site Primerised or with finish paints, depending upon their conditions, shall be touched up and painted at site. For these surfaces sand blasting is not envisaged and these surfaces shall be prepared using power brushes, buffing or scraping, so as to achieve a surface finish to St-3 as per SIS-05-5900. After wash-up the area to be touched up shall be jointly marked, measured and recorded for payment purposes. The type of system & nos. of coat (primer and/or finish paint) to be applied after touch up, which shall be decided by OWNER/CONSULTANT in writing before taking up the job.

When paint is to be applied on damaged painted surfaces of equipments all loose and flaking paint work should be removed to a firm feathered edge. Rusted spots should be cleaned by one of the methods specified in the clauses 4.4.1 & 4.4.2 above. In case the previous paint work is not compatible to the specified one the entire coating must be removed.

It shall be ensured that sand blasted surface/machine cleaned surface is not contaminated with oil and grease. Water shall also not be allowed to come in contact with sand blasted surface.

### 4.0 APPLICATION

#### 4.1 General

The final specification of paint systems to be used to suit the exposure conditions of equipment and steelwork, shall be as specified on the scope of work, equipment data sheets or the drawings.

All coatings shall be in accordance with Indian / International Standards, the coating manufacturer’s product data sheets and application instructions and the requirements contained in this specification.

#### 4.1.1 General Requirements for Shop Application

All work areas which facilitates shop paint application shall be surface prepared for painting and have the paint system applied before installation. Equipments assembled at site shall only receive primer coat in the shop and finish coatings will be applied at site.

In all cases, where surfaces will be inaccessible after shop assembly, they shall be prepared and have the paint system applied before assembly is carried out. Drying times between successive coats shall be at least those recommended by the manufacturer.

All known field weld areas shall be given the specified abrasive blast surface preparation but left uncoated for a distance of 50mm from the weld line. Such areas shall be given the appropriate touch-up treatment after installation.

The manufacturer's directions for preparation and application of coatings shall be followed to ensure that the durability of the coating system is not impaired.

The Contractor shall submit the full details of the proposed surface preparation and paint systems prior to the commencement of any surface preparation.

#### 4.1.2 General Requirements for Site Application

Paint shall be stored only in accordance with the manufacturer's instructions.
All materials used for the specific system being applied shall be products supplied by one manufacturer and details of such product shall be submitted for approval before commencement of work.

The contents of cans shall be thoroughly stirred before being poured into paint pots and shall be thinned only in the specified proportions in accordance with the manufacturer's instructions.

Finish coats may be applied by spraying except where any over spray is likely to affect finished surfaces or where spraying constitutes a health hazard to workmen in the other areas. Brush and roller application will require multiple coats to achieve the specified dry film thickness.

Brush application may be used only with the approval of the company.

Roller application shall only be used on relatively large surface areas (i.e. > 50m²) and only if spraying is not an option.

The Contractor shall complete the application of any one type of paint or each coat thereof, before beginning the next coat on that section.

In cases nominated as critical, the application of each coat shall be approved before application of the next coat can proceed, in accordance with 'hold' points nominated in the Inspection and Test Plans (ITPs)

All fittings within any given area are to be painted with the same system as the area unless otherwise specified.

Where 2 coat of finish paint are indicated they shall be applied in two different shades to ensure that two coat are applied.

Paint shall not be applied in rain, snow, fog or mist or when the relative humidity is such as to cause condensation on metal surface.

The CONTRACTOR must ensure the availability of a specialist from the paint manufacturer, at SITE during pendency of CONTRACT within his quoted rates to ensure the quality of painting & procedure. Addition of drying agents, pigments or other substances is not allowed unless specifically prescribed or approved by paint manufacturer's specialist.

Name plates/tags attached to the equipments/machineries shall not be painted or removed during painting job. Failing to comply with above, the CONTRACTOR may be required to replace name plates/tags at his cost.

4.1.3 Qualifications and Materials

All surface preparation, coatings application and inspection, shall be carried out by personnel experienced in that particular field. Contractors shall submit the names of subcontractors to be employed for the specific work together with the brand names of coating materials for approval prior to commencement of application.

4.1.4 Handling and Transport
All pipe work, steelwork and equipment that have been finish coated shall be handled with care to preserve the coating in the best practical condition.

Painted materials shall not be handled until the coating has completely cured and dried hard. Supports in contact with coated steel during transport and storage shall be covered with a soft material to prevent damage to the coating. Appropriate materials shall be used during transportation between coated steelwork and holding down chains to prevent damage to the coating.

### 4.2 Application of Coatings

#### 4.2.1 General

The application method and type of equipment to be used shall be suitable for the paint specified and the surface being painted.

Paints and thinners shall be brought to the point of usage in unopened original containers bearing the manufacturer's brand name and colour designation and ready-mixed unless otherwise specified. Two-pack systems shall be mixed at the site of application to the paint manufacturer's recommendations. The mixed amount prepared shall be no more than the amount that can be applied during the stated pot life.

Paint shall be applied so that an even film of uniform thickness, tint and consistency covers the entire surface and is free of pin holes, runs, sags or excessive brush marks. Film finish shall be equal to that of first class brushwork. Unless it is practical to do so, colour shades for primer, intermediate coat and finish coat must be different to identify each coat without any ambiguity.

Paint ingredients shall be kept properly mixed during paint application.

Equipment shall be kept clean to ensure dirt, dried paint and other foreign materials are not deposited in the paint film. Any cleaning solvents left in the equipment shall be completely removed before painting. To ensure the required film thickness is achieved on angles, welds, sharp external edges, nuts and bolts, a coat shall be applied to such items/locations immediately prior to the application of each coating to the whole area.

Care shall be taken to ensure paint application into all joints and crevices.

The contact surfaces between steelwork to be fastened by means of friction grip bolting shall be abrasive blast cleaned and prime coated only, prior to erection.

#### 4.2.2 Atmospheric conditions

Surface preparation and coating shall not be carried out in inclement weather and shall be carried out such that the surface being coated is free of moisture, wind-borne or blast cleaning dust.

Coatings shall not be applied if:

- The relative humidity exceeds 85%.
- The ambient temperature is less than 5°C (depending on local condition)
- The metal temperature is less than 3°C above the dew point.
- There is likely hood of an unfavourable change in weather conditions within two hours after painting.
As a general rule, sufficient ventilation, dehumidification and heating capacity to cope with local climatic conditions must be secured before any coating-related work is started.

In any case, humidity, ambient and surface temperature conditions at the time of paint application, and curing and drying time before application of the next coat, shall be in accordance with the paint manufacturer’s recommendations. These conditions shall be recorded in the Inspection Test Record (ITR) by the Contractor and be available for review.

4.2.3 Conventional or Airless Spray

Spray equipment shall be equipped with accurate pressure regulators and gauges. Spray gun nozzles and needles shall be those recommended by the paint manufacturer.

Air from the spray gun shall be clean and dry with no traces of oil or moisture.

Coatings shall be wet on contacting the painted surface. Areas of dry spray shall be removed and the correct system re-applied.

4.2.4 Brush Application

The method of "laying-off" shall be suited to the paint specified and shall ensure minimum brush marking.

4.2.5 Roller Application

A uniform method of application shall be adopted when painting large areas. The rolling direction shall minimise paint joint build up. Edges and areas subject to possible roller damage shall be brush-painted prior to rolling.

4.2.6 Thickness of Coatings

The maximum thickness DFT in any one application shall not exceed that specified in Technical specifications/recommended by the paint manufacturer.

Wet film thickness gauges shall be used to make frequent checks on the applied wet film. The Contractor shall maintain at the site of painting operations, a dry film thickness tester of an approved type with a valid current calibration.

Coating thickness checks in accordance with reference code shall be performed, and the Contractor shall undertake remedial action if the measured thickness is less than specified.

Build up of each material to required thickness shall be made prior to the application of the subsequent coat; final film build shall be the minimum specified.

4.2.7 Multiple Coat Applications (Except Wet-On-Wet)

Before successive paint coats are applied, intermediate coats shall be inspected for surface contamination. The presence of any grease or oil, shall be removed by a suitable solvent, and any salt and dirt adhering to the surface shall be removed by scrubbing with a solution of non-toxic detergent (except those prescribed by the manufacturer as "wet-on-wet"). Removal of contaminants shall only be performed after an intermediate coat has had sufficient time to cure.
The surface shall then be pressure hosed or dusted down by brush to disturb and remove deposits not apparent on visual inspection.

Coatings shall be applied only under the following conditions:
- The surface has been cleaned and is dry;
- The manufacturer's stated minimum time for re-coat has elapsed;
- The manufacturer's stated maximum time for re-coat has not elapsed. If the maximum time has elapsed then pre-treatment shall be in accordance with the paint manufacturer's recommendations; and
- Damaged areas in preceding coat have been made good in accordance with this Specification.

When multiple coat of finish paint are indicated, they shall be applied in different shades to ensure that multiple coats have been applied.

4.2.8 Protective Coatings for Fasteners

Black and galvanised erection bolts/nuts and galvanised holding down bolts/nuts shall be prepared and painted in accordance with Section 4.4 of this Specification.

Black high tensile bolts/nuts shall be painted after erection to the same paint system specification as the surrounding structural steel.

4.3 Hot Dip Galvanising

All galvanising shall be carried out by the hot dipping process and conform to the requirements of IS-2629:1985 and uniformity of coating shall confirm to IS 2633:1986.

All welding slag shall be removed by chipping, wire brushing, flame cleaning or abrasive blast cleaning where necessary prior to galvanising.

For temporary identification, either water-soluble marking paints or detachable metal labels shall be used. For permanent identification, figures/labels shall be heavily punched or embossed by the fabricator.

For galvanised items after pickling, the work shall be inspected and any defects that render the work unsuitable for galvanising shall be repaired. After such repairs, the work shall again be cleaned by pickling.

The coating mass of zinc shall be as specified on equipment data sheets and the Drawings. Galvanised coatings shall be tested by the methods described in referred code.

After galvanising all material shall be cooled to air temperature in such a manner that no embrittlement occurs.

Galvanised coatings shall be smooth, uniform, adherent and free from stains, surface imperfections and inclusions.
All gratings and fixtures including nuts, bolts and washers that are required to be galvanised, shall be hot dipped galvanised and all nut threads shall be re-tapped after galvanising and a lubricant applied on Cold working of galvanised steelwork shall be avoided.

4.4 Damaged or Inaccessible Surfaces

4.4.1 Damaged Paint Surface

Repair of damaged painted surfaces, as well as painting of galvanised and black bolts, and galvanised holding down bolts after erection shall comply with this Clause. The treatment shall be:

- Pre-clean the damaged or unpainted areas in accordance with Section 4.2.1 of this Specification;
- Disc or hand sand to clean bright metal;
- Inorganic zinc primers subject to mechanical damage or weld etc shall be power tool cleaned;
- Feather backs by sandpapering or whip blasting the original coatings surrounding the damaged area over a 50mm distance. A rough surface shall be obtained on epoxy coatings;
- Clean surface to remove all dust;
- Conduct surface contaminant test in accordance with Section 4.2.2 of this document; and
- Build up a new paint system over the affected area with paints equal to those originally used and having the same dry film thickness for each coat. As an exception, damaged inorganic zinc primers shall be repaired with epoxy organic zinc rich paint and shall be applied within four hours of blast cleaning.

The new coatings shall overlap the original coating over the 50mm prepared distance and shall be colour matched to the specified colour of the original coating.

4.4.2 Damaged Galvanised Surfaces

Damaged areas caused by oxy-cutting, welding or physical impact shall be treated as follows:

- Prepare the surface by removing any weld slag followed by vigorous power wire brushing of the coating surrounding the damaged area over a 50mm distance;
- Clean surface to remove all dust; and
- Apply two coats of organic zinc-rich primer to a minimum DFT of 100 microns.

The area to be reinstated shall be colour matched to the surrounding finish colour with 40 microns of aluminium paint to the manufacturer's written instructions.

4.4.3 Inaccessible Surfaces

Surfaces that will be inaccessible after erection of other elements of the structure, shall be fully painted prior to the installation of the obstructing item.

4.5 Surfaces Not To Be Coated

The following surfaces shall not be blasted or coated unless specifically directed:

Machined surfaces, bearings, seals, grease fittings, adjusting screws and name plates, and identification tags.

- Valve stems;
- Raised faces on pipe and equipment flanges;
- Electrical cabling;
- Instrumentation, gauges and sight glasses;
- Titanium, stainless steel and non-metallic surfaces; and

Field weld margins, 50mm either side of weld, on tankage and piping, prior welding.

The rear face of piping flanges shall be shop prime coated only. Flange holes for fasteners shall be fully coated.

4.6 Wash-Up

All surface of equipments/prefabricated piping etc. Primerised / painted at Vendor shop and received at site if required shall be washed up as follow:

a) Washing with clean water (Pressure 7 Kg/cm2) using suitable nozzles. During washing, broomcorn brushes shall be used to remove foreign matter.

b) Solvent washing, if required, to remove traces of wash up as per above procedure of all surfaces of equipment, piping, structure etc. completely painted at contractor's shop shall be included in the quoted rates of oil, grease etc. Wash up as per above procedure of all surfaces of equipment, piping, structure etc. completely painted at contractor's shop shall be included in the quoted rates.

4.7 Touch-Up Painting

Prior to the application of any coat, all damage to the previous coat(s) shall be touched-up. Damage to finished work shall be thoroughly cleaned and re-coated.

Surface preparation shall be done as per clause no. 3.0.........................

Items supplied with the manufacturer's standard coating system shall be touched-up with the same generic coating system or recoated.

4.8 Paint Storage

The following must be ensured:

a) All paints and painting material shall be stored only in such rooms assigned for the purpose. All necessary precaution shall be taken to prevent fire. The Storage building shall preferably be separate from adjacent buildings. A sign-board bearing the Words "PAINT STORAGE- NO NAKED LIGHT" shall be clearly displayed outside. The building shall be properly ventilated and shall be adequately protected with fire fighting equipment.

b) Storage shall be far away from heated surface open flames, sparks & well protected from sun rays.

c) Ambient temperature at which paints are stored shall be intimated to paint manufacturer & their advice sought regarding precautions to be taken if any, regarding flammability, explosiveness & toxicity.

d) Maximum allowed storage time for various paint materials shall be clearly indicated on individual containers. Materials which have passed expiry date shall not be used.

e) Paints in non-original containers and/or in containers without seals, shall not be used.
5.0 COATING SYSTEM SELECTION

Coating Systems for Structures Piping and Equipment

The following Table 1 shall be used as a general guide for the selection of a paint system suitable for a particular plant area application. Paint systems specified on equipment data sheets and the Drawings shall take precedence over the general paint system area applications listed in Table 1.

**NOTES:**

**Primers**

**ZINC ETHYL SILICATE PRIMER – P1**

The zinc ethyl silicate consists of two packs. One pack contains the ethyl silicate binder with suitable solvents. The other pack contains zinc dust (NOT Paste). Zinc dust shall be ASTM D 520 Type II. They have to be mixed in suitable proportions before application as recommended by manufacturer.

| Volume solids | Min.64% ±2 |
Zinc silicate Material curing shall be checked using ASTM D 4752, minimum Acceptable value is 4.

**ZINC RICH EPOXY PRIMER – P2**
The zinc rich epoxy consists of two packs. One pack contains the epoxy binder with suitable solvents. The other pack contains zinc dust as per ASTM D520 Type II. They have to be mixed in suitable proportions before application as recommended by manufacturer.

**TEMPERATURE INDICATING PAINT : F6**

It is a single pack temperature indicating system based on silicone binder. Pigments change colour by heating. The colour change of the coating is permanent. At approximately 200°C, the colour changes from green to blue, above 310°C, the colour changes from blue to greyish white. Maximum service temperature is 400°C.
### Volume solids
- Minimum 72%

### DFT Range
- 150 – 200

### Theoretical Spreading Rate
- 4.8 – 3.6 sqm/litre

### Application
- By brush or airless spray

### Drying time
- Touch dry within 4 hrs. @ 30 Deg C
- Hard dry < 9 hours @ 30 Deg C

### Storage life
- 12 months under sealed conditions

---

**TAR FREE EPOXY – F7 (Coal Tar is Banned Globally being Carcenogic)**

A high build two component abrasion resistant, pure epoxy with anti-corrosive properties meant for excellent performance.

- Shell of fixed roof                                                     WHITE 9010 |
- Roof of fixed roof tank                                                 WHITE 9010 |

### NOTE-1:
The colours shall be according to IS2379:1990/International STD. RAL or BS, proposed by Contractor or Manufacturer

### 8.0 PARTICULAR DESCRIPTION

The abrasive Grit Blasting shall be used for surface preparation. **Sand blasting is prohibited due to environmental regulations.**
Primerized surface shall be faultless and shall not have mud-cracking, dripping over thickness and dry sprays.

Blast cleaning and painting shall not be carried out on wet surfaces.
Blast cleaning shall not be done when surfaces temperatures are less than 3°C above dew point, or temperature is below 5°C.

No acid washes or other cleaning solutions or solvents shall be used on metal surfaces after they have been blasted.

The surface preparation of all steel surfaces to be coated shall be free of all mill scale, rust corrosion product, oxides, paint, oil or other foreign matter

Only dry abrasive blasting procedures will be allowed. The compressed air supply used for blasting shall be free of detrimental amounts of water and oil. Adequate separator and traps shall be provided and these shall be kept emptied of water and oil. Any blast cleaning set up without functioning moisture separators shall be removed from blast cleaning areas.
All welded areas and appurtenances shall be given special attention for removal of welding flux in crevices. Welding splatter, slivers, laminations and underlying mill scale exposed during sand blasting shall be removed or repaired.

The blast-cleaned or power brushing surfaces shall be coated with primer within four hours of surface preparation.

No primer or intermediate or finishing coating shall be applied without prior notification to the Company.

The application of the products shall be carried out in strict compliance with the paint manufacturer’s recommendation.

The Contractor shall provide suitable protection for all adjacent plants or equipment from airborne during spraying and sand blasting.

9.0 INSPECTION AND TESTING
The inspection and testing requirements outlined in this section shall be performed for shop and site applied coating systems.

Preference shall be given to manufacturers and applicators that are quality certified to ISO 9001: 2000.

Documentation of coating material manufacturers and applicators shall include daily inspection reports, equipment reports, and shall clearly identify and trace materials supply and testing performed on coated items and areas.

Inspection and Test Plans (ITPs), and quality control procedures used for application of coating systems shall form part of the Method Statement and shall be submitted for approval by the Principal prior to commencement of work.

The applicator shall appoint a certified inspector of coatings for inspection and testing of coating systems.

Tests of coated areas and items shall form part of the ITPs.
Surface Preparation in accordance to Swedish Standard SIS-05-5900 (Latest).

Blast cleaning profile shall be checked using a suitable profile meter – Acceptable profile shall be 40 - 60 microns.

Check of time of top coating and drying in accordance with the direction of the paint manufacturer.

Check of dry film thickness by suitable non-destructive Instrument such as “MIKROTEST”, “DIAMETER” or equivalent.

Before any coating work is performed on the site, the contractor shall ensure that any works applied by others is acceptable.

Any defect that are discovered, are to be notified in writing to the owner before proceeding with the contract work. To ensure the good execution of painting work following test shall be performed:

- Surface Preparation
- Surface contaminant tests
- Surface profile tests
- Coating thickness tests
- Tests for cure of coatings
- Adhesion tests
- Continuity testing
- Iron contamination
- Chloride contamination
- Dust Contamination

All Inspection and Test Records (ITRs) shall be submitted with the Manufacturer’s Data Report (MDR) at the conclusion of the job.

Defective coated areas shall be suitably marked for rectification work to be performed in compliance with this specification.

Access shall be granted for inspection of all paint work, and witnessing of test work. This shall not however relieve the Contractor of their own QA/QC responsibilities.

10.0 ADHESION TEST RESULTS

For all type of primer the Contractor shall guarantee the Classification of Adhesion Test Results as per ASTM D3359. The acceptable Rate Adhesion Test Results shall be for sandblasted and primerized surfaces shall be minimum 3A (or Higher)

For primer plus finishing coat(s) the Contractor shall guarantee the Classification of Adhesion Test Results as per ASTM D 3359. The acceptable Rate Adhesion Test Results shall be for blast cleaned and painted surfaces shall be minimum 3A (or higher).

After test, the surface must be repaired according to the system applied.

11.0 SUBMISSION OF DATA

Contractor shall submit in phase of bid the original technical data sheet and system for all material supplied by him to apply for the permanent works and test report for the paint in compliance to IS101. This material shall be subject to Owner’s approval.

The test certificates of zinc silicate shall provide the specific gravity of mixed paint.

12.0 LETTER AND NUMBER INSCRIPTION
Inscriptions letters, as herebelow indicated, shall be made on equipments, piping, storage tanks, machinery etc.

12.1 Geometric forms and dimensions

Letters and numbers dimensions shall be orientativaly fixed according to following:

(A – Dimension of side of unitary elements of grid)

a) Storage Tanks A – 60 mm
b) Equipments and piping with O.D. above 600 mm A– 40 mm and
c) Equipments and pipings with O.D. from 300 to 600 mm and for machinery of great dimensions A – 20 mm
d) Equipments and pipings with O.D. less than 300 mm and for machinery with small dimensions A – 10 mm

12.2 Inscription’s Colours

Inscriptions shall be Black ENI 901 (RAL 9005) on light base

Inscriptions shall be White ENI 101 (RAL 9010) on dark base

12.3 Spaces and Interspaces

Spaces between words and assemblage of numbers shall have dimensions equal to 2A

Interspaces between letters or numbers shall have dimensions equal to A.

13.0 Colour Band for piping ;-

As a rule minimum width of colour band shall confirm to the following Table:-

<table>
<thead>
<tr>
<th>Nominal pipe Size</th>
<th>Width L (mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>3” &amp; below</td>
<td>25</td>
</tr>
<tr>

</tbody>
</table>

14.0 LIST OF MANUFACTURERS :

1. M/s Berger Paints
2. M/s Jensons & Nickolson
3. M/s Jotun Paints
4. M/s Asian Paints
5. M/s Grauer & Weil (India) Limited
6. M/s Shalimar paints
7. M/s Garware Paints
8. M/s Goodlass Nerolac Paints Ltd
9. M/s HEMPEL Paints
10. M/s International Paints (Akzo Nobel Brand)
11. M/s Carboline (India) Pvt. Ltd.
12. M/s Mohan Paints

15.0 The contractor shall obtain prior approval from Engineer-In-Charge for the brands of paint material proposed to be used. The contractor shall submit the following details of paint material either at the time of bidding or soon after award of work for approval of paints.

a. Technical data sheet
b. Material safety data sheet
c. Finger printing of paint products as per ISO 20340

16.0 Owner reserves the right to take random samples and get it tested through reputed labs. In case the supplied paint material do not meet the specified performance requirements then suitable action shall be taken against the paint supplier. The decision of Engineer-In Charge shall be final and binding on the Contractor in such cases.

17.0 WARRANTY:
Contractor along with Paint Manufacturer jointly shall develop the paint schemes following the system specification.

They shall jointly provide a performance guarantee for a period 5 years as stipulated below,

After 1 years – Corrosion in 3% of total painted area accepted
After 2 years – Corrosion in 6% of total painted area accepted
After 3 years – Corrosion in 9% of total painted area accepted
After 4 years – Corrosion in 12% of total painted area accepted
After 5 years – Corrosion in 15% of total painted area accepted

where spontaneous visible corrosion has broken down the paint film to a degree exceeding “Ri 3” (as defined in ISO 4628/3-2003).
ANNEXURE- 7 - 3

QUALITY CONTROL PROCEDURE AND INSPECTION REQUIREMENTS

1.0 LSTK CONTRACTOR’S QUALITY CONTROL

1.1 LSTK CONTRACTOR shall provide a quality control program manual include specific WORK methods and inspections, which assure quality.

This quality control program manual must be submitted to OWNER for Approval before starting the construction activities.

All installation WORK must be in strict accordance with this approved manual.

1.2 The quality control program shall include as a minimum the following:

- Methods use to control drawings; specifications and CONTRACT correspondence to assure that only the latest revisions are being used in the field.
- Inspection personal name, organization.
- Inspection methods and documentation of inspection (or tests) for shop fabrication, if required, and installation.
- Material control procedures from SITE receiving point, through "over, short and damage inspection" through storage and through installation.
- Positive material identification Procedures for:
  - Electrical cable pulling and testing.
  - Asphalt placement inspection.
  - Handling and storage methods to prevent damage.
  - Inspection and testing procedures and reports for civil, structural, piping, electrical, instrument, equipment and all installation WORK.
  - Repair.
  - Scrap and reject.
  - Grouting.
  - Welding.
  - Welder qualification.
  - Receiving all permanent plant material & equipment.
  - Rigging.
  - Welder's tests.
  - Nondestructive examinations to be used.
  - Positive material identification. etc.
- Identification of LSTK CONTRACTORS and ensuring their compliance with the manual and WORK required.
- Material certification verification methods.
- Calibration procedures for measurements and test equipment.
- Marking and identification of components in process and complete assemblies.

2.0 Shop fabrication and field installation inspection OWNER'S REPRESENTATIVE to ensure specifications. in the following areas will be performed by full adherence to Receiving and inspection.

- Calibration of test inspection equipment.
- Preventive maintenance and storage protection.
- Internal cleanliness.
- Proper material use and control.
- Nondestructive testing and its results.
- Workmanship.

3.0 OWNER'S REPRESENTATIVE or others as authorized by OWNER are to be permitted access to LSTK CONTRACTOR'S work areas for the purpose of inspection of material, equipment, documentation and other areas as required in LSTK CONTRACTOR'S quality assurance / quality control program.

4.0 No concrete will be placed by LSTK CONTRACTOR without an OWNER "Pour Release Form'.

5.0 OWNER'S construction inspections will not relieve. LSTK CONTRACTOR of inspection or other responsibilities.

6.0 For piping all welders test pieces shall be supplied by LSTK CONTRACTOR and fully prepared for welding by LSTK CONTRACTOR.

7.0 LSTK CONTRACTOR shall evidence its familiarity and experience with the execution of the installation of WORK to the requirements of the applicable codes and shall perform its WORK in accordance to these requirements and to instructions issued by OWNER'S REPRESENTATIVE in this regard.

8.0 CHECK ON QUALITY OF WORK

8.1 OWNER'S REPRESENTATIVE'S inspector shall have free access to the place where the WORK is performed at all times, in order to check the quality of WORK.

8.2 If during inspection / check reveals unsatisfactory WORK, LSTK CONTRACTOR shall immediately at LSTK CONTRACTOR'S expense. take such corrective measures as deemed required.

9.0 CONTROL SYSTEMS

LSTK CONTRACTOR shall initiate and maintain the following control systems

9.1 Backfilling
- Compaction tests.

9.2 Concrete
- Design mix and approval record(s).
- Batch plant inspection record.
- Slump test record.
- Compressive test record.
- Pour release record.
- Grouting release record.
- Placement inspection records.
9.3 **Concrete curing records.**
- Design mix and approval records.
- Batch plan inspection records. Placement inspection records.

9.4 **Asphalt**
- Weld x-ray file.
- Pipe and fitting certificate file.
- Isometric weld control sheet. Hydrostatic test records.

9.5 **Grounding**
Earth resistance test records.

9.6 **Electrical Cable and Instrument cable**
- Insulation resistance test records.
- Continuity test records.

9.7 **Material certification files**

9.8 **Equipment**
- Weld x-ray file.
- Material certificate files.
- Equipment installation records.
- Equipment maintenance record.
- Hydrostatic test records.
- Grouting release records.
- Alignment records.
- Vibration records.

10. **Requirements for Certification of Materials**

10.1 Mill certification of materials will be required based on the material type, the use and the codes and requirements.

10.2 LSTK CONTRACTOR shall provide:

Type A certification of compliance, for all but not limited to the following materials which LSTK CONTRACTOR is responsible to supply:
- Imported backfill materials.
- Ready mix concrete.
- Asphalt paving materials
- Prefab concrete items, including pre-cast manholes, catch basins, pits, sumps and sleepers.
- Paving stones and tiles.
- Inserted and embedded items, other than rebar, wire mesh and anchor bolts.
- Masonry blocks.
- Steel sliding plates.
- Special grouting materials, i.e. non-shrink type.
- Grouting materials, including grounding loop and branch wire which they are LSTK CONTRACTOR'S supply.

Type "B "certificate, for all but not limited to the following materials, which LSTK CONTRACTOR is responsible to supply:
- Materials to be considered structural or structural grade.
- Reinforcing grade.
- Wires mesh reinforcement fabric.
- Anchor bolts.

10.3 **Definition of Type of Certificates**

**Type A (certificate of Compliance):**

This is a certificate of compliance, issued by the manufacturing or processing works and signed by the quality department or persons to carry the responsibility for quality and conformity, stating that the materials supplied correspond with what was agreed in the purchase order.

**Type B (mill Certificate):**

This is a certificate on which the manufacturer's head of quality department confirms that the product supplied corresponds with what has been agreed in the purchase order. Certification shall be on the basis of tests carried out on the material of the product itself, as per purchase order specification. The testing and certification are to be carried out by a testing center which is independent of the production section of the manufacturing works and which has the code-approved facilities. Independence of such testing center should be warranted by LSTK CONTRACTOR.

10.4 **LSTK CONTRACTOR will maintain a systematic filing system of all certificates and reports for all tests and inspections carried out by it under the applicable specifications, standards and codes of practice quoted therein.**

LSTK CONTRACTOR may use its own format for records but this must be submitted to OWNER'S REPRESENTATIVE for his approval prior to use.

LSTK CONTRACTOR can expect to be audited on a continuous basis. Originals of all documents to be sent to OWNER'S REPRESENTATIVE.
ANNEXURE- 7 – 4

SCHEDULE, PROGRESS EVALUATION AND PROGRESS REPORTING

1.0 GENERAL

1.1 WORK shall start and be completed in the field as indicated on the approved project construction schedule.

LSTK CONTRACTOR shall follow the sequence of construction in executing the WORK as shown in the schedule or as modified by OWNER.

The detailed scheduling of WORK will be supplied by the LSTK CONTRACTOR. WORK shall be conducted in such a manner that other construction activities are not affected.

Once detailed schedule, established and approved by OWNER, LSTK CONTRACTOR commits itself to follow the schedule in detail.

2.0 DETAILED & SCHEDULE

2.1 Detailed construction schedule must cover all construction work, from lowest level up to highest level.

2.2 Activities shown by means of a bar chart must include as a minimum the activities listed in 4.

3.0 PROGRESS REPORTING

LSTK CONTRACTOR shall issue a reporting procedure and a representative sample of all progress reports.

Following schedules and reports must be issued by LSTK CONTRACTOR to OWNER:

Construction schedule. (preliminary and detailed)
Monthly status report.
Weekly progress report.
Monthly construction guide schedule.
Daily manpower reports.

All except detailed construction schedule based on approved project construction schedule.

4.0 CONSTRUCTION SCHEDULE
Within Two months after Effective Date, LSTK CONTRACTOR will issue separate graphical "S" curves for the following work activities of total CONTRACT.

Installation of:

- Concrete foundations, pits, manholes, catch basins, trenches and concrete structures.
- Prefabricated concrete items
- Concrete paving and elevated slabs
- Other paving and final surfacing
- Grouting.
- Final road paving.
- Underground piping.
- Underground cable trenches and cables.
- Building erection.
- Structural steel erection.
- Engineering and design of small bore carbon steel piping systems.
- Prefabrication of piping.
- Electrical installation.
- Instrument installation.
- Equipment assembly and erect
- Erection of piping.
- Flushing and cleaning
- Hydro-testing
- Painting
- Insulation.

5.0 INTRODUCTION

The introduction to the monthly status report shall include LSTK CONTRACTOR’S comments on the overall construction schedule with a status update line as attachment, and shall consist of the following items:

- Goals achieved last month.
- Goals for next month.
- Reason for delay, if any. Reason for deviation of original schedule.
- Average manpower by craft, including management and indirect staff.
- LSTK CONTRACTOR’S comments to general situation.

6.0 CONSTRUCTION ACTIVITIES STATUS

This section consists of scheduled versus actual progress curves.

The progress curves are to be commented upon by LSTK CONTRACTOR.

The basis for reporting shall be the construction schedule:
The monthly status shall be reported as a percentage of the total WORK per type of WORK.

7.0 MANPOWER AVAILABILITY / REQUIREMENTS FOR THE MONTH COMING

LSTK CONTRACTOR shall submit its manpower availability requirements for the next month. This section consists also of the scheduled versus the actual manpower curves.

These manpower curves are accompanied by LSTK CONTRACTOR’s comments hereon.

8.0 MAIN CONSTRUCTION EQUIPMENT AVAILABILITY / REQUIREMENTS FOR THE MONTH COMING

LSTK CONTRACTOR shall submit its main construction equipment availability / requirements for the next month. This section consists also of the scheduled versus actual construction equipment requirement curves. These by LSTK CONTRACTOR’S comments hereon.

9.0 WEEKLY PROGRESS REPORT

Progress reporting will be done on a weekly basis by the actually completed work based on details of work such as quantities or piece of equipment as a percentage of the total anticipated work per work activities as defined in item 4.

9.1 Progress will only be reported on the basis of completed activities as per the percentage breakdown of the major steps as follows:

Progress Measurement Parameters

Actual physical progress in the field shall be measured based upon standard percentage of completion of progress stages, that, they are to be prepared by LSTK CONTRACTOR and Approved by OWNER to calculate actual physical progress of the WORK, the exact weight value of each activity from lowest level up to highest level in each category of the WORK shall be specified by LSTK CONTRACTOR and supplied to OWNER.

After OWNER’S Approval this weight value can be used for calculation of actual progress of the WORK

10.0 WEEKLY PROGRESS MEETING

10.1 Weekly Work List

In the weekly progress review meeting LSTK CONTRACTOR shall forecast the WORK it plans to perform during the week by means of a weekly WORK list including its manpower resource allocation as per the activities listed in 4 and 6.

This weekly program shall be in accordance with the construction guide schedules.
10.2 **Work Front**

LSTK CONTRACTOR shall submit monthly and weekly a total recapitulation of the total work front available with estimated manpower requirements, materials and equipment which shall be supplied by LSTK CONTRACTOR.

11.0 **MONTHLY CONSTRUCTION GUIDE SCHEDULE**

Based on approved overall construction schedule, LSTK CONTRACTOR must issue a monthly construction guide schedule covering a two (2) months period, for each individual activity.

Progress updating of construction guide schedules must be weekly and presented in the weekly progress review meeting at site.

The updated issue will show for each individual activity:

- Percent complete.
- Weight factor complete.

12.0 **DAILY MANPOWER REPORTS**

LSTK CONTRACTOR shall be furnished daily manpower report as per agreed format.
ANNEXURE- 7 – 5

EXECUTION PLAN

1.0 BIDDER ORGANISATION

1.1 Company Organisation

Bid shall include a description of the organization, its management structure and organization chart of Bidder's company with particular reference to the means whereby the execution of this project will be related to the overall company organization.

The Bidder shall also furnish the name(s) of their partners, associated/ subsidiary companies & their activities, and whether any such associated/ subsidiary company will be involved in the execution of WORK, and if so, their scope thereof.

1.2 Project Organization

Bidder shall give charts of organization, which he intends to use in the execution of the work. Such charts must show lines of authority and communication of senior personals who will be assigned to this work in Bidder's home - office and other offices where WORK shall be performed (if any) and the lines connecting such Project Organization to the Bidder's internal overall organization including partners (if any). The chart shall be supported by a narrative, which shall explain how the proposed organisation will operate and in particular will provide

The name of the location of the office(s) in which the Basic and Detail Engineering Design Packages of the plant shall be carried out.

If any parts of the Basic and Detail Engineering Design Packages are to be carried out in more than one office, then details of the distribution of the jobs between offices and coordination procedure shall also be presented.

A description of the facilities offered to the OWNER'S resident engineers.

2.0 Estimated project and Engineering man-hours

Bidder shall give an estimate of the engineering man-hours and its break down for all activities

3.0 Methods and procedures

Bidder shall summarise the methods and procedures that BIDDER intends to implement during the performance of the WORK. It shall include the proposed procedures such as Engineering, Procurement, construction strategy, WORK Progress Measurement, Pre-commissioning, Commissioning and Performance Test Run of the PLANT, and Training.

BIDDER shall also furnish proposed procedures for the Project management, communication and method and frequency of reporting the progress of the WORK.

The final form for reports, which will be subject to OWNER's Approval, shall include as a minimum the following :

a) Planning and Scheduling
b) Work Progress

c) Safety and Security

NOTES:

a) Sample reporting forms and other key standard forms shall be included.
b) Bidder shall state the extent to which he will be using computerized drafting, etc.

4.0 Job descriptions and personnel resumes

Bidder shall include job descriptions and personnel resumes of his staff nominated to the key positions, including (where applicable) at least the followings, or Bidder's equivalent:

- Project director
- Process engineering co-ordinator
- Construction manager
- Process engineer
- Project engineering co-ordinator
- Senior pre-commissioning engineer
- Senior commissioning engineer
- Training co-ordinator and instructor.
- Construction Engineering Coordinator
- Construction Quality Control Engineer
- Construction Project Control Engineer
- Welding Specialists
- Heavy Lift Rigging Specialist
- Senior Specialist Engineers
- Senior Planning Engineers
- Materials Coordinators
- Senior Construction Engineers
- Senior Pre-commissioning Engineers
- Warehousing Officer
- Material Planning Engineers

Resumes shall give at least the name, age, nationality, education, professional exception/deviation and previous experience of each assigned personnel. Additionally, one alternative shall be offered for each position. **Bidder shall ensure that personnel to be deployed meet the minimum criteria specified in Annexure-7-6**

Bidder shall confirm that these key personnel will be made available to WORK on the Project as required by the schedule on full time basis.
Bidder shall furnish Summary of its Deployment Schedule Personnel as per **Annexure-7-7**.

Bidder understands that the said proposal represents the minimum deployment and the Bidder acknowledges that the said deployment may have to be augmented with additional number and/or categories, if required, if directed by Engineer-in-Charge in order to complete the work within the completion schedule and quoted lump sum price.

5.0 **Construction equipment and machinery**

The BIDDER shall furnish details of construction equipment & machinery, testing equipment, tools/tackles, etc., which will be made available by the Bidder at the Site. Bidder shall furnish Summary of such details as per **Annexure-7-8, Annexure-7-9**.

Such list shall, in no way limit the CONTRACTOR's responsibility to arrange & provide any additional construction equipment, tools, tackle, etc., which might be required to execute and complete the WORK as per contractual schedule.

BIDDER shall furnish the procedures and his tools for erection of the Heavy Lift Equipments including tall columns):

6.0 **Heavy lifts**

BIDDER shall furnish his proposed, site transportation, lifting, along with preliminary rigging schemes and erection procedure for the heavy lifts. Such plans / schemes shall be furnished along with detailed write -up on heavy cranes proposed to be deployed by CONTRACTOR, duly supported by relevant technical literature.

7.0 **BIDDER experience & exception/deviation to perform the work**

The BIDDER should have experience in the construction of similar Plants. The BIDDER should have successfully executed and completed construction of at least one similar Plant with his own project management and with complete responsibility of construction / erection and pre-commissioning.

The BIDDER shall furnish, as a part of his Tender Documents establishing the BIDDER'S experience and exception/deviation to perform the CONTRACT. Such documentary evidence shall also establish to OWNER's satisfaction that the BIDDER has the necessary financial, technical, project management capabilities and the requisite resources to execute the Work.

Such documentary evidence shall also be furnished for BIDDER'S proposed Subcontractors, if any. The Bidder shall furnish, in a tabular from, a list of jobs of similar type and magnitude executed by them in the past. BIDDER shall also furnish details of their experience in erection of heavy lifts. The Bidder shall furnish documentary evidence, establishing to OWNER satisfaction, that such jobs have been timely and successfully executed by them. The BIDDER shall also furnish the details of their present major commitments.

8.0 **QA/QC Program**

Bidder shall furnish a summary description of their proposed QA/QC program.

Bidder shall furnish any other technical information / details as per the requirements of ITB.

9.0 **Technical assistance**

The extent of the Technical Services and Assistance to be rendered by CONTRACTOR for, commissioning and performance test run, etc., is to be proposed
10.0 Training

Bidder shall furnish the following details regarding the Training of OWNER'S personnel:

a) Bidder's organisation set up for Training program.

b) Training facilities available with the Bidder to train the OWNER'S personnel in:
   - Theory of process, operation, maintenance and manufacturing of products
   - Field (on the job) training in process, operation, maintenance and manufacturing of products, to train the personnel on the job.
   - Test procedure and other matters.

c) The courses and their duration, number of attendees in each course and location where such courses will be held that the Bidder would recommend OWNER to consider.

d) Bidder's experience of training the personnel for units similar to the subject PLANT.

11.0 Estimate of the number of personnel required for the safe and satisfactory operation of the Plant.

<td>1.0</td>
<td>Performance Guarantees</td>
<td>3</td>
</tr>
<tr>
<td>2.0</td>
<td>Performance Tests</td>
<td>13</td>
</tr>
</tbody>
</table>
1.0 GENERAL

This section describes the guarantee parameter which steam generation package must fulfil and the rejection of the plant by the owner.

Prior to conduct guarantee test, contractor shall demonstrate the operability of individual equipment such as de-aerator, pumps etc. in sustain load test to prove the selected sizes vis-a-vis bid requirement.

Necessary instruments etc. shall be provided by the contractor during performance testing to establish the guarantee parameters.

The contractor shall guarantee the equipment/ complete system for the design, materials, workmanship, size, capacity, performance efficiency and compliance to various technical requirements mentioned in the tender document. The guarantee shall also include sub-ordered /bought out items forming part of the total supplies.

Owner/ consultant inspection OR review of vendor’s design/ drawings/ documents/ deviations shall in no way absolve the vendor OR reduce his responsibility towards this guarantee.

Performance guarantee shall be exclusive if instrument tolerances / uncertainties

2.0 PERFORMANCE GUARANTEES

2.1 The contractor shall submit the detailed performance guarantee test procedure for the performance test for approval of the OWNER/PMC during detail engineering phase, prior to actual conduction of the tests.

LSTK Contractor must fulfil guarantee parameters of Steam Generation Plant as specified in this Clause under the following heads to meet his contractual obligations.

a. Capacity of boilers (All possible combinations of two boilers running) for export steam as well as individual boiler system
b. Internal Power consumption in steam generation plant B.L.
c. Internal steam consumption in steam generation plant B.L.
d. Quality & quantity of Effluent (LSTK to specify): Liquid, Solid & Gaseous
e. Quality and quantity of steam and BFW
f. Noise Level
g. Gaseous Emission
h. Life of the Catalyst (if applicable)
i. Fuel consumption

Failure to meet capacity of the plants, quality of the products, pollution levels, noise levels, gaseous emission shall be breach of contract requiring corrective action by LSTK contractor irrespective of the cost involved.

Bidder shall Guarantee Performance Parameters for the Steam Generation Plant as per followings:

a. Capacity of Steam Generation Plant
b. **Quality of the Product & Effluent**

The quality of steam, BFW & Boiler blow-down from steam generation plant shall be according to the following specifications:

### H.P superheated Steam

<td>&lt;10</td>
</tr>
</tbody>
</table>

### c. Pollution Level
LSTK Contractor shall guarantee the limits of liquid effluents at the Battery Limit, gaseous emission to the atmosphere and noise levels as specified. The determination of the ability of Steam Generation to meet these guarantees will be made during the seven days’ guarantee test or at any other time under similar conditions prior to the Preliminary Acceptance of the Process Plant/Units.

In the event guaranteed pollution level are not fulfilled during the 7 days’ guarantee test it shall be breach of contract, requiring corrective action by LSTK contractor irrespective of the cost involved.

**Gaseous Emission**

**Stack gas Emission Limits**

<table>
<thead>
<tr>
<th>S. No.</th>
<th>Source</th>
<th>Suspended Particulate Matter (mg/Nm³)</th>
<th>SOx (mg/Nm³)</th>
<th>NOx (mg/Nm³)</th>
<th>Hg (mg/Nm³)</th>

<td>100</td>
<td>100</td>
<td>0.03</td>
</tr>
</tbody>
</table>

The LSTK Contractor may install the FGD unit (if required) to guarantee the gaseous emission as specified above from various points of the ISBL plants.

LSTK Contractor to follow latest norms pertaining to Central Pollution Control Board / State Pollution Control Board norms before submission of the bid.

1. Contractor shall Guarantee and demonstrate that maximum Ammonia slip downstream of SCR reactor shall not exceed 3 ppm at 3-4% oxygen (O2) content in flue gas on dry gas basis from 40 % to 100 % load condition considering the range of coals specified.

2. Contractor shall demonstrate that over entire range of steam Generation operation from 40 % to 100 % and for whole range of specified coal, the total NOx (from thermal as well as from fuel) at the outlet of SCR shall not exceed 100 mg/nm3 at 3-4% oxygen content in the flue gas on dry gas basis.

**d. Noise Level**

LSTK Contractor shall guarantee the noise level within the ISBL Plant premises. Noise nuisance from machinery is normally specified as sound pressure level which for standard design shall not exceed, in work areas, 85dB (a) at 1m distance from each source.

**e. Life of the Catalyst (if applicable)**

The Catalysts in the FGD Unit (if required) & De-NOx unit shall retain their full abilities and performance for the following periods which commence from the date of Preliminary Acceptance of the Plant.

<table>
<thead>
<tr>
<th>Sl. No</th>
<th>Service</th>
<th>Guaranteed Life (in years)</th>
</tr>
</thead>
</table>
Contractor guarantees that if any catalyst does not meet the guaranteed EOR conditions before the expiry of its guaranteed life as specified in table above, from the date of preliminary acceptance of plant, contractor shall replace as follows:

a) If the catalyst fails to fulfil the guarantee, contractor shall deliver full replacement of catalyst volume free of charge during the entire guaranteed period of 5 years.

Contractor shall pass on to Owner the residual catalyst life as guaranteed by the catalyst manufacturers to Contractor, if any, beyond the guaranteed life of catalyst under contract.

2.2 Works cost (Consumption of Raw material & Utilities) Guarantee:

LSTK bidder shall guarantee the consumption of Raw material and utilities like Coal, Fluxant, De-mineralized water, Instrument Air, and Power required for Steam Generation Plant (2W+1S) in terms of works cost “₹ per MT” of H.P. superheated steam export which will also include superheating of external steam as specified in 2.1a.

<table>
<thead>

<td></td>
</tr>
<tr>
<td>9.0</td>
<td>Guaranteed Specific Work Cost = SUM [S] / [Total Steam export in a day] “₹ per MT”</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Note:

i) The guaranteed works cost shall include cost of materials and utilities required, building cooling/heating, lighting, ventilations, air conditioning and consequent costs of such materials which are in the usual operation of the Steam Generation Plant.

ii) Bidder has to provide individual coal consumption for each boiler. However, Coal consumption for which 2 boilers having maximum coal consumption out of three boilers shall be considered.

iii) The above unit prices are indicative and may change at a later date. Revision if any will be intimated to LSTK Contractor before 15 days of price bid opening and the same shall be used for evaluation of the bids.

iv) No instrument/ meter tolerances are allowed.
v) During PGTR, adjustment will be done based on enthalpy difference, if any variation in specified parameters given in works cost table with respect to actual parameters of HP superheated export steam & HP saturated import steam at battery limit.

vi) During PGTR, Required Liquid/ vapour Ammonia shall be arranged by LSTK Contractor. Necessary unloading and Pumping & Handling system shall be provided by LSTK Contractor.

vii) Maximum power available at the B.L of steam generation plant from Client shall be 8 MW during normal operation, accordingly LSTK Contractor shall select the drives of machine keeping in view relevant codes/ guidelines (IBR) requirement.

viii) Custody flow meters of various raw materials & utilities to be provided for permanent measuring arrangements the guaranteed parameters inside their B.L.

In the event works cost is more than 100% but less than 102.5% of the Guaranteed Works Cost then the Contractor will pay owner Mutually Agreed Damages as specified under the Contract. If the Works cost as demonstrated during the performance test is more than 102.5% of the Guaranteed Works Cost then it shall be breach of contract requiring corrective action by LSTK contractor at his risk and cost within reasonable time in consultation with owner.

2.3 Conditions for Guarantees:
Raw materials and utilities in sufficient quantities conforming to the range of specifications supplied to LSTK Contractor by Owner and used as the design basis.

2.4 Consumption of Raw Materials & Utilities:
Consumption of raw materials and utilities shall be measured and calculated as per figures indicated by various calibrated instruments. The guaranteed figures shall be inclusive of all instrument tolerances no further meter tolerance shall be allowed in calculation. All measurement instrumentation shall be part of the system/ plant installed by the LSTK Contractor and no special instrumentation for the purpose of guarantee tests shall be required. Any mobile/portable instrument required temporary for fulfilling the guarantee test shall be arranged by LSTK contractor.

2.5 Basis of Work Cost:
i) Costs mentioned in the clause 2.2 are indicative and may change at a later date. Revision, if any, will be intimated to LSTK Contractor before 15 days of price bid opening and the same shall be used for evaluation of the bids.

ii) The guaranteed works cost shall include cost of materials and utilities required, for building cooling/heating, lighting, ventilations, air conditioning and consequent costs of such materials which are in the usual operation of the plant.

3.0 PERFORMANCE TESTS

3.1 General:
LSTK Contractor shall prove the performance guarantees during tests of the plant as specified in this clause under the following headlines:

- Sustained Load Test
- Guarantee Test
- Measurements during Guarantee Test
- Inconsistent Measurements
- Deviations from Specifications
- Guarantee Test Run Results
- Demonstration Run Results

3.1.1 Sustained Load Test:

After Mechanical Completion, the LSTK Contractor shall commence the Commissioning operations of Plant. After Plant has been commissioned and at least near rated daily capacity has been achieved, LSTK Contractor’s authorised representative shall give notice in writing to Owner that Plant is ready for a sustained load test. On receipt of this notice, but not later than 15 days after the notice, LSTK Contractor shall conduct the sustained load test for consecutive period of total 10 days for all combination of 2 boilers AND/OR Single boiler as per mutual discussion with Owner/PMC. The sustained load test of the plant shall be deemed to have been completed if Plant produces an average of not less than 90% of the daily rated capacity (100% of normal capacity). If, during the sustained load test, there are interruptions due to reasons not attributable to the obligations and responsibilities of LSTK Contractor, periods of such interruptions shall be included and regarded as days of operation at min. 90% of daily rated capacity or actual load prior to interruptions whichever is lower. The cumulative period of such interruptions shall be limited to a maximum of 2 (two) days. Owner shall have the option to reduce the period of sustained load test of 10 days. During the sustained load test, LSTK Contractor shall use their best efforts to ensure that pollution level and noise level are within the limits specified in the Contract. LSTK Contractor shall endeavour to complete the sustained load test within a reasonable period after Mechanical completion, but shall complete the same in any case within 30 days from Mechanical completion. If, during the sustained load test, corrective measures are required and involve procurement of new items of Equipment or modification of items of Equipment which require longer period for delivery than covered by the 60 days period, the period shall be suitably adjusted as agreed with Owner. However, design engineering and placement of orders shall be completed within 45 days from Mechanical completion. On satisfactory completion of the sustained load test, the results achieved shall be tabulated and jointly signed by LSTK Contractor’s and Owner’s representatives within ten days of completing the sustained load test. During the sustained load test, no standby items of Equipment shall be used in parallel for completing the test.
3.1.2 **Notice of Guarantee Test:**
On successful completion of the sustained load test, LSTK Contractor shall give notice in writing for commencing the guarantee test. On receipt of the notice, but not later than 15 days after the notice, LSTK Contractor shall conduct the guarantee test run under the direction of Owner/PMC. During the guarantee test, no stand by items of Equipment shall be used in parallel for proving the guarantee. The range of operating conditions shall be within the design conditions.

3.1.3 **Guarantee Test:**
LSTK Contractor shall give the guarantee test for individual boiler or Combination of any as per discretion by Owner/PMC. The guarantee test shall be carried out for 5 (Five) continuous days without any interruption. In determining the ability of the plant to meet the guarantees all feed rates, product rates and quality, and utility consumption shall be averaged over a period consisting of best continuous 72 hours selected out of the 5 (Five) days test period. The 72 consecutive hours period shall exclude periods during the test when the operating conditions are other than those recommended or approved by LSTK Contractor or periods of non-operation due to failure of Equipment, lack of sufficient feed or utilities, or any other cause beyond the control of LSTK Contractor including the period required to bring Steam Generation plant back to operation at the rate of production achieved prior to the upset. For the purpose of computing the average performance, LSTK Contractor shall select any best continuous 3 days out of the 5 days test period so long as this includes a continuous and uninterrupted run of 72 (Seventy Two) hours and the aggregate total hours of interruptions do not exceed 48 hours.

LSTK Contractor shall be given the max. 3 nos. chance for PGTR. LSTK Contractor’s authorised representative shall give notice in writing to Owner that Plant is ready for a Guarantee Test. On receipt of this notice, but not later than 15 days after the notice, LSTK Contractor shall conduct the guarantee test. On receipt of this notice, but not later than 15 days after the notice, LSTK Contractor shall conduct the guarantee test for consecutive period of total 5 days for all combination of 2 boilers AND/OR Single boiler as per mutual discussion with Owner/PMC. In case of failure (beyond acceptable limits/parameters where Mutually Agreed Damages’ are levied) of 1st Guarantee test, the LSTK Contractor, within 15 days from the beginning of the 2nd guarantee test, shall give a full and detailed statement in writing to OWNER. The statement shall contain the detailed description and corrective measures which LSTK Contractor intends to take and the time required for the same to be completed and a repeat guarantee test to be made. LSTK contractor shall wherever possible shall carry out such corrective measures and repeat the guarantee test within the shortest possible time, but not later than 30 days (or for such time as may be mutually agreed between owner & LSTK contractor) from the beginning of the first
guarantee test unless otherwise agreed with Owner. Further, refer clause no. 34.0 of GCC Part-1 Commercial.
During the Guarantee Test Run, the Production capacity of the Steam generation plants (considering export & internal consumption) & Specific works cost shall be guaranteed as per clause 2.2.
LSTK contractor shall further demonstrate operating capacity of each boiler at 0.4x (LSTK to Specify) Mt/hr for a period of 24 hours to meeting all quality & emission norms.

3.1.4 Measurements during Guarantee Test

For determination of the average performance achieved during the guarantee test, all inputs and outputs shall be measured through appropriate meters specified and installed in plant by LSTK Contractor and jointly calibrated and certified to be correct by LSTK Contractor and Owner. LSTK Contractor shall have all measurements and records certified by Owner beforehand.

3.1.5 Inconsistent Measurements

If any measurement is demonstrably inconsistent with the bulk of the data, or is otherwise suspected to be incorrect, then meter will be re-calibrated. Inconsistency in metering after the calibration if observed then it has to be rectified or in the worst case, meter to be replaced. However in no case, reading should be adjusted.

3.1.6 Deviations from Specifications

In the event that the feed, fuel, utilities, climatic conditions, or any other conditions is not in accordance with conditions specified or referred to in Contract and are prejudicial to LSTK Contractor for establishing the performance guarantee parameters, Owner and LSTK Contractor shall mutually, reasonably, and in good faith negotiate an adjustment to the performance guarantees. Any such adjustments to the performance guarantees shall be made utilising the same methods of calculation as were used in establishing the original performance guarantees to the extent such methods continue to be applicable in accordance with good and sound engineering principles and practice.

3.1.7 Guarantee Test Run Results

Within a reasonable period of time but not later than 10 working days from the completion of the guarantee test Run, Contractor shall determine the results thereof and if in LSTK Contractor's judgement, the performance guarantees have been achieved, submits its calculations and report to Owner/ PMC for Owner’s acceptance. The method of calculation for the Guarantee Test Run shall be mutually agreed by LSTK Contractor, Owner and PMC before starting of Guarantee Test Run. All data will be collected jointly in presence of LSTK contractor, Owner and PMC. Owner/ PMC will review the report, calculations and the supporting data and accept the same in writing, if
the results are in accordance with the provisions of this Section. In case, Owner does not accept the performance guarantee results, Owner shall indicate in writing to LSTK Contractor in what respect the performance guarantees have not been met, within 10 working days of receipt of the report by Owner from the LSTK Contractor. In the event of rejection of Guarantee test Run results by Owner, LSTK Contractor shall take immediate actions to set right as per the provisions of the contract and repeat guarantee test Run to the satisfaction of Owner.

1.0 DRAWINGS & DOCUMENTS

This chapter details out various drawings and documents to be generated at various stages during the course of execution of the Project by the LSTK Contractor for different project activities. Categorization of the documents/ drawings for review/ information/ records of PMC and the review/ approval requirements of the Owner/ PMC along with routing of the documents/ drawings will be conveyed separately as a philosophy.

The efficient handling of drawings and documents to be prepared by the LSTK Contractor under the contract is the key to the timely completion of the plants. The LSTK Contractor undertakes to ensure that all drawings and documents to be submitted by him to the Owner/ PMC shall be of professional quality and conforming to the contractual requirements. The LSTK Contractor also undertakes to institute a formal drawing control system which will be documented and submitted to the Owner/PMC for review or approval.

Compliance of this chapter on drawings and documents is mandatory and is non-negotiable.

The drawings / documents are to be generated by the LSTK Contractor at various stages of the project covering different activities. The drawings / documents generated will be in the category of Approval/ Review/ Information. The list of drawings and documents required is enclosed; however, the categorisation for the drawings/ documents will be informed separately. However, this will in no way relieve the LSTK Contractor of responsibility to conform to drawings, standards, specification, codes and contractual requirements / obligations.

The LSTK Contractor shall prepare the drawing numbering procedure and submit to Owner/ PMC for approval. Each Drawing submitted by the LSTK Contractor shall be clearly marked with the name of the Owner, PMC with revision number & date. It should contain the minimum following details:

a. Size of Drawing.

b. Discipline of Engineering for which the drawing is issued.

c. Discipline wise segregation of numbering sequence for example:
   100 Series for Process. 200 Series for Mechanical etc.

LSTK Contractor to note that the number corresponds to Steam Generation Plants and shall be prefixed to all related documents/deliverables which shall be indicated to successful bidder.

LSTK Contractor shall submit 4 hard copies & 1 soft copy of drawings/documents for review / approval and for information .

LSTK Contractor shall submit 6 hard copies & 2 soft copies in CDs of final drawings/documents prior to despatch of the equipment. These shall be made in sets and supplied in fine plastic coated folder.
Details of the Drawing and Documents submission and tools to be used for generating these documents:

All other documents like presentations etc. and other data shall be in MS Office; the required operating system for Data Exchange shall be at least Windows.

All documents before forwarding to Owner/PMC will have to be vetted in detail by the LSTK Contractor/duly approved engineering sub-contractor appointed by the LSTK Contractor. Document received without vetting will be returned.

The review by the PMC/Owner shall not be construed by the LSTK Contractor, as limiting any of his responsibilities and liabilities for mistakes and deviations from the requirements, specified under these specifications and drawings.

Each drawing submitted by the LSTK Contractor shall be clearly marked with the name of the Owner, Unit Designation, Specifications, Title, Specification number and the name of the Project with Revision number and date. If standards, catalogue pages are to be submitted, the applicable items shall be indicated therein. All titles, noting, markings and writings on the drawings shall be in English.

All the dimensions should be in metric units. Upon receiving comments on Drawings & Documents by the LSTK Contractor, the subsequent submission should give compliance report, separately on each of the comments, document-wise. Comments given by PMC/Owner to be discussed and finalised within agreed schedule.

The schedule of submission of the Drawings & Documents shall be in accordance with project plans only. The detailed list under different category, document-wise, shall be prepared by the LSTK Contractor for approval of Owner/PMC. This activity is to be completed within one month of Fax of Intent.

Sequence of submission of drawing is essential for proper review of documents and timely completion of the project is to be adhered. In case sequence is not maintained, the documents submitted will not be reviewed by Owner/PMC and responsibility of timely execution of plant shall be to the LSTK Contractor's account.

### 2.0 CATEGORY OF DOCUMENTS

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
<th>Action by Owner/PMC</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>

</table>

Owner/PMC will review and advise the LSTK Contractor of any Comments on Contractor’s Drawings / documents within specified schedule (i.e. 2 weeks), from date of receipt in PMC office of LSTK Contractor's drawings/documents.

The review period is defined as date of receipt of documents by PMC, to date of issue of comments by PMC.

This review period shall be valid only if submission of drawings is done by LSTK Contractor in accordance with approved drawings / documents schedule as indicated in ITB. In case of any non-conformity to the above by LSTK Contractor due to which the period of review extends beyond 2 weeks by the PMC, schedule delay, if any will have to be absorbed by the Contractor.

The documents falling under Review category will be returned with comments within specified time schedules subject to fulfilling other conditions enumerated. The information category document will be retained for information only but however Owner/PMC reserves the right to comment at any stage of the Project, but not later than two weeks of receipt.

Where clearance of Owner/ PMC is required for ordering of equipment materials, enquiry documents and one technically selected offer is to be submitted for review. The unpriced copies of purchase orders detailing both technical and commercial aspects for all items shall be submitted to PMC/ Owner within 15 days of issue of the same.

Each purchase order forwarded should contain complete technical documents. It is obligatory for the LSTK Contractor to obtain acceptance on all the technical documents and accepted copy only to be forwarded to Owner / PMC. Any inaccuracies /omissions/inconsistencies noticed and brought to the notice of the LSTK Contractor at any stage of the project will be rectified/ replaced by LSTK Contractor without any cost & time implication to the Owner/ PMC.

Detailed manufacturing schedules of fabricated/ manufactured items shall be submitted within one month of ordering, Status report for all the items in detail, will be submitted once in a month.

Documents to Boiler Regulation authorities shall be submitted and getting the documents reviewed by PMC/Owner. To any other agencies, documents shall be submitted under intimation to PMC/Owner.
As built drawings and documents will be generated within one month of completion of activities on respective items of work.

**As Built Drawings:**

LSTK Contractor will furnish reproducible and electronic files of all the drawings under their scope to Owner / PMC, certified as “As-Built Issue” by Third Party Inspection Agency (TPIA) for Vendor Items coming under Third Party Inspection / LSTK Contractor for all other drawings.

Upon completion of identifiable units or components of the fabrication, construction and installation phase of the project the Contractor will complete all the related plans to the "as built' stage including all Vendor drawings and furnish Owner/PMC with the following:

a. One complete set of all original tracings copies.

b. One complete set of reduced size (A3-297x420 mm) copies of all drawings.

c. Two set of CD for all documents/drawings/data

d. All the as built drawings duly certified should be scanned and converted into electronic files made on magnetic/discs/optical long storage.

e. All other project documents such as operating and maintenance manuals, manufacturers' Catalogues etc. shall also be scanned on magnetic/optical discs for safe storage and retrievals by the Owner when needed.

f. 6 complete sets of full size prints of the drawings and 4 sets of reduced size prints.

g. 6 complete bound sets of Manufacturer's specifications including design calculations.

h. 6 complete sets in hard binders of the Manufacturers data book including certified prints and data for all items including test reports. Data Books shall be complete with index as tag numbers associated with Manufacturer's data shown. Equipment data shall include as a minimum requirement the principal and description of operation, drawings and dimensions, spare parts lists and un-priced purchase orders and bill of material.

i. 6 bound copies each of the Spare Parts data books and the Lubricants inventory Schedule.

j. 6 complete sets of field records shall be signed by both the Contractor's and Owner's Representative at the site.

k. Original approvals and related drawings and documents from the statutory authority.

l. Copies of correspondence with the statutory authorities.
3.0 PROCEDURE

The procedure for compilation of final as-built documents / drawings shall be informed later. However the Procedure for routing the final / as built documents/ drawings to PMC / Owner shall be informed during the execution stage.

FORM NO: 02-0000-0021F3 REV5
All rights reserved
1.0 SPARE PARTS FOR COMMISSIONING

1.1 LSTK Contractor shall supply free of cost all spares and consumables covering pre-commissioning, commissioning, testing, PGTR and till handing over of the Steam Generation Plant.

1.2 Supply of Mandatory Spares/Insurance spares for Electrical/Mechanical/Instrumentations and other plant machinery shall be under LSTK Scope.

1.3 Supply of spares and consumables post handing over of the plant shall be under Owner’s scope.

1.4 LSTK Contractor shall submit/provide recommended 2 years O&M spares (other than Mandatory spares) list with budgetary offers valid for 2 years from the date of submission of offer for TFL/Owners consideration.

2.0 MANDATORY / INSURANCE SPARE PARTS

LSTK Contractor shall supply mandatory spare parts of the plant as detailed below.

a) Process Items
b) Centrifugal / Axial / Rotary Compressor
c) Reciprocating Compressor
d) Screw Compressor
e) Centrifugal Fan
f) Steam Turbine
g) Centrifugal Pump
h) Reciprocating Pump
i) Metering Pump
j) Agitator
k) EOT cranes
l) Static Equipments
m) Piping items
n) Electrical items
o) Instrument items
p) Material Handling items
q) Fire & Safety.

2.1 Process Items

Notes:
1) Quantities shown are for each size and type of part.
2) The parts listed are the principal parts only. Other parts shall be considered for recommendation in quantities consistent with the above table.
3) All special tools and tackles required for maintenance for critical items shall be supplied along with equipment.

2.13 Piping Items:
Following spares are to be supplied for the Piping Bulk Materials:
### Notes (Piping items):
1. Percent of quantity required as mandatory spares is for each and every item/size/material consumed in as built.
2. No substitution in size, rating and material is allowed.
3. Pipe length in meter and other items in No. or Set shall be supplied.
4. Fractional part of quantity shall be converted into nearest upward whole part.
5. For rating ≥900# and sizes ≥16”, minimum one qty. valve spare shall be supplied for each size, rating & material.

1) Set means complete replacement of particular part in one machine.
2) Wherever "Each Type" is specified, it means "of the Type/make/model/size/rating and exactly replaceable"
3) Wherever "% qty." is specified, Bidder to quote in next higher rounded figure
4) Out of % age spares and minimum qty specified against each item - higher of the two shall be supplied.
5) Electrical EQUIPMENT which has not been mentioned in this table and needs spare parts, CONTRACTOR shall consider spare parts for them, the quantities for such spare parts shall then be APPROVED by OWNER/CONSULTANT.
2.15 **Instrumentation Items:**

1) Set means complete replacement of particular part in one machine.
2) Wherever “Each Type” is specified, it means “of the Type/make/model/size/rating and exactly replaceable”
3) Wherever “% qty.” is specified, Bidder to quote in next higher rounded figure
4) Out of % age spares and minimum qty specified against each item - higher of the two shall be supplied.

3.0 VENDOR’S RECOMMENDED SPARE PARTS

Contractor shall submit list of recommended spare parts of specialised items not covered under Mandatory spares, along with itemised price. Owner will review and decide the recommended spares required for the project.

General Notes:

1) The above spares do not include installed spares / commissioning spares. The above shall be Mandatory spares only.

2) Set means complete replacement of particular part in one machine/equipment/Fired heater etc.

3) Item wise price against each item shall be furnished.

4) Wherever "Each Type" is specified, it means "of the Type/make/model/size/rating and exactly replaceable"

5) Wherever "% qty." is specified, LSTK Contractor to quote in next higher rounded figure

6) Out of % age spares and minimum qty specified against each item - higher of the two shall be supplied.

7) Spares mentioned above to be offered as mandatory spares. However, if these spares are not used in the equipments being offered / supplied, the same need not be supplied. Bidder shall
clearly indicate against each such spare that these spares / items are not used in their equipments.

8) The above is owner’s recommended list of spares. The supplier may add other items as per their recommendations.

9) The quotation should contain sectional drawing showing location & part no. (For exact identification) & material specification.

10) LSTK Contractor to supply all commissioning spares for all necessary equipment’s for smooth & trouble free operation of complete system.

LSTK Contractor to supply all mandatory spares parts as per the list for all necessary equipment’s for smooth & trouble free operation of complete system.

Itemwise Price List to be furnished by LSTK Contractor with validity of 2 Years for 2 years Bidder’s recommended Operational Spares for smooth & trouble free operation of complete system. However these prices shall not be part of LSTK bid.

4.0 MAINTENANCE TOOLS AND TACKLES

The Contractor shall include all necessary maintenance tools required for maintenance of the Static equipment/Boiler supplied by him. The tools included by the Contractor shall cover all minimum maintenance tools considered necessary by the Contractor. A comprehensive list of maintenance tools shall be furnished. For some of the equipment/systems, requirement of maintenance tools and tackles has been specified in Data Sheets. Contractor shall necessarily supply these tools in addition to other tools and tackles as required.

1.0 OWNER'S ENGINEERS IN LSTK CONTRACTOR'S DESIGN AND DETAILED ENGINEERING OFFICE:

1.1 LSTK Contractor shall provide to Owner's Engineers in LSTK Contractor's Design and Detailed Engineering Office the following facilities and services free of charge:

The basis is fifteen (15) man months not exceeding three (3) Engineers at any time.

1.1.1 Fully furnished offices: one double occupancy office, one single occupancy office. A conference table shall be provided in the single occupancy office.

1.1.2 Office equipment for exclusive use by Owner's Engineers shall be:

- 1 Scanning machine
- 1 Speaker-type telephone per office
- 1 PC with internet per engineer and printing facility
- 1 Photocopying machine

1.1.3 Office stationery

1.1.4 Local transportation from residence to office and vice versa by means of car or car pool transportation.

1.1.5 Telephone services in LSTK Contractor's Design and Detailed Engineering office as follows:

a) Cost of local and domestic telephone calls is in LSTK Contractor's fixed price.

1.1.6 Owner's Engineers offices should be near LSTK Contractor's project team (as far as possible) and can access to LSTK Contractor's general computer services of the non confidential nature, computer network and the Engineers shall be authorized to use Internet and e-mail for inter office and other countries and use the video teleconference.

1.0 GENERAL:

Given below is a typical program to train Owner’s Operation and Maintenance manpower in similar plants. Under this program nominated personnel shall be trained at:

- LSTK Contractor’s Detailed Engineering Office
- LSTK Contractor’s other Similar Plant in operation

2.0 OBJECTIVES OF MANPOWER TRAINING:

2.1 The objectives of training program shall be to transfer Technology and develop technical expertise in a core of individuals so that there is a pool of knowledge among Owner’s personnel which can be used to operate and maintain complete plants along with trouble shooting and to handle emergency situations envisaged during operation. The basic objective of training shall comprise of following main elements:

2.1.1 Owner’s manpower shall receive sufficient detailed instructions & exposures on the plants to enable them to carry out normal operations, to take corrective action in the event of upset conditions, and to set up routine operating and maintenance procedures.

2.1.2 Owner’s manpower shall be able to develop a thorough understanding of the plants and the know-how and processes behind it, be in a position to take positive and corrective action to prevent any upset and breakdown conditions from occurring, and to optimize plants’ operations, maintenance and organization.

3.0 REQUIREMENT OF TRAINED PERSONNEL:

Requirement of Technical Personnel for the plants shall be demonstrated to Owner by LSTK Contractor based on organisation chart of similar Plants indicating the total number of personnel required or operation, maintenance, laboratory works, etc.

4.0 TRAINING PROGRAM: CONTENT AND TIMING:

4.1 Title: Technology Training Course

<table>
<thead>
<tr>
<th>Objective</th>
<th>To train Process Engineers and Senior Operations’ Personnel. It provides participation with theoretical and practical knowledge and skills required for efficient and safe operation of the plants.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content</td>
<td>This course describes the process flow and equipment, process control, maintenance procedures, analytical procedures, metallurgy and safety. Process and catalyst and adsorbent and desorbent chemistry (as required) and effects of process variables are carefully explained. Plants start-up, shutdown, emergency procedures and production quality control are discussed in detail along with a trouble shooting analysis. Each participant will receive a Technology Training Manual.</td>
</tr>
<tr>
<td>Duration</td>
<td>1 Week</td>
</tr>
<tr>
<td>Trainers</td>
<td>One LSTK Contractor’s Instructor cum coordinator</td>
</tr>
<tr>
<td>Participants</td>
<td>Maximum 08 (Eight)</td>
</tr>
<tr>
<td>Location</td>
<td>LSTK Contractor’s Detailed Engineering Office.</td>
</tr>
</tbody>
</table>
4.2 Training Courses at the LSTK Contractor's other Similar Plant Site:

4.2.1 Title: Process Operation training Course

<table>
<thead>
<tr>
<th>Objective</th>
<th>To provide a basic overview of process chemistry, operating variables and process control suitable for foreman, control room operators and outside. Start-up, Shut-down, Safety and Emergency procedures</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content</td>
<td>Description of Process flow and control, Equipment of Plants, Routine duties and operating emergency procedures.</td>
</tr>
<tr>
<td>Duration</td>
<td>02 Weeks</td>
</tr>
<tr>
<td>Trainers</td>
<td>Two LSTK Contractor’s Technical Advisors.</td>
</tr>
<tr>
<td>Participants</td>
<td>Maximum 08 (Eight)</td>
</tr>
<tr>
<td>Location</td>
<td>LSTK Contractor ‘other Similar Plant Site</td>
</tr>
</tbody>
</table>

4.2.2 Training as indicated in respective Design Philosophy (Section 5.0) shall also be provided by LSTK Contractor in Vendor’s works/ Plant.

5.0 LANGUAGE OF TRAINING:

All training shall be conducted in English language.

6.0 MANAGEMENT AND COORDINATION OF TRAINING SERVICES:

LSTK Contractor shall appoint a Training Manager to manage and coordinate training services for this Project. Owner for his part shall appoint a Training Manager to coordinate with LSTK Contractor. Owner’s training Manager shall be responsible for discipline of trainees during all phases of training, inside and outside India.
SECTION : VI – 13.0

INFORMATION REQUIRED IN TECHNICAL PROPOSAL

PLANT : STEAM GENERATION PLANT

PROJECT : INTEGRATED COAL BASED FERTILISER COMPLEX, AT TALCHER, ANGUL DISTRICT, ODISHA
1.0 INFORMATION REQUIRED IN THE TECHNICAL PROPOSAL

1.1 General

1.1.1 Comprehensive Engineering Specification/Standards and Design Codes for all types of Equipments/items including Mechanical, Electrical, Instrumentation, Civil & Structural proposed to be adopted by the LSTK Contractor.

1.1.2 Technical particulars, technical literature, drawings of the equipment offered and other details stipulated under design philosophy for respective equipment/ facility.

1.1.3 Type test certificates of the equipment offered.

1.1.4 Hazardous area classification drawing.

1.1.5 Construction Power requirement.

1.1.6 List of consumables, including first fill of oil & lubricants (including meeting short fall thereof till handing over) with quantities included in offer.

1.1.7 Specifications of Catalysts, Chemicals and Raw Materials and their estimated Initial and yearly requirement.

1.1.8 List of spares required for erection & Commissioning, performance guarantee tests till handing over of installation with quantities required.

1.1.9 Services considered to be provided by Owner at battery limit with specification & details of such services.

1.1.10 Details of Shop & Field Testing and Inspection Procedures proposed to be adopted. Inspection of equipment & machinery should be carried out by a Third Party Inspector. Owner also has the right to inspect any equipment, machinery at any stage.

1.1.11 Master Time Schedule in latest version of Primavera showing all the activities from date of receipt of LOI/ FOI and till handing over of complete installation.

1.1.12 An Implementation Plan showing man-power deployment schedule during various stages of implementation period, including peak requirements. LSTK Contractor shall indicate the schedule, category and number of personnel proposed for supervisory services during different phases of work, indicating clearly as to how many of them would be deployed by LSTK Contractor.

1.1.13 Project Plan showing Project Organisation, Project team, Project services offered by the LSTK Contractor at home office and at site. A time schedule for the complete project in the form of a Bar Chart and Network indicating the time allocated for various activities.

1.1.14 Quality Assurance & Quality Control procedure to be followed by LSTK Contractor for the implementation of this project.

1.1.15 List of all construction equipments, tool-tackles & man power resources proposed to be used.

1.1.16 List of Deviations. LSTK Contractor shall submit list of deviations to technical NIT indicating clearly clause-wise deviation from NIT. Any deviation listed other than in deviation list shall not be considered.

1.1.17 List of Recommended Spare part (for 2 Years Operation & Maintenance). Complete list of itemised spare part for all Process, Mechanical, Electrical, Instrument items considered for this project.
1.2 **Experience in executing similar orders**

Bidder shall submit list of Steam Generation Plants completed in last 10 years including the orders under execution indicating following:

1.2.1 Name of the Project with capacity, scope of work involved, order value & location.
1.2.2 Name of the client
1.2.3 Date of issue of order
1.2.4 Date of completion as per order
1.2.5 Date of actual completion (or % progress for ongoing projects till date of submission of bid for this project)
1.2.6 Performance certificate issued by owner.
1.2.7 Reasons for delay in completion, if not completed within completion date specified in order.

1.3 **Performance Parameters**

1.3.1 Performance parameters will be as per Section-VI-8.0 of NIT.
1.3.2 Performance of all other equipment shall be checked as per relevant standards for specified capacity, turn down, specified outputs and noise levels.
1.3.3 Bidder shall also very clearly and unambiguously describe in his offer

- The format that would be used for recording the observations and the correction factors/ formulae’s etc that will be used (a) for corrections and (b) for evaluation of performance.
- Detailed methodology that would be adapted for conducting performance evaluation,
- The test conditions,
- The points where measurements shall be made and
- The detailed list of instruments (with accuracy class) that would be arranged and used by them for performance evaluation.
- The list of loads (electrical) that would not be considered for the purpose of computing guaranteed value of consumption of auxiliaries.

1.4 **Summary Of Technical Parameters of Major Equipment**

<table>
<thead>
<tr>
<th>Sl. No.</th>
<th>Equipment Description &amp; Quantities</th>
<th>Make &amp; type Country of manufacture</th>
<th>Applicable std.</th>
<th>Rating as per design conditions of tender</th>
<th>Guaranteed tech. Data</th>
</tr>
</thead>
</table>

1.5 **Information to be furnished regarding Process**

1.5.1 Basis of Design

Design basis for all Process, Mechanical, Electrical, Instrumentation, Civil & structural items.

1.5.2 Process Description.
A detailed description of the process offered, including overall process scheme and the specific merits of the process scheme being offered.

1.5.3 Process Flow Diagram / Material Selection diagram
Process flow diagrams, Material Selection Diagrams indicating the major equipment in proper Flow sequence, Flows, Temperatures, Pressures, Compositions, Pressure drops for critical equipments, Critical Instrumentation, Control points and the material of construction adopted for the major lines.

1.5.4 Utility flow diagram.

1.5.5 P&I Diagrams for all process and package items.

1.5.6 Material and Energy Balances
Material and Energy Balances shall cover all process route, showing input and output utility streams as well as composition, volumetric flow, molecular weight and densities of principal process streams at inlet and outlet of each equipment.

1.5.7 Detailed Steam, Condensate and Cooling water Balance
Detailed Steam, Condensate and Cooling water Balance diagram showing production and consumption at different points for each level of steam pressure, Cooling Water Balance showing In/Out temperatures, cooling water flow to each exchanger using cooling water, process and condensate flows from the process plants.

1.5.8 Utility Requirements (Anticipated Normal and Peak requirements of each utility).

1.5.9 Start-up Requirements of Utilities such as Inert Gas, Steam, Instrument Air, Electrical Power etc.

1.5.10 Emergency Power Requirement and the list of equipments connected to it.

1.5.11 Instrumentation Control philosophy.

1.5.12 Plot Plan showing principal equipment and machinery including detailed floor plans and elevations. The plot plan should show clearances required, roads and all principal pipe racks.

1.5.13 Plant Battery Limit termination point details.

1.5.14 Turndown capability and operating range.

1.5.15 System suggested for on-line product quality control

1.6 Information to be furnished regarding Boiler

1.6.1 The net capacity of boiler

1.6.2 Number & type of boilers

1.6.3 Steam pressure at the outlet of Main Steam Stop Valve during the controlled load

1.6.4 Steam temperature at the outlet of Main Steam Stop Valve

1.6.5 The minimum continuous load

1.6.6 At steady state operation the difference in temperature between the ambient and the outside surface of insulation

1.6.7 The maximum noise pressure level at 1.0m distance for the boiler and any associated equipment within 1 m distance will be equal to or less than

1.6.8 Conditions considered for the purpose of design of boiler viz. Ambient temperature, RH, Boiler feed water temperature,
1.6.9 Emission at outlet of ESP & stack
1.6.10 Boiler efficiency for varying GCV
1.6.11 Curves for radiation losses
1.6.12 Curves for Condenser performance for varying ambient temperature
1.6.13 Specification sheet with complete details.
1.6.14 Product Steam

1.7 Information to be furnished regarding Turbine
1.7.1 Specification sheet with complete details
1.7.2 Rated Capacity
1.7.3 Steam pressure at the inlet of turbine
1.7.4 Steam temperature at the inlet of turbine
1.7.5 Detailed manufacturing programme
1.7.6 Equipment layout with main overall dimensions including those required for foundations and piping design for Turbine and auxiliaries.
1.7.7 Performance curves for steam turbine comprising (but not limited to):
   (a) steam consumption versus kW (for various extraction rate in case of extraction turbine)
   (b) overall efficiency vs. load curve
   (c) steam consumption correction curves
   (d) curve showing variation of exhaust temperature with inlet flow (i.e. under various loads):
      - for change in live steam pressure
- for change in live steam temperature
- for change in speed from governor set point speed to max. continuous speed
- for change in cooling water inlet temperature from 25°C to 35°C

(e) Heat rate & Turbine output Vs exhaust pressure
(f) Heat rate & Turbine output Vs inlet steam pressure
(g) Heat rate & Turbine output Vs inlet steam temperature
(h) Curves for radiation losses

1.8 **Information to be furnished in respect of Fans & Blowers**

1.8.1 Specification sheets completely filled
1.8.2 Characteristic Curves - Performance curves, showing discharge pressure, capacity, and brake horse power at the inlet specified conditions (Pressure, capacity, temperature, molecular weight).
1.8.3 Details of Lubrication and sealing system
1.8.4 Data for selection of motor
1.8.5 General Arrangement Drawing with all main dimensions, size and location of connections for ducting with all horizontal & vertical clearance necessary for installation and disassembly.
1.8.6 Reference list indicating duty condition, location, year of installation, name of client etc.
1.8.7 GA drawing with all details & dims. Including fan, drive, motor
1.8.8 Description of capacity control with details

1.9 **Information to be furnished in regarding piping**

1.9.1 Equipment Layout plan showing location of various equipment based on relevant appropriate norms.
1.9.2 piping layout drawing.
1.9.3 Detailed Technical Specifications of piping & valves with approximate tonnage/quantities in the form of Bill of Material.
1.9.4 Plant battery limit tie point details.

1.10 **Information to be furnished in respect of Coal Crusher House**

1.10.1 Scheme / Layout drg. of Coal Crusher House
1.10.2 GA Drawings of all the Coal Crusher House equipments along with detail specification of each equipment
1.10.3 Mechanical G.A drg. of Coal Crusher House buildings

1.11 **Information to be furnished in respect of Ash Handling System**

1.11.1 Scheme / Layout drg. Of Ash handling system
1.11.2 PFD of Ash handling System
1.11.3 GA Drawings of all the Ash handling System equipments along with detail specification of each equipment
1.11.4 Mechanical G.A drg. of all buildings (e.g. Silo, Bag house building etc.) showing Ash handling equipments
1.12 Information to be furnished in respect of Static Equipment
1.12.1 Filled in Data Sheets of pressure equipment along with outline sketches showing thickness of main parts, weight (erection & operating) and anchorage details
1.12.2 General arrangement for package items showing plan, elevation & end view
1.12.3 Details of internals including demister, i.e. make and model No., free volume, wire diameter, surface area, and density of material and separation efficiency.

1.13 Information to be furnished regarding Pumps
1.13.1 Pump specification sheet with complete details in Performa enclosed with enquiry
1.13.2 Dimensional outline drawing
1.13.3 Lube oil schematic
1.13.4 Performance curves
1.13.5 Foundation assembly drawing of pump with driver & all accessories mounted on base plate
1.13.6 Reference list for pumps supplied in past for similar duty conditions.

1.14 Information to be furnished in respect of EOT Cranes

1.15 Information to be furnished in respect of Hoists

1.16 Information to be furnished in respect of Elevators

1.17 Information to be furnished in respect of Environment pollution control measures:
Designed values of environment & effluent pollutants vis-a-vis values as per statutory norms shall be mentioned by bidder.
Both continuous and intermittent gaseous emission shall be indicated.
Details of Effluent Streams and Treatment System proposed within Battery Limits and required outside Battery Limits. Design and Guaranteed quality and quantity of various gaseous emissions and liquid effluents and solid waste at Battery Limits.

1.18 Information to be furnished in respect of emissions from stack
Designed values of emissions vis-a-vis values permitted as per statutory norms shall be mentioned by bidder.

1.19 Information to be furnished in respect of Electrical
1.19.1 Single line Power Distribution Diagram for Complete electrics included in his offer up to incomers, bus-couplers of switchboards, PCCs, PMCCs, MCCs, Distribution Boards, MLDBs indicating maximum demand on each bus-section,
1.19.2 Protection/ metering and interlocking scheme.
1.19.3 Load List indicating rated and absorbed power of loads in kW indicating voltage, rpm, speed variation requirement, type of starting/ control, duty type (Continuous/ Intermittent/ Standby) with type of power supply (Normal/ Emergency/ Critical).
1.19.4 Single line diagram for evacuation of power to sub-stations in various plants through Main receiving & Power Distribution sub-station
1.19.5 Layout of equipment proposed in Substation, control room, sub-stations, Electrical Rooms and other premises for installing of facilities (electrical, LMS) proposed by him to meet stipulations in ITB.
1.19.6 Hazardous area classification drawing.

1.19.7 'List of Deviations-Electrical', if any.

1.19.8 'List of Exclusions-Electrical', if any.

1.20 Information to be furnished in respect of Instrumentation

1.20.1 Consolidated list of drawing & documents.

1.20.2 Details of Instrumentation System including proposed models etc. as also details of the proposed control systems (DCS) Safety Interlock and Trip system

1.20.3 List of all control valves with purchase specifications, material of construction, codes/standards used

1.20.4 Instrumentation Control Philosophy, Logic Diagrams & Safety valve Specifications

1.20.5 Instrument Index & I/O List

1.20.6 Catalogue & technical literature of Instrument along with their accessories.

1.20.7 Deviation if any, from the technical spec. giving justification for the same.

1.20.8 Certificates from recognised authority for (a) degree of protection against environment (b) for intrinsic safety/ Ex-proof execution.

### 1.0 SITE LOCATION
The proposed project will be located within the premises of existing closed coal based Ammonia-urea complex of TALCHER FERTILIZERS LIMITED, Talcher, ANGUL DISTRICT, ODISHA (INDIA).

2.0 SITE ESTABLISHMENT

2.1 The LSTK contractor shall provide all huts, stores, tarpaulins and other covers for the accommodation of his staff, workmen and materials. All materials likely to deteriorate in the open shall be stored under suitable cover.

2.2 The LSTK contractor shall advise the owner within 15 days of the placement of LOI his space requirement which shall include for office, covered storage, open storage, fabrication space, etc. Depending on availability & requirement, space shall be allotted to the contractor for the duration of this contract. He will not be permitted to make use of any other space without the sanction of the Owner. The use of this space shall strictly be made for the execution of this contract only. The sanitary conditions of the ground in or around such structures shall, at all times, be maintained by the contractor in a manner satisfactory to the owner.

2.3 The security of the LSTK contractor's equipment and materials is his own responsibility.

2.4 The LSTK contractor's shall clear away periodically any rubbish, scrap materials, etc. and dump the same in the area indicated by the owner/consultant. All construction material shall be neatly stacked in an orderly manner as directed by the owner and care shall be taken to allow proper access to workmen and easy movement of men, vehicles, cranes and materials.

2.5 The LSTK contractor shall maintain all the drawings carefully mounted on the board of appropriate size and well protected from the ravages of weather termites and other insects.

2.6 The LSTK contractor shall not permit the entry to the site of any person not directly connected/concerned with the work without first having obtained the written permission of owner.

2.7 The LSTK contractor shall submit a list of plant, equipments, tools, tackles, etc. which he will use, to perform the work. The contractor shall submit a list in duplicate of all materials, tools and tackles etc. brought inside the plant site duly signed by owner's security staff as per the rules laid by owner. These tools, etc. shall not be removed from the site till the completion of job. A gate pass must be obtained from the owner in order to remove from site any plant, machinery, tools, materials and equipment.

2.8 All items such as instructions and other pertinent data regarding erection/commissioning and maintenance should be typed and classified for transmittal in a manner approved by the owner.

2.9 All employees of the LSTK contractor shall conform to any rules of conduct, etc. established by owner. Failure to comply with the rules of conduct will be sufficient cause for removal of such person from the site.
2.10 The LSTK contractor will be responsible for providing all plant, tools and tackles, consumables and scaffolding required for the execution of his work as per the best engineering practices.

2.11 The receipt, unloading, movement and storage at site of all the LSTK contractor plant, tools and materials is his responsibility. The receipt, movement & storage of material issued by owner also shall be the responsibility of the Construction Contractor.

2.12 ELECTRICITY

Construction power shall be arranged by LSTK contractor as per Section 7.0 Clause no. 3.0 of this contract.

2.13 CONSTRUCTION WATER

The LSTK contractor shall communicate his water requirements to the Owner within 7 days of the placement of LOI. Construction water shall be arranged by LSTK contractor as per Section 7.0 Clause no. 3.0 of this contract.

2.14 FIRST AID

The LSTK contractor may have access to the Owner's qualified first aid personnel and ambulance, in case of accidents, if available. The contractor will, however provide a first aid post for minor injuries to their staff.

3.0 SUPERVISION OF WORK

3.1 The LSTK contractor shall submit to the Owner resume of his site supervisors for approval prior to commencement of the work. Once approved, the LSTK contractor shall not remove his site supervisors without prior concurrence of the Owner.

3.2 The entire work is to be completed as per the agreed time schedule. The programme of work in details shall be submitted by the LSTK contractor before commencement of work. The detailed programmes prepared by the LSTK contractor shall conform to the targets set forth in the time schedule and will be subject to the approval of the owner. All the work shall be carried out in such a manner that the work of other agencies at site is not hampered due to any action of the LSTK contractor.

4.0 INSPECTION

The work of the LSTK contractor shall be subject to inspection by the Owner at all times.

5.0 EMPLOYMENT OF LABOUR

5.1 The LSTK contractor will be expected to employ on the work only his regular skilled employees with experience of this particular work. The permission of the Owner must be obtained before tradesman is recruited locally for the work. This rule does not apply to unskilled labour. No female labour shall be employed in dark hours/ i.e. hours prohibited under the applicable law. No person below the age of eighteen years shall be employed at any point of time.
5.2 All traveling expenses including provision of all necessary transport to and from site, lodging allowances and other payments to the LSTK contractor employees are his own responsibility.

5.3 The hours of work on LSTK Contractors / Owner and contractor shall adhere to the same.

5.4 All Construction contractors employees shall wear safety helmet and such identification marks as may be provided by LSTK contractor on work site and duly approved by Owner.

5.5 All notices displayed on the site and any instructions issued by the Owner shall be strictly adhered to by the LSTK Contractors and/or his LSTK contractor employees.

5.6 It shall be the responsibility of LSTK contractor to provide suitable accommodation including necessary facilities for their labour and staff.

5.7 LSTK contractor will arrange for Ration Cards and Permits for labour as per statutory provisions for its labour, as necessary.

5.8 The LSTK contractor shall be required to maintain employment records as covered in relevant Acts and produce documentary evidence to the effect that he has discharged his obligations under the Employees Provident Fund Act 1952 for the workmen working at site.

5.9 In case the Owner becomes liable to pay any wages or dues to the labour of the LSTK Contractors or his contractor or any Govt. agency under any of the provision of the Minimum Wages Act, Workmen Compensation Act or any other law due to act of omission of the contractor, the Owner may make such payment and shall recover the sum from Contractor's bills or any other dues.

6.0 COMPLETION OF WORK

Before finally leaving site, all the LSTK contractor store, huts, plant, tools and rubbish shall be removed and the site left clean and tidy. The space allocated by Owner shall be vacated and handed over to the Owner.

7.0 WORKING AND SAFETY REGULATIONS

7.1 The LSTK Contractor shall observe all statutory safety and legal requirements regulations issued by Central and State Governments applicable to the work as well as any local regulations applicable to the site issue by the consultant or any other authority.

7.2 Particular attention is drawn to the following:

   a) In case of accident, the Owner shall be informed in writing forthwith. The LSTK Contractor shall strictly follow regulations laid down by Factory Inspector, Govt. and State authorities in this regard.

   b) LSTK contractor shall fence his plant, platforms, excavations etc.

   c) Compliance with all electricity regulations.
d) Compliance with statutory requirements for inspection and test of all lifting appliances and auxiliary lifting gear.

e) Safety belts proposed to be used, shall be got checked by Fire & Safety Department of LSTK Contractor / OWNER in written before use.

f) Before using the lifting or pulling equipment, LSTK contractor shall carryout load test which shall be witnessed by LSTK Contractor / OWNER.

7.3 Staircase, doors or gangways shall not be obstructed in any way that will interfere with means of access of escape.

7.4 No excavations will be started without the permission of the LSTK Contractor / OWNER, who will inform the LSTK contractor of the position of any pipes or cables known to be buried in the area. All excavations must be effectively railed off at all times, or completely boarded over properly marked during the hours of darkness by red warning lamps, using Flame proof warning lamps in non smoking areas. Debris or material which cannot be immediately removed must be heaped in such a way as to be immediately remove and also to leave adequate passage way. Any finds such as relics or antiques coins or fossils etc. shall be promptly handed over to the Owner.

7.5 The LSTK contractor will notify the Owner of his intention to bring on the site any equipment, such as, space heating or welding apparatus or any container holding liquid or gaseous fuel or other substance which might create a hazard. The Owner will have a right to prohibit the use of such equipment or to prescribe the conditions under which such equipment may be used. The LSTK Contractor will have the right to inspect any construction plant, and to forbid its use if in his opinion it is un-suitable or unsafe. No claim arising there from shall be made by the LSTK Contractor.

The LSTK contractor or any one acting on his instructions will not bring on to the site any radio active substance or any apparatus using such substances or any X ray apparatus until written permission and direction regarding the use of such equipment has been received from the Owner.

The LSTK contractor shall be responsible for the safe storage of the radio graphic sources or those of his Construction contractors.

7.6 The LSTK contractor will meet all requirements, and act on the instructions of the Owner where it is necessary to operate a permit to work system.

7.7 Where it is necessary to provide and/or store petroleum products or petroleum mixtures and explosive, the LSTK contractor shall be responsible for carrying out such provision and/or storage in accordance with the rules and regulation laid down in Petroleum Act 1934, Explosive Act 1948 and Petroleum and Carbide of Calcium Manual Published by the Chief Inspector of Explosive of India. All such storage shall have prior approvals of the Consultant. In case any approval or clearance from Explosive or any statutory authorities is required, the contractor shall be responsible for obtaining the same.

7.8 The LSTK contractor shall have his own Fire Fighting Extinguishers and Equipment.

7.9 The LSTK contractor shall be responsible for the provision of all safety notices safety equipments including the safety gadgets for his workmen required by both the relevant legislation and such as the Owner may deem necessary.
7.10 While working at heights, safety belts shall necessarily be used.

7.11 "LSTK contractor shall employ a safety officer for safe executing the construction activities of the project who will be responsible for implementing safety requirement contained in the documents. The safety officer shall possess a recognised degree in engineering discipline preferably, F&S or (Any branch of engineering) and had a post qualification construction experience of minimum two years. In addition, he/she shall also possess a recognised degree or diploma in industrial safety and preferably have adequate knowledge of the language spoken by majority of the workers at the construction sites. Contractor shall ensure physical presence of safety personnel at each work location wherever Hot Work permit is required. No work shall be started at site until above safety personnel are physically present at site. The contractor shall submit a safety organogram clearly indicating the lines of responsibility and reporting system and elaborate the responsibilities of safety personnel in the HSE MANUAL/Program. The contractor should furnish Bio-Data/Resume of the safety personnel as above, at least 01 month before the mobilization for PDIL/owner’s approval.

7.12 LSTK contractor shall use only steel planks and clamps executing scaffolding. Wooden planks and rope shall not be allowed for this purpose.

7.13 LSTK contractor shall use asbestos cloth to ensure falling of weld spatters down below during above ground welding to ensure safety of electrical cables and personnel and avoiding any fire hazards.

8.0 ELECTRICAL SAFETY REGULATIONS

8.1 In no circumstances will the LSTK contractor interfere with fuse and electrical equipment belonging to the owner or other contractors.

8.2 Before the LSTK contractor connects any electrical appliances to any plug or socket belonging to the other contractor or owner, he will -

   i. Satisfy the Owner that the appliance is in good working condition.

   ii. Uses of matching sixes plug & does not uses bare wire to insert in socket.

   iii. Inform the Owner of the maximum current rating, voltage and phase of appliance.

   iv. Obtain permission of the Owner dealing the sockets to which the appliance may be connected.

   v. Use distribution board with ELCB for feeding power to hand held tools.

8.3 The Owner will not grant permission to plug in until he is satisfied that-

   i. The appliance is in good condition and is fitted with a suitable plug.

   ii. The appliance is fitted with a suitable cable having two earth conductors, one of which shall be earthed metal sheath surrounding the cores.
8.4 No electric cable in use by the other LSTK contractor/owner will be distributed without prior permission. No weight of any description be imposed on any such cable and no ladder or similar equipment will rest against or be attached to it. Cables/Wires used shall be in good condition without cuts & in insulation & joints.

8.5 The voltage for all portable equipment e.g. drilling machines, temporary lighting etc. will not exceed 240 volts.

8.6 No work must be carried out on any live equipment. The equipment must be made safe and a “permit to work” issued before any work is carried out.

8.7 LSTK contractor shall employ electrician to maintain his temporary electrical installation.

8.8 Take necessary clearance for working in hazardous area.

9.0 REPORTING

a) The LSTK contractor must report the following information to the Owner in writing daily. Number of men employed, trades-wise,
   - Progress achieved;
   - Concrete pour card, if any.

b) If during excavation any materials such as but not limited to precious materials or treasure troves etc are found, the same shall be reported to owner immediately and shall be the property of owner.

10.0 GENERAL SAFETY REQUIREMENTS TO BE OBSERVED DURING SITE FABRICATION AND ERECTION BY THE CONSTRUCTION CONTRACTOR

1. Before starting the work, **LSTK contractor** should get safety work permit and should strictly follow instructions written by the concerned authority in work permit. Permit is required for all types of job i.e. Hot, Cold Excavation, Chipping, Grinding etc.

2. Smoking is strictly prohibited inside factory areas.

3. Safety appraisal and equipments shall be provided to workmen as per the nature of work. Welders shall use gloves, goggles, shields etc. during welding, gas cutting etc. All technicians shall use gloves, goggles during grinding, chipping etc. If any unsafe practice is observed Fire & Safety Sections or the authority issuing the work permit is authorized to stop the work without any prior notice.

4. Temporary fire extinguishers, water hose shall be available near work place and in case of fire, Owner’s Fire & Safety Section should be immediately informed by LSTK contractor from nearest available telephone. Project Manager should also be immediately informed.

5. LSTK contractor shall secure necessary insurance of his workmen for the entire duration of works under the contract. Owner is not responsible for any
accident/injury caused whatsoever, to any person employed by the Construction Contractor. However, LSTK contractor has to inform Owner's Fire & Safety Section about accident, if any, immediately.

6. Temporary switch boards, cables, wires and electrical equipments should be installed in accordance with standard electrical practice with proper earthing etc. and should have prior approval of LSTK Contractor / Owner electrical engineer. Switch board shall be suitably protected against rainwater. The cable used for welding machine should have flexible tough rubber sheathing.

7. Temporary cables and wires including welding cables should be routed as not to cluster the work areas. Also any possibility of damage to live wires by falling objects should be avoided. Temporary electrical lines for power & lighting shall run overhead or underground so that they should not hinder the movement of men, materials and vehicles.

8. Portable hand lamps being used by construction crew shall be preferably of 24 Volts supply bulb to be protected with safety shields.

9. Earthing for welding shall not be taken through existing structure or equipments due to the very explosive nature of the plant, raw materials, reaction during process and final product. There is every possibility of fire and explosion in the equipment due to electric spark caused by loose earthing connection etc.

10. LSTK contractor should be careful while excavating so that no underground cable or pipe line is damaged. As soon as any brick cover or underground cables are exposed he should stop the work and inform Construction Manager immediately for necessary action.

11. LSTK contractor should not leave any welding machine etc. running after the work is stopped. Before leaving the work place, Contractor should ensure that welding sets are disconnected from welding socket outlet.

12. All work areas shall be kept reasonably clear and clean for easy movement of men & material. Also all approach roads shall be free from obstacles for easy movement of cranes, vehicles, fork-lifts, trollies etc. and all debris shall be periodically removed.

13. All temporary structure and supports for erection purpose such as scaffolding, ladders, walkways, platform, shuttering etc. shall be sufficiently strong for safe use and to prevent collapse & accidental fall of workman. Same shall be removed immediately after the work is completed.

14. All workmen working at unsafe elevation during the construction activity such as concreting, plastering, welding, erection work, painting, insulation etc. shall be safe and sufficient passage and should be properly instructed to take necessary safety precautions and observe safe practice to prevent accidental fall. Safety belts and helmets shall be used wherever necessary.

15. All supervisors, welders, electricians, technicians, riggers, engaged in the work shall be adequately skilled, experienced and acquainted with standard rules, regulation & practices of the work.
16. All open trenches, pits and other excavation carried shall be barricaded out by Construction Contractor, to avoid accident.

17. All lifting tools, tackles & accessories shall be in good working condition and of suitable capacity for the purpose for which they are used. All certificates/permits/licenses etc. required under any law or regulation for the same shall be available and valid during the entire period of the execution of the work under this WO/Contract.

18. LSTK contractor shall not use any structure or equipments erected or under erection for fastening, lifting or flying tackle guy-ropes etc. which may impose such loads for which structure or equipments are not designed to carry. However, LSTK contractor has to get prior approval from Construction Manager of Owner before using beams, permanent structure for the above purpose.

19. When work is carried out at high elevations, it is the responsibility of the LSTK contractor to ensure that tools and materials are not left in a position where they can fall on peoples moving /working below. Where necessary, places below should be cordoned off and caution boards be provided by contractor. Also, LSTK contractor should not cut existing hand railing/structure.

20. Contractor’s men must not tamper with any machines, switches, valve or equipment not connected with their work. Welding holders should not be tested on running pipe lines.

21. Nylon rope should not be used for scaffolding where hot line is running nearby, because there is every possibility of wire rope catching the fire. Also, no scaffolding is to be made on hot as well as insulated lines.

22. Necessary sign boards clearly indicating “RADIOGRAPHY HAZARDS” on all the four sides of the cordoned area surrounding radiography source will have to be displayed by Construction Contractor. Surrounding area will be cordoned with the help of manila rope and his personnel will be kept for watching/guard on all the four sides to prevent entry of personnel till the radiography work is completed. Construction Contractor’s personnel should be able to communicate clearly/properly to stop entry of unauthorized personnel within the area cordoned for the radiography work.

Refuse Disposal

23. Refuse must be removed daily to prevent accumulation. Materials liable to cause persons to slip or trip and fall should be cleared immediately.

24. Refuse removal teams working after work hour should be organized where normal cleaning can not cope with the build up of waste materials.

25. Projecting nails should be removed or bent over.

Personal Protective Equipments
26. Helmets should be provided for all who are exposed to the dangers of falling material or structures they might strike against.

27. Suitable eye protection should be provided for all who are exposed to flying particles, harmful glare and dangerous substances.

28. In the handling of rough objects, gloves should be provided and used.

29. Safety footwear should be provided to all who are exposed to foot injury, should be good fitting and comfortable to wear.

30. Safety belts should be provided where other means are not practicable. Both the anchorage points and lifelines provided for attaching safety belts should be of adequate strength. The umbilical line should be fixed in such a way that user's freefall will not exceed 1 metre.

31. Catch net should be used where persons are liable to fall and these should be securely supported at a level as near as possible to the working level.

32. Noise defenders should be provided for work area where the noise level exceeds 85 dBA.

33. Respiratory protection should be provided by employers and used by workers where the dust level remains high and where control at source is not practicable.

**Inspection & Record Keeping**

34. Where defects render the scaffolds unsafe, they should be rectified immediately. Where this is not practicable, a sign should be put warning against using it.

**Winches**

35. Adequate foundations should be provided for winches.

**Lifting Gear**

36. All lifting gear and slinging should be tested before use and thereafter inspected regularly by competent engineers. Workers should also check the lifting gear visually before using them.

37. Each piece of lifting gear should bear its safe working load, its identification number and its last inspection date. It could in addition be colour coded according to due date of inspection.

38. Wire ropes should be preserved against rusting, kinking, fraying, birdcaging and heat damage. Defective wires should be destroyed to prevent recycling.

**Concrete Mixers**
39. Moving parts which are liable to become nip points, such as gears, chains and rollers should be guarded.

40. Where concrete mixers are driven by internal combustion engineers, exhaust points should be located away from the workers’ work station so as to eliminate their exposure to obnoxious fumes.

**Electrical Components**

41. All components and conductors used must be in good condition.

42. Proper junction boxes and distribution boards from which electric power could be tapped should be provided at every floor level.

**Demolition: General Provisions**

43. Uncontrolled collapse of walls or other structures under demolition should be prevented.

44. The throwing of materials over the sides of the buildings should not be permitted.

**Waste Handling**

45. Where demolition is carried out near public areas:
   a) Hoardings slopping inwards should be erected around the building.
   b) Protective nettings should be hung around the building to prevent materials falling outside the periphery shelter
   c) asbestos

Where asbestos materials are present, appropriate dust control and respiratory protection approved by the local authority must be used.

**Excavation: General Provisions**

46. Test for toxic gases should be carried out where their presence is suspected.

47. Exposure of shorings to vibration such as that produced by engines or vehicular traffic should be kept to a minimum.

**General – Ventilation, Fire Protection/Fighting**

48. Where flammable gas concentration could reach explosive levels, it may be necessary to provide intrinsically safe electrical equipments.

49. Adequate lighting and emergency lighting should be provided.

50. Adequate evacuation stairways should be provided for rapid evacuation in case of an emergency.
First Aid

51. Sufficient First Aid Boxes containing simple dressings and supplies should be provided on the site under the control of the foreman.

Awareness

52. The contractor shall brief the visitor about HSE precautions which are required to be taken before proceeding to site and make necessary arrangement to issue appropriate PPE’s like HELMET, Safety shoes etc. to the visitors. The contractor shall promote and develop consciousness about Health, safety and environment among all personnel working for the contractor. Regular awareness programmes and fabrication shop/work site meeting at least on fortnightly basis shall be arranged on HSE activities to cover hazards involved in various operations during construction phase. During the awareness program, step shall be taken by the contractor to motivate & encourage the workmen and supervisory staff by issuing/awarding them the tokens/gifts/mementos/ Monitory incentives.

A verbal warning shall be given to the workers during the first HSE violations. A written warning shall be issued on second violations and thereafter for the third violations; the services of worker shall be terminated. For all these violations, a penalties’ shall be imposed, separately on the contractor. Records of warning for each worker shall be kept in the records.

53. Penalty

The Contractor shall adhere consistently to all provisions of HSE requirements. In case of noncompliance’s and also for repeated failure in implementation of any of the HSE provisions, Consultant/Owner may impose stoppage of work without any cost & time implication to the Owner and/or impose a suitable penalty.

The amount of penalty shall be limited to 0.5 % (Zero decimal five percent) of the contract value for LSTK contract.

The amount of penalty applicable for the Contractor on different types of HSE violations is as below.
1. For not using personal protective equipment (Helmet, Shoes, Goggles, Gloves, Full body harness, Face shield, Boiler suit, etc.)
   Rs 500/- per day/ Item / Person.
2. Working without Work Permit/Clearance Rs 20000/- per occasion.
3. Execution of work without deployment of requisite field engineer / supervisor at work spot Rs. 5000/- per violation per day.
4. Unsafe electrical practices (not installing ELCB, using poor joints of cables, using naked wire without top plug into socket, laying wire/cables on the roads, electrical jobs by incompetent person, etc.)
Rs 10000/- per item per day.

5. Working at height without full body harness, using non-standard/ rejected scaffolding and not arranging fall protection arrangement as required, like handrails, life-lines, Safety Nets etc.
Rs. 10000/- per case per day.

6. Unsafe handling of compressed gas cylinders (No trolley, jubilee clips double gauge regulator, and not keeping cylinders vertical during storage/handling, not using safety cap of cylinder).
Rs 500/- per item per day.

7. Use of domestic LPG for cutting purpose / not using flashback arresters on both the hoses/tubes on both ends.
Rs. 3000/- per occasion.

8. No fencing/barricading of excavated areas /trenches.
Rs. 3000/- per occasion.

9. Not providing shoring/strutting/proper slope and not keeping the excavated earth at least 1.5M away from excavated area.
Rs.5,000/- per occasion.

10. Non display of scaffold tags, caution boards, list of hospitals, emergency services available at work locations.
Rs.1000/- per occasion per day

11. Traffic rules violations like over speeding of vehicles, rash driving, talking on mobile phones during vehicle driving, wrong parking, not using seat belts, vehicles not fitted with reverse horn / warning alarms / flicker lamps during foggy weather.
Rs. 2000/- per occasion per day

12. Absence of Contractor's RCM/SIC or his nominated representative (prior approval must be taken for each meeting for nomination) from site HSE meetings whenever called by Consultant/Owner & failure to nominate his immediate deputy (in the site organ gram) for such HSE meetings.
Rs10000/- per meeting.

13. Failure to maintain HSE records by Contractor Safety personnel, in line with approved HSE Plan/Procedures/Contract specifications.
Rs 10000/- per month.
14. Failure to conduct daily site safety inspection (by Contractor’s safety engineers/safety officers), internal HSE meeting, internal HSE Awareness/Motivation Program, Site HSE Training and HSE audit at predefined frequencies (as approved in HSE Plan).
Rs.10000/- per occasion.
15. Failure to submit the monthly HSE report by 5th of subsequent month to Project’s Engineer-in-Charge /Owner
Rs. 10000/- per occasion and Rs.1000/- per day of further delay.
16. Poor House Keeping Rs. 5000/- per occasion per subject
17. Failure to report & follow up accident (including Near Miss) reporting system within specific timeframe.
Rs. 20000/- per occasion
18. Degradation of environment (not confining toxic spills, spilling oil/lubricants onto ground).
Rs10000/- per occasion
19. Not medically examining the workers before allowing them to work at height / to work in confined space / to work in shot-blasting / to work for painting / to work in bitumen or asphalt works, not providing ear muffs while allowing them to work in noise polluted areas, made them to work in air polluted areas without respiratory protective devices, etc.
Rs 5000/- per occasion per worker
20. Violation of any other safety condition as per job HSE plan / work permit and HSE conditions of contract (e.g. using crowbar on cable trenches, improper welding booth, not keeping fire extinguisher ready at hot work site, unsafe rigging practices, non-availability of First-Aid box at site, not using hood with respiratory devices by blaster for shot//grit blasting, etc.)
Rs. 5000/- per occasion
21. Failure to carry-out Safety audit in time (internal & external), close-out of identified shortfalls of Observations of Safety Aspects(OSA), etc
Rs. 20,000/- per occasion
22. Carrying out sand blasting instead of grit/shot blasting
Rs. 50,000/- per day
23. Failure to deploy adequately qualified and competent Safety Officer
Rs. 10000/- per day per Officer
24. Utilization of hydra/ back-hoe loader for material shifting or any other unauthorized /unsafe lifting works
Rs 25,000/- per occasion

25. Any violation not covered above to be decided by Consultant/Owner.

26. Any physical injury - maximum of Rs.2,00,000 per injury

27. Fatal accident - Rs. 25,00,000 per fatality

Note:- This penalty shall be in addition to all other penalties specified elsewhere in the contract. The decision of imposing stop-work instruction and imposition of work penalty shall rest with PDIL/Owner. The same shall be binding by the contractor. Imposition of penalty does not make the contractor eligible to continue the work in unsafe manner.
SECTION : VI - 15.0

VENDOR LIST

PLANT : STEAM GENERATION PLANT

PROJECT : INTEGRATED COAL BASED FERTILISER COMPLEX, AT TALCHER, ANGUL DISTRICT, ODISHA

NOTE:

1. Bidder to note that above vendor list enclosed with the NIT shall only be followed by bidder. Any additional vendor list furnished by bidder along with bid shall not be considered.
2. LSTK contractor shall evaluate and decide present financial, performance credential and shop loading conditions of the above vendors before placement of enquiry/orders.
3. Make of the equipment/machinery/item, not indicated shall be subject to Owner’s / Consultant’s approval.
4. Vendor List shall be prepared by Bidder for equipment/machinery/item not covered in above Vendor List. While submitting the additional vendor list, bidder has to ensure the following points.
   - As it is not possible to ascertain credentials of all the added vendors by Bidders by Owner, with regard to the additional vendors proposed by Bidder, following prequalification criteria, with respect to Past Performance / Experience for any Equipment/item shall be applicable:
     - The Vendor during the last 15 (fifteen) years, should have designed, manufactured (under third party inspection agencies like Lloyds Register/TUV/BVIS) and supplied at least TWO similar Plant Equipment or Machinery or Item for similar duties and operating conditions and same should be operating satisfactorily after installation for at least TWO years.

   The LSTK Bidder should satisfy themselves that sufficient documentary proof is submitted such as:
   a. Copy of Purchase Orders with full technical details of the equipment
   b. Certificate from user regarding satisfactory performance.
   c. Accreditation from third party inspection agencies like Lloyds Register, TUV, BVIS.
   d. Availability of After Sales Service and Spares in India.
   e. Availability of ASME Certification and its validity.

   All documents (PTR) shall be in English language only.

   The LSTK Bidder shall certify suitability of such vendors as per above.

Vendor for these equipment/machinery/item shall be finalized during detail engineering stage upon mutually agreed condition between bidder & Owner/Consultant.
