b) In general, the system shall be provided with an external GPS antenna connected to a master clock server. This server shall synchronise all DCS clocks and also provide time synchronising outputs to synchronise all non-DCS sub-system clocks. The node shall not exceed 30 millisecond time difference between GPS and any node clock come.

c) In case of failure of master clock server the time synchronisation shall be carried by the designated DCS master clock.

5.9 Shutdown Sub-system - Programmable logic controller (PLC)

5.9.1 Programmable logic controller shall be microprocessor based system which shall be used to execute all the process and safety shut-down logic of the plant when specified, it shall also execute plant interlock logics as well. Programmable logic controller shall be an independent unit and shall not depend on any of its functionality on any other system including Distributed Control System.

5.9.2 The system shall be designed fault tolerant and shall utilize high quality components of proven quality. Any single system fault shall not degrade the system safety or functionality of effect operation. The
system shall have certified Safety Integrity Level as per IEC-61508 / 61511 as applicable and specified in job specification. Unless otherwise specified it meet the availability requirement specified in Clause 5.1.3 of this specification.

5.9.3 The system shall have a very high noise immunity in order to ensure safe and reliable operation when subjected to electrical radio frequency interference and Electro-magnetic disturbances expected in a plant.

5.9.4 Unless otherwise specified, the scan time of programmable controller shall be of the order of 250 milliseconds. Scan time for a PLC shall be as defined under para 2.21(c) of this specification.

5.9.5 Operation of PLC shall be completely unaffected by a momentary loss of power of the order of 20 milliseconds.

5.9.6 On line replacement of any module of programmable logic controller shall be governed by Clause 5.1.6 of this specification in general. However, in case of Triple redundant, Quadruple Modular Redundant (QMR) configuration, Flexible Modular Redundant (FMR) configuration, Virtual Modular Redundant (VMR) configuration there shall not be any process upset while replacement of failed module.

5.9.7 It shall be possible to Hot swap any faulty system module without degrading the system safety or operation or freezing the output status. The switchover to the healthy module shall be bumpless. The swaped module shall take over the function of the failed module without any manual programming.

5.9.8 The system shall be programmed in principle as per the logic diagrams furnished during detail engineering. Vendor shall prepare their own Logic/Ladder diagrams depending upon the capability of the programmable logic controller offered by them. Owner / Consultant reserves the right to revise or review the logic diagrams even after acceptance of any offer. The programming language of offered PLC shall be as per IEC 61131.

5.9.9 Whenever the requirement of SIL is specified for the, it shall meet the requirements of SIL level specified and shall be certified by an independent body (e.g. TUV) for complying requirements of IEC-61508 / 61511 as specified. For shutdown application requiring SIL certification, PLC shall always meet SIL 3 requirements.

5.9.8 Power supplies in the system shall be provided as follows:

5.9.8.1 Each I/O rack shall have a separate independent power supply system. Each power supply shall be sized to take full load of the I/O rack/signal conditioning panel/rack and shall be provided with dual redundant power supply.
5.9.8.2 Each processor shall be provided with separate power supply. Failure of one power supply shall not affect the system operation in case of dual processor system. Wherever triple redundant system is specified each processor shall preferably be provided with a separate power supply. Also separate power supply must be provided for each multiplied process I/O channel.

5.9.9 System Architecture

5.9.9.1 General

a) PLC system configuration / architecture shall be as specified in the job specification. For emergency shutdown system application specified with SIL 3 classification, the system configuration shall be TMR, QMR, FMR or VMR.

b) Regardless the action feature selected (except for single architecture), the failure of single component shall not result in a failure of correctly executed safety function. The degradation mode for the selected configuration e.g. 3-2-0 or 4-2-0 or 3-2-1-0 etc. shall be documented in SIL certification report.

c) In general, the PLC system shall comprise of various sub-systems as described in the subsequent clauses of 5.9.9.

5.9.9.2.1 Input/Output system

5.9.9.2.2 Each I/O module shall have its own processor working asynchronously w.r.t control processor and other I/O processors. However, I/O modules configured in redundant configuration, shall have their processors properly synchronized.

5.9.9.2.3 Unless otherwise specified, system shall accept analog 4 – 20mA inputs and contact inputs. The maximum number of Input/Output per I/O module shall be limited as per the following table.

<table>
<thead>
<tr>
<th>Sl. No.</th>
<th>Type of Configuration</th>
<th>Maximum No. of I/Os</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Single I/O system</td>
<td>8</td>
</tr>
<tr>
<td>2</td>
<td>Dual I/O system</td>
<td>16</td>
</tr>
<tr>
<td>3</td>
<td>Triple Modular Redundant system (TMR)</td>
<td>32</td>
</tr>
<tr>
<td>4</td>
<td>Quadruplicate Modular redundant System (QMR), Virtual Modular Redundant (VMR) configuration</td>
<td>16</td>
</tr>
<tr>
<td>5</td>
<td>Flexible Modular Redundant (FMR) configuration</td>
<td>16</td>
</tr>
</tbody>
</table>
In case of PLC certified for SIL requirements, the maximum number of I/O's shall governed by the SIL certification applicable for specified SIL level.

5.9.9.2.3 Each I/O shall be galvanically isolated from external control circuit by suitable means. The minimum isolation level between I/O and logic circuit shall be 1000 volts DC.

5.9.9.2.4 Each I/O shall be protected against the reversal of polarity of the power voltage to I/O.

5.9.9.2.5 Each input shall be provided with filters to filter out any noise in the input line and contact bouncing noise, as applicable.

5.9.9.2.6 All the inputs shall be double ended i.e. two wires per input and not with common return for all inputs.

5.9.9.2.7 The interrogation voltage to the inputs and power supply for 2-wise instruments shall be powered from separate redundant power supply / supplies and shall not be a part of PLC, unless otherwise specified. This power supply shall be supplied at one point and shall be distributed by the vendor.

5.9.9.2.8 a) Each I/O module shall have a LED per channel to indicate the status of each Input/Output.

b) When specified, input module shall be capable of monitoring the input contacts for any wire open fault (i.e. 4 – 20mA).

5.9.9.2.9 Analog input module

a) Input module shall be capable to accept input from transmitters (e.g. 4 – 20mA).

b) The module shall have 12 bit A/D resolution accuracy of ±0.25% of full scale over the entire range, unless otherwise specified.

5.9.9.2.10 a) Output contacts from the PLC shall be potential free dry contacts with contact rating as per para 5.9.9.2.10 b) of this specification. Wet contacts/ powered contacts / TTL outputs etc. shall not be acceptable. Vendor must provide arc suppression device for each output contact.

b) The output contact rating shall be as follows:

<table>
<thead>
<tr>
<th>Sl. No.</th>
<th>APPLICABLE FOR</th>
<th>VOLTAGE RATING</th>
<th>CURRENT RATING</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>All output cards driving solenoid valve and alarm annunciator system unless otherwise specified.</td>
<td>110 V DC</td>
<td>0.5 A</td>
</tr>
<tr>
<td>2.</td>
<td>All motors/pumps/compressor output cards unless otherwise specified. Category – I Category - II</td>
<td>240 V AC 220 V DC</td>
<td>5.0 A 0.2 A</td>
</tr>
</tbody>
</table>

The category of contacts shall be specified in the material requisition.
c) Each output shall be short circuit proof and protected by fuse. Visual indication of fuse blown must be provided for each module.

d) When specified contact output module shall have monitored output features like 5.9.9.2.8(b).

5.9.9.2.11 The communication of I/O system with central processor shall be carried out redundant with complete error checking.

5.9.9.2.12 Where inputs or outputs have multiple field devices for the same measurement or device, the outputs shall be configured in separate I/O modules.

2.9.9.2.13 Where single input signal is available for TMR VMR, FMR, or QMR configuration, inputs shall be multiplied to feed independent inputs to each input modules.

5.9.9.3 Processor system

5.9.9.3.1 The processor shall have capability to implement all the control functions required to implement the logic scheme attached alongwith, as logic/ladder diagram.

5.9.9.3.2 The size of the memory shall be sufficient for storage of the program instructions required by the logic schemes and other functional requirements. Offer shall indicate the amount of memory capacity occupied by the actual program and spare capacity available for later program modifications or additions.

5.9.9.3.3 Memory shall be non-volatile. However in case volatile memory is provided, battery back up shall be provided with a minimum of 3 months lifetime to keep the program storage intact. A battery drain indication shall be provided at least one week before the battery gets drained. A potential free contact shall be provided for hardwired annunciation in the central control room.

5.9.9.3.4 Watchdog timer shall be a software device. The healthiness of processors shall be continuously monitored by watchdog timer. Any hardware or software problem in the processor system, which shall include, CPU, memory, power supply, communication interface etc. shall cause the watch dog timer to report processor failure.

5.9.9.3.5 Wherever Qurd redundant processor is specified, redundancy, shall be provided in such a way that in case of failure of the main processor, the standby shall take over automatically. The changeover, shall be bumpless and the system shall be fail proof, unless any other requirement is specified in the job specifications. Redundancy shall be provided for complete processor system including CPU, memory, power supply and communication sub system.
5.9.9.3.6 In case of triple redundant system all the three processors shall execute the same instructions / programs and check their results and majority vote to correct any faulty result. The faulty processor diagnostic shall be made available.

5.9.9.3.7 In case of VMR, FMR, QMR system, individual processors shall execute the same instructions / programs and check their results within same CPU module and vote to correct any faulty result. The faulty processor diagnostic shall be made available.

5.9.9.3.8 Failure of a single processor in triple redundant system and two processors in quad system shall not affect the system. In case of failure of complete processor system i.e. both processors in case of dual configuration, two or more in case of triple redundant system and more than two in case of quad system, outputs shall take failsafe state automatically unless otherwise specified in the data sheets.

5.9.9.3.9 In case multiprocessor configuration is offered, the processors must be able to communicate with each other over the interconnecting data link. Vendor must ensure that system performance shall not be degraded by any means when such a system is offered.

5.9.9.3.10 It shall be possible to generate the first out alarm contact by the PLC in case where a group of parameters are likely to trip a system.

5.9.9.4 PLC console (Programming)

5.9.9.4.1 The PLC console shall be used for programming, program storing, fault diagnostics and alarm monitoring and should be completely independent of control system(DCS) network /functionality/hardware/software. Whenever specified, it shall also be possible to use this for plant operation. The functionality to operate as engineering terminal or operator terminal or both shall be specified in the material requisition.

5.9.9.4.2 It shall consist of a at least one coloured 21" size TFT screen and one programming / operating keyboard and printer unless specified otherwise.

5.9.9.4.11 PLC console when used for plant operation shall also meet the following functional requirements.

5.9.9.4.3 The keyboard shall preferably be touch sensitive sealed type, easy to operate with each key clearly identified.

5.9.9.4.4 All illegal entries shall be rejected by the terminal and shall be identified by warning signal on VDU.

5.9.9.4.5 Manual forcing of any input or output contact connected to PLC shall be possible from keyboard. Forced functions shall have an associated audit trail.
5.9.9.6 It shall be possible to modify, add or delete the application program on line without affecting the outputs.

5.9.9.7 PLC Console shall display logic and/or ladder diagram indicating power flow and shall show description and status of each contact. It shall also be possible to display process alarms and diagnostic messages as and when they appear. Further it shall also be able to display I/O map in a user defined format.

5.9.9.8 It shall be possible to print out the ladder/logic diagram on the dedicated PLC printer. The printer in addition shall also print out:

a) The diagnostic messages as and when generated and diagnostic reports, when called for.

b) Process alarms connected to the programmable logic controller as and when they appear and alarm report whenever initiated. The choice of printing alarms on this printer shall be operator selectable from a key lock switch on PLC console.

c) The I/O maps showing status of all inputs and corresponding outputs in a user defined format.

5.9.9.9 The PLC console shall be provided with self diagnostics feature which shall display error messages and initiate an audible alarm if the fault is detected. A potential free contact for diagnostic group alarm shall be provided which shall be connected to the hardwired alarm and annunciator system.

5.9.9.10 The system shall be able to identify the failure at least up to the module level including I/O system and redundant processor and report print out.

a) When PLC console is specified, it shall have complete graphic capacity and shall be used for plant operation, process monitoring and control, fault diagnostics, alarm monitoring and report generation.

b) At least three number cursor control devices shall be provided in addition to keyboard which may include touch screen, mouse, track ball etc.

c) PLC operator console shall have complete graphic capability and shall be able to display process dynamic graphics, overview and group view displays. It shall be possible to operate the plant i.e. start and stop of rotating machinery, opening and closing of valves etc. from dynamic graphics and group displays available on PLC operator console.

d) It shall be possible to monitor, historise and print out all process alarms, diagnostic alarms and alarm reports.
e) The time stamping of all alarms shall be as per PLC processor time stamping.

f) The system shall be able to store and display stored data wherever required. The minimum storage capacity shall be for 30 days at 1 minute sample rate for all the inputs specified, diagnostic alarms, process and first out alarms, manipulation data etc.

g) The system shall be able to generate shiftily, hourly, daily, weekly and monthly reports. The log format shall be furnished during configuration.

h) The system shall be supplied with first out alarm generation capability. The resolution of alarm shall be as per processor cycle time.

5.9.9.5 PLC Communication Subsystem

5.9.9.5.1 The PLC communication subsystem shall be a digital communication bus that provides a high speed data transfer rapidly and reliably between the processor, I/O sub-system, PLC console and other devices connected in the PLC system.

5.9.9.5.2 Redundancy in PLC communication subsystem shall be provided as follows unless otherwise specified.

a) The communication subsystem between PLC processor and I/O subsystem shall be single unless otherwise specified. This shall include single communication bus and single interfaces/buffers.

b) For the triple redundant system, each processor shall have a separate set of PLC communication subsystem.

c) For the QMR, VMR, FMR systems each I/O subset shall have separate communication interface and bus for connecting to respective CPU module.

d) The communication subsystem between processor subsystem and PLC console shall be dual redundant, consisting of two separate communication interfaces and two buses, each one configured in redundant mode, unless this is only used as programming aid.

5.9.9.5.3 The mechanism used by the system for error checks and control shall be transparent to the application information / program. Error checking shall be done on all data transfers by suitable codes.

5.9.9.6 Interface with Distributed Digital Control System

5.9.9.6.1 The PLC shall be required to be interfaced to the offered Distributed Digital Control System bus. A suitable interface shall be offered in order to achieve the following functions:
a) Display of all input points under alarm/first out alarm connected to PLC or generated by PLC on the main operator console.

b) Generate shutdown reports on the logging printer of Distributed Digital Control System.

c) To receive certain operational commands from the operator console for the operation of certain output devices connected to PLC.

d) To display diagnostic messages of PLC.

5.9.9.6.2 In general, PLC shall provide data in a well established protocol format preferably MODBUS protocol.

5.9.9.6.3 The interface shall be dual redundant unless otherwise specified meeting all requirements as specified under para 5.9.9.5.3 and 5.9.9.5.4 of this specification.

5.10 System software

5.10.1 The system software shall include all programs for the PLC and PLC console which are required to perform all PLC functions including communication and self-diagnostics.

Whenever PLC is specified for shutdown application with SIL classification, the system shall be designed and engineered in full compliance with the requirement of IEC-61511.

Whenever different functional logics are combined within a common PLC, the safety related I/O's of each functionality shall be kept segregated within the system.

5.10.2 Logic program shall be recorded on the CD which shall be delivered in duplicate together with the system.

5.10.3 The PLC programming language for implementation of logic operations shall be based on the following representations:

a) Logic diagrams - Binary logic symbols such as AND, OR, NOT Gates, Timers and Flip-Flops.

b) Ladder diagram - Series parallel connection of relay contacts.

c) Combination of (a) & (b) above.

5.10.4 It shall be possible to print out the ladder/logic diagram on a dedicated printer. The printer shall also print out all diagnostic reports. Vendor must supply the off line software package to enable the owner to modify/add/delete any part of program and for documentation.
5.9.10.5 Software for the generation of various displays including dynamic graphics, whenever specified, to be provided as per para 5.4.3.5 of this specification.

5.9.10.6 The software for printing alarms, system as well as process and events on the PLC printer must be provided. All alarms must be printed as and when they appear.

5.9.10.7 Software package for displaying I/O map showing status of inputs and corresponding output as per logic shall be offered. The I/O map format shall be users definable.

5.9.10.8 The system shall have an extensive set of self diagnostic routines which shall be able to identify all permanent and transient system faults / failures at least up to module level including redundant components and power supplies through detailed VDU displays and report print out. Diagnostic software shall have the capability to provide information about the failed module/system either in the form of a system configuration display or provide information in the form of a statement.

5.9.10.9 System for the following functionalities shall be supplied when specified;
   a) Long storage historisation
   b) Log report generation
   c) First out alarm generation

5.9.10.10 System diagnostics shall be capable of identifying, locating and reporting the following faults, as a minimum;
   a) Processor fault
   b) Communication fault
   c) I/O module fault
   d) Power supply fault
   e) Over temperature monitoring
   f) Permanently close / open (stuck on or off) fault
   g) Scan time failure
   h) Memory fault
   i) Signal redundancy fault

Any other additional diagnostic alarm if available as standard shall also be provided by vendor.

5.9.10.11 Self diagnostic software shall have capability to detect faults which make the system permanently close/open in the I/O modules or I/O signal conditioning modules (incase of triple redundant system, whenever specified in the job specifications, this may be achieved by automatically running the testing software at cyclic intervals) The automatic cyclic testing feature shall also be provided for dual I/O configuration and dual I/O signal conditioning for triple redundant system. The testing software cycle
time may be considered one in 30 minutes however this shall be field adjustable by engineer. However, system performance shall not be degraded whenever testing feature is specified.

5.9.10.12 In case of triple redundant system or quadruplicate system, whenever output module testing software detects any faulty channel, the power supply to that particular module in that particular bank is removed automatically and further testing on the corresponding module in the other mirror image bank is stopped. However, the testing continues uninterruptedly in other output modules.

5.9.10.13 Feedback must be provided in case of triple redundant system and quadruplicate system from the output voter system to detect any latest faults of the system in addition to other diagnostic software as per para 5.9.10.9 through 5.9.10.10 of this specification.

5.9.10.14 Diagnostic package and its related equipment and software shall be supplied. A list of additional diagnostic packages available and the packages provided, including the description and capabilities, shall be provided with separate quote.

5.9.11 Sequence of Event (SOE) Function Requirement

Sequence of Event for analog and digital inputs shall be generated and time stamped in PLC. The maximum resolution between two events shall not exceed specified PLC scan time unless specified otherwise. A separate SOE PC with 21" size TFT screen and laser printer shall be provided for each PLC sub-system unless specified otherwise.

5.10 Foreign Device Interface

5.10.1 Foreign device interface shall be capable to transfer data from the foreign devices like analyser systems, gas chromatographs, gas turbine system etc. to other sub-systems connected to communication sub-system and vice-versa wherever specified in the job specifications.

5.10.2 Each device interface shall be redundant unless otherwise specified in job specifications.

5.10.3 Interface hardware and software shall be suitable to match the foreign device communication requirements like hardware interface, communication protocols etc.

5.10.4 While writing software or mapping the input/output in the interface device it must be ensured that integrity of the data to be transferred like resolution, correctness etc. shall be maintained.

5.10.5 Redundant interface switchover shall be designed based on the type of redundancy available in the foreign devices.
5.10.6 The total responsibility of selection of hardware, writing of software, switchover of redundant interface etc. shall be of distributed control system vendor only. All necessary information, assistance and help shall be rendered by the Foreign device vendor.

5.10.7 The exact requirements of Input/outputs to be transferred shall be as per job specifications.

5.11 **Interface with Smart Transmitters**

5.11.1 System shall be provided with suitable hardware and software to interface with the communication protocol of specified smart transmitters.

5.11.2 In case, smart transmitters are specified with 'HART PROTOCOL', the maintenance data related to these transmitters shall be made available on a separate Personnel Computer. The system shall meet the following requirements as a minimum :-

a) The system shall allow the maintenance functions like configuration, calibration and monitoring of transmitter's data from the associated personnel computer in addition to Hand held terminal, whenever used.

b) The hardware used shall allow unrestricted transfer of digital signal without degrading the analog data i.e process variable.

c) The software supplied shall be 'CORNER STONE' OR EQUIVALENT compatible with the specified transmitter protocol. The software shall allow the following data to be displayed on the PC:-

   (i) Complete configurational data base of all transmitters including data of commissioning, last calibration, next due calibration etc.

   (ii) Historical data for calibrations and configuration changes.

   (iii) Event and log reports.

   (iv) Multiple authorisation levels for carrying out Configuration changes and Calibration adjustments.

   (v) Manual editing of data base with Password and /or keylock protection.

5.12 **Hard-wired Instrumentation**

5.12.1 Hardwired instruments shall be stand-alone type and shall meet their functional requirements fully without depending on DCS system. Even power supply and input/output circuits of hardwired instruments shall be totally independent of DCS system.
5.12.2 Hard wired instruments shall be microprocessor based. Each instrument shall have as a minimum the necessary firm-ware to meet its functional and operational requirements.

5.12.3 Each device shall have its own analog to digital/digital to analog converter.

5.12.4 The display of each device shall preferably be bar graph type.

5.12.5 Controller shall be digital type capable of performing automatic control based on the set points given locally or from a remote device like another controller or Distributed Control System or Supervisory computer. The controller as an instrument shall also have provision for manually controlling the process by means of a manual loader and cascade-computer auto-manual transfer switch. The operation of the transfer switch shall be procedure-less and bumpless while changing mode from computer to cascade to manual and from manual to auto to cascade to computer. During such a change the output shall not change by more than 1% of span. Controller shall have a facia giving continuous indication of process variable, set value, controller output, and controller mode. It shall be possible to remove an instrument for maintenance without upsetting the process by use of device like service station. Operation of the controller like set point change, manual control, controller mode change shall be possible from the front of the controller. Controller shall be flush panel mounting type on the panel/hard wired console. Configuration and tuning of controller shall be possible through a portable and pluggable configurator.

5.12.6 Recorder shall have independent circuit and pen drive assembly for each channel. Recorder shall have capability of continuous line marking or digitized marking of input value with high resolution. Recorder chart drives shall be of multi-speed type and shall be operator selectable. Recorders shall be flush panel mounting type on the panel/hard wired console.

5.12.7 Manual loader unit shall have continuous display of process variable and manual loader output. It shall be possible to manually change the output to control valve. Manual loaders shall be flush panel mounting type on the panel/hardwired console.

5.12.8 Temperature transducers and trip amplifiers shall accept inputs from standard industrial thermocouple and resistance temperature detector (RTD). Linearization of the thermocouple and RTDs shall be done inside each instrument. Transducers and amplifiers shall be suitable for rack mounting.

5.12.9 Alarm cards shall accept standard outputs and shall produce changeover contact output. Each alarm card shall have one continuously adjustable blind setting device. Alarm cards shall be suitable for rack mounting.
5.12.10 Alarm and annunciator system

5.12.10.1 The alarm logic shall be executed in single input plug-in type logic modules. Where integral logic has been indicated, the logic module shall be accessible from the front of the annunciator after opening the swing door. The design of each module shall be such that by simply jumpering suitable point, it may be changed from normally open mode of operation to a normally closed mode of operation and vice versa.

5.12.10.2 Lamps shall be replaceable from the front. The power consumption of each lamp shall be approximately 10 watts.

5.12.10.3 The initiation of alarm condition in the annunciator shall take place approximately 330 millisecond after the condition sensing contact have assumed the off-normal state.

5.12.10.4 Hooter, in general, shall be solid state type with audibility of the order of 100 dB at a distance of 3 metres.

5.12.10.5 An interruption of power supply for a duration of 20 milliseconds or less shall not affect the functioning of the annunciator.

5.13 Instrument Asset Management System (IAMS)

5.13.1 Instrument Asset Management System shall facilitate the maintenance management of all smart, field-bus based and conventional field instruments. Unless otherwise specified, the system shall manage the maintenance of following;

a) All smart and field-bus based instruments connected to Distributed Control System or Programmable Logic Controller.

b) Conventional (non-smart / non field-bus) instruments connected to DCS or PLC or any other dedicated instruments.

c) Field Instruments other than (a) and (b) above eg. local gauges etc.

5.13.2 The system shall include all hardware and software to meet specified functional requirements. In general, IAMS shall be an integral part of Distributed Control System and shall acquire the data from the controller and data acquisition sub-system. Inputs, which are connected to programmable logic controller, shall be parallely connected to DCS in such a way that the hardware used shall allow unrestricted transfer of digital signal without degrading the analog signal.

5.13.3 A dedicated IAM console consisting of one video display unit along with a printer shall be provided;

a) Display all data related to device diagnostics.

b) Provide historical data for calibration and device configuration / reconfiguration etc.

c) Generate event and other device reports.
d) Manual data entry with password / key lock.
   
   The VDU shall be 21" colour TFT monitor along with a keyboard and a printer.

5.13.4 The system shall support multiple authorisation levels for carrying out configuration charges and calibration adjustment.

5.13.5 The Instrument Asset Management System shall meet the following requirements:
   
a) Instrument Configuration
   
   It shall be possible to configure, verify the configured parameters, reconfigure, re-range and calibrate / recalibrate the smart and field-bus devices from IAM console.

b) Device Status Monitoring
   
   The system shall monitor the status of all field devices and shall report any maintenance alarm generated by these devices. In general, following shall apply;
   - Diagnostic alarms from smart and fieldbus devices shall be classified into device failure and device diagnostic categories.
   - Out of limit alarm shall be generated to indicate device failure alarm for conventional devices.

   The system shall be capable of displaying and generating maintenance report listing all devices currently under alarm. The report may be generated unit-wise / area-wise or for complete plant.

c) Maintenance database
   
   The system shall be able to maintain maintenance database for all the instruments which shall include date of commissioning, last calibration date, next due calibration. The system software shall have capability to manage and track scheduling of all such maintenance related activities.

   The software shall also provide data as predictive maintenance such as list of transmitters experiences excessive drift, list of control valves loosing on shipping characteristics etc.

d) Audit Trail
   
   The system shall have capability to provide an audit trail for a complete historical record of all configuration, calibration and device alert data. This shall include tracking of maintenance history for all instruments in the plant, typically recording the type of maintenance work done, smart and compilation times of activity, person responsible for the activity etc.

e) Advanced diagnostics
The system shall be able to provide advanced diagnostics such as device step response, device signature, dynamic error band etc. special device diagnostic software whenever required (like for smart / field-bus position) shall run in the system.

f) Documentation

System shall generate documentation like trend reports, diagnostic reports, pre-detective maintenance report, audit report, historical data and device specification sheet etc. Definition, engineering, configuration, loading and completion of all reports whether specifically indicated are available as standard and shall be supplied as part of vendor scope of supply.

5.14 Alarm Information Management System (AIMS)

5.14.1 The purpose of Alarm Information Management System (AIMS) is to provide a centralised Alarm information over and above the requirements specified in Clause 5.4.3.8 of this specification and shall be used for acquiring, sorting, add value and provide redistribution platform, so as to streamline and transform the raw alarm data into intelligent, add actionable information for plant operation personnel.

5.14.2 The system shall acquire inputs from various systems such as;

- Distributed Control System / Systems and Programmable Logic Controllers.
- BMS, STG control System and F&G Systems
- Package unit control systems
- Machine monitoring and Analyser system
- Electrical control system / systems
- Electrical numerical relays
- Any other system defined specifically in the job specifications.

5.14.3 Unless otherwise indicated, the AIMS shall have a high speed data transfer OPC link connectivity with the systems. Where OPC link is not available, the data transfer shall be through dedicated serial links. In addition, AIMS shall also have capability to accept hardwired inputs.

5.14.4 Unless otherwise specified, the following type of data shall be acquired by the AIMS software for further analysis;

- Process and utility alarms
- System diagnostic alarm
- Sub system status alarms
- Operator activities
- Maintenance alarms

The AIMS shall offer a variety of alarm handling feature for processing, and presenting alarms in most efficient way. The package shall be a comprehensive tool with capabilities of;

a) Logical filtration of alarms during normal and special operating conditions such as start-up, process upset and turndown conditions.

b) Logical processing of events and sequence of events for facilitating quick assessment of normal or emergency situation based on pre-defined rule-sets.

c) Generation of different levels of alerts, based on type of alarms, sequence of alarms, logical processing of alarms etc. and propagation of the same to different groups and categories of personnel's, based on pre-defined alarm distribution matrix.

5.14.5 AIMS shall meet the following functional requirements, as a minimum;

5.14.5.1 Data Acquisition

The data acquired from the various sub-systems and other control systems shall be stored in a dedicated AIMS server. The data shall be stored in a structured format and shall contain tag number, time of occurrence, text information like service description, event type, alarm priority, alarm group priority etc.

5.14.5.2 Alarm Computing

The package shall have capability to generate / compute alarms based on a logical combination of states, conditions and events.

5.14.5.3 Information Analysis

The package shall have capability to analyse and present only the meaningful information. This shall include the following;

a) Analyse the alarm frequency within the predefined period and its repetition period.

b) Analysis of various alarms to identify nuisance, chattering and redundant alarms and eliminate them, if necessary.

c) Analysis of various alarms to identify serious alarms and monitor their frequency of occurrence.

d) Monitoring Operator actions.

5.14.5.4 Expert Alarming
The system shall be able to carry out statistical analysis on the alarms data gathered and perform;

- Real-time frequency analysis
- Alarm frequency break-up
- Alarm frequency monitoring
- Standing alarms
- Time elapsed between two alarms / events

ii) The system shall have capability of implementing rule sets to analyse various alarms / data and inform plant operator the probable reason, make recommendations for the action to be taken and provide operational alternatives.

iii) System shall also be capable of analysing and recommending maintenance requirements based on preset rules.

iv) The system shall have advanced search and sort features to provide quick access of alarm data to operator.

5.14.5.5 Alarm Prioritisation

The system shall have the capability to segregate the alarms as per their criticality and operational importance, which may be defined as per the severity with respect to its;

- Production losses
- Human and equipment safety
- Environmental safety
- Process reaction time like run-down reactions

The alarms shall be differentiated in different displays by allocating different colour codes.

The system shall be able to be configured with different priority levels which shall be defined based on the process criticality and operational requirements. As a minimum following priority levels shall be definable;

Level 1 - Alarms directly related to human safety – leading to heavy casualties

Level 2 - Alarms directly leading to total plant shutdown – personnel, environmental and equipment safety hazard.

Level 3 - Alarms leading to partial plant trip conditions.
Level 4 - Maintenance alarms not leading to immediate plant trip.

Level 5 - Status or low priority alarms for operator information.

Other priorities shall also be user definable. It shall also be possible to set priority for each and every alarm point. Assignment or change of level of priority shall be possible only under password protection.

Number of alarms under each level of priority shall be user definable. However, for the purpose of internal assignment, following numbers may be considered:

<table>
<thead>
<tr>
<th>Priority Level</th>
<th>No. of Alarms</th>
</tr>
</thead>
<tbody>
<tr>
<td>Level 1</td>
<td>10 Nos.</td>
</tr>
<tr>
<td>Level 2</td>
<td>70 Nos.</td>
</tr>
<tr>
<td>Level 3</td>
<td>5% of Total</td>
</tr>
<tr>
<td>Level 4</td>
<td>20% of Total</td>
</tr>
<tr>
<td>Level 5</td>
<td>75% of Total</td>
</tr>
</tbody>
</table>

5.14.5.6 Alarm Display

a) AIMS shall display alarms gathered from all Nodes / subsystems seamlessly and shall be displayed on any display irrespective of source or location.

b) Alarm display shall be sorted out in the form of alarms groups in the following categories;

- Priority level sorting
- Sorting as per type, frequency, unit-wise, area wise and operating area wise.

c) AIMS displays shall be in graphic form with user friendly displays, color modifiers etc.

d) The system shall process alarms using well proven analysis techniques, directly related to specific alarms, which are trendable.

The system shall have advanced Rule-based and latest abnormal condition management tool which shall provide prediction and anticipation of plant deterioration with sufficient lead time for operation action. The system shall also have real time root cause analysis.

5.14.5.7 Operator Actions

The system shall be able to acquire and analyse operation action required during plant operation such as;

- Time to alarm acknowledge
Controller mode changes
Controller set point changes
Analogue output changes (in manual mode)
Discrete output changes (in manual mode)
Alarm level of priority changes
Range changes
Tuning constant changes
System configuration changes e.g. control algorithm, cycle time changes etc.
Manual time adjustment
Alarm acknowledgement
ESD switch actuation (full or partial)
Any other operator action not specifically indicated above but required during operation. The operator actions shall also be categorised based on their criticality in various levels.

Level – 1 - Most critical operator actions leading to plant shutdown in full eg. ESD switch action.

Level – 2 - Configuration changes or set point changes which may lead to mal Operation or partial plant shutdown eg. set point changes, range Changes, time adjustment etc.

Level – 3 - Changes which may effect control but rarely could lead to plant Shutdown full or partial eg. controller mode change, range changes, tuning constant changes etc.

Level – 4 - Actions which are mere operation but does not lead to plant operation.

The system shall also able to provide information like;

i) Time to acknowledge alarms

ii) Alarm acknowledge time exceeding a pre-set value.

5.14.5.8 Report Generation Printing

The package shall have capability to;
a) Store alarm messages for a period of minimum one year and shall have facility for data archival on portable media.

b) AIMS shall be capable of generating and printing reports in user defined formats. The data in each report shall be either raw, manipulated, calculated, compressed or analysed.

c) The alarm shall be possible to be printed as and when required, as a user defined formats. These formats shall be defined during engineering.

5.14.5.9 System Diagnostics

The AIMS shall have extensive set of diagnostic subroutines running in real time basis and shall provide at least the following diagnostic alarms;

- System software failure
- Disc / Disc drive failure
- Application software failure
- Network failure
- Communication software failure
- Disc full
- Power supply failure

These diagnostic alarms shall also be made available at DCS operator and engineering consoles.

5.14.5.10 Data Storage and Archival

AIMS shall store alarms and events indicated in Clause 5.4.6 for a period of minimum 1 (one) year in the hard disc. Multiple disc configuration, if required, shall be provided for the purpose of calculating data storage capacity consider occurrence of 30% of alarm and events per day apart from other system defined functionalities.

5.14.5.11 Alarm Notification and Audio Messaging

The system shall be capable of performing following alarm notification and messaging functions;

a) Dial Telephone

In case of predefined alarm or alert condition the system shall automatically dial a telephone number and plays a pre-recorded message. All hardware and software for auto-dialing shall be included.

b) Dial a Cell phone
The system shall have facility to dial up mobile pager or mobile cell phone. When an alarm occurs, the system shall be able to send a test (SMS) message also.

c) E-mail

When a predefined alarm occurs, the system shall be able to send message through an e-mail to the predefined user. This facility shall also be utilised to send e-mails to the manufacturers of various system oriented items like DCS, PLC etc in case of occurrence of a critical system diagnostic alarm.

d) Audio Messages

The system shall be capable to play a pre-recorded message in case of predefined critical alarms on the plant public address system. For example, this shall be useful for alerting plant personnel's on gas / fire alarm in a particular area.

e) Emergency Hooters

The system shall be capable of generating input such that in case of an emergency condition emergency hooters can be initiated along with audio messages on the public address system.

5.14.6 System Hardware & Software

5.14.6.1 AIMS shall have all the hardware and software to meet the following major functional requirements;

a) Efficient storage and archiving of acquired and manipulated data to allow retrieval of reports or alarm analysis information.

b) Retrieval of important information on-line to a network drive disc or dedicated device.

c) Remote access to more than one clients on the network.

d) Export alarm, events or other information to other applications, Excel or Access.

e) Advanced diagnostic techniques for analysis of acquired data.

f) Log the time between specified alarms / messages.

g) Assignment of various level of pass-ports.

h) Multiple client's displaying different data or data screens simultaneously.

i) Disc mirroring for data storage over the network.

j) Automatic Triggering of alarm reports and messages on devices like mobiles,
telephones, computer networks etc.

k) Data search facilities with efficient search engines like SQL.

l) Data sorting facility as per defined rule-set.

m) Time stamping of data as per AIMS clock wherever required.

5.14.6.2 AIMS can be realised on either the DCS platform or as a stand along system. In either case the offered solution shall meet all the requirements specified in MR without exception.

5.14.6.3 In case AIMS functionality realised on DCS platform a separate dedicated AIMS station shall be provided. This station shall have same hardware and software configuration as operator console and shall have redundant storage disks for bulk data storage.

5.14.6.4 In case stand-alone system is considered, the same shall meet the following requirements;

a) The system shall be capable of interaction with DCS via a serial port or by OPC connectivity.

b) The system shall have a minimum of one dedicated server with monitor and cursor control devices capable of meeting all functional requirements for AIMS. If the system demands more than one server to meet job requirements, the same shall be supported and provided.

c) The AIMS console shall be server based machine and shall have 21” LCD display screen with keyboard, mouse and read / write DVD drive.

d) The system shall support client server architecture with minimum of 4 clients. Detailed functionalities of these clients shall be finalised during engineering. The clients shall also meet hardware and software requirement specified in Clause 5.14.6.4(c).

e) AIMS server shall have redundancy in storage discs for bulk-data storage.

5.14.6.5 In general, all alarms and events shall be transferred to AIMS with time stamped by the originating devices. AIMS shall maintain this time for further analysis. AIMS shall time stamp the acquired data only when this data is not transferred by the originating device with time stamp.

5.14.6.6 The AIMS connectivity to third party devices and systems shall be either from the control network (i.e. communication sub system) or from the serial ports available in these devices. For third party systems direct connectivity from the station having master database is preferred.

5.14.6.7 When multi drop serial link connectivity, not more than four (4) devices shall be multi-dropped on one serial link to server.
5.14.6.8 AIMS shall have sufficient flexibility in hardware and software to interface a variety of peripheral devices, these include but shall not be limited to;

- Printer to be provided and attached to the server or client for printing reports and alarms.
- Public Address system for automatic broadcasting of alert messages in pre-designated areas. (The package shall be supplied with a voice package, which shall automatically broadcast the message as the occurrences of the particular alarm).
- Fixed line EPBAXs and Mobile telephones
- Horn and / or beacons for Audio / Visual alarming.

5.14.6.9 AIMS server memory shall be sized suitably to display and printout the alarm history of all the tags of all the systems and sub-systems connected to it.

5.15 Unit History Node (UHN)

5.15.1 UHN shall primarily used to carryout the following activities;

a) Store automatically gathered data from control system (DCS, PLC, etc), other DCS systems over OPC and manually entered data.

b) Present data in a meaningful manner for performance enhancements and fault analysis.

c) Long term historisation of data for future reference and decision making.

d) Carryout calculations on the real time and stored data, as necessary.

5.15.2 The UHN shall be a high capacity data storage device where data from various process units shall be stored in a fast access database. The node shall support standard open system interfaces like OPC, SQL, OLE, DDE and shall provide active X facility.

5.15.3 UHN shall collect data from;

a) Distributed Control system of which this UHN is a node.

b) UHN's of other control systems

c) Nodes other than UHN's connected on information network.

d) Manually entered data.

The data collected shall be of various types like process variable, set point, computed variable, manipulated data, outputs, alarms, events, which shall be used for long term storage, trending and report generation.

5.15.4 UHN shall have capability of storing real time data in real time database and shall perform functions like;

a) Identification of bad data (algorithm to run in UHN when necessary)
b) Specify dead band and data sampling rate (or collection rate) as user definable parameter.

c) Calculate maximum, minimum, average, summation, and, integrated values of collected data. The time period of calculating average shall be user definable.

d) Specify high / low, high – high / low – low alarm limits for triggering an event or message or alarm as applicable.

e) Specify damping parameter, delay parameter etc. to reject unwanted data.

f) Specify data storage / sampling rate and period of storage necessary for historical storage of data.

g) Mathematical functions and application program as specified in material requisition which are necessary for report generation. (This does not include advanced control functions but do include MIS reports)

All the parameters indicated or functions performed shall be definable tag number wise.

5.15.5 Data Management and data presentation

5.15.5.1 UHN shall act as a network server and shall support two way data communication between;

a) DCS and UHN for real time data transfer. UHN shall acquire real time data from DCS and provide derived and calculated data to DCS.

b) UHN and information network to transfer data from other systems on information network to UHN and vice versa.

5.15.5.2 UHN provides the user with current raw and calculated / manipulated data on predefined graphic screens or pre-defined report formats. The graphic screens and report formats are user configurable.

5.15.5.3 UHN perform long-term historization of raw and calculated / manipulated data.

5.15.5.4 The data received or sent from the UHN shall have time stamp associated with it from the originator of the data. The data update is effected in case the data value has changed by more than the configured dead band since the last update.

For manually entered data, the time stamp shall be time of entering data (by default) or the time entered with the data as applicable.

5.15.5.5 UHN time shall be synchronized with DCS time clock. For time synchronization refer clause 5.8 of this specification.

5.15.5.6 UHN shall maintain relational database and shall support oracle ROBMS tool.

5.15.5.7 All data raw, manipulated or manually entered acquired or calculated by UHN shall be stored, as unit-wide historian. Historian can be accessed to retrieve the data from specified period in the past. Historian should have capability to store data for a period of one year (365 days) with a sampling rate of 30 seconds, as a minimum. Other sampling rates such as 1 minute, 5 minutes, 10 minutes and 1
hour shall also be possible. The duration of on-line storage shall be controlled by the archiving facilities which in turn shall be dependent on specified sampling rate.

5.15.5.8 The data shall be presented to the user in a well structured hierarchically configured user displays. User shall be able to navigate down to any detailed data displays without any system configuration knowledge.

The display structure may include;

a) Overview display or main menu display, displaying key process parameters and performance indicators like real time data, swap-shot, calculated variables, real time trend, historical trends, manual data entry, function block, alarm and events, reports etc.

b) The reports generated shall include both tabular and graphical type (i.e. trend and bar graph). The reports as a minimum, shall include shiftily, daily, weekly, monthly and yearly reports. The report formats and specific data shall be finalised during system configuration stage.

5.15.6 System Administration and Security functions

5.15.6.1 The system shall perform the following administration functions;

a) System start-up and shutdown
b) System configuration and configuration changes
c) System diagnostic alarm management
d) Archiving and storing history data.
e) System back-up and system restoration from back-up.
f) Manning user and security files.
g) Maintenance sub-routines and manipulation of data in the database with Audit.

5.15.6.2 UHN shall provide a full data security guarantee and shall be equipped with proper fire wall security features. For details refer clause 5.1.12 of this specification. Typically firewall shall be CISCO system appliance firewall (PIX) and software (IOS) or equivalent.

5.15.7 System Configuration

5.15.7.1 UHN shall be higher grade RAID 5 server machine with preferably Xeon CPU. The selected UHN hardware platform shall meet system throughput and capacity requirements. As a minimum, the system hardware shall meet the following requirements;

a) VDU shall be 459.7 mm active matrix TFT type coloured LCD screen.
b) QWERTY keyboard with SCSI interfaces
c) Mouse or track-ball control
d) Memory as 1GB RAM and 80GB hard disc (HDD) and shall support DAT and DVD / CD ROM.
e) Clock speed as 2.4 GHZ
f) Coloured laser printer
5.15.7.2 The system shall be supplied with a robust operating system and all supporting softwares necessary to meet functional requirements specified here in including RDBMS such as oracle or SQL with TCP/IP as network protocol.

5.15.8 System Sizing

Following criteria shall be followed for sizing UHN;

a) UHN shall interact concurrently with minimum 10 number of users in addition to DCS (of which UHN is the node) and clients main computer. Unless otherwise specified, ten concurrent user licenses shall be supplied along with UHN node. For the purpose of sizing consider at least 20 concurrent users.

b) The data shall be accessed from remotely located data sources through information network or through auto-dialing with proper ID address and password protection. The rate of data access from/to this network shall be considered as 1000 tags per second.

c) The data access from DCS shall be all 1.4 times the all analog (PV, MV, SV) and digital tags accessed at the rate of 1000 tags per second.

d) UHN historian shall be sized considering following factors;

Storage data : 2 times the total analog (PV, MV, SV) and digital data of all DCS connected tag number (through hardwiring, serial ports, fieldbus etc.

Storage time : 1 year (365 days)

Storage rate : 30 seconds for all data

Storage interval on RAM: 20 minutes

5.15.9 System Performance

5.15.9.1 The response to all online enquiries and actions from any user shall be complied with 95% confidence level from any client with a maximum of 20 concurrent users as defined in clause 5.15.8(a) of this specification shall be as follows;

a) A data query to display on graphic or report : 5 second

b) Pre-defined trends up to 1 hour data : 5 seconds

c) A data query to present a 24 hours report : 10 seconds

5.15.9.2 Average loading shall not exceed 50% when averaged over 15 minutes with peak loading at any time not to exceed 70%.

5.15.9.3 All securities shall be positioned while evaluating system performance.

5.16 Sequence of Event Recorder (SER)
5.16.1 Sequence of event recorder shall be provided for recording sequence of alarms / events for shutdown inputs.

5.16.2 The inputs for sequence of event recording shall be handled as follows;
   a) The maximum number of inputs for I/P module shall be 32.
   b) The contact inputs (either open or close on alarm) shall be multiplied using dual output contact barrier one of which contact shall be connected to PLC while the other contact is routed to SER. Wherever necessary, fast response multiplying relays may be used (certified by SER manufacturer)
   c) For analog input, the signal shall be connected in parallel across the conditioning resistance to PLC or dual output barrier and to a dedicated alarm card, the contact of which shall be routed to SER. In case analog input are to be routed to different physical locations or more than two devices, analog isolators shall be used.

5.16.3 SER shall be capable of providing demonstrable alarm resolution of 1millisecond between the events and shall also be able to print out the same with similar resolution.

5.16.4 The contacts or alarm may be close or open on failure and must be configurable for close / open on failure.

5.16.5 The SER system shall be capable of providing alarm monitoring, printing and inputs for management packages. The configuration of inputs and other functions mentioned above shall be carried out using a dedicated terminal, which is also provided with a printer. Once configured, the access to configuration shall be denied except with 3 level of password protection.

5.16.6 All the trip / alarm settings should be same as that of PLC in all respects. The accuracy and resolution of measurements and settings are to be equal or greater than that of PLC.

5.16.6.7 Vendor shall make a provision to connect PLC outputs to SER recorder whenever necessary and decided during engineering with proper isolation.

5.16.8 There must be 20% installed and wired spare input channels up to the marshalling cabinet for each type of input / output of DCS, PLC and other systems.

5.16.9 The system must have facility of keeping at least 96 hours of record at the time with last in and first out facility.

5.16.10 It shall be possible to configure / modify / reconfigure the system online through a dedicated programming unit. Engineering shall be possible to engineer the system using menu driven fashion. Any addition and deletion of inputs should be menu driven only and should be possible to be done during running condition.

5.16.11 It shall be possible to archive data from the SOE recorder on tape drive / CD drivt. CD driver and CD writer along with all necessary software shall be part of system supply by the vendor. The CD driver and CD writer must be with latest hardware and latest software.
5.16.12 The system shall have an extensive set of diagnostic package, which shall be able to provide the fault alarms up to the module level. The same shall be also printable on the laser printer. The system shall be able to generate an audit report, which can be printed on demand. The audit report shall be able to provide shutdown area, time of shutdown and reason for shutdown.

5.16.13 Sequence of events shall also record PLC shutdown outputs.

5.17 Large Screen

5.17.1 The Giant Screen (Large screen) in the control room, is primarily used for:

a) Display important operational data of the plant/unit for ready reference like daily production, shutdown required/requested etc.

b) Display operational situations like start up or shutdown to enable managers/operators to discuss without disturbing the unit operator.

c) Display any operator screen on the large screen.

d) To provide real time clear luminous view of the unit to share information’s between operators, unit managers and refinery manager.

e) To hold demonstrations to visitors for ready impressive and effective plant overview and plant highlights.

5.17.2 The giant screen shall be installed in the control room wall. The size of the screen shall be approximately 3200mm(L) X 1300mm(H) as a minimum.

5.17.3 The giant screen system shall have the following specifications:

i) The screen design shall be based on single chip DLP technology.

ii) Optical system shall have a resolution of 1024 pixels X 768 pixels Colour pixels per cubic. Each cube shall have a screen diagonal of 70 inches with 16.7 million colours.

The lamp shall be pre-adjusted in lamp module, which shall not require any readjustment after replacement. The minimum operational time of lamp shall be 8000 Hrs.

They shall be able to provide uniform brightness of 95% with a contrast 250:1, which shall be able to provide high contrast even in bright ambient light.
iii) The display screen shall be seamless and flicker less. It shall be black or grey in colour. The brightness and contrast shall remain uniform irrespective of the number of cubes used.

iv) The control of screen displays shall be carried out either from the operator console. The signal transfer shall provide guaranteed disturbance free operation, which shall not affect sharpness and colour quality.

v) The giant screen shall be lightweight and low-thickness type, which can be supported from the control room wall. Only the front access shall be provided for any maintenance.

vi) The system shall perform satisfactorily in ambient conditions with maximum temperature of +40 degree Celsius and 80% non-condensing humidity.

vii) Provision of automatic switch off of Giant screen if temperature in the console room increases above the maximum permissible limit for Giant screen is required.

viii) VDU shall be provided with the Giant screen Control station. Ethernet card shall be provided in Giant Screen to connect it with Ethernet port for necessary functionality.

5.17.5 The Giant screen system shall be interfaced with the system such that any operator display of any screen could be displayed on the Giant screen suitably. It shall meet the following requirements;

i) Any operator console display or all operator console displays shall be able to be displayed or switched as desired.

ii) Screen areas should be protected for each console group.

iii) Priority of displays should be assignable.

iv) The system shall be supplied complete with all hardware and software as necessary for the specified application including interface software for DCS.

6.0 MISCELLANEOUS REQUIREMENTS

6.1 Safety requirements

6.1.1 Unless otherwise specifically indicated in job specification, all the equipment covered in this specification shall be located in general purpose non hazardous area, normally in control room or / and satellite rack room. However, transmitters, process switches and final control elements including smart positioners, solenoid valves etc. I/P converters (not forming part of this specification) shall be located in the field and shall be specified as per the electrical area classifications.

6.1.2 Unless otherwise specified, intrinsically safe certified transmitters, smart positioners, field-bus devices, and I/P converters shall be used when located in hazardous area.
6.1.3 Intrinsic Safety Protection

6.1.3.1 I/O modules of Distributed system shall have either built in intrinsic safety or shall use external barriers for intrinsic safety. Safety barriers shall also be used whenever intrinsic safety is specified for contact inputs and solenoid valves. Barriers shall not be required when protection other than intrinsic safety are specified.

6.1.3.2 The system as a whole shall be intrinsically safe based on entity concept. It may be noted that the field instruments are being bought separately and can be of different make and models by different recognised statutory body. These details shall be furnished during detailed engineering. Safety barriers selection shall be carried out based on the entity (safety) parameters which shall be properly matched. Field-bus segment terminator shall be considered for evaluating intrinsic safety of a segment. Any limitation or special requirements for cables to meet the intrinsic safety requirements shall be brought out in the offer.

6.1.3.3 Conventional or smart Instrumentation

a) Whenever intrinsic safety is specified for conventional and smart instrumentation entity parameters of the elements in loop shall be matched with the barrier safety description parameters (i.e. loop design as per entity concept).

b) In case of smart transmitter, the entity parameters of the hand held terminals shall also be considered while selecting proper barriers.

c) Unless otherwise specified all intrinsically safe barriers shall be isolating type only providing isolation between;

i) Input and output (non-hazardous to hazardous side of barriers)

ii) Power supply and input

iii) Power supply and output

The minimum isolation level shall be 250V. In case of I/O modules have built in barriers, I/O modules shall also meet the requirements specified in Clause 6.1.3 of this specification.

d) Unless specifically indicated, only single channel barriers shall be selected. Following shall apply;

i) Dual input barriers shall not be selected

ii) Single input and single output barriers shall be selected.
iii) Single input dual output shall be selected when specifically indicated.

6.1.3.4 Field-bus instrumentation
   a) Whenever intrinsically safe field-bus system is specified with Entity concept, safety parameters of
      various items in the segment shall be matched with the selected barrier.
   b) Whenever FISCO system is specified, all components in the segment is FISCO complied, segment
      power supply selected shall also meet FISCO compliance. Segment design shall also meet FISCO
      requirements.
   c) Whenever non-incendive is specified, all components in the segment shall be FINICO complied
      including segment power supply.

6.1.4 All intrinsically safe barriers shall be of the isolating type only, shunt diode type of safety barriers
shall not be used. Only single channel type of barriers shall be used.

6.2 Power supplies and distribution

6.2.1 System Power Supply

6.2.1.1 Unless specified otherwise, the system shall operate on uninterrupted power supply (UPS). However
      the system shall be capable of operating satisfactorily at the following power supply specifications:

      Voltage : 220 V AC ±10%
      Frequency : 50 Hz ±3 Hz
      Harmonic contents : Less than 5%
      Power interruption : 10 millisecond

      Various main load centres of distributed control system may be sequentially started whenever
      the starting current are high. The requirement of sequential starting shall be specified in job
      specification. The sequential starting circuit shall be designed using hardware timers and contactors of
      adequate rating.

6.2.1.2 The system shall be supplied with dual DCS feeders each capable of handling 100% of the total power
      supply load requirements. The system shall be engineered such that;

      a) The redundant systems / sub-systems shall be powered such that main and redundant
         components are powered from separate UPS feeders.
      b) The non-redundant components / items shall be powered from either of the
         feeders, unless otherwise specified in the job specification.
      c) In case of failure of one feeders, redundant feeder shall supply the total load.
6.2.1.3 Each power feeder shall be monitored for its voltage and current in DCS, the transducers required for the measurement shall be located in power supply distribution cabinet/cabinets.

In addition to above, following indication / alarms shall also be provided for each feeder;

a) Voltmeter, ammeter and power-on-lamp on the cabinet front of respective power supply distribution cabinet.

b) Power failure Alarm contacts for such feeder for DCS monitoring.

c) One common power failure alarm contact for alarm on hardwired console.

6.2.2 DC Power Supply

6.2.2.1 DC supply shall be generally used for ESD devices and shall be 24V DC as specified in job specifications. In general, DC supply shall have the following specifications;

Voltage : 24V ±10%

Harmonic Contacts : ...

6.2.2.2 Each DC power supply feeder shall be monitored for its voltage. The voltage transducer shall be installed in the DC supply distribution cabinet.

6.2.2.3 In addition to above, following indications and alarms shall also be provided for each DC supply feeder;

a) Voltmeter installed on the respective DC power supply distribution cabinet.

b) Power failure alarm contacts for each feeder for DCS monitoring.

c) One common power failure contact for alarm as hardwired console.

6.2.3 Non-UPS Power Supply

6.2.3.1 Non-UPS power supply shall be generally used for panel / cabinet / console lighting, power sockets. The voltage shall be 240V 50Hz power supply. In general, 240V 50Hz Non-UPS power supply shall follow the following specifications;

Voltage : 240V ± 10%

Frequency : 50Hz ± 3%

6.2.3 All cubicles lighting shall be on 240 V, 50 Hz normal power supply.
6.2.4 Power supply shall be made available at one point. Further power distribution network shall be designed such that a single power fault in any instrument branch system shall not cause a trip of the entire system. Each consumer shall be provided with a separate switch and fuse for isolation and protection of the system.

6.2.5 Each transmitter shall preferably be powered with individual power supply. However when several transmitters are powered by a common DC source, each power supply branch shall have a separate switch and fuse. The distribution network shall be designed in such a way that overload in any branch shall not trip the main power supply. Enough redundant power supplies/battery banks shall be provided which shall take over automatically in case of main common power source failure. All power supplies shall have one to one redundancy and shall be sized for full load.

6.3 Equipment assembly

6.3.1 General

6.3.1.1 All system equipment like instruments, electronic modules, power supplies, barriers, relays etc shall be installed in either of the following enclosures / cubicles as specified in purchaser's job specifications. The layout of these enclosures shall be prepared considering proper accessibility and maintainability;

a) Control Panels

All indicating types of dedicated instruments like single loop controllers, indicators, recorders, alarm annunciators, manual loading station manual switches etc shall be installed on control panel when control panel is the operator interface or when specifically indicated in the job specifications.

b) Hardwired Console

All indicating type of dedicated instruments like single loop controllers, indicators, recorders, alarm annunciators manual switches shall be installed on hardwired console when hardwired console is the operator interface or whenever specifically indicated in the job specifications.

Hardwired consoles form the part of main operator console and shall have same design, dimensions, colour, and shape as operator consoles.

c) System cabinets

All system hardware (excluding consoles) shall be installed in system cabinets. This shall include system racks, system modules, communication modules, power supply modules etc.

System cabinets shall be pre-standing type and shall be freely accessible from front and / or back as required. Following system cabinets shall be required, in general;
i) Power distribution cabinet (for AC and DC distribution).

ii) Safety barrier mounting cabinet (when field instrument is intrinsically safe).

iii) Controller and data acquisition sub-system cabinet.

iv) Temperature converter trip amplifier and other auxiliary card mounting cabinet.

v) Shutdown system cabinets (PLC processor and I/O cabinets)

vi) SER Cabinet

vii) Marshalling cabinets

Free issue items mounting cabinet (for mounting items which are free issued to vendor)

6.3.1.2 In general, control panels and hardwired consoles supplement the operator consoles for plant operation. Those instruments which provide direct operating interface to the plant operator are installed on these enclosures / cubicles.

In contrast, system cabinets generally house back and items / equipments / instruments which are not required by the plant operator for direct operation.

6.3.1.3 Mechanical Design

6.3.1.3.1 As far as possible, panels / cabinets / consoles shall be manufactured using standard modular design and standard equipment. Vendor may follow their standard manufacturing procedures, however following points must be ensured:

a) All nuts, bolts, screws, washers (lock or flat) and hinges shall be of stainless steel. All fastening links shall also be of stainless steel.

b) Document pocket / wallet shall be provided on the inner side of front and rear doors of each cabinet and on the inner side of the door of each panel. Similar arrangement shall also be made on the inner side of doors of console.

6.3.1.3.2 Control Panels

a) Control panels shall have self-supporting free standing cubical construction with back doors made up of sectional steel panels. Two doors shall be provided for each panel, as standard.

b) Each panel section shall have the following dimensional details;

   Height : 2000mm

   Width : 1200mm
Depth: 1000mm

Panel shall be rigidly mounted on 100mm high channel base.

c) The panel shall be fabricated using angle iron frame section of minimum 50mm x 50mm x 4.0mm size. The control panel front shall be fabricated preferable from 3.0mm cold rolled carbon steel sheet.

d) Unless otherwise specified the panel shall be straight face type. Desk type panel shall be supplied where specified. Case shall be taken to ensure that the face of the panel is truly float and smooth.

e) Panel painting procedure shall include sand blasting, grinding, chemical cleaning, surface finishing by suitable filler and two coats of high grade lacquer with wet sand blasting between coats. Two coats of paint in the panel colour shall be provided. Final coat shall be given after assembly at site of non-glossy high satin finish when specified in the job specifications. Colour of the panels shall be as per job specifications.

f) Normal mounting heights of instruments (centre lines of instruments to floor) on panel shall conform to the following, with minor adjustments depending upon instruments selected.

<table>

</tr>
<tr>
<td>3</td>
<td>Electrical push buttons</td>
<td></td>
<td>700 mm</td>
</tr>
</tbody>
</table>

d) Door locking arrangement

All doors of cabinets / panels / consoles shall have flush mounted handles with key operated mechanical door locking arrangement. The locking arrangement shall be interchangeable and shall have common key for locking / unlocking all locks (master keying arrangement).

e) Internal lighting arrangement

Internal illumination shall be provided for all panels / cabinets / consoles to ensure proper illumination level of 250 lux for performing maintenance activities.

Fluorescent lamps shall be provided in each cabinet / console / panel which shall be activated individually by door operated magnetic switches. The lamps shall activate when door is opened and deactivate when the door is closed. The magnetic switches selected shall have undergone life cycle cyclic test of at lest 10,00000 operations. A manual over-ride switch shall be provided inside.
the panel / cabinet / console which shall keep the lamp deactivated even when the door is open. Panels / cabinets / consoles housing memories, which are likely to be effected by fluorescent light, shall have incandescent lamps.

The cabinet / panel / console lighting shall operate on 240V AC emergency power supply.

f) Utility Sockets

Each cabinet / panel / console shall have at least one number each of 240V AC (emergency power) and 220V AC, (UPS) power socket. The sockets shall be rated for 10A as a minimum.

g) Ventilation

In order to effectively remove dissipated heat from the cabinets / panels / consoles, ventilation fans along with vent louvers backed by wire fly screen shall be provided as required. Ventilation fans shall be provided in all cabinets / panels / consoles where the temperature rise with all doors closed and all internal and external loads energised shall exceed 10°c above the ambient temperature. A temperature element (resistance temperature detector) shall be provided in each cubicle for temperature measurement. Ventilation fans shall be provided in dual configuration, as a minimum.

Each fan shall have a separate dedicated assembly and shall be replaceable on-line without shutting down any equipment / panel / cabinet / console in part or in complete.

Ventilation fan assembly shall operate at 240V AC emergency power supply. Each fan shall have its own dedicated circuit breaker.

Each ventilation fan shall be fitted with a protection type finger guard. Whenever, the number of panels / cabinets / consoles are compacted (supplied in mechanical joined conditions), each panel / cabinet / console shall be provided with separate ventilation fan assembly.

The maximum noise level with all fans operating and cubicle doors open shall not exceed 85dBA. Following signals and alarms shall be provided for each panel, cabinet and console separately;

i) Fan failure alarm for each cubicle in DCS.

ii) Temperature indication of each cabinet or compacted combination, as applicable in DCS.

iii) A common alarm each for high temperature and fan-failure on hardwired console.

h) Earthing

Each cubical (panel / cabinet / console) shall be provided with earth bus bars of at least 15 x 5 square mm cross-section for the following;
i) Electrical earthing (non-isolated earth) where all metal components like all cabinet panels, doors etc shall be connected.

ii) System earthing (isolated earth) where cable shielding of all cables shall be earthed. System earth bus bar shall be isolated from electrical earth and also from metallic doors, panels etc.

iii) DC earth (isolated earth) where cable shielding of all 110V DC shall be earthed. DC earth shall be isolated from electrical earth, system earth and also from metallic doors, panels etc.

i) Lifting lugs

All control panels and system cabinets shall be provided with removable lifting lugs to permit lifting of panels / cabinets. The panel structure / frame shall be designed to permit panel / cabinet lifting without deformation. The normal working load of the lifting lugs shall be more than 1.5 time the panel / cabinet load. The eye bolts shall be certified for their normal working load. Panels / cabinets shall also be supplied with plugs which can be fitted after the lifting lugs are removed after their placement.

j) Name Plates

All panels / consoles / cabinets shall have name plates fixed on the front, back and inside with following details;
Front and Back : Tag number and description
Inside : Manufacturer’s name, purchase order number and year of manufacture, port number of manufacture.

All other details shall be as per clause 5.1.22 of this specification.

6.3.1.3.3 System cabinets

a) All the cabinets shall be free standing, enclosed type and shall be designed for bottom entry for cable connection. Cabinets structure shall be sound and rigid.

b) Cabinets shall be equipped with front and rear access doors. Doors shall be equipped with lockable handles and concealed hinges with pull pins for each door removal.

c) Each cabinet shall have the following dimensional details;

<table>
<thead>
<tr>
<th>Dimension</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Height</td>
<td>2000mm</td>
</tr>
<tr>
<td>Width</td>
<td>600mm / 1200mm</td>
</tr>
<tr>
<td>Depth</td>
<td>800mm</td>
</tr>
</tbody>
</table>
Cabinets shall be rigidly mounted on 100mm high channel base. Construction shall be modular preferably to accommodate 19" standard electrical racks. All racks shall be of same height. Maximum swing out for doors and drawers shall be limited to 600 mm.

d) Cabinets shall be fabricated from cold rolled steel sheet of minimum 2 mm thickness suitably reinforced to prevent warping and buckling. Doors shall be fabricated from cold rolled steel sheet of minimum 1.6 mm thickness. Cabinets shall be thoroughly deburred and all sharp edges shall be grounded smooth after fabrication.

e) Equipment, within the cabinet, shall be laid out in an accessible and logically segregated manner. All metal parts of the cabinet including doors shall be electrically continuous and shall be provided with a common grounding lug.

f) Cabinet painting procedure shall include sand blasting, grinding, chemical clearing, surface finish by suitable filler and two coats of high grade lacquer with wet sand blasting between the coats. Two coats of paint shall be provided. Colour of the cabinet shall be as per job specifications.

6.3.1.3.4 Electrical Wiring

All the cabinets, consoles and panels shall be completely wired and/or tubed, as required. Interconnections shall preferably be done with the help of pre-tracked cables. Vebdir may follow their standard wiring practices, however the requirements specified herein must be complied.

6.3.1.4.1 Terminals and Terminal Blocks

a) All terminal / terminal blocks shall be DIN Rail mounted type and shall be easily removable. The size of the terminal blocks / terminals of different types shall be consistent and identical.

b) All terminal blocks shall be mounted on suitable anodised metallic or plastic stand-off.

c) Terminal strips shall be arranged group-wise for incoming and outgoing cables separately. Terminal blocks for intrinsically safe wiring shall be separate. 20% spare terminals shall be provided, as a minimum, preferably in each terminal strip.

d) Terminal housing shall be strictly sized with considerations for accessibility and maintenance. Minimum distance required between various components are listed below. These distances are clear distances, and are excluding the width of the raceways or any other component / item mentioned herein. Following clearances should be considered;

   i) Distance between terminal strip and side of the cabinet parallel to the strip, up to 50 terminals, shall be minimum 50mm.

   ii) Distance between terminal strip and, top and bottom of the cabinet shall be minimum 75mm.
iii) Distance between two adjacent terminal strips shall be minimum 100mm.

iv) Additional distance for each additional 25 terminals shall be minimum 25mm.

v) Distance between cable gland plate and the bottom of the strip shall be minimum 300mm.

6.3.1.4.2 Terminals

a) Terminals shall be non-hygroscopic type made up of unbreakable fire-retardant, safe extinguishable, halogen free polyamide compound of VO grade of 960°C. These shall be manufactured as per IEC-60947-7-1.

b) Terminals shall be suitable for wires up to 2.5 sq. mm base solid or standard conductor in general. For power cables, higher size terminals shall be used.

c) The metal parts of terminals shall be of high quality (pure electrolytic) copper and shall be tin or nickel plated (of thickness up to 15 micron). The contact terminal resistance shall be of the order of 0.3 multi ohm.

d) The spring material for all terminals shall be chrome nickel spring steel of high tensile strength and of excellent corrosion resistance.

e) Voltage withstand capacity of the terminals shall be up to 4KV for 60 seconds as per IEC/EN-60664-1.

f) Field side terminal blocks in marshalling cabinet shall be cage clamp interruptable (i.e. disconnect) terminals providing necessary polarity distribution, protection, test point and earthing.

6.3.1.4.3 Wiring Requirements

a) All wiring shall conform to SPI RP 550 Part-I, Sections 7 and 12. Different signal level cables shall be routed under false flooring with separation distances as recommended by API RP 550 Section 7.

b) All wiring inside racks, cabinets, and back of the panels shall be housed in covered, non-flammable plastic raceways arranged to permit easy assembly to various instruments for maintenance, adjustments, repair and removal.

c) All wiring in the raceways shall be properly clamped. All incoming cable shall be terminated by vendor at marshalling rack with cable glanding including supply of cable glands. Total wiring cross-sectional area shall not exceed 50% of the raceway cross sectional area.
d) Separate wiring raceways shall be used for power supply wiring, DC and low level signal wiring, and intrinsically safe wiring. Parallel runs of AC and DC wiring closer than 300mm shall be avoided.

e) Vendor can alternately offer prefabricated cables for interconnection between different cabinets and panels.

f) Wire termination shall be done using self-insulating crimping lugs. More than two wires shall not be terminated on one side of single terminal. The use of shorting links for looping shall be avoided.

g) No splicing is allowed in between wire / cable straight run.

6.3.1.3.5 Hardwired console

a) Hardwired console shall be non-graphic self supporting, free standing cubicle with back doors and shall be designed for better cable entry for connections. Console structure shall be sound and rigid.

b) The design and dimensions of hardwired console shall strictly match with the operator consoles. For designing hardwired console, following points must be ensured;

- No instrument or switch shall be installed on the horizontal portion of console.
- Horizontal portion of console shall be spill proof, as well as scratch proof. Materials other than metallics can also be accepted for horizontal portion provided this can provide rigid, hard, flat and smooth surface. This shall require the purchaser's approval prior to deciding the material.
- In order to reduce number of hardwired consoles, vendor may utilize back-lighted switches and miniature instrumentation and annunciator windows.

c) Whenever the operator consoles are specified with table top design instead of console type of design, the hardwired console shall be identical and symmetrical to the operator console design.

d) Panels/hard wired console shall be fabricated preferably from 3 mm thick cold rolled steel sheet. Angle iron frame shall use a minimum section of 50 x 50 x 4 mm angle.

e) Cabinet paint procedure shall include sand blasting, grinding, chemical cleaning, surface finish by suitable filler and two coats of high quality laquer with wet sand blasting between two coats. Two coats of paint shall be provided. Colour of hardwired console shall be as specified in job specification.

6.4 Earthing

6.4.1 All system equipments such as panels, marshalling cabinets, system cabinets and other powered equipments shall be provided with following type grounding system;
a) Protective Earth / Electrical Earth

b) System earth / signal earth

c) Safety earth / ZB earth (when required)

d) SPD Earth

Both system earth and safety earth shall be totally separate from protective earth.

6.4.2 Protective earth / Electrical earth

a) Earth metallic enclosure / cabinet / panel / console etc shall be provided with electrical earth lug, as a minimum. Door hinges, flexible conduits or self-detachable connectors shall not be considered path for earth connectivity/earth return paths. Separate earth lug or permanent connectivity shall be considered.

b) Unless recommended otherwise by vendor, all earthing lugs of metallic equipments indicated in Clause 6.4.2(a) above shall be connected individually to electrical protective earthing system bus-bar / earthing station using a maximum of 10sq mm solid copper conductor PVC installed wires.

c) Where multiple cabinets are multiplexed together, earth looping with permanent shorting link cables shall be acceptable. Two earthing connection wires as indicated in Clause No.6.4.2(b) above shall be used for connecting multiplexed cabinets to protective earth station / bus-bar.

6.4.3 System Earth

a) System earth shall be totally noise free dedicated earthing system and shall be fully isolated from electrical protective earth. This earth must be very high integrity system and shall be used to ground zero volt references and signal cable grounds.

b) System earth shall be less than one (1) ohm grounding system with its own dedicated earthing pits. These earth pits shall be away from any heavy noise plant equipment. Outside the control room building is the most appropriate location.

c) The earth pit design shall be as per IS-3043 code of practice for earthing. A minimum of four (4) number of earth pits shall be provided for grounding system integrity. In case number of pits required to meet 1 ohm resistance are more than (2), the number of earth pits shall be two times the actual number of pits required to meet resistance criteria. All
these pits shall be security connected with each other to form a one homogeneous system earth grid.

d) Each marshalling / system cabinet / panels etc shall be provided with system earth bus-bar which shall be insulated from the metallic body frame. This bus-bar shall be used to earth also signal zero volt references and signal cable screens. Terminals used for termination of spare conductor pairs / cores of multi-pair signal / control cables shall be connected to system earth bus-bar. Shorting links shall be used for spare terminal looping.

e) System bus-bars in the multiplexed cabinets can be joined together by permanent shorting links. System bus-bars of other cabinets can also be connected together provided they are permanently joined using 35 sq mm stranded copper conductor cable in a looped both ends except for the following exceptions;

6.4.4 Safety earth / Zener barrier earth

a) Whenever Zener barriers are selected or used to meet intrinsically safe requirements, the earthing terminal of the zener barriers shall be connected to a separate earth bus bar.

b) This earth shall meet all the requirements specified in Clause 6.4.3 of this specification.

c) Safety earth bus bar shall be directly connected to earth pits using dual insulated cable. Cable conductor size shall be minimum 95 sq. mm (copper).

6.4.5 SPD Earth

a) SPD earthing terminals are connected to separate earthing bus bar in the cabinets.

b) This earth shall meet all the requirements specified in Clause 6.4.3 and 6.4.4(c) of this specification.

1.0 SCOPE

1.1 This specification defines the basic guidelines to Distributed Control System vendor for factory testing and acceptance, installation, commissioning and field acceptance of the fully integrated system.

1.2 These guidelines shall also be applicable to all sub-systems and hardware bought by DCS vendor.

1.3 On the basis of this specification, vendor shall submit detailed testing and acceptance procedures specifically applicable for their system. The procedure shall include both hardware as well as software testing and acceptance methodology covering following details:

a) Hardware Testing;
   The procedure shall include;
   i) Test name
   ii) Purpose of Test
   iii) Test equipment
   iv) Test set-up (Block diagram)
   v) Input definition
   vi) Test procedure
   vii) Results expected
   viii) Acceptance criteria.

b) Software Testing;
   The procedure shall include;
   i) Test name
   ii) Purpose of Test
   iii) Test equipment
   iv) Test set-up
   v) Sequence of Execution
   vi) Results expected
   vii) Acceptance criteria

The procedure shall not omit any column as indicated above in the procedure submitted. Indicate 'NA' whenever any column is not applicable. Additional requirement, if any may be include, as applicable.

1.4 The testing and acceptance of the system shall be carried out on the approved testing procedures and criterion based on this specification and vendor’s standard testing requirements and procedures.

2.0 FACTORY TESTING AND ACCEPTANCE

2.1 General
2.1.1 Vendor shall test and demonstrate the functional integrity of the system hardware and software. No material or equipment shall be transported until all required tests are successfully completed and certified “Ready for Shipment” by the owner/consultant.

2.1.2 The purchaser reserves the right to be involved and satisfy himself at each and every stage of inspection. The purchaser shall be free to request any specific test on any equipment considered necessary by him although not listed in this specification, as a part of approval of factory testing procedure. The cost of performing all tests shall be borne by the vendor.

2.1.3 Vendor to note that acceptance of any equipment or the exemption of inspection or testing shall in no way absolve the vendor of the responsibility for delivering the equipment meeting all the requirements specified in Material Requisition.

2.1.4 It shall be vendor’s responsibility to modify and/or replace any hardware and modify the software if the specified functions are not completely achieved satisfactorily during testing and factory acceptance.

2.1.5 Failure of components/ modules/ sub-systems during Testing

2.1.5.1 Vendor shall not replace any system component/module/sub-system unless it is failed. A log of all failed components/modules in a sub-system shall be maintained which shall give description of the failed component/module, effect of failure on the sub-system, cause of failure and number of hours of operation before it failed.

2.1.5.2 If malfunction of a component/module in a sub-system repeat, the test shall terminate and vendor shall replace the faulty component/module. Thereafter the test shall commence all over again. If even after this replacement, the sub-system fails to meet the requirements, vendor shall replace the full sub-system to the one meeting the requirements and the system shall be tested all over again.

2.1.5.3 If a sub-system fails during the test and is not repaired and made operational within four hours of active repair time after the failure, the test shall be suspended and restarted all over again only after the vendor has replaced the device in the acceptable operation.

2.2 The factory testing and acceptance shall be carried out in two phases i.e. Phase I and Phase II. The schedule for the testing shall be submitted by the vendor for both Phase I and Phase II separately. The minimum requirements for testing during these two phases are as follows:

2.2.1 Phase-I

2.2.1.1 Vendor shall perform tests at his works to ensure that all components function in accordance with their respective specifications. A test report shall be submitted to the owner/consultant for review within one week of completion of testing giving details. Phase II testing (witness inspection) shall start only after.

2.2.1.2 All sub-systems shall undergo a minimum of 30 days (720 hours) burn-in period. The system shall be offered for factory acceptance only after it has completed the specified burn-in period. The requirements shall be as follows;
a) The burn-in time shall start after the sub-system is fully assembled and is powered up. It may include any such time for which the system has been kept powered on even for system generation and Phase I testing.

b) Burn-in period log report shall be maintained by the vendor clearly recording sub-system (Tag No. / Identification No.), date and time of power-on, date and time of power-off, failed component (if any) with identification, communicative power-on time and sign-off. In case power to the sub-system is switched off because of any reason, the same shall be recorded in this log report.

c) Vendor shall submit burn-in period log report as part of Phase I test report for purchaser's review.

2.2.1.3 All the test results shall be recorded in the test log report. The test logbook shall contain the following information about the tests:

a) Date/time
b) Assembly / loop tag number
c) Test input
d) Test results and sign off with personnel name
e) Action required (if deficiency is detected)
f) Action taken, date of completion and sign off
g) Special test methods (including special equipment requirement, bypasses used etc.)

2.2.1.4 Test details

Following tests shall be performed by the vendor and report shall be forwarded to the owner/consultant.

2.2.1.4.1 Quality control test

a) Quality control tests shall be carried out to assure quality of all components and modules in accordance with vendor’s quality control and assurance procedures. QA / QC test methodology shall be in accordance with relevant international standards and practices. Vendor shall forward the details of these procedures for purchaser’s review.

b) The sampling procedures for all purchased components or components manufactured by the vendor shall be in accordance with the vendor standard quality assurance / quality control procedures.

c) All assemblies shall be aligned and adjusted before conducting tests. All tests shall be carried out as per manufacture's published / established testing methods and shall be recorded in a test logbook. The test logbook shall be duly signed by the QA / QC manager.

2.2.1.4.2 System power-up tests
All sub-systems shall undergo complete functional testing as part of Phase I power-up testing. Testing shall include, but not limited to, the following;

a) System hardware functional testing including redundancy, wherever applicable, as per vendor standard testing procedures.

b) System software testing as per vendor standard testing procedure including builder functionality.

c) System performance on power supply variations as per vendor standard procedures.

d) Application, Software testing;

Complete application programme generated by the vendor specific to the job shall be tested by simulating inputs. This shall include the following, as a minimum;

- Database verification including loop configuration as per approved functional schematics.
- Display verification including dynamic graphics and hierarchical displays.
- Trending, real time and historical, functionality and assignment.
- Logging and report generation
- Serial port assignment and its proving
- Security functionalities, as applicable e.g. password functionalities, fire-wall protection
- Testing of third party equipments (if applicable)
- Verification of logic diagrams
- Alarm management verification
- Any other software verification necessary for the offered system, as per vendor standard.

e) System Diagnostic verification

All the test results shall be recorded as per Clause 2.2.1.3 of this specification.

2.2.2 Phase II (Witness Inspection)

2.2.2.1 During Phase II testing, all the hardware and software shall be systematically, fully and functionally tested in the presence of purchaser representative.

All the sub-systems shall be interconnected to simulate, the totally integrated system as close as possible. Vendor purchased items (third party equipment) e.g. programmable logic controller, sequence of event recorder, alarm information management system etc shall also be integrated with the system. Free issue item, if any supplied by purchaser to the vendor for integrated factory acceptance test, shall also be integrated with the system. Barrier cabinets shall be used as the connecting points for the test inputs and outputs.
2.2.2.2 The duration of Phase II testing shall be communicated by the vendor along with day wise testing schedule to the purchaser. System shall be shipped to site only after the successful completion of this testing and the system is certified 'ready for shipment' by purchaser.

2.2.2.3 Data review:

Purchaser shall review the following documents before starting the witness Inspection (Phase II);

a) The latest document revisions, based on which vendor has generated the system, to the current data. Any revision or changes required shall be informed to the vendor before starting the witness inspection.

b) Test reports of all bought-out items by their respective manufacturers.

c) The test report/log book forwarded by vendor after Phase-I testing. Owner / consultant has right to witness any test performed in Phase I, if found necessary.

2.2.2.4 Testing record

a) During testing of Phase II, each test carried out shall be recorded. Any deficiency or problem observed during testing shall be clearly recorded and corrected thereafter.

b) Vendor shall prepare a punch list report listing out all the action points. All punch list actions must be completed before system dispatch.

c) Any change in the data or configuration etc informed to the vendor during testing by purchaser shall be recorded and modifications required shall be carried out by the vendor.

2.2.2.5 Visual and mechanical testing.

Visual and mechanical testing shall be carried out in principle to assure correct, proper, good and neat workmanship by the vendor. This testing shall include the following, as a minimum;

i) Dimensional verification

ii) Sheet thickness

iii) Layout verification as per approved GA drawings

iv) Quality of painting (outer and inner)

v) Nameplates, identifiers and tag plates

vi) Adherence to ferruling philosophy.

vii) Dressing of wires / prefabricated cables and clearances

viii) Locks and handles

2.2.2.6 Verification of Bill of Material (BOM)

Hardware and software including bought-out items shall be available for verification with the bill of material (BOM) document submitted by the vendor during engineering. Vendor must obtain
purchaser's prior approval if any sub-system or bought-out equipment / item can't be made available
during Phase II testing i.e. witness inspection. The verification of BOM shall include the following;

a) Hardware verification

The verification shall include verification of all hardware including mandatory spares as per the
model numbers and quantities indicated in bill of material document. Items which can't be
identified with model numbers, shall be verified with manufacturer's serial numbers. In all such
cases, vendor must ensure that the serial number has been indicated against all such items in the
BOM document.

b) Software verification

The verification shall include verification of licenses and their numbers for all softwares as listed in
bill of material document. All licenses shall be in the client's name. Number of copies of as built
application programmes shall be verified at the time of site acceptance test and not during factory
acceptance test.

All system hardware including network interfaces and all software including operating system, console
software, network software, complete application software etc. shall be installed and tested as part of
function testing.

2.2.2.7 Functional testing

All system hardware including network interfaces and all software including operating system, console
software, network software, complete application software etc. shall be installed and tested as part of
function testing.

Functional testing shall include the simulation of inputs and outputs to verify proper system response
for both analog and discrete signals. Unless otherwise specified, at least 20% of I/O's shall be simulated
in controller and data acquisition sub-system while all I/O's shall be simulated and corresponding logics
shall be verified in case of Programmable logic controllers. The I/O sampling shall be at random and
shall be selected by the purchaser during testing. The testing, as a minimum, shall include the
following:-

a) Complete system configuration loading.

b) Controller and Data acquisition Sub-system

Demonstration of all controller functionalities verification and data acquisition sub-system
functions from local as well as from central level including;

- Changing control algorithms
- Changing control mode and controller action
- Changing alarm limits
- Controller tuning using tuning trend.
Controller tuning using auto-tuning package and change in tuning package and change in tuning parameters either automatically or manually.
- Output status on controller failure.
- Setting of macro-cycle time for fieldbus segment.

c) Scan time verification of scan time values for controllers and data acquisition sub-system and PLC testing shall be carried out by simulating the inputs as follows;

i) Open or close the contact input as per logic execution requirements.

ii) Step input or slow ramp input (typical frequency of 4 cycles / second) with amplitude corresponding to 16mA (4mA to 20mA or vice versa) for all conventional analog and smart (HART) inputs from a signal generated.

The processor cycle time setting and the processor loading shall not exceed the specified limits while verifying scan time.

Checking of scan time values for controllers and data acquisition sub-system and PLC;
The inputs to the system shall be;

- Step input i.e. 0 or 1 for all contact inputs.
- Step input or ramp input for all analog inputs

The processor cycle time setting and the processor loading shall not exceed the specified limits while verifying scan time.

Control cycle time shall be measured by simulating a segment with transmitters and positioners in the worst case fieldbus segment (w.r.t number of transmitters and positioners) and scheduled activities.

d) Checking of correct change-over of the back-up units in case of main unit failure. This shall include the following:-

i) Uninterrupted controller operation shall be verified even during and after switchover of back-up device. The failed controller Database, point records, inputs and outputs of the failed main controller shall be transferred to the back up controller without any interruption. The same shall be repeated for transfer back from back up controller to the main controller. Maximum transfer time shall not exceed the specified value. The test shall be repeated for controller all redundant devices including input /output modules.

ii) Uninterrupted data transfer from main communication network and communication interfaces to the redundant ones shall be checked. The transfer back from back-up device or back-up communication network to main network or interface shall not be automatic (automatic transfer from back-up device / network to main device / network shall also be
acceptable in case the changeover procedure is flawless and smooth). This test shall be
repeated for all interface units in the system including foreign device interfaces.

iii) Uninterrupted operation of system shall be checked on failure and resumption of any of the
power supplies where redundant power supplies are provided.

iv) Uninterrupted operation of the system incase of redundant H1 module, power supply
conditioners and LAS functionality.

e) Checking of controller loading

Controller loading shall be verified as displayed by the system by simulating as many as inputs to
simulate worst case data transfer condition.

f) Simulation of fieldbus segment

At least one fieldbus segment of each type (e.g. foundation fieldbus, profibus etc) shall be
simulated as applicable. The segment shall include at least one device of each make and model
number being used in the project (purchaser shall identify and provide the device to vendor for
segment simulation). Following minimum tests shall be carried out;

i) Inter operability test to ensure correct data transfer between devices of different makes and
host (i.e. DCS).

ii) Control cycle time verification as per specifications.

iii) Control loop functionality when control algorithm is configured in DCS and in a field
device i.e. positioner and in transmitter.

iv) Verification of functionality of control input data transfer along with fieldbus converter by
simulating inputs.

g) Functional verification of cursor movement devices

Verification of correct functioning of all keyboards, mouse, touch screens, light pen etc shall be
carried which shall include;

i) Smooth functioning of all devices.

ii) Functional commands verification

iii) Dual function key configuration.

The devices shall include those attached to operator console, engineering console, PLC console,
personal computers, other sub-systems / accessories.

h) Verification of loop configuration

Data base and the configuration of all the loops shall be verified for their correctness with respect
to range, limits, engineering units, alarm set points, software configuration, output status of
controller / control block failure etc with respect to latest revisions of instrument details and functional schematics / P&ID's supplied by purchaser.

i) Verification of Displays

All types of displays, process as well as system, configured on operator console, engineering console and PLC console shall be verified with respect to correct display configuration, colour scheme, colour modifiers, engineering units, windowing feature, alarms, flags, restricted operation etc.

j) Verification of functionality of accessories

All the accessories like printers and hard copiers shall be verified for their proper operation by printing either test data or actual data.

k) System Diagnostics

System diagnostics shall be thoroughly checked for all sub-systems on local level as well as on operator/engineering console. These shall include diagnostics of failure of main as well as redundant items such as a sub-system, sub-system module, HI module, LAS functionality, power supply, interface unit, network and network module, consoles, third party device interfaced with DCS, printers, hard copier, server failures, key-board / cursor movement devices, disc and disc drives, field-bus devices, field-bus segment, network devices etc. and other detailed diagnostics and their corresponding displays. Diagnostic alarms for any ventilation fan failure, cabinet temperature high and corrosion monitor shall also be verified.

l) Verification of Application programme

Following application programming shall also be verified thoroughly in addition to the complete loop operation by simulation;

i) Verification of trending and trend displays.

ii) Verification of historisation functionalities

iii) Verification of alarm management

iv) Verification of data retrieval functionalities.

v) Verification of all dynamic graphics.

vi) Verification of interchangeability between various video screens of a console.

vii) Synchronisation of system clocks.

viii) Verification of various log formats and log reports including MIS reports as applicable.

ix) Complete (100%) verification of interlock and shutdown logic by simulating inputs and verifying outputs preferably using simulator, other related functions like forcing, first out shall also be verified.
x) Verification of third party device (like PLC, analyser system, computers, MMS, F&G systems etc) interfaces for complete data transfer between device and DCS and vice versa. Where third party devices are not supplied by vendor (and cannot be provided by purchaser for conducting factory testing), the complete address mapping shall be verified and the link shall be proved using third party device simulation.

xii) Verification of data and reports related to instrument asset management system.

m) Verification of other specific requirements when specified like;

i) Large screen functionality and display solution shall be verified along with large screen controller. Where large screen is not available during factory acceptance test, vendor may utilize a PC in place of display unit for application verification.

ii) Verification of all functionalities of alarm information and management system including report generation.

iii) Verification of functionalities of unit history node and its verification. The verification shall include configuration verification, sample rate versus storage time verification (by extrapolated method for extended time period), throughput, report formats and report generation.

iv) OPC node verification with respect to its configuration, data structure and throughput.

v) Sequence of Event Recorder functionalities verification by verifying identification of events with the specified resolution. The input shall be generated using pulse generator of suitable frequency.

vi) Functionalities of other items when specified shall also be verified.

n) Verification of hardwired console and its functionality. All functions shall be 100% verified such as operation of hardwired instruments, hardwired annunciator, switches, ramps, pushbuttons, instruments like controllers, indicators, recorders etc. Hardwired consoles must be present during factory acceptance test and shall be interconnected for functional verification. All hardwired instruments like alarm cards, barriers and relay shall also be verified for their proper operation.

o) Verification of all system builder functions and engineering console functionalities.

p) Verification of fieldbus simulator functionalities when specified and purchased along with the system.

q) Verification of display update rate and call-up time under worst loading conditions. Network performance shall also be verified by verifying display update rate of an analog tag number when all other inputs in the system are under varying conditions.
2.2.2.8 The vendor shall notify the owner/consultant at least three weeks prior to final system testing. In the event that representatives arrive and the system is not ready for testing, the vendor will be liable for back charges for any extra time and expenses incurred.
2.2.2.6.4 Checking of loop configuration for correctness with respect to ranges, limits, alarm points, engineering units etc.

2.2.2.6.5 Checking of all types of VDU displays including process and system displays on operator Engineering and PLC console.

2.2.2.6.6 Checking of correct functioning of key-board operation for operator, Engineering and PLC console.

2.2.2.6.9 Testing of proper functioning of all printers and hard copy units.

2.2.2.6.10 Testing of system features like interchangeability between VDUs of a console, synchronisation of system clocks, selective tuning from Engineering console, key-lock functions etc.

2.2.2.6.11 Checking of various log formats, shut down reports, I/O mapping and other MIS formats printing.

2.2.2.6.12 Checking of shutdown and interlock configuration and proper operation thoroughly.

2.2.2.6.13 Proper system operation at power supply specifications specified in the Material Requisition.

2.2.2.6.14 Checking of proper operation of all interfaces with the system like interface with PLC, computer, analyzer system etc as specified in Material Requisition.

2.2.2.6.15 Checking of bus-degradation while loading the bus from 10% to 100%.

2.2.2.6.16 Simulation of power failure and restarts.

2.2.2.6.17 Checking of all hardwired instrumentation including all alarm cards, alarm annunciator system, switches and other indicating instruments.

3.0 INSTALLATION, TESTING AND COMMISSIONING

3.1 Vendor shall offer the services of the installation team which would install the equipment in the control room, lay the interconnecting cabling inside the control room, check out, test and commission the system.

All technical personnel assigned to the site by the vendor shall be fully conversant with the supplied system and software package, and shall have both hardware and software capability to bring the system on line quickly and efficiently with a minimum of interference with other concurrent construction and commissioning activities.
3.2 Vendor’s responsibility at site shall include all activities necessary to be performed to complete the job as per material Requisition including:

   a) Receipt of hardware/software and checking for completeness of supplies.

   b) Installation of the system including free supply equipment and field cable termination in the system.

   c) Check out of the equipment installation.

   d) Checking of interconnection, hardware & software configuration, overall system functioning etc.

   e) Loop checking.

   f) Liaison with vendor’s home office.

   g) Field tests

   h) Commissioning and on-line debugging of the system.

   i) Performance of final acceptance test.

3.3 The only exclusion from vendor’s responsibility shall include the following:

   a) All civil works in the control room including false flooring, control room lighting and air conditioning ducting.

   b) Laying and identification of field cables.

   c) Field instrument installation and calibration.

3.4 Field Inspection

3.4.1 All equipments shall be inspected thoroughly by vendor after its receipt at site. The tests, as a minimum, shall include:

   (a) Hardware verification as per packing list.

   (b) Visual and mechanical checking.

   (c) Complete System Configuration loading.

   (d) Functioning of all VDUs, keyboards, disc drives, printers, hardcopy units etc.
(e) Checking of correct change-over of redundant devices.

(f) Checking of hardwired instruments.

(g) Any other checking.

3.4.2 The testing defined in para 3.4.1 shall be carried out to ensure functional integrity of all hardware being supplied. Vendor must initiate the remedial action in case unsatisfactory operation of any equipment or item is observed during this testing with an intimation to Engineer-in-charge.

3.4.3 Vendor must document all observations including details of malfunctions observed, if any. Items/equipments requiring total replacement must document reasons for the same.

3.5 Loop Checking

3.5.1 Vendor shall be responsible for loop checking which shall also include checking of the interconnection, at control room end, configuration and ensuring over all system functioning.

3.5.2 Calibration and installation of field instruments, installation of junction boxes, interconnection between instruments and junction boxes, laying of single, multi pair cables upto control room, tagging all field cables, performing continuity/insulation test of cable, core identification of field cables etc. shall not be in the vendor scope. This work shall be carried out by the field contractor.

3.5.3 Vendor’s scope of work, as a part of system installation and loop checking shall include termination of all field cables in control room, checking of interconnection between instrument glanding and equipment, ferruling and tagging of interconnecting cables in control room, ferruling of field cables in control room and performing overall loop performance check.

3.5.4 Loop checking shall be carried out to check the functional performance of all elements comprising the loop and thereby ensuring proper configuration, functioning and interconnection.

For fieldbus devices the loop checking shall include the checking of complete fieldbus segment connectivity with its devices including noise, device configuration, waveform checking. The complete device configuration shall be downloaded to all field devices from DCS prior to the start of loop checking.

3.5.5 Vendor shall co-ordinate with the field contractor for smooth and proper loop checking. Any discrepancy found during checking shall be brought to the notice of Engineer-in-Charge. Complete loop checking shall be performed in the presence of Engineer-in Charge or his authorised repre-
sentative. All readings shall be recorded on a suitable format which shall be handed over to the vendor by the field contractor after completing calibration record of each field device. On the completion of loop checking, remaining information related to loop checking shall be filled by the vendor. Completely filled format duly signed shall be submitted for approval, to Engineer-in Charge.

3.5.6 a) All the components of the loop shall be checked for proper functioning. All field instruments connected to control room shall be loop checked at 0%, 50% & 100% of FS (for both increasing and decreasing signals). The mode of generating signal from the field by field contractor shall be as follows for different instruments types:-

<table>
<thead>
<tr>
<th>Type of Instrument</th>
<th>Mode of Signal Generation</th>
</tr>
</thead>
<tbody>
<tr>
<td>a) Differential pressure/ flow instruments/ DP type level instruments</td>
<td>By applying impulse to the primary by squeeze bulb or regulator at field</td>
</tr>
<tr>
<td>b) Pressure instruments</td>
<td>By applying impulse to the instrument using instrument air, regulator &amp; standard gage or using portable hydraulic pump and standard gage.</td>
</tr>
<tr>
<td>c) External Displacer</td>
<td>Cage shall be filled with water for different levels and specific gravity correction shall be applied</td>
</tr>
<tr>
<td>d) Other type of tank level instruments</td>
<td>By lifting the float of the level instruments for 0% and 100% of range</td>
</tr>
<tr>
<td>e) Temperature loops with thermocouple</td>
<td>Appropriate mV signals shall be fed from thermocouple head</td>
</tr>
<tr>
<td>f) Temperature loops with RTD</td>
<td>Appropriate resistance shall be fed from RTD head</td>
</tr>
<tr>
<td>g) Field switches for Alarm &amp; Shutdown</td>
<td>Abnormality shall be simulated by disconnecting and connecting the wires at field instruments end</td>
</tr>
<tr>
<td>h) Owner supplied items</td>
<td>As per Engineer-in-Charge’s Instructions</td>
</tr>
<tr>
<td>i) Special instruments &amp; any other type of instruments</td>
<td>As per Engineer-in-Charge’s Instructions</td>
</tr>
</tbody>
</table>

b) Receiver alarm cards shall be checked by the vendor for different settings on both increasing and decreasing signals.

c) Shutdown schemes shall be checked for proper functioning, configuration and actuation.

d) Performance of individual loops may be accepted for an overall accuracy of ± 1.0% unless otherwise specified. Where deviation exists, re-calibration of instruments, based on the scope of work, shall be carried out either by field contractor or by vendor.

e) Signal from controllers/shutdown schemes to control valves/shutdown valves shall be checked at the respective valves. The stroke checking including checking of time of operation of control
valves/shutdown valves also forms a part of loop checking. Vendor shall coordinate this activity with field contractor and record the same in the loop checking format.

f) For the loop checking of loops connected to substation, vendor shall be responsible to coordinate with the Electrical Contractor.

g) After loop checking is completed, vendor shall connect back any terminals and connections removed for loop checking.

4.0 SYSTEM ACCEPTANCE

4.1 The owner shall provisionally takeover the system from vendor after System acceptance test. System acceptance test shall be started only after the satisfactory performance of loop checking and verification of all loop checking records by Engineer-in-charge.

4.2 The system acceptance test shall be carried out in the presence of owner's representative and Engineer-in-charge or his authorised representative. The tests carried out in System acceptance test shall be fully recorded and duly signed by all representatives participating in the System Acceptance Testing.

4.3 Vendor shall carry out the following functional tests on the fully integrated system as a part of System acceptance test, as a minimum;

a) Hardware verification as per final Bill-of-material.

b) Visual and mechanical checking for proper workmanship, identification, ferruling, nameplates, etc.

c) System configuration as per approved configuration diagram.

d) Checking of correct functioning of all keyboards and dual function keys.

e) Checking of proper operation of hardcopy unit and all printers including printing of Alarms and Events on the Alarm & Event (A&E) printer.

f) Demonstration of all system diagnostics.

g) Checking of correct changeover of redundant devices.

h) Checking of redundancy for LAS functionality for fieldbus segments.

i) Checking of communication between DCS, PLC and other foreign devices.

j) Checking of proper functioning of all disc drives, historical trend-points, alarm summary and alarm history.
k) Verification of proper functioning of assignable trend recorder

l) Printing of Configuration and Configuration changes on C&M printer.

m) Proper information transfer on the information network by verifying system displays and printouts.

5.0 FINAL ACCEPTANCE TEST

5.1 The owner will take over the system from the vendor after the final acceptance test, which is defined as successful uninterrupted operation of the integrated system for three weeks for all units of the plant. Vendor’s personnel shall be present during the test. Any malfunctioning of the system components shall be replaced/repaired as required. Para 2.1.6 of this specification shall be applied for failure of components & readjustments. Once the system failure is detected, the acceptance test shall start all over again from the beginning. The warranty period commences from the day owner takes over the system.

6.0 TESTING/CALIBRATION EQUIPMENTS

6.1 Vendor shall make available all consumable, instruments, and equipments necessary for testing, calibration, maintenance etc. as required by the defined scope of works. All instruments and equipments used for the above purpose shall be of standard make with accuracy better than the accuracy expected from the calibrated/tested instruments, and certified by National Physical Laboratory or other equivalent agencies. These instruments/equipments are necessary only during testing/calibration/maintenance.

1.0 SCOPE

1.1 This specification defines the general requirements expected to be fully complied by Distributed Control System vendor including logistic supports, documentation, warranty, maintenance contract and shipping instructions etc.

1.2 The requirements defined in this specification shall also be applicable for all sub-system and hardware bought and supplied by vendor from manufactures other than his own.

2.0 LOGISTIC SUPPORT SERVICES

2.1 The hardware maintenance engineers shall be trained for module level nd optionally component level diagnostics of the system. Vendor is required to quote separately for these training facilities. It is also necessary to include in the proposal the details of diagnostic software package for isolating the fault at module level for all the sub-system of Distributed Control System.

2.2 Training

2.2.1 The requirements of training for owner/consultant personnel (one group consisting of operators and other group consisting of hardware/software maintenance engineers) in the operational software and diagnostic programs, are set forth herein.

2.2.2 Vendor shall be responsible for furnishing details of course outlines, manuals of training, equipment necessary to conduct the training, exercises to evaluate trainees’ progress. Vendor shall also be responsible for any other requirements necessary to train the engineers deputed by owner within a time limit so that they acquire the necessary expertise to operate and maintain the programs and the equipments supplied.

2.2.3 Owner/consultant or his authorised representatives shall select personnel for training on the basis of his requirements and will review all materials furnished for adequacy of teaching aids and time tables.

2.2.4 Training Personnel.

Each instructor-designate shall have the following minimum qualifications for his area of instructions:

a) Six months of formal class-room instructor experience.

b) Complete and thorough technical knowledge of the equipment and system supplied under the contract and skilled experience in their programming, maintenance and operation.

c) Complete and thorough knowledge of the test and laboratory equipment maintaining, diagnosing, programming, operating and trouble shooting the hardware software system.

2.2.5 Course contents

2.2.5.1 The outline of each course shall give the subject matter, a short resume of the pre-requisite subjects (if applicable), the position of the course in the training programme, the aim and yardsticks for evaluation and other topics which will add to the usefulness of the program. In order that the selected trainees shall have time to participate in the course, sufficient advance notice of minimum 8 weeks shall be given by the vendor. The course outlines shall be submitted 10 weeks ahead for review.
2.2.5.2 The training exercise shall be designed to be objective in nature and shall include trouble shooting exercises on similar equipments.

2.2.6 Training manuals

2.2.6.1 All training manuals shall be prepared by the vendor and submitted for review 10 weeks ahead of the commencement of the course. After course completion, these manuals shall become the property of the owner. Any change in equipment, manuals and other material shall be informed to the owner during the guarantee period. In addition to vendor documentation, the following minimum requirements shall be adhered to for the training manuals:

a) Functional flow-charts, descriptive material, program source listings applicable to all operating and application software and diagnostics programs.

b) Schematic drawings of each assembly of the hardware for the course on maintenance.

c) All manuals pertaining to procedures, specifications and operation for each equipment.

2.2.7 DCS hardware and software maintenance training

2.2.7.1 Vendor shall conduct a course in hardware (module level and optional component level) maintenance, software maintenance and diagnostic of the system for owner at vendor’s facility. The course shall be conducted prior to the factory system performance tests so that trained personnel can participate effectively in the final testing.

2.2.7.2 The hardware maintenance training course shall cover every equipment item supplied as part of the Distributed Control System. This course shall include:

a) Actual operation, detection and correction of faults in equipments.

b) Familiarisation with maintenance procedures for the system offered.

2.2.7.3 Some of the topics covered in the course shall include:

- Fundamentals of the system
- Equipment logic diagrams
- Diagnostic procedures
- Peripherals maintenance
- Preventive maintenance procedures

2.2.7.4 Software maintenance training shall cover all software supplied with the system. The trained personnel shall be able to write and debug the application and system software.

2.2.7.5 The vendor is required to quote for in-house and on-site training separately and manhour rate for additional training, if required by the owner.

2.2.8 Site training facility and training kit

2.2.8.1 The training kit shall essentially be used for refresher and training courses for process engineers, operating and instrument maintenance staff. The training kit shall be simple control system with process simulator for a group of loops and shall include:

a) An operator console with a VDU, operator key board and engineering keyboard.
b) Controller with auto backup facility.
c) One each of the varieties of PCBs used in data acquisition.
d) Signal simulator.

2.2.8.2 Vendor to provide the details of the kit offered along with the proposal.

2.2.8.3 Training kit system shall be stand alone with respect to hardware and software and in no way be lined with the main system.

2.3 Spare parts

2.3.1 Vendor shall include in the proposal, provisions for special tools, test equipments and initial stock of maintenance spares for a period of two years after commissioning as are essential for proper maintenance and operation of the equipment. In addition, estimated requirements of spares consumption per annum should also be indicated. Full particulars of the tools, test equipments and spare parts shall be provided separately. The list should also include the item wise price.

2.3.2 The successful vendor shall warrant that spare parts for the system would be available for a minimum of fifteen years. After this period, if vendor discontinues the production of spare parts, vendor shall give at least twenty four (24) months notice prior to such discontinuation so that the owner may order his requirements of spares in one lot.

3.0 DOCUMENTATION

Vendor shall furnish all the manuals necessary to test, operate and maintain Distributed Control System hardware and software.

3.1 Hardware documentation

3.1.1 The following documentation for all hardware supplied and as built under this contract shall be submitted for review two months before the start of factory acceptance testing.

a) The specifications for all off-the-shelf hardware manufactured by vendor, his sub-contractors or suppliers. Supplier’s name and identification of ordered hardware and expected delivery data to vendor’s premises shall also be supplied along with this.

b) Documentation relating to off-the-shelf hardware and hardware developed by vendor including description, specifications, theory of operation, maintenance procedures, installation information and drawings. This information shall exclude all non-applicable information.

c) Where more than one size, rating or type of construction appears on the submitted catalogue data, those characteristics applicable shall be identified. Non applicable information shall be suppressed.

d) Test plans and test reports as specified in Part II of this specification for each item of hardware, to be supplied.

e) Bill of material listing all hardware to be supplied including manufactures part numbers, name plates data, approximate volume, weight and overall dimensions.

f) Spare parts catalogue for all items (at component level) to be supplied.
g) Recommended spare parts for two years.

3.2 Software documentation
The following documents shall be submitted for review before 90 days of the shipment of the system, for the software packages included in the supply:

a) The specifications for all software to be obtained in-house or from subcontractors or suppliers. The details supplied shall also include the name of the suppliers, software identification including latest modification data.

b) Reference manuals, operating manuals, programming manuals and other software manuals (if any).

c) Description of the function of each program. This shall include the logic, configuration requirements and constraints and sub-programs used, memory map and special characteristics.

d) Input and output details for each program.

e) Listing of assembled programs with label and symbol tables in assembler/compiler language.

3.3 System manuals

3.3.1 Manuals shall be submitted for assuring satisfactory operation and maintenance of the system. Detailed literature for installation and maintenance of all hardware should be provided to the owner.

3.3.2 All system manuals shall be supplied in hard cover loose ring folders in A size i.e. 216 x 279 mm. All drawings and sketches shall be in multiple of ‘A’ size like ‘B’ (279 mm x 432 mm) or ‘C’ type (406 mm x 518 mm) etc. but folded to ‘A’ size.

3.3.3 Instruction Manual

The information submitted shall preferably be in three parts.

I Part
First part shall give the following information:

a) A general functional description of the whole system.

b) General software description.

c) General Instructions and start up procedures.

II Part
Second part shall describe the system software in detail including its interaction with application programs and other programs used as supporting software.

III Part
The third part shall include detailed maintenance information including all data pertaining to equipment required for maintenance of the system.

3.3.4 Maintenance manuals

3.3.4.1 The maintenance manual shall include details of
a) Preventive maintenance procedures.
b) Trouble shooting procedures including failure analysis.

3.3.4.2 A section on repairs shall provide enough information on repairs including removal, repairs, adjustment and replacement.

3.3.4.3 The maintenance manuals shall contain a list of all maintenance parts to facilitate quick identification of the parts for replacement and ordering. Standard hardware structural parts, or other parts not requiring maintenance shall not be included here. At the end of the list of parts requiring maintenance, a list of special tools required for the maintenance of each unit shall be given. List of manufacturers of each part shall also be included.

3.3.5 The final system manuals shall be furnished to owner within a month of completion of final satisfactory field testing. All field modifications shall be incorporated and system as built drawings and documents shall be included. Fifteen copies of each manuals shall be submitted to the owner/consultant.

3.3.6 Engineering drawings

3.3.6.1 The vendor shall provide a complete set of drawings covering each art of the supply for the owner/consultant record. The vendor is required to include owner’s project number on each of his drawings in order to ease owner/consultant’s record keeping.

3.3.6.2 Functional schematics and logic diagrams are furnished by owner/consultant to provide an idea of system hardware and software requirements to the vendor. Functional schematics shall be furnished in two parts.

a) Part-I, containing all system hardware and software requirements is furnished along with Material Requisition.

b) Part-II, containing the field devices details like transmitter, junction box details, final actuating device single and multi cable/core details, shall be furnished later. Vendor shall develop loop wiring diagrams, containing full information of each loop (one drawing per loop) including field termination, junction box details, cables numbering, rack number, bus address code, device address code, power supply connections, final actuating device details including positioner and air supply etc and furnish these before the installation of system.

3.3.6.3 All field modifications shall be carefully recorded by the vendor’s commissioning personnel and change shall be incorporated into final drawings. Fifteen copies of each drawing shall be submitted with one reproducible.

4.0 WARRANTY

4.1 Vendor shall be fully responsible for the manufacture in respect of proper design, quality, workmanship and operation of all the equipment, accessories etc. supplied by the vendor for a period of 18 months from the date of taking over by the owner at the site as mentioned in this specification or 24 months from the shipment date whichever is later.

4.2 It shall be obligatory on the part of vendor to modify and/or replace any hardware and modify the operating, application and diagnostic software free of cost, in case any malfunction is revealed even during on line operation after taking over within the warranty period.
4.3 Vendor shall also provide the total maintenance of the system during warranty period. The cost for warranty maintenance, if any, shall be included in the proposal separately in 'vendor proposal outline and pricing details'.

**5.0 MAINTENANCE CONTRACT**

5.1 Vendor shall quote separately for maintenance contract after warranty period for two years based on per day rate for each category of personnel required. The personnel deployed shall have thorough knowledge of the system and at least two years of experience on the maintenance of similar systems. Any other conditions of contract required by vendor shall be explained in the offer.

**6.0 PACKING AND SHIPPING INSTRUCTIONS**

6.1 All the material used for packing, wrapping, sealers, moisture resistant barriers and corrosion preventers shall be of recognised brands and shall conform to the best standards in the areas for the articles which are packaged.

6.2 Workmanship shall be in accordance with best commercial practice with the requirement of applicable specifications. There shall be no defects, imperfections or omissions which would tend to impair the protection offered by the package as a whole.

6.3 The package shall be suitable for storing in tropicalised climate, the ambient conditions being specified in the job specifications.

6.4 Shipment shall be thoroughly checked for completeness before final packing and shipment.
OPERATOR STATIONS, ENGINEERING STATIONS, SERVERS SHALL BE AS PER ITB
Following shows the minimum requirement of the control system, any extra systems required to fulfil the requirements shall be in scope of bidder

Independent Racks for each STG
All serial communications shall be redundant (R)
TCP- Turbine control Panel

1.0 GENERAL

1.1 Scope

1.1.1 This specification, together with the Material Requisition defines the minimum functional requirements for the design, hardware, software and firmware specifications, nameplate marking, testing and shipping of Programmable Logic Controllers (PLC) designed for reliable effective and optimum control and monitoring of a process plant. 1.1.2 The related standards referred to herein and mentioned below shall be of the latest editions prior to the date of the purchaser's enquiry:

APIRP 552 Transmission Systems
EN 10204 Metallic Products - Types of Inspection Documents
EN 50039 Electrical Apparatus for Potentially Explosive Atmospheres: Intrinsically Safe Electrical System 'I'
IEC 60079 Electrical Apparatus for Explosive Gas Atmosphere
IEC 60529 Degree of Protection Provided by Enclosures
IEC-60584 Thermocouple Part 2: Tolerances
IEC 60617 Graphical Symbols for Diagram
IEC-60751 Industrial Platinum Resistance Thermometers and Platinum Temperature Sensors
IEC 61000-4-3 Electromagnetic Compatibility (EMC) - Testing and Measurement Techniques - Radiated, Radio Frequency, Electromagnetic Field Immunity
IEC-61000-4-4 Electromagnetic Compatibility (EMC) - Testing and Measurement Techniques - Electrical Fast Transients / Burst Immunity Test
IEC-61000-4-5 Electromagnetic Compatibility (EMC) - Testing and Measurement Techniques – Surge Immunity Test
IEC-61000-6-2 Electromagnetic Compatibility (EMC) - Generic Standards - Susceptibility - Industrial
IEC 61508 Functional Safety of Electrical/Electronic / Programmable Electronic Safety-related Systems
IEC 61131 Programmable Logic Controllers
IEC 61511 Functional Safety -Safety Instrumented Systems for the Process Industry Sector

IEEE 802.3 Telecommunication and Information Exchange between Systems -Local and Metropolitan Area Networks -Specific Requirements -Part 3: Carrier Sense Multiple Access with Collisions Detection (CSMA / CD) Access Method and Physical Layer Specifications

IS 2148 Flameproof Enclosures of Electrical Apparatus

IS-3043 Code of Practice for Earthing

IS 13947 Specifications for Low Voltage Switchgears and Control Gears

ISO 9241-7 Display Requirements with Reflections

1.1.3 In the event of any conflict between this specification, data sheets, statutory regulations, related standards, codes etc., the following order of priority shall govern:

a) Design Basis / Statutory regulations

b) Data Sheets
c) Standard Specifications

d) Codes and Standards

1.1.4 In addition to meeting purchaser's specifications in totality, vendor's extent of responsibility shall also include the following:

a) Purchaser's data sheets specify the minimum acceptable functional requirements for the programmable logic controllers. It shall be vendor's responsibility to select proper hardware, software and firmware to meet the specified functional requirements.

b) Purchaser's data sheets specify the scan time / cycle time / response time and loading requirements. Vendor shall be responsible for sizing and selecting their standard product i.e. hardware, software and firmware to meet the requirements specified in the purchaser's data sheets.

c) Selection of proper and adequate hardware, software and firmware to meet system requirements specified in the purchaser's specifications, keeping the integrity of functional blocks specified in the configuration 'diagram attached with the material requisition.

d) Adequacy of Bill of Material selected to meet purchaser's requirements. Vendor to note that bill of material shall not be verified by the purchaser during evaluation stage. Any hardware, software and firmware required to meet the purchaser's specified requirements shall be provided by the vendor without any implication.

e) Providing adequate mandatory spares including consumable spares as specified in the purchaser's specifications. Vendor shall be responsible to meet mandatory spare requirements specified by the purchaser.

1.2 Bids

1.2.1 Vendor's quotation shall be strictly as per the bidding instructions to vendor attached with the material requisition. Vendor's quotation shall enumerate and include the detailed specification of each subsystem and each module of programmable logic controller, detailed system configuration, hardware and software capabilities, programming aids, display facilities and other relevant information.

1.2.2 Whenever a detailed technical offer is required, vendor's quotation shall include the following:

a) Compliance to the specifications.

b) Detailed specification sheets for each sub-system. The specification sheet shall provide information regarding hardware specifications, software specifications, redundancy requirements, capacity, power consumption etc. of the programmable logic controllers and its accessories. The material specifications and unit of
measurement for various items in vendor's specification sheets shall be to the same standards as those indicated in purchaser's data sheets.

c) System security features and design details.

d) Proven references for each offered model in line with clause 1.2.4 of this specification whenever specifically indicated in the purchaser's specifications.

e) A copy of approval for flameproof enclosure, intrinsic safety etc whenever specified, from local statutory authority, as applicable, like Petroleum and Explosive Safety Organization (PESO) / Chief Controller of Explosives (CCOE), Nagpur or Director General of Mines Safety (DGMS) in India along with:

i) Test certificate from recognized house CIMFR (Central Institute of Mines & Fuel Research) / ERTL (Electronics Research and Test Laboratory) etc. for specified protection class as per relevant Indian Standard for all Indian manufactured equipments or for equipments requiring DGMS approval.

ii) Certificate of conformity from agencies like LCIE, Baseefa, PTB, CSA, UL etc., for compliance to ATEX or other recognized standards for all equipments manufactured outside India.

f) Deviations on technical requirements shall not be entertained. In case vendor has any valid technical reason to deviate from the specified requirement, they must include a list of deviations item wise, summing up all the deviations from the purchaser's data sheets and other technical specification along with the technical reasons for each of these deviations.

g) Certificate for specified SIL requirement (e.g. SIL-3) from Independent Testing Agency.

h) Catalogues giving detailed technical specifications, model decoding details and other related information for each item / sub-system covered in the bid.

1.2.3 Vendor shall offer only their standard proven product i.e. system hardware, system software and firmware, which shall be configured to meet the functional requirements specified in the material requisition. Moreover, the equipment being offered / supplied shall be of latest proven version available in the current manufacturing range and meeting the requirements specified in clause 1.2.4 of this standard specification.

1.2.4 The system hardware, software and firmware as offered, shall be field proven and should have been completed trouble free satisfactory operation for a period of minimum 02 years on the bid due date in the similar application with equal or higher than the proposed system size with respect to number of inputs and outputs specified in the purchaser's data sheet. Items with prototype design or items not meeting proneness criteria specified above shall not be offered or supplied.
1.2.5 The detailed scope of work, specific job requirements, exclusions, deviations, additions etc. shall be indicated in the job specifications which shall be part of material requisition.

1.2.6 Whenever specified, vendor shall furnish tested values of failure rates, probability of failure on demand and test intervals for safety integrity level analysis.

1.2.7 All documentation submitted by the vendor including their quotation, catalogues, drawings, installation, operation and maintenance manuals shall be in English language only.

1.2.8 Vendor shall also quote for the following:

   a) Two year's operational spares for each sub-system and their accessories which shall include the following as a minimum:

      i) All type of electronic modules e.g. I/O modules, processor modules, communication modules, memory modules, disc controller module, power supply modules etc.

      ii) All type of auxiliary items e.g. barriers / isolators, hardwired instruments, annunciator modules, receiver switches, trip amplifiers, temperature element converters etc.

      iii) Switches, lamps, fuses, connectors, terminals, pre-fabricated cables, circuit breakers, relays etc.

      iv) Video display units, keyboards, disc drives, PC's, network items (e.g. switches, hubs etc.) etc.

   b) Any special tools and test equipments needed for the maintenance of PLCs and other items being offered by vendor. Vendor must confirm in their offer if no special tools or test equipments are needed for maintenance other than those specifically indicated in purchaser's data sheet.

1.3 Drawing and Data

1.3.1 Detailed drawings, data, catalogues and manuals required from thy vendor are indicated by the purchaser in vendor data requirement sheets. The required number of prints and soft copies shall be dispatched to the address mentioned, adhering to the time limits indicated.

1.3.2 Final documentation consisting of design manuals, installation manual, operation and maintenance manual etc., submitted by the vendor after placement of purchase order shall include the following, as a minimum:

   a) Specification sheet for each sub-system, auxiliary instrument and bought out item.

   b) Certified drawings for complete system including the following:
i) GA drawings for panels, cabinets, marshalling racks, hardwired consoles, operator console, programming terminal etc with complete dimensional details, internal construction and weight in kilograms.

ii) Control room layouts e.g. console room, rack room and engineering room layout with all dimensions in millimetres.

iii) Channel base frame drawing for console room, rack room and engineering room.

iv) Input / output assignment.

v) Logic / Ladder diagrams.

vi) Loop wiring diagram.

vii) Power supply distribution diagram.

viii) Memory loading calculations/Scan time calculation.

ix) Protocol/Pin Details.

x) Dynamic graphic diagrams.

xi) System grounding drawing.

c) Design manuals and functional design specifications which shall include hardware design manual, software design manual and special software specifications.

d) Copy of type test certificates.

e) Copy of test certificates for all tests indicated in this specification.

f) Installation manual containing installation procedure for programmable logic controllers and other items covered in the material requisition.

g) Power-on, start-up and internal testing procedures.

h) Software debugging and system configuration procedures.

i) Calibration and maintenance manual containing maintenance procedures including replacement of parts, application modification etc.

j) Any other drawings and documents specifically indicated in job vendor data requirement enclosed with the material requisition.

All system manuals and documentation shall be supplied in hard dover loose ring folders in 'A4' size as per ISO 216 i.e. of size 210mm x 297mm. All drawings and sketches shall be in
multiple of 'A4' size like 'A3' (297mm x 420mm) or 'A2' type (420mm x 594mm) etc. but folded to 'A4' size.

2.0 DEFINITIONS

The various terms used in this specification are defined as follows:

2.1 Programmable Logic Controller

The class of control systems which can be programmed to execute plant shutdown and / or interlock / sequence logics to the specified safety integrity levels.

2.2 Accessible

A system feature that is viewable by and interactive with the operator and allows the operator to perform user permissible control action e.g. set point change, auto-manual transfers or on-off actions.

2.3 Assignable

A system feature that permits an operator to direct a signal from one device to another without the need for change in wiring, either by means of switches or via other data entry devices like keyboard commands to the system.

2.4 Configurable

The capability to select and connect standard hardware modules to create a system or the capability to change functionality or sizing of software functions by changing parameters without having to modify or regenerate software.

2.5 I/O

Input / Output with respect to process / operator

2.6 PLC Console (Operator)

PLC console (Operator) is the operator's main plant interface device through which operator can view, monitor and control the plant and can give instructions to peripherals to execute commands, and shall have protective access to configure and maintain the system.

2.7 PLC Console (Programming Terminal)

PLC console (Programming Terminal) shall be the engineer's main interface device through which engineer can configure / program and maintain the system, and shall have protective access to monitor and control the plant, give instructions to peripherals to execute commands.
2.8 Local Level

All those sub-systems; which directly interface with field devices shall be referred to as local level.

2.9 Central Level

Operator Console and Programming Terminal, which present data acquired from local level devices shall be referred as Central Level.

2.10 Database

Database shall be defined as the information stored temporarily or permanently in the system which can be accessed by various programs to meet all its functional requirements.

2.11 Loop Integrity

A system shall be said to have loop integrity if the failure of one component in the system/sub-system does not affect more than one loop.

2.12 System Loading

System loading for a sub-system is defined as the percentage of time a sub-system spends in carrying out various activities referred to the use of memory, CPU time and communication capacity in the worst case of high sub-system operation out of the designed/designated cycle time of the sub-system.

2.13 Redundancy

A system component shall be termed as redundant if it takes over automatically the operation in the event of the failure of the main component without causing any interruption in the system and upsetting the process. The repaired or replaced device shall be brought in-line only through operator action without upsetting system operation.

2.14 Switchover Time

Time required for a back up instrument/system to come on-line automatically in case of the failure of the main instrument/system.

2.15 Processor Cycle Time (tpc)

Processor cycle time is the measure of the processing speed of a processor. Processor cycle time for a sub-system of the programmable logic controller shall be defined as follows:

Processor cycle time for programmable logic controller shall be defined as the total time taken by the processor to read input supplied by input module, execute all computations...
(analog as well as logic as configured) and write the outputs for the output module.

2.16 Scan Time (ts)

Scan time of a logic loops is the end-to-end response time of a sub-system and shall be defined as follows:

The scan time for a logic loop shall be defined as the total time taken by a sub-system e.g. programmable logic controller to read input from the input terminal, process input, execute logic, updating logic output and write output at the output terminal for all the logics configured within the subsystem.

2.17 User's Memory

Free memory space available after utilisation of memory required for system operation, configuration and implementation of application and other system related functions for implementation of user defined specific programs such as plant calculations, process optimization or MIS (like free formatting of certain logs). The programs shall either be written in high level language or system specific language.

2.18 Event

An event shall be defined as any action taken by the operator via operator keyboard or switches on hardwired console like change of set point, change of control mode, start/stop of motor, open/close of shut down valves, alarm acknowledge etc.

2.19 Sequence of Event (SOE)

Arranging events in the sequence of their occurrence in time with a specified time resolution by a program is defined as sequence of event.

2.20 Sequence of Event Recorder (SER)

System or sub-system which presents and / or records the events in the sequence of their occurrence in time with a specified time resolution utilizing its hardware and software capabilities is termed as sequence of event recorder.

2.21 Real Time Trend

Real time trend shall be defined as a continuously progressing graphical record showing updated parameter with most recent value and a past record of minimum of 10 minutes without pressing any additional key for moving backward in time.

2.22 Plant Information Network

High-level communication network which serves various users within a plant and transfer information for the purpose of unit / plant monitoring. This network is different than control
network and is generally realised using open communication protocol network e.g. OPC etc.

2.23 Tag

A Tag is a collection of attributes that specify either a control loop or a process variable, or a measured input, or a calculated value, or some combination of these, and all associated control and output algorithms. Each tag is unique.

3.0 SPARES PHILOSOPHY

3.1 The system including sequence of event recorder, hardwired instruments etc. shall meet the following spare philosophy. This philosophy shall also be applicable for items like barriers, relays, terminals, lamps, push buttons etc.

3.1.1 Mandatory Spares

Vendor shall include following mandatory spares in their scope of supply:

3.1.1.1 Installed Engineering Spares

Installed engineering spares shall be provided in each sub-system for each type of module to enhance the specified system functional requirements by 20%. The basis of offering installed engineering spares shall include:

a) For a system with conventional and / or smart analog input / output, discrete (contact) input / output, 20% spare input / output of each type shall be considered for calculating I/O modules and all other related accessories.

b) For all serial input / outputs to the system, 20% spare serial I/O ports of each type of serial input / output shall be provided.

c) 20% spare accessories like relays, switches, lamps, fuses, circuit breakers, barriers, isolators, terminals etc.

d) The engineering spares shall be wired up to the field cable interface and shall be in ready-to-operate condition when field cable is connected to spare assigned terminals.

e) Spare pairs of the incoming cables shall be terminated on spare terminals in the marshalling / barrier cabinets as applicable.

f) The system shall be fully engineered considering 20% installed engineering spares including processor loading.

3.1.1.2 Spare Space Requirement

In addition to installed engineering spares specified in Clause 3.1.1.1 of this specification, the
system shall be provided with following spare space:

a) I/O racks of programmable logic controller shall have 10% usable spare space for installing additional I/O cards of each type in future. However internal wiring for the same shall be connected up to the I/O terminals.

b) Processor system of programmable logic controller shall have capability to execute additional 20% logics.

c) Each operator console shall contain 20% usable spare group and related display capability in addition to as specified in para 3.1.1.1 of this specification.

d) The system shall have capability to extend its historical trending, logging and user's memory by 20% to meet future expansion with/without adding additional memory modules.

e) The communication sub-system shall have sufficient capacity to handle additional data contributed by addition of 20% I/O over and above installed engineering spares.

f) Usable spare space in panels and cabinets to install 10% spare hardwired items like relays, switches, lamps, fuses, circuit breakers, barriers, isolators, terminals, panel mounted instrument etc. in future.

3.1.1.3 Spare Memory Requirement

a) The system shall be provided with a minimum of 40% spare memory capacity, as required for application program and data base to meet specified functional requirements.

b) It shall be possible to extend the memory by at least 20% over and above the actual requirement at a later date.

3.1.1.4 Spare Software Capability

a) Sufficient additional software capacity shall be available in the system to take care of spares requirement as specified in para 3.1.1.1 and 3.1.1.2 of this specification to meet all functional requirements as per para 4.0 of this specification.

b) Unless specifically indicated otherwise, the offered system shall have software licenses to cover all the tag numbers indicated in the material requisition, including installed engineering spares and spare space indicated in clause 3.1.1.1 and 3.1.1.2 of this specification.

3.1.1.5 Predefined Mandatory Spares

a) Mandatory spares shall be ware-house spares and shall be supplied as loose
items.

b) Mandatory spare module of 5% or one module of each type, whichever is higher, must be supplied for each type of modules being used excluding modules used in consoles, servers, Personal Computers.

c) For items like, Video Display Units, keyboards, disc drives, network components, hardwired instruments like barriers, lamps, fuses and circuit breakers, complete item limited to 5% or minimum one of each type shall be supplied as predefined mandatory spare. But this shall not include hardware like hard discs, terminals.

3.1.1.6 Consumable Spares

Any paper, ribbon, printer heads, toner and ink required for printers, video copier or any other consumable item shall be supplied along with system required for minimum of six months duration after system acceptance.

3.1.1.7 Commissioning Spares

Unless otherwise specified, vendor shall be responsible to supply all spares which are found necessary to replace failed modules, failed sub-systems, or corrupted / faulty softwares while performing pre-commissioning and commissioning activities.

3.1.2 Two Years Operational Spares

Two years operational spares shall be as per Clause 1.2.8(a) of this specification and shall be quoted separately.

4.0 DESIGN AND CONSTRUCTION

4.1 Design Requirements

4.1.1 Programmable logic controller shall be microprocessor based system which shall be used to execute all the process and safety shut-down logic of the plant. When specified, it shall also execute plant interlock logics and sequence operation. Programmable logic controller shall be an independent unit and shall not depend on any of its functionality on any other system including Distributed Control System.

4.1.2 The system shall be of modular construction and expandable in future by adding additional modules which shall be easily accessible for maintenance and repair. The type of modules shall be kept to the minimum possible in order to have interchangeability and low inventory.

4.1.3 System Availability

a) The system shall be designed 'fault avoidant' as a minimum by selecting high grade components of proven quality and proper design of system electronics.
Redundancy shall be provided, as a minimum, as per this specification to improve system availability and reliability. Due considerations shall be given to the environmental conditions particularly for field mounted sub-system, if specified in job specifications, during system design.

b) The system shall have a high MTBF value and shall have well proven record of operating in hydrocarbon plants.

c) The system shall be designed with 99.995% or greater availability. The availability shall be defined as follows:

\[
\text{Availability} = \frac{\text{Mean Time Between Failure (MTBF)}}{\text{MTBF} + \text{Mean time to repair (MTTR)}}
\]

For the purpose of calculations, consider mean time to repairs as four (4) hours unless the manufacturer recommends higher value for MTTR. It is therefore necessary that:

i) Vendor covers all necessary spare parts in 2 years recommended operational spares which shall be necessary to meet specified MTTR time.

ii) Vendor provides adequate training to owner's personnel and cover all necessary maintenance related topics in their training programmes to ensure specified MTTR time.

### 4.1.4 Operating Environmental Conditions

#### 4.1.4.1 Environmentally Controlled Location Installation

a) All subsystem of Programmable Logic Controllers located in Control Room, Local Control Room or in Satellite Rack Room shall be able to operate satisfactorily from 15°C to 30°C and 20% to 80% non condensing humidity.

b) In addition to above, all such sub-systems shall also be able to operate satisfactorily in case of air conditioning failure with ambient temperature of 50°C and 90% no condensing humidity until the system safe operating limits are exceeded. The minimum period of continuous operation in such condition shall be 48 hours at least once in a month without any damage or degradation of system performance. Vendor, therefore, shall provide continuous temperature monitoring for each enclosed cabinet housing items / equipments generating heat, such as system cabinets, barrier cabinets, relay cabinets etc and also provide alarm for operator alert in case the safe operating temperature limits are exceeded.

c) Chemical filters have been provided in the incoming air conditioning air to limit the concentration of contaminants below following limits:

<table>
<thead>
<tr>
<th>Contaminants</th>
<th>Concentration</th>
</tr>
</thead>
</table>

---

All subsystems of Programmable Logic Controllers located in Control Room, Local Control Room or in Satellite Rack Room shall be able to operate satisfactorily from 15°C to 30°C and 20% to 80% non condensing humidity.
(Corrosive Gases)

SOx  < 0.01 ppm by volume
NOx  < 0.05 ppm by volume
H2S  < 0.003 ppm by volume
Cb   < 0.001 ppm by volume
NH3  < 0.5 ppm by volume
SPM  < 200 ug/m'
RSPM < 100 ug/m'

All sub-systems and system components shall be suitable for operating continuously in the above mentioned corrosive environments

4.1.4.2 Outdoor Installations

a) Sub-systems or system components which are installed outdoor shall be suitable to continuously operate at ambient temperature and humidity specified under ambient conditions. The heat generation effect of current carrying for the electronic modules shall also be considered. For this purpose the system shall be rated for minimum 5 deg C more than the maximum ambient temperature specified. In case the system is not suitable for the above conditions, necessary cooling arrangement shall be provided.

b) Unless otherwise specified, all PLC sub-systems or system components installed outdoor shall have corrosive environmental protection coating meeting the environmental classification class G3 as per ISA-S71.04.

4.1.5 Transient, Static and EMI / RFI Protection

4.1.5.1 The system shall be internally protected against system errors and hardware damage resulting from:

a) Electrical transients on power wiring.

b) Electrical transients on signal wiring.

c) Connecting and disconnecting devices or removing or inserting printed circuit boards in the Programmable Logic Controller (PLC).

4.1.5.2 All sub-systems and system components shall be capable of accepting various signal inputs for its direct use while preventing noise errors due to electromagnetic interference (EMI) or radio frequency interference (RFI) including nearby radio stations, hand held two way radios,
solenoids, relays or contactors carrying heavy currents as per levels of Environmental electromagnetic phenomenon defined in IEC-61000-6-2. The system shall have total noise immunity from UHF / VHF radio communication equipments, (RFI) and (EMI) noise generating equipments as per IEC-61000-4.

4.1.5.3 For interplant, inter unit and other system cables routed in the field, the level of surge immunity required for equipment signal ports shall be increased to level 4 as defined in IEC-61000-4-5 and the system shall operate according to performance criterion B as defined in IEC-61000-6-2.

4.1.6 On-line Replacement

4.1.6.1 On-line replacement of any module of programmable logic controller shall be possible in such a way that removal and addition of the module shall be possible and safe without de-energising the system. Furthermore, there shall not be any interruption of the system while replacing a faulty module wherever redundant modules are provided.

4.1.6.2 Apart from system modules, power supply units shall be replaceable on-line without disrupting the process and without affecting the system redundancies. It shall be possible to hot swap any faulty system module without degrading the system safety or operation or freezing the output status. The switchover to the healthy module shall be bumpless. The swapped module shall take over the function of the failed module without any manual programming.

4.1.7 Electrical Isolation

Galvanic or optical isolation shall be provided for all field signals. The isolation levels shall be as follows:

Analog I/O channel to system ground  1500V AC

Discrete I/O channel to system ground  500V AC

External isolator shall be provided, if necessary to meet the above.

Isolation shall also be provided between Engineering / operator console/PLC programming terminal and related sub-systems connected to it if there is any possibility of high voltage being transmitted to the sub-systems.

4.1.8 Design Requirements of Equipments in Hazardous Area

4.1.8.1 Unless specifically indicated, the field devices are beyond the scope of this specification. However vendor shall be fully responsible for integrating these devices with their system.

4.1.8.2 General requirements

a) Unless otherwise specified, all instruments in hazardous area shall be intrinsically
safe type. Other concepts shall be used when specified.

b) For conventional instrumentation, entity concept shall be used for selecting proper barriers / isolators.

4.1.9 Repeat Signals

4.1.9.1 Unless otherwise specified in the job specifications, following philosophy shall be followed for repeat signals:

a) Whenever repeat contact outputs are required as per job specifications following philosophy shall be followed:

i) For intrinsically safe input contacts, isolating barrier with dual contact output shall be utilized.

ii) For all other contact inputs, repeat contact shall be provided using electromagnetic relays.

4.1.10 The system shall be designed fault tolerant and shall utilize high quality components of proven quality. Any single system fault shall not degrade the system safety or functionality or affect operation. The system shall have certified Safety Integrity Level as per IEC61508/61511 as applicable and specified in job specification. Unless otherwise specified, it shall meet the availability requirement specified in Clause 4.1.3 of this specification.

4.1.11 Unless otherwise specified, the scan time of programmable controller shall be of the order of 250 milliseconds for SIL certified PLCs. Scan time for a PLC shall be as defined under para 2.16 of this specification.

4.1.12 Operation of the PLC shall be completely unaffected by a momentary power loss of the order of 20 milliseconds.

4.1.13 The system shall be programmed in principle as per the logic diagrams furnished during detailed engineering. Vendor shall prepare their own Logic/Ladder diagrams depending upon the capability of the programmable logic controller offered by them. Owner / Consultant reserve the right to revise or review the logic diagrams even after acceptance of any offer. The programming language of offered PLC shall be as per IEC 61131.

4.1.14 Whenever the requirement of SIL is specified for the PLC, it shall meet the requirements of SIL level specified and shall be certified by an independent body (e.g. TUV) for complying requirements of IEC-61508 / 61511 as specified. For shutdown application requiring SIL certification, PLC shall always meet SIL 3 requirements.

4.1.15 The system shall have extensive set of self diagnostics hardware and software for easy and fast maintenance of PLC. Routine checks should run automatically at frequent intervals for identifying any fault in software or hardware. Diagnostics shall be required at local as well as console level.
1.1.16  Safety barriers shall be provided by the vendor for intrinsically safe input/output circuits wherever specified. In such cases, the system shall be designed intrinsically safe based on entity concept. The barriers shall be certified by a statutory authority like Baseefa, LCIE, CSA, UL, PTB, CIMFR etc., for the use in the area classification as specified elsewhere in the job specifications. The proper selection of the safety barriers shall be the vendor's total responsibility. In case of smart transmitter, the entity parameters of the hand held terminals shall also be considered while selecting proper barriers.

1.1.17  Unless otherwise specified all intrinsically safe barriers shall be 3 port isolating type only providing isolation between:

i)  Input and output (non-hazardous to hazardous side of barriers)

ii)  Power supply and input

iii)  Power supply and output

The minimum isolation level shall be 250V.

4.2  System Configuration

4.2.1  General

a)  PLC system configuration / architecture shall be as specified in the job specification. For emergency shutdown system application specified with SIL classification, the system configuration shall be TMR or QMR or DMR or VMR as per the job specification and shall be certified by independent agency e.g. TUV.

b)  Regardless of the action feature selected (except for single architecture), the failure of single component shall not result in a failure of correctly executed safety function. The degradation mode for the selected configuration e.g. 4-2-0 or 3-2-0 or 3-2-1-0, etc. shall be documented in SIL certification report.

c)  In general, the PLC system shall comprise of various sub-systems as described in the subsequent clauses of 4.2.

4.2.2  Input/ Output Subsystem

4.2.2.1  Each I/O module shall have its own processor. I/O modules configured in redundant configuration, shall have their processors properly synchronised.

4.2.2.2  Unless otherwise specified, system shall accept analog 4 -20mA inputs and contact inputs. The maximum number of Input/Output per I/O module shall be limited as per the following table.

<table>
<thead>
<tr>
<th>SI No.</th>
<th>Type of Configuration</th>
<th>Maximum No. I/O s</th>
</tr>
</thead>
</table>
4.2.2.3 Each I/O shall be galvanically isolated from external control circuit by suitable means. The
minimum isolation level between I/O and logic circuit shall be 1000 volts DC.

4.2.2.4 Each I/O shall be protected against the reversal of polarity of the power voltage to I/O.

4.2.2.5 Each input shall be provided with filters to filter out any noise in the input line and contact
bouncing noise, as applicable.

4.2.2.6 All the inputs / outputs shall be double ended i.e. two wires per input / output and not with
common return for all inputs.

4.2.2.7 The interrogation voltage to the inputs and power supply for 2-wire instruments shall be
powered from separate redundant power supply / supplies and shall not be a part of PLC,
unless otherwise specified. This power supply shall be supplied at one point and shall be
distributed by the vendor.

4.2.2.8

a) Each module shall have a LED per channel to indicate the status of each input
output.

b) When specified, input module shall be capable of monitoring the input contacts for
any wire open fault and short circuit.

4.2.2.9 Analog Input Module

a) Input module shall be able to accept 4~20 mA DC input from smart transmitters
(e.g. 4-20mA HART).

b) The module shall have 12 bit Analog to Digital resolution accuracy of ±0.2S% of
full scale over the entire range, unless otherwise specified.

4.2.2.10
a) Output contacts from the PLC shall be potential free dry contacts with contact rating as per para 4.2.2.10 b) of this specification. Vendor must provide arc suppression device for each output contact.

b) The output contact rating shall be as follows:

<table>
<thead>
<tr>
<th>SL.No.</th>
<th>APPLICABLE FOR</th>
<th>VOLTAGE RATING</th>
<th>CURRENT RATING</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>All output cards driving solenoid valve and alarm annunciator system unless otherwise specified Category -I</td>
<td>110 V DC 24VDC</td>
<td>0.5 A 2A</td>
</tr>
<tr>
<td>2</td>
<td>All motors/pumps/compressor output cards unless otherwise specified. Category –I</td>
<td>240 V AC 220 V DC</td>
<td>5.0A 0.2 A</td>
</tr>
</tbody>
</table>

(c) The category of contacts shall be specified in the material requisition. Each output shall be short circuit proof and protected by fuse. Visual indication of fuse blown must be provided for each module.

d) When specified contact output module shall have monitored output features like wire open and short circuit.

4.2.2.11 Where inputs or outputs have multiple field devices for the same measurement or device, the corresponding inputs / outputs shall be configured in separate I/O modules.

4.2.2.12 Where single input signal is available for QMR or TMR or FMR or VMR configuration, inputs shall be multiplied to feed inputs to each input modules / channels.

4.2.2.13 PLC shall be provided with Auto I/O testing facility as a standard diagnostics features. PLCs which do not have auto I/O testing facility, manual testing facility shall be provided to detect any system fault. For manual testing, manual switches shall be provided to bypass each input at a time and its effect on the output shall be monitored.

4.2.3 Processor System

4.2.3.1 The processor shall have capability to implement all the control functions required to implement the logic scheme as logic/ladder diagram.

4.2.3.2 The size of the memory shall be sufficient for storage of the program instructions required by the logic schemes and other functional requirements. Offer shall indicate the amount of memory capacity occupied by the actual program and spare capacity available for future program modifications or additions.

4.2.3.3 Memory shall be non-volatile. However in case volatile memory is provided, battery backup shall be provided with a minimum of 3 months lifetime to keep the program storage intact.
battery drain indication shall be provided at least one week before the battery gets drained.

4.2.3.4 Watchdog timer shall be a software device. The healthiness of processors shall be continuously monitored by watchdog timer. Any hardware or software problem in the processor system, which shall include, CPU, memory, power supply, communication interface etc. shall cause the watch dog timer to report processor failure.

4.2.3.5 Wherever dual redundant processor is specified, redundancy shall be provided in such a way that in case of failure of the main processor, the standby shall take over automatically. The changeover shall be bump less. Redundancy shall be provided for complete processor system including processor, power supply and communication sub system.

4.2.3.6 In case of triple modular redundant system all the three processors shall execute the same instructions/program and check their results and vote to correct any faulty result. The faulty processor diagnostic shall be made available.

4.2.3.7 In case of QMR system, individual processor shall execute the same instructions/programs and check their results within same CPU module and majority vote to correct any faulty result. The faulty processor diagnostic shall be made available.

4.2.3.8 Failure of a single processor in dual redundant, triple redundant system and two processors in QMR system shall not affect the system. In case of failure of complete processor system i.e. both processors in case of dual configuration, two or more in case of triple redundant system and more thah two in case of QMR system, outputs shall take failsafe state automatically unless otherwise specified in the data sheets.

4.2.3.10 It shall be possible to generate the first out alarm contact by the PLC in case where a group of parameters are likely to trip a system.

4.2.4 PLC Console (Programming Terminal)

4.2.4.10 The PLC console (Programming Terminal) shall be used for programming, program storing, fault diagnostics and alarm monitoring. Whenever specified, it shall also be possible to use this console for plant operation. The functionality to operate as engineering / programming terminal or operator terminal or both shall be as specified in the job specification.

4.2.4.2 It shall consist of at least one coloured 21" Flat screen LCD monitor with TFT technology and one programming / operating keyboard, mouse and printer unless specified otherwise.

4.2.4.3 PLC console when used for plant operation shall also meet the functional requirements as per clause 4.2.5 of this specification

4.2.4.4 The keyboard shall preferably be touch sensitive sealed type, easy to operate with each key clearly identified.

4.2.4.5 All illegal entries shall be rejected by the terminal and shall be identified by warning signal on
4.2.4.6 Manual forcing of any input or output contact connected to PLC shall be possible from
keyboard. Forced functions shall have an associated audit trail.

4.2.4.7 It shall be possible to modify, add or delete the application program on line without affecting
the outputs.

4.2.4.8 PLC Console shall display logic and/or ladder diagram indicating power flow and shall show
description and status of each contact. It shall also be possible to display process alarms and
diagnostic messages as and when they appear. Further it shall also be able to display I/O
map in a user defined format.

4.2.4.9 It shall be possible to print out the ladder/logic diagram on the dedicated PLC printer. The
printer in addition shall also print out:
   a) The diagnostic messages as and when generated and diagnostic reports, when
called for.
   b) Process alarms connected to the programmable logic controller as and when they
appear and alarm report whenever initiated. The choice of printing alarms on this
printer shall be operator selectable from a key lock / password protected switch on
PLC console.
   c) The I/O maps showing status of all inputs and corresponding outputs in a user
defined format.

4.2.4.10 The PLC console shall be provided with self diagnostics feature which shall display error
messages and initiate an audible alarm if the fault is detected. Wherever specified, a potential
free contact for diagnostic group alarm shall be provided which shall be connected to the
hardwired alarm 'annunciator system.

4.2.4.11 The system shall be able to identify the failure at least up to the module level including I/O
system and redundant processor and report print out.

4.2.5 PLC Console (Operator)

4.2.5.1 Where dedicated PLC operator console is specified, it shall be used for operation of plant,
fault diagnostics, alarm monitoring and report generation.

4.2.5.2 It shall consist of coloured 21” Flat screen LCD monitor with TFT technology, operator
keyboard and printer unless specified otherwise.

4.2.5.3 At least two number cursor control devices shall be provided in addition to keyboard which
may include touch screen, mouse, track ball etc.

4.2.5.4 PLC operator console shall have complete graphic capability and shall be able to display
process dynamic graphics, overview and group view displays. It shall be possible to operate the plant i.e. start and stop of rotating machinery, opening and closing of valves, Pill function etc. from dynamic graphics and group displays available on PLC operator console.

4.2.5.5 It shall be possible to monitor, historise and print out all process alarms, diagnostic alarms and alarm reports.

4.2.5.6 Unless otherwise specified, the time stamping of all alarms shall be as per PLC processor time stamping.

4.2.5.7 The system shall be able to store and display stored data wherever required. The minimum storage capacity shall be for 30 days at 1 minute sample rate for all the inputs specified, diagnostic alarms, process and first out alarms, manipulation data etc.

4.2.5.8 The system shall be able to generate shiftly, hourly, daily, weekly and monthly reports. The log format shall be furnished during detailed engineering.

4.2.5.9 The system shall be supplied with first out alarm generation capability. The resolution of alarm shall be as per processor cycle time, as a minimum.

4.2.6 Communication Subsystem

4.2.6.1 The PLC communication subsystem shall be a digital communication bus that provides a high speed data transfer rapidly and reliably between the processor, I/O sub-system, PLC console and other devices connected in the PLC system.

4.2.6.2 Redundancy in PLC communication subsystem shall be provided as follows unless otherwise specified:

a) For single architecture, the communication subsystem between PLC processor and I/O subsystem shall be single unless otherwise specified. This shall include single communication bus and single interfaces/buffers.

b) For dual I/O configuration, each I/O sub set shall have separate communication interface and bus for connecting to PLC processors.

c) For the triple redundant system, each processor shall have a separate set of PLC communication subsystem.

d) For the QMR systems each I/O subset shall have separate communication interface and bus for connecting to respective CPU module.

e) The communication subsystem between processor subsystem and PLC console shall be dual redundant, consisting of two separate communication interfaces and two buses, each one configured in redundant mode, unless this is only used as programming aid.
4.2.6.3 In case of redundant PLC communication sub system, on the failure of the active device, the redundant device shall take over automatically without interrupting the system operation. Information about the failed device shall be displayed at local as well as on PLC console. It shall be possible to manually switch over the communication from main bus / device to redundant bus / device without interrupting any system function.

4.2.6.4 The mechanism used by the system for error checks and control shall be transparent to the application information / program. Error checking shall be done on all data transfers by suitable codes.

4.2.6.5 In general, PLC shall provide data in a well established protocol format preferably MODBUS protocol.

4.2.7 System Power Supplies

4.2.7.1 Unless specified otherwise, the programmable logic controller shall operate on uninterrupted power supply (UPS). However the system shall be capable of operating satisfactorily at the following power supply specifications:

- **Voltage**: 220 V ±10%
- **Frequency**: 50 Hz±3 Hz
- **Harmonic contents less than**: 5%
- **Power interruption**: 10 millisec

4.2.7.2 The power supply system shall be supplied with dual PLC feeders each capable of handling 100% of the total power supply load requirements. In case of failure of one feeder, redundant feeder shall supply the total load.

4.2.7.3 Each I/O rack shall be provided with separate power supply unless otherwise specified in job specifications. Each power supply shall be sized to take full load of the I/O rack/signal conditioning panel. Each rack shall be provided with dual redundant power supply.

4.2.7.4 Processor subsystem shall be provided with separate power supply, as a minimum, unless otherwise specified in job specification. Failure of one power supply shall not affect the system operation/processor switchover in case of dual processor system. Wherever triple redundant system is specified each processor shall preferably be provided with a separate power supply. Also separate power supply must be provided for each multiplied process I/O channel.

4.2.8 Self Diagnostics

4.2.8.1 The system shall have an extensive set of self diagnostic routines which shall be able to identify all permanent and transient system faults / failures at least up to module level including redundant components and power supplies through detailed VDU displays and
4.2.8.2 At the local level, failure of a module in any subsystem shall be identified by an individual LED.

4.2.8.3 Diagnostic software shall have the capability to provide information about the failed module/system either in the form of a system configuration display or provide information in the form of a "statement".

4.2.8.4 Self diagnostic software shall have capability to detect faults which make the system permanently close/open in the I/O modules or I/O signal conditioning modules (in case of triple redundant system, whenever specified in the job specifications, this may be achieved by automatically running the testing software at cyclic intervals). The automatic cyclic testing feature shall also be provided for dual I/O configuration and dual I/O signal conditioning for triple redundant system. The testing software cycle time may be considered once in 30 minutes however this shall be field adjustable by engineer. However, system performance shall not be degraded whenever testing feature is specified.

4.2.8.5 System for the following functionalities shall be supplied when specified:
   a) Long storage historisation
   b) Log report generation
   c) First out alarm generation

4.2.8.6 System diagnostics shall be capable of identifying, locating and reporting the following faults, as a minimum:
   a) Processor fault
   b) Communication fault
   c) I/O module fault
   d) Power supply fault
   e) Over temperature monitoring
   f) Permanently close / open (stuck on or off) fault
   g) Memory fault
   h) Signal redundancy fault

Any other additional diagnostic alarm if available as a standard shall also be provided by vendor.
4.2.8.7 Testing software shall be capable of detecting faults in case of normally closed system as well as in normally open system.

4.2.8.8 Feedback must be provided in case of triple redundant system and QMR system from the output voter system to detect any latest faults of the system in addition to other diagnostic software.

4.2.9 System Software

4.2.9.1 The system software shall include all programs for the PLC and PLC console which are required to perform all the PLC functions including communication and self-diagnostics. Whenever PLC is specified for shutdown application with SIL classification, the system shall be designed and engineered in full compliance with the requirement of IEC-61511. Whenever different functional logics are combined within a common PLC, the safety related I/O's of each functionality shall be kept segregated within the system.

4.2.9.2 Logic program shall also be recorded on the external electronic media like DVD which shall be delivered in duplicate together with the system.

4.2.9.3 The PLC programming language for implementation of logic operations shall be based on the following representations:

   a) Logic diagrams -Binary logic symbols such as AND, OR, NOT Gates, Timers and Flip-Flops.
   b) Ladder diagram -Series / parallel connection of relay contacts.
   c) Combination of (a) & (b) above.

4.2.9.4 Diagnostic package and its related equipment and software shall be supplied. A list of additional diagnostic packages available and the packages provided, including the description and capabilities, shall be provided with separate quote, wherever asked.

4.2.9.5 It shall be possible to print out the ladder/logic diagram on a dedicated printer. The printer shall also print out all diagnostic reports. Vendor must supply the off line software package to enable the owner to modify/add/delete any part of program and for documentation.

4.2.9.6 Software for the generation of various displays including dynamic graphics wherever specified to be provided as per given below:

4.2.9.6.1 It shall be possible to display dynamic graphic of plant on the operator console VDU screens. Graphic displays shall be field configurable only through PLC Console (Programming terminal) with standard / user defined graphic symbols. Dynamic graphic displays of different sections of the plant shall be displayed on different pages.

4.2.9.6.2 The system shall have graphic symbol library as per ISA-5.1 and 5.3. In addition standard industrial symbols like distillation columns, heat exchangers, pumps, compressors, tanks etc.
shall also provided as a standard.

4.2.9.3 Graphic displays shall be interactive type through which it shall be possible to control the process. It shall also be possible to send motor start/stop and shutdown valve open/close commands, as specified in job specifications, from this display.

4.2.9.4 It shall be possible to view the process variable and alarm points and view and change set point value, manipulated variable, controller mode etc. from the graphic display. Also rotating machinery (i.e. compressor / pump) status and valve status shall be displayed on the graphic display with different colours.

4.2.9.5 Various colours used in the generation of graphics like colour of the process lines, utility lines, Instrument signal lines and event modifier conditions shall be finalised during detailed engineering. The colours used to identify event modified conditions shall generally be as follows unless otherwise indicated during detailed engineering:

- Red - All points alarm
- Blue- Valve open, pump running
- Green - Valve closed, pump stopped
- Flashing green - Shut down valve transition state

4.2.9.6 It shall be possible to go from any graphic page to related graphic pages or any group view or alarm summary in single key stroke using soft key function.

4.2.9.7 The software for printing alarms, system as well as process, and events on the PLC printer must be provided. All alarms must be printed as and when they appear.

4.2.9.8 Software package for displaying I/O map showing status of inputs and corresponding output providing tag numbers as per logic diagram shall be offered. The I/O map format shall be user definable.

4.2.10 **Power Supply Distribution**

4.2.10.1 All type of power supplies shall be made available at one point. Further distribution of power supply shall be in vendor's scope.

4.2.10.2 In general, all output contacts and solenoids shall be powered with 110V±10% DC/ 24V±10% DC power supply. However, the actual interrogation voltages shall be as per job specifications and logic diagrams.

4.2.10.3 The distribution network for interrogation voltage shall be designed such that a single fault in any branch shall not cause trip of the logic other than where the fault has occurred.
4.2.10.4 Sequential starting of various load centers shall be provided whenever specified.

4.2.10.5 Power distribution network must use bus bars of adequate capacity with DPDT (Double Pole Double Throw) switches and HRC (High Rupture Capacity) fuses in each branch network. Vendor may select circuit breaker if short circuit characteristics do not match the HRC fuse.

4.2.10.6 All cubicles lighting shall be on 240 V, 50 Hz AC normal power supply.

4.2.11 PLC System Cabinets

4.2.11.1 All PLC system cabinets shall be completely wired with all modules in place. Inside cabinet wiring shall preferably be done using ribbon type pre-fabricated cables.

4.2.11.2 All the cabinets shall be free standing, enclosed type and shall be designed for bottom entry of cables. Cabinet structure shall be sound and rigid. Cabinet shall be provided with removable lifting lugs to permit lifting of the cabinets.

4.2.11.3 Cabinet shall be fabricated from cold rolled steel sheet of minimum 2 mm thickness suitably reinforced to prevent warping and buckling. Doors shall be fabricated from cold rolled steel sheet of minimum 1.6 mm thickness. Cabinets shall be thoroughly deburred and all sharp edges shall be grounded smooth after fabrication.

4.2.11.4 Cabinet finish shall include sand blasting, grinding, chemical cleaning, surface finishing by suitable filter and two coats of high grade lacquer with wet sanding between two coats. Two coats of paint in the cabinet colour shall be given for non-glossy high satin finish. Colour of the cabinets shall be as per job specification. Final coat shall be given after assembly at site when specified in the job specifications.

4.2.11.5 Each cabinet shall be maximum 2100 mm high (excluding 100 mm channel base), 800 mm wide and 800 mm deep, in general. Construction shall be modular preferably to accommodate 19" standard electrical racks. All cabinets shall be of same height.

4.2.11.6 Cabinets shall be equipped with front and rear access doors. Doors shall be equipped with lockable handles and concealed hinges with pull pins for easy door removal.

4.2.11.7 In order to effectively remove dissipated heat from the cabinets, ventilation fans along with vent louvers backed by wire fly screen shall be provided as required. Ventilation fans shall be provided in all cabinets where the temperature rise with all doors closed and all internal and external loads energised shall exceed 10° C above the ambient temperature. A temperature element (resistance temperature detector) shall be provided in each cubicle for temperature measurement. Ventilation fans shall be provided in dual configuration, as a minimum.

Each fan shall have a separate dedicated assembly and shall be replaceable on-line without shutting down any equipment / panel/cabinet / console in part or in complete. 

Ventilation fan assembly shall operate at 240V AC power supply. Each fan shall have its own dedicated circuit breaker.
Each ventilation fan shall be fitted with a protection type finger guard. Whenever, the numbers of cabinets are compacted (supplied in mechanical joined conditions), each cabinet shall be provided with separate ventilation fan assembly.

The maximum noise level with all fans operating and cubicle doors open shall not exceed 85dBA.

Following signals and alarms shall be provided for each cabinet:

i) Fan failure alarm for each cubicle in PLC.

ii) Temperature indication of each cabinet or compacted combination, as applicable in PLC.

iii) A common alarm each for high temperature and fan-failure shall be made available.

4.2.11.8 Internal illumination shall be provided for cabinets to ensure proper illumination level of 250 lux for performing maintenance activities. Illumination shall be provided for all cabinets by incandescent lamps, which shall be activated individually by door operated magnetic switches. The lamps shall activate when door is opened and deactivate when the door is closed. The magnetic switches selected shall have undergone life cycle cyclic test of at least 1000000 operations. A manual over-ride switch shall be provided inside the cabinet which shall keep the lamp deactivated even when the door is open.

4.2.11.9 Equipment within the cabinet shall be laid out in an accessible and logically segregated manner. Cable glands shall be provided and supplied by vendor for incoming and outgoing cables to prevent excessive stress on the individual terminals. All metal parts of the cabinet shall be electrically continuous and shall be provided with a common grounding lug.

4.2.12 Control Panels/ Hardwired Console

4.2.12.1 Control panels, if required, shall be non-graphic self supporting, free standing cubicle with back doors made up of sectional steel panels. Each section shall be maximum 2100 mm high, 1200 mm wide and 1000 mm deep and shall be mounted on 100 mm high channel base. Care shall be taken to ensure that the face of the panel is truly flat and smooth.

4.2.12.2 Panels / hardwired console shall be fabricated from 3.0 mm thick cold rolled steel sheet. Angle iron frame shall use a minimum section of 50x50x4mm angle.

4.2.12.3 Front of panel/console instrument nameplates shall be black laminated plastic with white core. Nameplate shall be provided on the rear of the panel also for each instrument.

4.2.12.4 Document pocket / wallet shall be provided on the inner side of front and rear doors of each cabinet and on the inner side of the door of each panel. Similar arrangement shall also be made on the inner side of doors of console.
4.2.13 Wiring Requirements'*

4.2.13.1 All wiring shall conform to API RP 552-Transmission Systems. Different signal level cables shall be routed with separation distances as recommended by this code.

4.2.13.2 All wiring inside racks, cabinets, and back of the panels shall be housed in covered, non-flammable plastic raceways arranged to permit easy assembly to various instruments for maintenance, adjustments, repair and removal. \

4.2.13.3 All wiring in the raceways shall be properly clamped. All incoming cable and outgoing cables shall be terminated by vendor at marshalling rack. Total wiring cross-sectional area shall not exceed 50% of the raceway cross sectional area.

4.2.13.4 Separate wiring raceways shall be used for power supply wiring, DC and low level signal wiring, and intrinsically safe wiring. Parallel runs of AC and DC wiring closer than 300mm shall be avoided.

4.2.13.5 Vendor can alternately offer prefabricated cables for interconnection between different cabinets and panels.

4.2.13.6 Wire termination shall be done using self insulating crimping lugs. More than two wires shall not be terminated on one side of single terminal. The use of shorting links for looping shall be avoided.

4.2.13.7 Terminal housing shall be strictly sized with considerations for accessibility and maintenance. Minimum distance required between various components is listed below. These distances are clear distances and are excluding the width of the raceways or any other component / item mentioned herein. Following clearances should be considered:

- a) Distance between terminal strip and side of the cabinet parallel to the strip, up to 50 terminals, shall be minimum 50 mm.
- b) Distance between terminal strip and, top and bottom of the cabinet shall be minimum 75mm.
- c) Distance between two adjacent terminal strips shall be minimum 100 mm.
- d) Additional distance for each additional 25 terminals shall be minimum 25 mm.
- e) Distance between cable gland plate and the bottom of the strip shall be minimum 300 mm.

4.2.13.8 All terminal/terminal blocks shall be DIN Rail mounted type and shall be easily removable. The size of the terminal blocks / terminals of different types shall be consistent and identical. All terminal blocks shall be mounted on suitable anodised metallic or plastic stand-off.

4.2.13.9 No splicing is allowed in between wire/ cable straight run.
4.2.13.10 Terminal strips shall be arranged group-wise for incoming and outgoing cables separately. Terminal blocks for intrinsically safe wiring shall be separate. 20% spare terminals shall be provided, as a minimum, preferably in each terminal strip. Terminals shall be suitable for wires up to 2.5 sq. mm base solid or stranded conductor in general. For power cables, higher size terminals shall be used.

4.2.13.11 Cabinet and rack layout shall be made considering proper accessibility and maintenance.

4.3 Earthing

4.3.1 All system equipments such as panels, marshalling cabinets, system cabinets and other powered equipments shall be provided with following type grounding system:

a) Protective Earth/ Electrical Earth
b) System Earth/ Signal Earth
c) Safety Earth/ Barrier Earth (when required)

Both system earth and safety earth shall be totally separate from protective earth.

4.3.2 Protective Earth / Electrical Earth

a) Each metallic enclosure / cabinet / panel/console etc. shall be provided with electrical earth lug, as a minimum.

b) Unless recommended otherwise by vendor, all earthing lugs of metallic equipments indicated in Clause 4.3.2 (a) above shall be connected individually to electrical protective earthing system bus-bar / earthing station using a maximum of 10sq mm solid copper conductor PVC insulated wires.

c) Where multiple cabinets are multiplexed together, earth looping with permanent shorting link cables shall be acceptable. Two earthing connection wires as indicated in Clause NoA.3.2 (b) above shall be used for connecting multiplexed cabinets to protective earth station / bus-bar.

4.3.3 System Earth

a) System earth shall be totally noise free dedicated earthing system and shall be fully isolated from electrical protective earth. This earth must be very high integrity system and shall be used to ground zero volt references and signal cable grounds.

b) System earth shall be less than one (1) ohm grounding system with its own dedicated earthing pits. These earth pits shall be away from any heavy noise plant equipment. Outside the control room building is the most appropriate location.
c) Wherever supply of earth pit is kept in vendor's scope in the Material Requisition, the earth pit design shall be as per IS-3043 code of practice for earthing. A minimum of four (4) number of earth pits shall be provided for grounding system integrity. In case number of pits required to meet 1 ohm resistance are more than (2), the number of earth pits shall be two times the actual number of pits required to meet resistance criteria. All these pits shall be securely connected with each other to form a one homogeneous system earth grid.

d) Each marshalling / system cabinet / panels etc shall be provided with system earth bus-bar which shall be insulated from the metallic body frame. This bus-bar shall be used to earth also signal zero volt references and signal cable screens. Terminals used for termination of spare conductor pairs / cores of multi-pair signal/control cables shall be connected to system earth bus-bar. Shorting links shall be used for spare terminal looping.

e) System bus-bars in the multiplexed cabinets can be joined together by permanent shorting links. System bus-bars of other cabinets can also be connected together provided they are permanently joined using 35 sq mm stranded copper conductor cable.

4.3.4 Safety Earth / Zener Barrier Earth

a) Whenever Zener barriers are selected or used to meet intrinsically safe requirements, the earthing terminal of the zener barriers shall be connected to a separate earth bus bar.

b) This earth shall meet all the requirements specified in Clause 4.3.3 of this specification.

c) Safety earth bus bar shall be directly connected to earth pits using dual insulated cable. Cable conductor size shall be minimum 95 sq. mm (copper).

4.4 Interface with DCS

The PLC shall be required to be interfaced to the Distributed Control System bus whenever specified. A suitable interface shall be offered in order to achieve the following functions:

a) Display of all input points under alarm/first out alarm connected to PLC or generated by PLC, continuous indication for analog signal on the main DCS operator console.

b) Generate shutdown reports on the logging printer of Distributed Control system.

c) To receive certain operational commands from the operator console for the operation of certain output devices connected to PLC

d) To display diagnostic message of PLC.
In general, PLC shall provide data in a well established MODBUS protocol format.

The interface shall be dual redundant unless otherwise specified.

The speed of data transfer shall be such that any change in I/O which is to be updated on the operator console shall not exceed 3 second from the time event to update on the operator console screen considering one second standard update rate in DCS operator console.

4.5 **Sequence of Event (SOE) Function Requirement**

Sequence of Event, whenever specified, for analog and digital inputs shall be generated and time stamped in PLC. The maximum resolution between two events shall not exceed specified PLC scan time unless specified otherwise. A separate SOE PC with 21" size TFT screen and printer shall be provided for PLC sub-system unless specified otherwise.

5.0 **TESTING, INSTALLATION, COMMISSIONING AND ACCEPTANCE**

5.1 **General**

5.1.1 This specification defines the basic guidelines to vendor for factory testing and acceptance, installation, commissioning and field acceptance of the complete PLC system. On the basis of this specification, vendor shall submit their own detailed testing, installation, commissioning and acceptance procedure. For hardware, the procedure shall include test name, purpose of test, test equipment / set up, definition of input, test procedure, results expected and acceptance criteria. Similarly for software, it shall include test name, details of the method, list of tests, sequence of execution, results expected and acceptance criteria. For PLC system with SIL 3 requirement, certificate for hardware & software (Like TUV etc.) shall be verified.

5.1.2 The testing and acceptance of the system shall be carried out on the approved testing procedures and criteria based on this specification and vendor's standard testing requirements and procedures.

5.2 **Factory Acceptance Tests (FAT)**

5.2.1 Vendor shall test and demonstrate the functional integrity of the system hardware and software. No material or equipment shall be transported until all required tests are successfully completed and certified "Ready for Shipment" by the owner/consultant.

5.2.2 The purchaser reserves the right to be involved and satisfy himself at each and every stage of inspection. The purchaser shall be free to request any specific test on any equipment considered necessary by him although not listed in this specification, as a part of approval of factory testing procedure. The cost of performing all tests shall be borne by the vendor.

5.2.3 Vendor to note that acceptance of any equipment or the exemption of inspection or testing
shall in no way absolve the vendor of the responsibility for delivering the equipment meeting all the requirements specified in Material Requisition.

5.2.4 It shall be vendor's responsibility to modify and/or replace any hardware and modify the software if the specified functions are not completely achieved satisfactorily during testing and factory acceptance.

5.2.5 Schedule of FAT shall be included in the Vendor's proposal.

5.2.6 Vendor shall not replace any system component/module/sub-system unless it is failed. A log of all failed components/modules in a sub-system shall be maintained which shall give description of the failed component/module, effect of failure on the sub-system, cause of failure and number of hours of operation before it failed. If malfunction of a component/module in a sub-system repeats, the test shall terminate and vendor shall replace the faulty component/module. Thereafter the test shall commence all over again. If even after this replacement, the sub-system fails to meet the requirements, vendor shall replace the full sub-system by the one meeting the requirements and the system shall be tested all over again. If a sub-system fails during the test, which is not repaired and made operational within four hours of active repair time after the failure, the test shall be suspended and restarted all over again only after the vendor has replaced the device in the acceptable operation.

5.2.7 Testing and FAT shall be carried out in two phases. The minimum requirements for testing during these two phases shall be as follows:

5.2.7.1 Under the first phase, vendor shall perform tests at his works to ensure that all components function in accordance with the specification for each type of test. A test report shall be submitted for purchaser review within one week of completion of this test. Phase II testing (witness inspection) shall start only after this.

All subsystem shall undergo a minimum of 30 days burn in period. The burn-in time shall start after the sub-system is fully assembled and is powered up. It may include any such time for which the system has been kept powered on even for system generation and Phase I testing.

Following tests shall be performed by the vendor and reports shall be forwarded to purchaser:

a) Quality control test which shall be carried out to assure quality of all components and modules in accordance with vendor's quality control and assurance procedures.

b) System pre-test which shall be physical check of all modules, racks, cabinets etc.

c) System power-up test which shall test functionally all hardware and software. This shall include testing of redundancy, System performance on power supply variations, application software testing and system diagnostic verification.
5.2.7.2 The second phase of testing shall systematically, fully and functionally test all hardware and software in the presence of purchaser representatives. All subsystems shall be interconnected to simulate, as close as possible, the total integrated system. Following minimum tests shall be carried out:

a) Visual and mechanical testing, which shall be carried out in principle to assure correct, proper, good and neat workmanship by the vendor. This testing shall include dimensional verification, Layout verification as per approved GA drawings, Verification of Sheet thickness / Quality of painting (outer and inner) / Nameplates, identifiers and tag plates / Adherence to ferruling philosophy / Dressing of wires / prefabricated cables and clearances / Locks and handles as a minimum.

b) Verification of Bill of Material. The Bill of material verification shall include both hardware and software.

c) Functional testing:

This shall include the simulation of each input and output to verify proper system response. The testing as a minimum shall include:

i) Complete system configuration loading.

ii) Demonstration of all PLC system builder functions including addition/deletion of an input/output, addition/deletion of a rung or an element in a rung, generation of dynamic graphics and other views, report generation etc.

iii) 100% checking of logics configured in the PLC by connecting switch/lamp at input/output, by simulating inputs and verifying outputs preferably using simulator, other related functions like forcing, first out shall also be verified.

iv) Checking of scan time. Scan time verification shall be carried out using high resolution storage oscilloscope during Factory Acceptance Test based on the specified requirements considering discrete input by given step change. The scan time values so observed shall be within 90% confidence level. In case of analog inputs, input shall be ramp or minimal step, however such reading for analog inputs should be noted only for reference.

v) Checking of all PLC console displays, keyboard and touch-screen operation (wherever specified), printer/hard copier functions etc.

vi) System redundancy check including correct change over of the back-up unit in case of failure of main unit.

vii) System diagnostic checking for all subsystems on local level as well as on console, including checking of the testing software for I/O modules/signal conditioning modules, when specified.
viii) Checking of output status on processor failure.

ix) Checking of first-out alarm generation.

x) Simulation of power failure and system restart auto boot-up of system configuration and program after power restoration.

5.2.8 Vendor shall notify the purchaser at least three (3) weeks prior to factory acceptance test. In the event that representative arrives and the system is not ready for testing, vendor shall be liable for back charges for any extra time and expenses incurred.

5.3 Installation, Testing and Commissioning

5.3.1 Vendor shall offer the services of an installation team which would install the equipment in the control room, lay the interconnecting cables inside control room, check-out, test and commission the system.

All technical personnel assigned to the site by the vendor shall be fully conversant with the supplied system and software package, and shall have both hardware and software capability to bring the system on line quickly and efficiently with a minimum of interference with other concurrent construction and commissioning activities.

5.3.2 Vendor's responsibility at site shall include all activities necessary to be performed to complete the job as per material requisition including:

   a) Receipt of hardware/software and checking for completeness of supplies.

   b) Installation of the system including for free supply equipment, if any.

   c) Field cable termination and inter-cabinet cabling and termination.

   d) Check out equipment installation.

   e) Checking of interconnections, hardware and software configuration, overall system

   f) Loop checking.

   g) Field tests.

   h) Commissioning and on-line debugging of the system.

   i) Involvement during plant commissioning and performance of final acceptance test.

   j) Co ordination for integration with DCS / other third party system.

5.3.3 Field Inspection

5.3.3.1 All equipments shall be inspected thoroughly by vendor after its receipt at site for
completeness and proper functioning. Vendor must initiate the remedial action, in case unsatisfactory operation of any item is observed, with intimation to Engineer-in-charge.

5.3.3.2 Vendor must document all observations including details of any malfunction observed. Items/equipments requiring total replacement must document the reasons for the same.

5.3.4 Loop Checking

5.3.4.1 Loop checking shall be carried out by vendor including checking the interconnections, configuration and overall system functioning.

5.3.4.2 Vendor's scope of work as a part of system installation and loop checking shall include termination of field cables in the control room, checking of interconnection between instrument/equipment, glanding, ferruling/tagging of interconnecting cables in control room, ferruling of field cables in control room and performing overall loop performance check.

5.3.4.4 The input signals shall be simulated by disconnecting/connecting the field wires for all field switches connected to ‘PLC. All field transmitters connected to control room shall be loop checked at 0%, 50% & 100% of full scale (for both increasing and decreasing signals). Wherever receiver cards are used, the set point shall be generated by giving the input signal to receiver card. All outputs shall be checked in field, either for actual operation of solenoid valve or actual pick-up of electrical contractor for rotary equipments. Shutdown schemes shall be checked for proper functioning, configuration and actuation.

5.3.4.5 After loop checking is completed, vendor shall connect back any terminals and connections removed for loop checking.

5.4 System Acceptance

5.4.1 The owner shall provisionally takeover the system from vendor after System acceptance test. System acceptance test shall be started only after the satisfactory performance of loop checking and verification of all loop checking records by Engineer-in-charge.

5.4.2 The system acceptance test shall be carried out in the presence of owner's representative and Engineer-in-charge or his authorised representative. The tests carried out in System acceptance test shall be fully recorded and duly signed by all representatives participating in the System Acceptance Testing.

5.4.3 Vendor shall carry out the following functional tests, as a part of system acceptance test, as a minimum.

   a) Hardware verification as per final Bill of Material.

   b) Visual and mechanical check-up for proper workmanship, identification, ferruling, nameplates etc.

   c) System configuration as per approved configuration diagram.
d) Demonstration of all system function, display and diagnostics.

e) Checking of correct change-over of redundant devices.

f) Checking of various peripheral devices like printers and printing of all reports.

g) Complete checking of logic system, loading of user's program and checkout of results.

h) Checking of proper functioning of all disc drives, alarm summary, alarm history etc.

i) Proper information transfer on the information network by verifying system displays and printout.

5.5 Final Acceptance Test

The owner will take over the system from the vendor after the final acceptance test, which is defined as successful uninterrupted operation of the integrated system for three weeks. Vendor's personnel shall be present during the test. Any malfunctioning of the system components shall be replaced / repaired as required. Once the system failure is detected, the acceptance test shall start all over again from the beginning. The warranty period commences from the day owner takes over the system.

6.0 GENERAL REQUIREMENTS

6.1 Vendor shall comply fully with the general requirements of PLC system including logistic support services, documentation, warranty, maintenance contract and shipping instructions.

Post Warranty Maintenance Contract

Vendor shall quote separately for post warranty maintenance contract after warranty period for five years for the complete system as per commercial terms and condition of the requisition and the type (i.e. comprehensive or non-comprehensive) of post warranty maintenance shall be as specified in job specification. The personnel deployed during post-warranty maintenance shall have thorough knowledge of the system and at least two years of experience on the maintenance of similar system. Any other conditions of contract required by vendor shall be explained in the offer.

7.0 SHIPPING

7.1 All the materials used for packing, wrapping, sealers, moisture resistant barriers and corrosion preventers shall be of recognised brands and shall conform to the best standards in the areas for the articles which are packed.

7.2 Workmanship shall be in accordance with best commercial practices and requirements of applicable specification. There shall be no defects, imperfections or omissions which would
tend to impair the protection offered by the package as a whole.

7.3 The packing shall be suitable for storing in tropicalised climate, the ambient conditions, being specified in job specifications.

7.4 Shipment shall be thoroughly checked for completeness before final packing and shipment. Vendor shall be responsible for any delay in installation or commissioning schedule because of incomplete supply of equipments.
STANDARD SPECIFICATION FOR

SAFETY RELIEF VALVE

Safety Valve sizing will be done only after control valve sizing is fixed.

All Safety Valves / Thermal relief valves shall be flanged type, irrespective of licensor's recommendation of NPT.

1.00 General

1.01 This general specification together with the data sheets and inspection standards attached herewith define the technical requirement for the supply of Safety / Relief valves, spares, documentation, inspection-testing and shipping.

1.02 In the event of any conflict between Engineering specification and Instrument specification the later shall prevail.

2.00 Codes and Standards

2.01 The pressure relieving devices design, manufacture, installation and testing shall be in accordance with the following codes and recommendations and as specified in the individual specification sheets:

a) ASME Boiler and pressure vessel code section I
   - Design, manufacture and calculation for steam services in fired pressure vessels.

b) ASME Boiler and pressure vessel code section VIII
   - Design, manufacture and calculation for steam, gas, vapour and liquid services in unfired pressure vessels

c) API-RP-520, part I and II sizing, selection & installation of pressure relieving system in refineries.

d) API standard 521 guide for pressure and depressurising system.

e) API standard 526 flanged steel safety relief valves.
   - Design and manufacture as per ASME section VIII and orifice calculation as per API -RP-520 part I and II , appendix C

f) API standard 527 commercial seat tightness of safety relief valves with metal to metal seat.

g) API 2000 for sizing of pressure / vacuum relief valves on storage tanks.

h) ASME B16.5 steel pipe flanges, flanged valves and fittings.

i) ASME B46.1 surface textures.

j) Indian Boiler Regulations for valves on steam service, Paragraph 293.

k) ASME B16.34 for non destructive tests
3.00 Sizing and Design Criteria

Sizing of safety relief valves shall be in accordance with API RP-520 (latest edition), Indian Boiler Regulations ASME Section I (Power Boilers) and ASME code for Pressure Vessels Section VIII'. The code stamps shall be provided for safety valves in case ASME and Indian Boiler Regulations design.

Safety relief valves shall normally be direct spring loaded types and provided with full nozzle type. Balanced bellows type safety valves shall be provided when variable backpressure exceeds 10% of the set pressure or fluid is corrosive. Pilot operated pressure relief valves shall be used for special services and where set pressure is closer than 10% of the operating pressure, in general. Thermal relief type valves shall be used for thermal expansion of liquid or gas. Vacuum relief type valves shall be used for storage tank. Steam jacket type safety valves shall be used for crystallizing fluid at ambient temperature.

The body material shall, as a minimum, be as per piping specifications. Nozzle and disc material shall be SS316 as a minimum with machined stainless steel guide, and spindle. Whenever semi nozzle designs are unavoidable, body material shall be at least same as nozzle material.

The spring material of pressure relief valves shall be as follows unless otherwise necessary because of process conditions.

-29°C to 250°C : Cadmium/nickel plated carbon steel
Above 250°C : Tungsten alloy steel
Below – 29°C : Stainless steel 316

Flanged connection shall normally be specified

Conventional type safety valves shall have vented bonnets with screwed caps; balanced bellows type safety valves shall be of the yoke type with screw settled caps.

Plain lifting levers shall be provided for steam and air services. Packed lifting levers shall be used when protection against leakage is required.

CONTRACTOR shall submit calculations for all safety relief valves.

All safety relief valves relieving to flare header shall be balanced bellows type only with trims and bellows in SS 316 L.

Pressure relief valves required for liquid service shall have liquid trim with discharge coefficient certified by ASME.

Pressure relief valve body casting and nozzle casting with inlet rating of 600 # and above in Hydrogen service shall undergo Helium leak test.

3.01 The manufacturer shall furnish calculations in accordance with the code specified in the individual instrument specification sheets. Each manufacturer to state its own "K" factor and actual measurable area. In addition, approx. weight of each valve shall be specified.
All the above information shall be submitted at the time of bidding, approval after order placement & along with final despatch.

3.02 The percent over-pressure and accumulation used in calculation for sizing of relieving devices shall be considered as indicated in the individual specification sheet.

3.03 For Steam, BFW & condensate services the instrument shall be IBR certified. For items of foreign origin the certification shall be done by Lloyds or any other IBR approved authorities in specific IBR format.

3.04 Wherever NACE certificate requirement has been specified in Instrument specification, the material composition & hardness tests shall be conducted only as per MR-0175 latest edition. The tests shall be carried out in an approved laboratory.

3.05 For corrosive services like UREA wetted parts of stainless steel 316L grade and Cr-Ni-Mo 25-22-2 alloy shall be used. For these materials chemical analysis and corrosion tests (Huey test) shall be carried out as per ASTM A 262 'practice C'. The tests shall be carried out in an approved laboratory.

3.06 All safety valves of inlet rating 900# and above shall be subjected to radiography/ultrasonic test as per procedures outlined in ASME-B16.34 and mutually agreed quality assurance plan, if not otherwise stated in the individual specification sheet.

3.07 Safety / relief valves for thermal expansion (on liquids) shall be flanged type. Thermal relief valves shall be flanged with Inlet 1" 600# RF and outlet 2" 150# RF with typical "D" designation and typically 0.38 cm² orifice size.

3.08 All valves except thermal relief ones shall be full nozzle type. All valves shall have the facility of blow-down adjustment except thermal relief valves. Base/modified or semi-nozzle types shall be specified for thermal relief valves.

3.09 Lifting Levers shall be furnished for exposed spring bonnets on valves in steam and hot water service, on air and hot water valves with closed bonnets. All the lifting levers shall be packed type unless the valve is handling inert gas at ambient temperature.

3.10 Bonnets shall be plain closed ones for toxic or inflammable gases as well as for vapours and liquids. Exposed spring bonnet shall be specified for steam service and in boiler feed water service above 200°C. Extension type of bonnet shall be used above 400°C & cryogenic service.

3.11 Balancing or Sealing Bellows shall be used under the following conditions or as specified in the individual specification sheet.

a) When the back pressure exceeds 10% of the set pressure.

b) The back pressure is variable.

c) The valve is handling corrosive fluid.

3.12 Material Of Valve Body shall conform to the material specified in the enclosed individual instrument specification sheets. In general valve body material and rating shall conform to upstream line specification or specification of the vessel wherever it is mounted.

3.13 Material of nozzle and disc shall be, in general, SS 316 (A182 F316) and 17.4 pH or 316SS with stellite facing if not otherwise stated in the individual instrument specification sheets.
3.14 Springs shall be carbon steel cadmium plated (rust proof) for normal process operating temperature (-) 25°C to 200°C and tungsten/ alloy steel for high temperature above 200°C. Below (-) 25°C stainless steel may be used. Carbon steel (Rust proof) is permitted above 200°C when the bonnet is open.

3.15 Test Gag shall be furnished on all safety and relief valves and they shall be handed over to owner after testing clearly labelled with the tag number of the valve they belong to.

3.16 The manufacturer must specify Cold Differential Set Pressure (CDSP) for each pressure relieving devices at 25°C.

3.17 Rupture disc if specified used at inlet of safety valves shall have fragmentation free burst. The stamped capacity of safety valves shall be derated by 20%, unless the combined capacity of the rupture disc and safety relief valve is established by the disc manufacturer.

3.18 The space between safety valve and rupture disc shall be vented during normal operation. The disc holder shall be supplied with 4” telltale pressure gauge with SS body, wetted parts, pipe nipple, excess flow valve. The excess flow valve and pressure gauge shall have 1/2” NPT connections.

3.19 Burst sensors with rupture discs in hazardous areas shall either be ex-proof or intrinsic safe confirming to area classification & execution specified against each item in the individual specification sheets.

Ex-proof certification confirming to CENELEC, FM, BASEEFA and IS is preferred. IS - 2148 certification must be supplemented with the temperature classification certification confirming to IS - 8239.

Intrinsic safe certification shall in general confirm to CENELEC standard EN 500014 and EN 50020, if not otherwise specified in the individual specification sheet.

3.20 Components made of copper and copper alloys exposed to atmosphere and coming in contact with the operating fluid must not be used for ammonia & urea services.

3.21 All pressure relief valves in oxygen and chlorine service shall be thoroughly degreased using reagents like trichloro-ethylene or carbon tetrachloride. End connections shall be blinded/plugged after this degreasing process to avoid images of oil particles.

**Pilot Safety Valves**

- For pilot operated valves, the pilot design shall be of inherently fail safe.
- Unless specified otherwise, pilot shall be non-flowing type.
- All accessories like back flow preventer, pilot filter etc. required for proper operation of pilot operated valves as per indicated service conditions shall be included.
- Material of construction of pilot shall be same as that of main valve nozzle as a minimum.
- The o-ring and diaphragm material of pilot shall be suitable for the pressure and temperature conditions specified in the data sheet.
4.00 Inspection, Factory tests and approval

4.01 Within two weeks of receipt of the LOI/order the vendor must contact the Inspection Agency specified in the order and finalise with them the Quality Assurance Plan for carrying out Inspection and test. In absence of any Inspection Agency the vendor must submit the quality Assurance Plan for OWNER’s approval. All tests, in such cases, shall be conducted by vendor’s Quality Department and the results of tests shall be forwarded alongwith the supply.

4.02 The manufacturer shall give clear 15 days notice informing readiness of the valves at manufacturer’s works.

4.03 The vendor shall permit the authorised representative of OWNER to inspect the manufacture and assembly of the valves in various phases in compliance with approved drawings, standards and specifications.

4.04 The vendor should make available to the authorised inspector the results of all the checks/calibrations conducted before presenting for Owner’s inspection.

4.06 The vendor to provide all necessary facilities free of cost to Owner's inspector for carrying out the checks/calibration as per standard/approved quality assurance plan. In no condition inspection can be waived off without the written permission of Owner.

4.07 No assembly shall be shipped until all the required tests are successfully completed and certified “Cleared for despatch” by the inspection authority.

4.08 The following tolerances are permitted for calibration:

   a) For valve calibration < 5 kg/cm², +/- 2.8% of the calibrated value.
   b) For valve calibration > 5 kg/cm², +/- 3% of the calibrated value.

4.09 The following tests shall be carried out as a minimum for safety valves

   (i) Verification of cold differential test pressure 100% for all valves
   (ii) Hydraulic pressure tests for primary parts (Refer ANSI B 96.1 for terminology) shall be tested at 1.5 times the set pressure.
   (iii) Pneumatic shell test for closed bonnet valves on secondary side shall be at 1.5 times back pressure (or) 2 kg/cm² whichever higher when back pressure is zero or not stated. For positive back pressure test pressure shall be 1.5 times the back pressure.
   (iv) Seat leakage test for metal to metal seated safety valves shall be done in accordance with API-527. For steam, soft seat, pilot valves and special cases where leakage test is not covered in API-527, the procedure for testing in such cases shall be mutually decided and recorded in the Quality assurance plan.
   (v) Foundry /forge shop test certificate to be provided for verification of body, bonnet, nozzle for conformance to standards.
   (vi) Vendor’s test certificate for material conformance and pressure test to be provided.
   (vii) IBR certificate wherever applicable. Refer clause no. 3.03
(viii) Radiography/Ultrasonic inspection. Refer clause no. 3.06

(xi) NACE certificate wherever applicable. Refer clause no. 3.04

(xii) Corrosion test (Huey test) wherever applicable. Refer clause no. 3.05

(xiii) Sealing test on bellows (as per manufacturer’s standard)

4.10 Test certificate verification for coefficient of discharge

5.00 Packing

Each safety / relief valve and its accessories wherever applicable shall be suitably packed and protected from damage due to transportation, loading and unloading.

The safety / relief valves along with their spares shall be despatched as a single consignment.

6.00 Identification and Marking

6.01 Each safety / relief valve shall be fitted with a stainless steel permanently fixed name plate with the following minimum information:

- Complete tag no of the valve as per inst. data sheet.
- Manufacturer’s name
- Valve model and serial no.
- Inlet and outlet sizes with ratings
- Body and trim material
- Bellows material wherever required
- Designated orifice with area in sq. cm.
- Set pressure in kg/cm².

All valves are applied two coats of red oxide metal primer, prior to applying two final coats of synthetic enamel paint. The second coat of synthetic enamel paint is applied just before despatch.

7.00 Spares

Spares shall be as per enclosed spares list separately attached.

8.00 Documentation
The following documents (Technical) are required to be submitted by the vendor alongwith bid, after placement of order for approval purposes and final documentation before despatch of consignment.

1.01 This Engineering specification together with the Instrument specification attached herewith define the technical requirement for the supply of rupture disc its spares, documentation, and testing.

1.02 In the event of any conflict between Engineering specification and Technical specification of the Rupture disc, the latter shall prevail.

2.00 GENERAL REQUIREMENT

2.01 All rupture disc shall be sized in accordance with API RP 520 or ASME codes section I & VIII as specified in the individual specification sheet. In cases, where exponent of the isentropic expansion has not been stated in the data sheets 1.4 shall be used for calculation purpose. Any restriction in the discharge area caused by the disc holder assembly shall be considered in the calculations. Vendor must submit orifice calculations and corresponding selected body sizes for approval.

2.01.1 CONTRACTOR shall provide rupture disc assembly wherever shown in P&ID. The assembly shall consist of:
A) The rupture disc fitted in a pre torqued holder assembly.
B) J bolt for proper installation
C) The Rupture disc experiences vacuum, shall be provided with vacuum support as recommended by manufacturers.

Disc material shall be compatible with the vessel contents and shall be consistent with the bursting requirements. Inconel discs shall be used above 100ºC if compatible with the process fluid.

2.01.2 When rupture disc is used upstream of a pressure relief valve, a pressure gauge, pressure switch and excess flow check valve / safety relief valve as recommended by manufacturers. (Tell-tale assembly) shall be provided on the downstream of the disc to indicate any rupture of the disc. In addition derating capacity factor for the safety valve – rupture disc assembly as recommended by ASME section VIII shall apply. Tell – tale assembly as above must be provided irrespective of P&ID representation. For plugging toxic service pressure gauges shall be diaphragm seal type.

2.01.3 Each rupture disc must be supplied with minimum three number of additional discs. This is in addition to discs required for carrying out burst testing at factory.

2.01.4 The indication of leaky rupture disc (i.e. the disc with a pen hole) or burst rupture disc shall be provided in the main control room.

2.01.5 The bursting tolerance of the rupture disc shall be ±5% of the specified bursting pressure or less. Unless otherwise specified.
2.02 Rupture disc devices shall be supplied as a complete unit i.e. disc holder and the required number of discs. The scope shall also include pre-assembly screws, jack screws, companion flanges, studs, nuts & gasket.

2.03 Flow direction, flange size and rating, burst pressure and temperature shall be marked on the disc holder.

2.04 The type and material of rupture disc shall be selected in accordance with service conditions, like pressure, temp., process media, vacuum or pulsating service.

2.05 Reverse buckling and non-fragmenting discs are preferred.

2.06 Disc holders shall be suitable for mounting between flanges. The design shall prevent wrong installation of the disc.

2.07 Rupture disc used at inlet of safety valves shall have fragmentation free burst. The stamped capacity of safety valves shall be derated by 20%, unless the combined capacity of the rupture disc and safety relief valve is established by the disc manufacturer.

2.08 The space between safety valve and rupture disc shall be vented during normal operation. The disc holder shall be supplied with 4” telltale pressure gauge with SS body, wetted parts, pipe nipple, excess flow valve. The excess flow valve and pressure gauge shall have 1/2” NPT connections.

3.00 INSPECTION, FACTORY TESTS AND APPROVAL

3.01 All instruments and accessories shall be inspected & tested to ascertain that the supply is in accordance with approved specification. The inspection & tests shall not relieve the supplier/ manufacturer from his responsibilities for materials and the performance of the instrument supplied.

Within two weeks of receipt of the Letter Of Intent (LOI) /order, vendor must contact the Inspection Agency specified in the order and finalise with them the Quality Assurance Plan (QAP) for carrying out Inspection and test.

In absence of any Inspection Agency the vendor must submit the Quality Assurance Plan for PDIL/OWNER’s approval. All tests, in such cases, shall be conducted by manufacturer’s quality department and the results of tests shall be forwarded alongwith the supply.

Procedure and extent of tests shall be governed by QAP mutually agreed between the vendor and PDIL/OWNER’s inspection authority.

No instrument / accessory shall be shipped until all the required tests are successfully completed and certified “Cleared for dispatch” by the inspection authority.

4.00 Packing

Each rupture disc and its accessories wherever applicable shall be suitably packed and protected from damage due to transportation, loading and unloading.

The rupture disc alongwith their spares shall be despatched as a single consignment.
5.00 IDENTIFICATION AND MARKING

5.01 Self adhesive tapes or signs are not permissible for permanent marking of any instrument.

5.02 Each rupture disc shall be fitted with a SS tag plate and shall contain the following information:
   - Complete tag no of the assembly as per inst. Data sheet.
   - Manufacturer’s name
   - Disc and holder model and serial no.
   - Inlet and out sizes with ratings
   - Holder and disc material.
   - Burst pressure in kg/cm²g.

Besides the above each instrument shall have a separate circular tag number plate in stainless steel with engraved tag number and range and attached securely to the instrument with a soft stainless wire. The size of letters and figures shall be minimum 4mm and the plate should be 25mm diameter with 1-2 mm thick. Also each instrument shall have corrosion resistance nameplate with 6 mm minimum size black letters on white background and identified with their relevant loop number.

5.03 All spare parts shall be fitted with identification plate having following data clearly printed and easily readable.

   - Spare parts name/model no. as per purchaser’s Instrument specification sheet
   - Serial no.

6.0 SPARES

Spare parts for rupture shall be supplied as per spares list separately enclosed

**NOTES:**

1. (A) for Approval    (I) for information

2. Sl. No. 1 to 9 shall be forwarded to principal as per details outlined in enquiry/order.

3. Sl. No. 10 shall be mutually finalised with Inspection Authority specified in the order.

Number of sets alongwith bid for approval and as final documentation shall be supplied as stipulated in the purchase order.
STANDARD SPECIFICATION

FOR

CLOSED CIRCUIT TELEVISION (CCTV) SYSTEM
Abbreviations:

BIS : Bureau of Indian Standard
CCOE : Chief controller of Explosives
CIF : Common Image Format
CMRI : Central Mining Research Institute
ERTL : Electronics Regional Testing Laboratory
DGMS : Director General of Mine safety
IEC : International Electrotechnical commission
Ip : Internet Protocol
MPEG : Motion Picture Experts Group
PAL : Phase Alteration by Line
TCP : Transmission Control Protocol
UDP : User Datagram Protocol
CCD : Charge Coupled Device
1.0 GENERAL

1.1 Scope
1.1.1 This specification, together with the data sheets attached herewith, covers the requirements for the design, materials, nameplate marking, inspection, testing and shipping of Closed Circuit Television (CCTV) system.

1.1.2 The related standards referred to herein and mentioned below shall be of the latest edition prior to the date of purchaser's enquiry;

ANSI/ASME  
American National Standards Institute/American Society of Mechanical Engineers.

B 1.20.1  Pipe Threads General Purpose (Inch)
B 16.5  Steel Pipe Fittings and Flanged Fittings, NPS 1/2” through NPS 24

EN-I 0204  Inspection Documents For Metallic Products

IEC-60079  Electrical Apparatus for Explosive Gas Atmospheres

IEC- 60529  Degree of Protection Provided by Enclosures (IP Code)

rs- 13947  Specification for Low Voltage Switchgear and Control gear

IS- 2148  Electrical Apparatus for Explosive Gas Atmosphere - Flameproof enclosures 'd'

1.1.3 In the event of any conflict between this standard specification, data sheets, statutory regulations, related standards, codes etc., the following order of priority shall govern:

a) Statutory Regulations
b) Data Sheets
c) Standard Specification
d) Codes and Standards

1.1.4 In addition to compliance to purchaser's specification, Vendor's extent of responsibility shall include the following:

a) Purchaser's data sheets indicate the minimum requirements of camera, video encoders, video management system, video recorders etc., however, this does not absolve the vendor of the responsibility for proper selection with respect to the following:

i) Selection of lens focal length, camera, encoding techniques, selection of hardware and appropriate software for video management, selection of video recorder and its sizing to meet the storage requirements mentioned in the datasheets, accessories etc for proper monitoring and control.

ii) Selection of equipment suitable for the environmental conditions.

b) Carryout complete application engineering so as to achieve the desired objectives with the stated performance requirements.

c) Provide all hardware and software, as necessary, to meet functional requirements specified in the purchaser's specification.
1.2 Bids

1.2.1 Vendor's quotation shall be strictly as per the bidding instructions to vendor attached with the material requisition.

1.2.2 Vendor's technical offer shall include the following:

   a) Compliance to the specifications.

   b) Detailed specification sheet for each item providing all the details regarding make and model, type, construction, Maximum and minimum viewable distance, Maximum tilt or pan angle possible, Pan and tilt speed, Allowable Voltage and frequency variations, Interconnecting cable and transceiver module specifications, utility requirement, Network Bandwidth requirements and calculations to support the same considering bus loading as' 50% maximum, Hardware, software and licensing requirements, Storage calculations for video recorders.

   c) Detailed dimensional and sectional drawings including mounting details for all the units offered. All dimensions shall be in millimeters.

   d) Block-diagram showing all units with model numbers.

   e) Interconnection wiring diagram between the various components of CCTV system, including location of each item. The diagram shall show the size of cable and brief specification of the cable.

   f) Proven references for the offered model of CCTV system in line with clause 1.2.3 of this specification.

   g) A copy of approval from local statutory authority, as applicable, such as Petroleum and Explosives Safety Organization (PESO), Chief Controller of Explosives CCOE), Nagpur or Director General of Mines Safety (DGMS) in India, for the electronic instruments installed in electrically hazardous area along with:

      i) Test certificate from recognised test house like CIMFR/ERTL etc. for flameproof enclosure, as specified in the data sheet, as per relevant standard for all Indian manufactured equipments or for items requiring DGMS approval.

      ii) Certificate of conformity from agencies like LCIE, Baseefa, PTB, CSA, FM, UL, CE etc. for compliance to ATEX directives or other equivalent standards for all equipments manufactured outside India.

   h) Power consumption for the complete CCTV system including accessories.

   i) Deviations on technical requirements shall not be entertained. In case vendor has any valid technical reason, they must include a list of deviations clausewise, summing up all the deviations from the purchaser's data sheets and other technical specifications along with the technical reasons for each of these deviations.
j) Catalogues giving detailed technical specifications model decoding details and other information related to hardware and software for the items covered in the bid.

1.2.3 The integrated CCTV system comprising of Cameras, encoders, video management system, video recorder etc, as offered, shall be field. proven and should have been operating satisfactorily individually for a period of minimum 02 years on the bid due date in the conditions similar to those as specified in the purchaser's data sheets. Items with proto-type design or items not meeting proveness criteria specified above shall not be offered.

1.2.4 Vendor's quotation, catalogues, drawings, installation, operation and maintenance manuals shall be in English language.

1.2.5 Vendor shall also quote for the following:
   a) All associated accessories and cables.
   b) Two years operational and maintenance spares for all items including their accessories as per vendor's recommendation which shall include the following as a minimum:
      i) Each type of electronic module
      ii) Fuses
   h) Any special tool or test equipment needed for calibration and maintenance work.

1.3 Drawings and Data

1.3.1 Detailed drawings, data, catalogues and manuals required from the vendor are indicated by the purchaser in vendor data requirement sheets. The required number of reproducible, prints and soft copies shall be dispatched to the address mentioned, adhering to the time limits indicated.

1.3.2 Final documentation consisting of design data, installation manual, operation and maintenance manual etc. shall be submitted by vendor after placement of purchase order shall include the following as a minimum:
   a) Specification sheet for each camera and its accessories.
   b) Certified drawings for the CCTV system which shall provide the following information:
      i) Overall dimensions in millimetres
      ii) Detailed interconnection diagram identifying each component with terminal number, cable type, cable size and cable entry details. The interface details shall be clearly identified in the drawing
      iii) Grounding detail of each item
      iv) Power supply distribution details
      v) Clearance space required for maintenance work
      vi) Weight of camera and other accessories
c) Configuration data.
d) Power consumption.
e) Installation procedure of camera and other accessories.
f) Maintenance procedure including replacement of its parts/ internals.
g) Copy of type test certificates.
h) Copy of the test certificates for all the tests indicated in clause 4.0 of this specification.

2.0 DESIGN AND CONSTRUCTION

2.1 The Closed Circuit Television (CCTV) system shall consist of the following units as a minimum:

a) Camera Unit.
b) Composite Video Baluns for Video Transmission
c) Video encoders
d) Video management, Video analysis system along with LCD monitors
e) Video Recorder
f) CCTV System cabinet
g) Power supply distribution board
h) Cables, cable glands, connectors and other accessories
i) Network switches

2.1.1 CAMERA UNIT

Camera unit shall consist of Video Camera, camera unit enclosure, remote controlled pan and tilt unit, remote controlled washer and wiper assembly, sun shield - and thermostatically controlled heaters, receiver units, junction boxes etc.

2.1.1.1 Video Camera

a) Unless otherwise specified, the video camera shall be colour type comprising of y,, or 113°cmos sensor with HD resolution of 540 TVLs (TVL: TV lines) as a minimum.
b) The camera shall have Automatic Gain Control (AGC) facility with gain adjustment of typically up to 18dBA. The video amplifier shall ensure a signal to noise ratio of 50.
c) The camera shall be able to operate satisfactorily under varied light intensity levels. The light sensitivity of the CCTV camera shall be 2.5 lux and shall be able to view objects in illumination level of 45 lux at the distance of 50 m as a minimum.

d) Automatic lens iris control facility shall also be provided as per' the background light levels.

e) The focal length of the camera shall be based on the distance of the objects from the camera. The lens adjustment for focus control and zoom control shall be motorized and remote controllable.

f) The camera shall have feature of backlight compensation.

2.1.1.2 Camera unit enclosure

Camera unit enclosures in safe areas shall be weather proof to IP-65 as per IS-13947. Camera unit enclosures in hazardous areas shall meet the following requirements, as a minimum:

Weather-proof : IP-65 as per IS-13947

Camera unit enclosure shall be suitable for the area classification indicated in the datasheets.

2.1.1.3 Pan and Tilt Unit

The pan and tilt arrangement shall be able to adjust camera within an angle of 0° to 335° horizontally (i.e. pan range) and a minimum of 180° (±900) vertical (i.e. Tilt range). The movement of the device shall be smooth. Pan speed shall be 6 degrees /sec and tilt speed shall be 3 degree/second as a minimum. Pan and tilt action shall be operable from video management system in control room. Pan and tilt unit shall be suitable for area classification as indicated in the datasheets. Pan and tilt units shall also be weatherproof to IP-65 as per IS13947.

2.1.1.4 Wiper and Washer

Whenever camera is for outdoor installation or the application necessitates. the glass window shall be provided with a wiper and washer unit. The washer unit shall comprise of washer tank, motor & pump and associated tubing. The washer tank shall be placed in an FRP enclosure near the camera and shall be easily accessible. The tank shall have a water inlet connection, a valve along with ball float actuator, a water outlet connection, necessary tubing & connectors between the water outlet connection, water pump, and nozzle at the camera. The rising water level in the tank shall raise the lever which will close the valve. The pump shall either be located in the explosion proof housing of the camera or placed inside the FRP enclosure of the washer tank. Whenever the pump is placed in the FRP enclosure, it's motor shall be explosion proof certified for the area classification. Vendor shall indicate the media to be used for actual washing with requirements like flow, pressure etc. Whenever specified, the washer tank shall have a capacity of 10 litres as a minimum and the minimum flow rate of the pump shall be 0.5 litres per minute.

2.1.1.5 Space Heater

For outdoor applications and where there is a possibility of condensation on the glass window, the camera unit shall be provided with a thermostatically controlled anti-condensation heater.
2.1.1.6 Junction Box

The junction boxes for housing the accessories shall be suitable for outdoor installation with minimum IP-65 weatherproof protection and shall be certified for the specified area classification as per datasheets.

2.1.1.7 Camera Mounting

Cameras shall be provided with suitable mounting accessories for mounting on structures, roofs, poles as indicated in the datasheets. Whenever specified, the height of the support poles shall be as per the datasheets. The pole shall have ladder for camera maintenance.

2.1.2 VIDEO ENCODER

a) The video encoder shall digitize and compress the video signal using MPEG-4 & MJPEG compression technique. The operator shall have the option of changing the frame rate from 1 to 25 frame per second (fps)/camera and also change the resolution to CIF,2CIF and 4CIF (PAL).

b) The video encoder shall be capable of TCP/UDP, unicast and Multicast transmission of live video. If connected over an IP network, then each video encoder shall be IP addressable and shall be able to connect to networking devices such as switches/ routers. Encoder shall be single/ multi channel as specified in the datasheets. Multi channel encoder shall have 4 channels maximum.

c) The video encoder shall be capable of receiving camera control commands from video management system and relay them to cameras on RS485.

d) The encoder shall be capable of detecting the loss of video signal from the camera video output.

e) Encoder shall have motion detection.

f) The encoder shall be able to send alarm signals (e.g., on motion detection or loss of video signal) over the network to the respective video management system. The video management system at the control room shall receive the alarm signals over the network and shall drive outputs such as an audible alert or a visual indication on a monitor to alert an operator.

g) It shall be possible to upgrade the video encoder software remotely.

2.1.3 VIDEO MANAGEMENT SYSTEM

2.1.3.1 The system shall support the virtual matrix capability (i.e., software based matrix) to allow the operator to assign any camera to any local or remote monitor on the network. Also it shall be possible to Control and monitor any camera on the network.

2.1.3.2 The video management system shall be able to permit online selection of:
a) Camera Units

b) Monitors

c) No. of views on one monitor

d) Recording Commands

e) Pan-tile Control

f) Sequential Switching of image on monitors

g) Focus, wiper, wash and zoom operating for each camera unit.

2.1.3.3 The monitors shall be 26” colour LCD monitors with necessary controls like colour brightness, contrast adjustment and monitor ON/OFF control. These functions shall be possible from the monitor front.

2.1.3.4 The camera views on the monitor shall be populated based on the operator request. The operator shall be able to view 1/4/9/16 views per monitor. The operator shall be able to enlarge the views.

2.1.3.5 The operator shall be able to view cameras through simple drag and drop commands.

2.1.3.6 The system shall be equipped with the web based client software to allow users to view the cameras on the Microsoft explorer browser from any PC on the network, provided if they are given the permission and password.

2.1.3.7 The user interface shall present the operator with a camera tree that shall show the list of all the cameras and camera sequences that are available to the operator. The Vendor shall present the hierarchy of the camera tree together with the grouping of cameras and the way in which the user/ operator shall interact with it.

2.1.3.8 The NVMS user interface shall have a map to allow viewing the graphical representation of the area together with allowing the operator to place camera icons on the map. The Vendor shall present the full features and operations of the map and shall present the way in which the user/ operator shall interact with the map.

2.1.3.9 The operator shall be able to perform pan/ tilt! zoom/ washer and wiper unit control for PTZ cameras.

2.1.3.10 The operator shall be able to enable/ disable Motion detection for cameras.

2.1.3.11 The operator shall be able to write macros/scripts for the cameras to do the following as a minimum:

(i) To define the sequence of cameras to be viewed on a given monitor

(ii) To define the period and start/ stop time for viewing a camera on a monitor
2.1.3.12 The viewing and control of cameras shall be controlled by use of passwords. Two levels of password shall be provided:

   a) The operator level in which the operator shall be able to perform PTZ controls, viewing, recording and playback.

   b) The supervisor level in which the supervisor shall be able to make configuration changes in addition to the PTZ controls, viewing, recording and playback.

2.1.3.13 VIDEO RECORDER

   a) Whenever specified the system shall also supplied with video recorder to record video images automatically or on manual demand. The recorder shall meet the following requirements as a minimum.

   b) The video recorder shall have disk space to store on-line video storage for duration as specified in the datasheets and access to high capacity archiving mechanisms for removal of stored video to off-line storage media.

   c) The vendor shall size the video recorder hard disc space based on the number of cameras, number of days (minimum 30 days) for which the recording has been done, the resolution of recording and the number of frames per second to be recorded, as indicated in the datasheets. Vendor shall submit calculations/ equations for storage requirements. Use of software without supporting calculations shall not be acceptable.

   d) The system shall mark the events with time and date stamping during monitoring and recording. The system shall allow the operator to view stored information with respect to time and date of recording with scan and search of the marked events/ timing.

   e) The operator shall be able to playback the recorded events in slow and fast motion with variable speed.

   f) It shall be possible for the operator to schedule recordings for each individual camera taking place in the future. The operator shall be able to configure the Start and Stop time for the scheduled recording.
g) The operator shall be able to export previously stored video to DVD or latest storage option as specified in the datasheets.

h) The exported video shall be able to retrieve archived video from DVD or the latest storage option as specified in the datasheets.

i) Captured images or videos shall be easily distributed to any remote locations through the LAN/WAN environment, if required. The operator shall be able to export previously stored video from a recorder to any other network storage devices including a network drive. An exported file must be in MPEG-4/ MJPEG format and, as such, should be readable using any MPEG-4/MJPEG compliant decoding software.

j) Each video recorder shall be of 19” rack mountable type.

k) Video recorder shall support RAID 0 +1 as a minimum.

2.1.3.14 VIDEO ANALYSIS

a) System shall generate alarm on motion detection in areas where no motion is expected.

b) System shall generate alarm on no motion detection in areas where motion is expected.

c) System shall generate alarm on flare flame failure.

d) System shall generate alarm in case fire is detected.

e) System shall generate alarm when toxic cloud is observed.

2.1.4 ALARMS & EVENTS

a) The operator in the control room shall be able to get an indication of the faults occurring in any of the devices connected over the network. This includes faults occurring in the cameras, video encoders, computers, and video recorders. Faults occurring in each of these devices shall generate an alarm in the operator console.

b) The operator shall be able to view the chronology of events by device, date, time description.

c) The system shall support logging of events for reviewing and analysis in the future.

d) Upon detecting a fault, the system shall be able to automatically send an E-mail alert.
2.1.5 CONFIGURATION

The following facilities shall be provided for configuration of the CCTV system as a minimum:

a) Assign an ID or name to each camera.
b) Add/delete cameras.
c) Change the camera details (e.g. Camera location, Camera ID, Camera number, etc)
d) Configure the camera encoding parameters in terms of number of frames per second.
e) Configure the camera encoding resolution in terms of setting it to CIF, 2CIF, or 4CIF.
f) Creation of schedules for recordings.
g) Configure recording either on demand, continuous recording or based on motion detection.
h) Add/ delete monitors to the system.
i) Add/ delete computers to the system.
j) Creation of a camera group, view a camera group, view a camera sequence, and view a multiple view screen.
k) For an IP based system, assign IP addresses to video encoders, computers of video management system, video recorders, video wall controllers as applicable.
l) Program external outputs based on certain events.

2.1.6 INTERFACING WITH DCS

Wherever specified, interfacing with DCS shall be done to allow DCS operators to view live video along with DCS graphics on the DCS operator consoles. Hardware required for the same shall be provided by vendor. Software required in video management system and DCS shall be provided by vendor.

2.1.7 CCTV CABINETS

2.1.8.1 The CCTV cabinet(s) shall house the following components: (i) Computer(s) (ii) video encoder(s), (iii) video recorder(s), (iv) control unit (v) network switches (vi) Transceiver modules, if any (vii) indoor fibre patch panel, if any (viii) VGA boosters, if any(ix) Line drivers, if any (x) Miniature circuit breakers etc. as applicable.

2.1.8.2 The cabinet(s) shall be fitted with lockable doors and shall have front and rear access. All system cabinets shall be completely wired.
2.1.8.3 The cabinet shall be free standing, enclosed type and shall be designed for bottom cable entry. Cabinet structure shall be rigid and shall be provided with removable lifting lugs to permit lifting of the cabinets.

2.1.8.4 Cabinets shall be fabricated from cold rolled sheet steel of minimum 2 mm thickness suitably reinforced to prevent warping and buckling. Doors shall be fabricated from cold rolled steel sheet of minimum of 1.6 mm thickness. Cabinets shall be thoroughly de-burred and all sharp edges shall be grounded smoothened after fabrication.

2.1.8.5 Each cabinet shall be of maximum 2100 mm height and 1200 mm width. Construction shall be modular preferably to accommodate 19” standard electrical racks. Maximum swing out for Pivot card racks, doors and drawers shall be limited to 600 mm. Doors of the cabinet shall be equipped with lockable handles and concealed hinges with pull-pins for each door removal.

2.1.8.6 In order to effectively remove dissipated heat from the cabinets, vent louvers backed by wire-ply screen shall be provided on the cabinet doors. Ventilation fans shall be provided in each cabinet along with fan failure alarm contact.

2.1.8.7 Fluorescent lamps shall be provided in each cabinet for each cabinet for internal illumination along with door operated micro switches. All lighting shall be on 230v 50Hz normal power supply.

2.1.8.8 All wiring within the cabinet shall be neatly laid and shall be accessible. Clamping rails shall be provided for incoming cables to present excessive stress on the individual terminals. All metal parts of the cabinet including doors shall be electrically continuous and shall be provided with common grounding lug.

2.1.8.9 The color of the CCTV cabinets shall be matched with the existing cabinets at control room.

2.1.8.10 Cable glands shall be provided for cable entry into the CCTV cabinet. Spare cable entries shall be plugged.

2.1.8 OPTICAL FIBER CABLE

The Optical Fiber Cable (OFC) used for the CCTV system shall conform to the following specification as a minimum:

a) The OFC shall be CSTA (corrugated steel tape armored, electrolytically chrome plated low carbon steel) armored cable.

b) The OFC shall have FRP strength member, loose tubes for single mode optical fibers filled with moisture resistant jelly, moisture barrier of polymer coated Aluminum tape or water swellable tape, inner sheath of HOPE and outer sheath of PVC.

c) Optical fibers shall be single mode fibers compliant to ITV-T G 652 and fibers colours shall correspond to IEC 793-2 and 304. Optical fibers shall be coated with UV cured double acrylic resin. It should not have any reaction with cladding or core material.
coating should provide maximum resistance to micro-bending & abrasion and ensure mechanical & optical strength. The coating shall be easily stripped with mechanical tools.

d) The number of fibers in the OFC shall be decided depending upon the requirement with 8 fibers as a minimum.

e) The cabled fiber attenuation shall be -S 0.37 dB/km for 1310 nm wavelength range and 0.22 dB/km for 1550 nm wavelength range.

f) The tensile performance shall be as per IEC-794-IEC and with tensile load of 9.81 W Newton with attenuation change -S 0.05 dB/km at 1310 nm. W is weight of OFC/km.

2.1.9 NETWORK SWITCH

The network switch used for the CCTV system shall conform to the following specification as a minimum:

The network Switch shall be configured to provide communication paths and provide the facility for adaptive packet and message routing through any available communication link. The network Switch shall provide the facility of multiple protocol router and bridge that provides high bandwidth connections into backbone networks for remote sites.

The hardware design shall be based on distributed processing architecture with packets forwarding to be performed on the network interface modules. It shall be based on the modular design and architecture and shall allow new network interface cards to be added in the racks without powering down the unit and ensuring no disruption of service to the network users.

The network Switch shall support both intra-area and inter-area routing for transporting messages between nodes and shall support the network routing! bridging services for OSI, TCP/IP, X.25, LAT and other industry standard wide area networks/protocols. The network switch shall be adaptive 10/100/1000 Mbps interface port, supporting pass through! Crossover adaptation of port. The network switch shall be provided with optical fiber module interface suitable for long distance transmission.

2.1.10 POWER SUPPLY

2.1.10.1 The system shall operate on 110 VAC/230VAC (as specified in the datasheets) with the following specifications:

Voltage variation 

± 10%

Frequency 

50 Hz± 3 Hz

Any other power supply required shall be derived from this power supply by the vendor.

2.1.10.2 Power Supply distribution for all items related to closed circuit television system shall be carried out from the system cabinet itself. Vendor shall supply any hardware required for conversion/distribution. Power supply for each item shall be provided with a separate switch and fuse for isolation and protection of the system.
2.1.10.3 The CCTV camera unit shall be capable of withstanding plant vibration level of 2.1 G (within the frequency range of 5 Hz to 200 Hz) and sudden shocks of level 5 G (with frequency of 2 Hz). Any vibration pads required to meet this requirement shall be in vendor's scope of supply.

2.1.10.4 The CCTV system shall have the capability for future expansion to add cameras and additional storage in video recorders.

2.1.10.5 All cable glands, as required, for camera enclosure, pan/tilt unit, junction boxes, CCTV cabinet etc. shall be Nickel plated brass, dual compression type, suitable for area classification specified in datasheets.

3.0 NAMEPLATE

3.1 Each camera shall have a SS label name plate attached firmly to it at a visible place furnishing the following information:

a) Manufacturer's model no. and serial no.

b) Manufacturer's name / trademark.

c) Type and Resolution of Camera

d) Lens Focus Length

e) Pan and Tilt Range

f) Type of explosion protection and certificate number

g) Power Requirement.

3.2 Each item of Close Circuit Television and its accessory shall have SS labels attached firmly to it at a visible place, furnishing the following information:

a) Manufacturer's model no. and serial no.

b) Manufacturer's name / trademark.

c) Type of explosion protection and certificate number

d) Power Requirement.

4.0 INSPECTION AND TESTING

4.1 Unless otherwise specified, purchaser reserves the right to test and inspect the system at vendor's works. Vendor shall provide facilities like competent manpower, equipment and utilities required for the purpose to Purchaser's representative for inspection. Vendor shall test and demonstrate integrity of the system hardware and software. No material or equipment shall be transported until all required tests are successfully completed and certified 'Ready for Shipment' by the Owner / Consultant.
4.2 The Purchaser reserves the right to get involved and satisfy himself at each and every stage of project execution. The purchaser shall be free to request any specific test considered necessary by him although not listed specifically. The cost of performing all tests shall be borne by the vendor.

4.3 Vendor shall submit the following test certificates and test reports for purchaser's review:

   a) Dimensional verification certificate
   b) Manufacturer's test reports as per Type 3.1 of EN 10204
   c) Minimum light intensity testing
   d) Power supply variation check
   e) Certificate from Statutory authority for flame proof and weather proof enclosure, as applicable

4.4 Witness Inspection

4.4.1 All items shall be offered for pre-dispatch inspection for following, as a minimum, unless otherwise specified:

   a) Physical dimensional verification and workmanship.
   b) Bill of material check
   c) Effect of variations in power supply, voltage and frequency
   d) Performance testing and verification of integrated CCTV system.
   e) Review of all certificates and test reports.

4.4.2 In case, the witness is waived off by the owner / Consultant, the test report of test carried out by vendor as indicated shall be forwarded by vendor for review. The equipment shall be dispatched only after it is cleared by owner / Consultant for dispatch.

5.0 SHIPPING

5.1 All threaded openings and cable entries shall be suitably protected to prevent entry of foreign material.

5.2 Any glass item shall be protected with foam sheet to protect against damage during transportation.

5.3 Each panel and accessory shall be suitably packed and protected from damage due to transportation, unloading and loading.
5.4 Each component part requiring identification for proper assembly at site shall be piecewise marked.

6.0 REJECTION

6.1 Vendor shall submit their offer in detail, as per clause 1.2 of the specification and shall attach these documents, which are specifically indicated in the material requisition. Vendor shall make offer w.r.t every clause of this specification.

6.2 Any offer not confirming to the above requirements shall be summarily rejected.
FIRE ALARM SYSTEM REQUIREMENTS

1.0 SCOPE - FIRE ALARM SYSTEM

1.1 LSTK contractor shall provide the Fire Detection and Alarm System which shall be an independent system comprising of individual break glass type manual call points, automatic sensors e.g. smoke and heat detectors, main panel, repeater panel, hooter, battery, battery charger and any other hardware. Contractor has to provide the provision of interface with Centralised Fire Alarm panel and if required by Owner then do the hook up job with centralised FA system.

1.2 Fire alarm system shall be provided in all the enclosed areas such as substation, control room, cabins and wherever flammable equipments are being placed.

1.3 Fire protection for substations shall be provided to comply with requirements of Indian Standard/NFPA. Substations shall be provided with smoke detectors and fire alarm system as per relevant Indian Standard

1.4 The system shall be designed to provide audio-visual indication at the main panel to be located in sub-station and repeater panels shall be provided in fire station.

1.5 The manual call points shall be provided at strategic locations with access of 60 M along all exit routes and roads.

1.6 Electrical sirens shall be provided to cover entire plant area. Hooters and exit lights shall be provided at required locations in the buildings.

1.7 Panel design and component selection shall be done for future extension upto 10% of specified zones or one zone, whichever is maximum in each panel. The design of common facility and hardware shall be provided for required future extension of zones.

1.8 The fire detection system shall be interfaced with fire suppression system, wherever specified.

1.9 Supply, installation, testing and commissioning of above mentioned components/equipment for plant area, substation & control room shall be by the LSTK contractor along with necessary supply and laying of required signals cables.

1.10 The required nos. of MCPs and detectors in substation & control room shall be calculated as per IS norms and contractor shall get approval from client during detailed engineering stage.

1.11 Any other specifications refer TS-0821 & TS-0822.

1.0 SCOPE

The intent of this specification is to define the requirements for design, manufacture and supply of Flame Retardant type PVC sheathed cables for use in plant communication and fire alarm systems and Jelly filled telecommunication cables.

2.0 CODES AND STANDARDS

2.1 The equipment shall comply with the requirements of the latest revision of the following standards issued by BIS and DOT, unless otherwise specified:

2.1.1 BIS standards:

- IS-694: PVC insulated cables for working voltages up to and including 1100V.
- IS-1554 (Part-I): PVC insulated (heavy duty) electric cables-(Part-I for working voltages up to and including 1100V).
- IS-5831: PVC insulation and sheath of electric cable.
- IS-8130: Conductors for insulated cables and flexible cords.
- IS-9938: Recommended Colours for PVC insulation for LF wires and cables.
- IS-10418: Drums for electric cables.
- IS-12444: Continuously cast and rolled electrolytic copper wire rods for electrical conductors.

2.2 DOT Standards:

- GRJWIR-06/03: Specification for cable - switchboard (Screened and Unscreened) Generic Requirements.
- G/CUG-O1/02: Specification for solid polythene insulated fully filled, Polythene sheathed underground telecom cables.

2.3 In case of imported cables, standards of the country of origin shall be applicable, if these standards are equivalent to or stringent than the applicable Indian standards.
2.4 The cables shall also conform to the provisions of the Indian Electricity rules and other statutory regulations currently in force in the country.

2.5 In case Indian standards are not available for any material, standards issued by IEC / BS / VDE / IEEE / NEMA or equivalent agency shall be applicable.

2.6 In case of any contradiction between various referred standards/ specifications/ datasheets and statutory regulations the following order of priority shall govern:

- Statutory regulations.
- This specification.
- Codes and standards.

3.0 SITE CONDITIONS

Cables shall be suitable for installation in following conditions:

i. Above ground in open-air locations (trays / ducts) in tropical, humid and corrosive atmosphere prevalent in refineries/petrochemical plants with severe weathering and exposure to solar radiation.

ii. Directly buried in underground trenches, conduits with uncontrolled back-fill and possibility of flooding by water and chemicals.

iii. Unless otherwise specified, the design ambient air temperature of 45° C / ground temperature of 30° C.

4.0 TECHNICAL REQUIREMENTS - NON JELLY FILLED CABLES

4.1 Conductors

4.1.1 The size of conductor shall be as per job requirement.

4.1.2 The conductors shall consist of annealed, high conductivity solid copper wire, smoothly drawn, circular in cross-section, uniform in quality, free from defects and uniformly coated with pure tin and shall conform to Cl. 3.0 of DOT specification GR/WIR-06/03.

4.2 Insulation

4.2.1 The core insulation shall be with PVC compound applied over the conductor by extrusion.

4.2.2 PVC insulation, when used shall meet the following requirements:

<table>
<thead>
<tr>
<th>Conductor (Area)</th>
<th>Diameter</th>
<th>Type of Insulation</th>
<th>Thickness of Insulation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Upto 0.63 mm (0.3mm²)</td>
<td>Type-2 of Table-3 as per IS-13176</td>
<td>As per Table-1 of DOT Specs. GR/WIR-09/02</td>
<td></td>
</tr>
<tr>
<td>Above 0.63mm (Above 3.0 MM²)</td>
<td>Type-A as per IS-5831</td>
<td>Table-2 as per IS-1554 (Part-I)</td>
<td></td>
</tr>
</tbody>
</table>
4.2.3 The colours used for insulation shall conform as nearly as practicable to the standard colours as per 18-9938. The wire insulation shall have colours in accordance with Table-2 of DOT specification GR/WIR-06/03. The applied colour shall neither have deleterious effect on the electrical, mechanical or ageing properties of basic insulation nor shall get damaged by any friction etc.

4.2.4 For single pair cables, the colour shall be incorporated in the insulation.

4.2.5 For multi pair cables, cores shall have uniform pattern of continuous spiral (Pitch not exceeding 25mm) to facilitate easy identification. This may be done by the application of one or more coloured strips on a base colour or by direct extrusion.

4.2.6 Alternately, colouring may consist of concentric coloured rings or dots or dashes on the base colour. The coloured rings, dots or dashes shall have a width of not less than 1.0mm and shall be repeated along the length of the insulation at an interval not less than 15mm and not more than 25mm.

4.2.7 The dots or dashes shall be applied on diametrically opposite sides of the insulation, so that all colours are visible when the insulation is viewed from any side.

4.3 Twisting

The two insulated conductors of a pair shall be uniformly twisted with a suitable right hand lay, which shall not exceed 80mm.

4.4 Core Formation

The core formation shall conform to C1.6.0 of DOT specification no. GR/WIR-06/03.

4.5 Screen

4.5.1 Unless otherwise specified the cables used for fire alarm and detection shall be provided with overall screen. The screen shall be of aluminium tape with minimum thickness of 0.04mm. The overlap shall be minimum 3mm for cables up to 50 pair & minimum 6mm for cables above 50 Pair. The screen shall be backed by an outer protective layer of 0.13mm PVC tape or other non hygroscopic material lapped applied longitudinally or helically with overlap.

4.5.2 The cables shall be provided with a drain wire. Drain wire shall have a minimum cross-section of 0.5mm², shall be composed of multistrand bare tinned annealed copper conductor. The drain wire shall be in continuous contact with the aluminium side of the overall screen. The drain wire resistance including screen shall not exceed 30 ohm/km.

4.6 Ripcord

A non-metallic ripcord of suitable quality shall be laid longitudinally under the inner sheath & screen. The ripcord when pulled shall cut through the sheath and strip the core.

4.7 Inner Sheath
4.7.1 An extruded inner sheath of type ST1 PVC, as per IS-5831, with minimum thickness as per Table-4 of IS-1554 (Part-1) shall be applied over the laid up core, by extrusion to fit closely on it.

4.7.2 The inner sheath shall be as circular as possible. It shall be possible to remove the inner sheath without damage to the insulation.

4.7.3 When one or more layers of non-hygrosopic tape is helically applied over the laid up cores, as a binder, the thickness of such tape(s) shall not be construed as a part of the inner sheath.

4.8 Armour

4.8.1 The cables shall be provided with armouring, made of hot dip galvanised steel wire /strip over the inner sheath.

4.8.2 The armour shall be by means of 104mm thick round wires for cables with under armour diameter upto 13mm. For cables with an under armour diameter above 13mm, the armour shall either be of steel strip or round wire with thickness as per IS-1554 (Part-1).

4.9 Outer Sheath

4.9.1 The cables shall be provided with an extruded PVC sheath for external protection. The PVC shall be type ST1 PVC, as per IS-5831.

4.9.2 The other sheath shall be with oxygen index 29 at 27±2°C and possess flame retardant properties meeting the requirements of IS 10810 Part-62 category - AF. In addition, suitable chemicals shall be added to the PVC compound of the outer sheath to protect the cable against rodent and termite attack.

4.9.3 The thickness of outer sheath shall be as per IS-1554 (Part 1).

4.9.4 The outer sheath shall fit tightly on the armour and shall be applied in such a manner that no undue residual strain is left in the material.

4.9.5 The outer sheath shall be grey in colour except for cables to be used for fire alarm system where it shall be red.

4.9.6 Sequential marking of the length of the cable, in meters, shall be provided on the outer sheath at every one meter. The marking shall be legible and indelible by suitable method.

4.9.7 The overall diameter of the cables shall be strictly as per the values declared in the technical information furnished along with the bids, subject to a maximum tolerance of ±2 mm.

4.10 Cable Capacitance

4.10.1 The core to core capacitance of the cables shall not exceed 100nF/Km at 1KHz.

4.10.2 The core to screen capacitance for the screened cables shall not exceed 250nF/Km at 1KHz.
5.0  TECHNICAL REQUIREMENTS FOR JELLY FILLED CABLES

5.1  Jelly filled telecom cables shall in general conform to the requirements of DOT specification G/CUG-01/02, unless otherwise specified in this specification.

5.2  Conductors

5.2.1 The conductors shall consist of annealed, high conductivity solid copper wire, smoothly drawn, circular in cross-section, uniform in quality, free from defects and uniformly coated with pure tin and shall conform to cl. 3.0 of DOT specification G/CUG-01/02.

5.3  Insulation

5.3.1 Each conductor shall be insulated with insulating grade PE conforming to C1.4.0 of DOT specification G/CUG-01/02.

5.4  Twisting

The two insulated conductors of a pair shall be uniformly twisted with a suitable right hand lay, which shall not exceed 150mm.

5.5  Core Formation

The core formation shall conform to C1.6.0 of DOT specification G/CUG-01/02.

5.6  Filling Compound

5.6.1 The cable shall be filled with a suitable stable water resistant compound, which shall be compatible with the insulation, binders and tapes used in the cable.

5.6.2 It shall be homogeneous and uniformly mixed material containing an anti-oxidant.

5.6.3 The compound shall not obscure the identification of the colour of the insulation of the conductors.

5.6.4 It shall not contain dirt, metallic particles or other foreign matter.

5.6.5 The compound shall be readily removable from the insulated conductors by wiping.

5.6.6 It shall be free from any unpleasant odour and shall have no toxic or dermatic hazards.

5.6.7 The flash point of the compound shall not be less than 200°C.

5.6.8 The volume Resistivity measured at 100°C shall not be less than 1010 ohm- ern.

5.6.9 The permittivity at 1 MHz tested as per ASTM 0-924 shall not be greater than 2.3 at 20°C.

5.7  Core Wrapping

At least one closed helical or longitudinal application of a non-hygroscopic and non-wicking polyester tape or tape of any other suitable material shall be provided over the cable core.

5.8  Screen
The cables shall be provided with overall screen. The screen shall be of aluminium tape with minimum thickness of 0.2mm. The overlap shall be minimum 3mm for cables having maximum diameter over inner sheath < 30mm & minimum 6mm for cables having maximum diameter over inner sheath ~ 30mm. The screen shall be coated with 0.05 mm nominal thickness polythene/copolymer on both sides. The thickness of the composite tape shall be 0.3mm±15%.

The aluminium tape shall be electrically continuous throughout the length of the cable.

5.9 Inner Sheath

5.9.1 The inner sheath shall be as circular as possible and free from pinholes and other defects. It shall be possible to remove the inner sheath without damage to the insulation.

5.9.2 The inner sheath shall be of polythene conforming to type 03C or H03C of BS 6234 and shall contain a suitable antioxidant system. The material shall be virgin as per ASTM 0-883 and meet the following requirements.

Density 0.910 to 0.940 g/10 minutes (190 °C, 2160 g load)

5.9.3 The thickness of inner sheath shall conform to Table - 6 of DOT specification no. G/CUG01/02.

5.9.4 The maximum diameter over inner sheath shall conform to Table - 7 of DOT specification no. G/CUG-0 1/02.

5.10 Armour

5.10.1 The cables shall be provided with bedding and armour over the inner sheath.

5.10.2 The bedding shall consist of two close helical lappings of polythene or polypropylene tape. Each tape shall be applied with a minimum of 5% overlap.

5.10.3 The armour shall be made of hot dip galvanised steel tape of thickness as per Table - 8 of DOT specification G/CUG-01/02.

5.11 Outer Sheath

5.11.1 The external protection shall consist of a polythene sheath conforming to the material specification defined in Clause 5.9 above.

5.11.2 The thickness of outer sheath shall conform to Table - 9 of DOT specification G/CUG-01/02.

5.11.3 The outer sheath shall be as circular as possible and free from pinholes and other defects. It shall be possible to remove the inner sheath without damage to the insulation.

5.11.4 The outer sheath shall be grey / black in colour except for cables to be used for fire alarm system where it shall be red.
5.11.5 The maximum diameter over outer sheath shall conform to Table - 7 of DOT specification G/CUG-01/02.

5.12 Cable Capacitance

The average mutual capacitance of the pairs measured at 800 to 1000Hz shall be $52 \pm 3$ nF/km.

However, the mutual capacitance of individual pairs shall be within the limits of $52 \pm 4.5$ nF/km.

6.0 INSPECTION, TESTING AND ACCEPTANCE

6.1 The cables shall be tested and examined at the manufacturer's works. All the materials employed in the manufacture of the cable shall be subjected to examination, testing and approval by PDIL/Owner. Manufacturer shall furnish all necessary information concerning the supply to PDIL/Owner's inspectors. The inspector shall have free access to the manufacturer's works for the purpose of inspecting the process of manufacture in all its stages and he will have the power to reject any material, which appears to be of unsuitable description or of unsatisfactory quality.

6.2 The following acceptance tests shall be conducted on the completed jelly filled cables as per the test procedures given in DOT specification G/CUG-01/02 and this specification:

i. Measurement of diameter of conductor, over inner sheath & over outer sheath.

ii. Measurement of Thickness of insulation, inner sheath, screen, armour & outer sheath.

vi. Colour coding.

vii. Conductor continuity test.

viii. Mutual Capacitance test.

ix. Capacitance Unbalance test.

x. Cross talk test.

xi. Attenuation test.

xii. Insulation resistance test.

xiii. Dielectric strength test.

xiv. Drip test.
xv. Armour Galvanisation Test.

xvi. Conductor Annealing Test.

xvii. Measurement of drum length.

6.3 The following tests shall be conducted on the completed non jelly filled cables as per the test procedures given in DOT specification GR/WIR-06/03 and this specification:

6.3.1 **Acceptance tests:**

i. Measurement of diameter of conductor, over inner sheath & over outer sheath.

ii. Measurement of Thickness of insulation, inner sheath, screen, armour & outer sheath.

iv. Colour coding.

v. Conductor continuity test.

vi. Mutual Capacitance test.

vii. Capacitance Unbalance test.

viii. Insulation resistance test.

ix. High Voltage test.

x. Armour Galvanisation Test.

xi. Conductor Annealing Test.

xii. Measurement of drum length.

6.3.2 **Special Tests**

The non jelly filled cables shall also be subjected to following special tests.

i. Oxygen Index test as per IS-l 0810 (Part 58).

ii. Flammability test on finished cable as per IS-I0810 (part 61 & 62).

The special test shall be conducted on one sample from each lot. The sample will be selected by the inspector.

7.0 **PACKING AND DESPATCH**

7.1 Cables shall be despatched in non-returnable wooden drums of suitable barrel diameter, securely battened, with the take-off end fully protected against mechanical damage. The wood used for construction of the drum shall be properly seasoned, sound and free from defects. Wood preservatives shall be applied to the entire drum. Ferrous parts used shall
be treated with a suitable rust preventive finish or coating to avoid rusting during transit and storage.

7.2 On the flange of the drum, necessary information such as project title, manufacturer's name, type, size, length of cable in meters, drum no., cable code, BIS certification mark, gross weight, 'Owner's particulars', 'P.O. numbers' etc., shall be printed. An arrow shall be printed on the drum with suitable instructions to show the direction of rotation of the drum.

7.3 Cables shall be supplied in drum lengths of 1000 meters, if not specified otherwise.

7.4 A tolerance of plus or minus 5% shall be permissible for each drum. However overall tolerance on each size of cable shall be limited to ±2%. Offers with short/non-standard lengths are liable for rejection.

7.5 For non jelly filled cable, PVC / rubber end caps shall be supplied free of cost for each drum with a minimum of eight per thousand meter length. In addition, ends of the cables shall be properly sealed, with caps, to avoid ingress of moisture/water during transit and storage.

7.6 For jelly filled telephone cables, the ends of the cable shall be sealed by thermo shrinkable end caps of adequate wall thickness. Alternately ends may be sealed by enclosing them in rubber or PVC caps of wall thickness not less than 1.8mm. The caps shall be secured to the outer sheath with hose clips or ties or black adhesive tape or heat shrinkable sleeves.

7.7 The cables may be stored outdoors for long periods before installation. The packing shall be suitable for outdoor storage in areas with heavy rains / high ambient temperature, unless otherwise agreed.

1.0 SCOPE

1.1 The intent of this specification is to define the functional and design requirements for an Integrated Fire Alarm System for industrial plants and buildings. This specification covers the requirements for selection, design, and engineering, manufacture, testing at vendor's works, supply, installation, testing at site and commissioning of the system.

1.2 The Integrated Fire Alarm System shall be conventional or microprocessor based analog addressable system comprising of MCP, detectors; conventional or microprocessor based Fire Alarm panels, CFAP and associated equipments detailed hereunder and in Project data sheets/ drawings.

2.0 CODES AND STANDARDS

2.1 The system and equipment shall comply with relevant BIS (Bureau of Indian Standards) and other Indian/ International standards, as applicable. In case Indian standards are not available for any equipment, standards issued by IEC/ BS/ VDE/ IEEE/ NEMAINFPA or equivalent agency shall be applicable. In case of imported equipment, the standards of the country of origin shall be applicable if these standards are equivalent or more stringent than the applicable Indian standards.

2.2 The equipment shall also conform to the special requirement/ provisions of applicable statutory regulations currently in force in the country.

2.3 In case of any contradiction between various referred standards/ specifications/ data sheets and statutory regulations, the following order of decreasing priority shall govern:

- Statutory regulations
- This specification
- Codes and standards

2.4 The fire alarm system and the components used shall conform to the latest edition of the following and also the other Indian and International Standards as applicable.

- IS-5 Colours for ready Mixed Paint & Enamels.
- IS - 513 Specification for cold rolled low carbon steel sheets and strips
- IS-2148 Flameproof enclosures for electrical apparatus
- IS - 1646 Code of practice for fire safety of buildings (general): Electrical Installations
- IS - 2175 Specification for heat sensitive fire detectors for use in automatic fire alarm system
- IS - 2189 Code of practice for selection; installation and maintenance of automatic fire detection and alarm system.
IS - 3034  Code of practice for fire safety of Industrial buildings: Electrical generating and distributing stations

IS - 3700  Essential ratings and characteristics of semi conducting devices (Applicable parts)

IS - 3826  Connectors for frequencies below 3 kHz General requirements Part-I and tests

IS - 5469  Code of practice for the use of semi-conductor junction devices (Applicable parts)

IS - 5780  Specification for Intrinsically safe electrical apparatus and circuits

IS - 11360  Specification for smoke detectors for use in automatic electrical fire alarm system.

IS - 12459  Code of practice for fire safety in cable runs

IS - 13346  General requirements for electrical apparatus for explosive gas atmosphere

IS-14154 Part 2  Electrical apparatus with protection of enclosure for use in the presence of combustible dust

NFPA 72 Vol 4  National Fire Alarm code

LPC  Loss prevention council recommendations.

BS - 5839  Specifications for manual call points.

BS-EN 50081-1  EMC (Electromagnetic compatibility test)

BS-EN 50082-1  EMC (Electromagnetic compatibility test)

3.0 GENERAL REQUIREMENTS

3.1 The offered equipment shall be brand new with state of the art technology and a proven field track record. No prototype equipment shall be offered.

3.2 Vendor shall ensure availability of spare parts and maintenance support services for the offered equipment for at least 15 years from the date of supply. The spares shall be available ex-stock with the vendor.

3.3 Vendor shall give a notice of at least one year to the end user of equipment and PMC before phasing out the product/spares to enable the end user to place order for spares and services.

3.4 The vendor shall be responsible for design, engineering and manufacturing of the complete system and equipment to fully meet the intent and requirements of this specification and attached data sheets.
3.5 All equipment and accessories required for completeness of the system, whether specifically mentioned or not but considered essential for satisfactory performance, shall be included as a part of the offered system.

3.6 The system integrator shall coordinate with the manufacturers of various bought-out items associated with the system, as required, and shall freely and readily supply all technical information as and when called for.

3.7 Equipments to be located in hazardous areas shall have test certificates issued by recognized independent test house such as CMRI, ERTL, BASEEFA, UL, FM or equivalent. All indigenous equipment shall conform to Indian standards and shall be certified by Indian testing agencies. All equipment (indigenous & imported) shall also have valid statutory approvals as applicable for the specified location. All indigenous flameproof equipment shall have valid BIS license and marking as required by statutory authority.

4.0 DEFINITIONS

4.1 CFAP

It is a fire alarm panel located in fire station or in disaster management control rooms. It is electronic for conventional and microprocessor based for addressable system. CFAP is designed to gather information from distributed fire alarm panels provided in the plant/buildings and have features such as provision to activate plant-wide sirens, have interface with telephone exchange, plant's public address system etc. It has mimic for geographical display of alarms either on panel or as graphic displays on MMI.

4.2 DGFAP

It is a Microprocessor based fire alarm panel, designed for use with addressable fire alarm system. It has alpha-numeric LCD displays along with LED displays for fire/fault conditions. It also includes loop cards (for field devices), I/O cards for interface with other Purchaser's equipment, exit sign and hooters. It functions as fire alarm panel located centrally to population of fire detectors distributed over an area for optimizing and limiting the loop lengths.

4.3 ZFAP

It is a fire alarm panel for conventional fire alarm system. This has functionality similar to what is provided for DGFAP. This has LEDs for fire/fault annunciations.

4.4 Repeater Panel

It is similar to distributed fire alarm panels (DGFAP/ZFAP) but will not have Zone card/Loop card for field devices. These are provided at manned locations and are configured to acquire information about the fire/fault of selected zones from DGFAP/ZFAP and annunciate.
4.5 Integrated Fire Alarm System

It signifies a comprehensive fire alarm system comprising all the distributed fire alarm panels (DGFAP, ZFAP, repeater panels etc) having integration with CFAP for fire monitoring of total plant/building. It provides audio/visual alarm building/plant-wide having provisions for connectivity with telephone exchange, pager system and public address system. It shall provide interfaces with fire protection system and other systems like pressurization systems, air conditioning etc.

4.6 System Architecture

System architecture is line diagram defining the connectivity of DGFAPs, repeater and CFAP. This also specifies various system requirements such as redundancy, communication protocol, communication hardware, cable requirement, workstation and programming tools.

4.7 Data High Way

This term is meant to define the communication path between DGFAPs, CFAP and other network components in microprocessor based fire alarm system. Physical media for Data highway can be fibre optic (FO) cable or twisted pair copper conductor, screened cable.

4.8 Field Devices

Devices such as detectors, MCP, exit signs, hooters, siren etc. are termed as field devices.

4.9 HAB

This term is defined as Hooter Acknowledgement Box. HAB for individual buildings shall be provided at its exit.

4.10 Hazardous Area

An area in which an explosive gas/dust atmosphere is present, or likely to be present in quantities such as to require special protection for the construction, installation and use of electrical apparatus.

5.0 SYSTEM AND SITE CONDITIONS

All equipment shall be designed to operate with power supply and site conditions as specified below:

5.1 Input Power Supply

5.1.1 Unless stated otherwise, purchaser shall provide one point power supply to each fire alarm panel (ZFAP/DGFAP/CFAP/repeater panel), details of which are indicated in data sheet. A suitable power distribution to various equipment and sub system shall be included in vendor's scope.

5.1.2 Power supply for fire alarm panels shall have battery back up as per IS-2189. Battery AH rating shall be determined on the basis of maintaining the system in normal operation for a
period of not less than 48 hours (quiescent condition) and successive full load alarm condition of period not less than 30 min after the failure of normal mains supply.

The switch over from mains to back up, in the event of mains failure, shall be automatic. Batteries shall be Ni-Cd/ VRLA type as specified in data sheets. Suitable and adequately rated battery charger shall be supplied as a part of back up battery system.

(The full load alarm condition is defined as operation of all panel/field audio and visual alarm and the alarm load of 25 percent of total zones besides other normal operation loads.)

5.2 Site Conditions

The offered equipment shall be capable of operating continuously and maintaining its guaranteed performance at the site ambient conditions indicated in data sheet.

Unless specified otherwise, fire alarm panels along with associated hardware shall be suitable for installation and operation in a closed building/ room with restricted ventilation. Any specific requirements for air conditioned/ dust free environment, etc. for the panels, if absolutely necessary, shall be clearly highlighted by the vendor in the offer.

6.0 FIRE ALARM SYSTEM DESCRIPTION

6.1 General

Fire alarm system under this specification is envisaged to provide fire monitoring in industrial plants/ chemical plants/ plant and non-plant buildings. The system shall be designed to detect incipient fires and generate audio/ visual alarm in case of fire.

The system shall consist of automatic fire detectors and manual call point or break glass unit. Automatic fire detectors shall work on the principle of sensing of smoke, heat or infrared rays. Depending on type of smoke, optical or ionization type detectors shall be used. Detectors shall generally be provided in plant/ non-plant buildings. Manual Call Point shall be provided at exit doors of the buildings and at exit route of industrial plants. Number of detectors and break glass unit shall be decided as per guidelines given in applicable codes and standards.

The plant/ building shall be divided into fire monitoring zones. Detectors and MCP at these buildings and plants shall be connected to DGFAP/ ZFAP. These panels shall continuously monitor the state of these devices. On sensing fire condition, an audio/ visual alarm shall be initiated identifying the zone where fire is detected. Panels shall continuously monitor the health of the cabling and in case of short circuit or open circuit fault alarm shall be actuated. Fire alarm panels shall also have powered outputs for switching on exit signs and hooters as specified in data sheet. Further, panels shall provide required output for interfacing with the Purchaser's systems such as air conditioning system or pressurization system or fire protection systems.
Alarms, if specified, shall be relayed to repeater panel provided in buildings like control rooms/administrative buildings to provide zone wise annunciation. In addition facility shall be provided to actuate siren/ hooter.

For integrated fire alarm system where plant-wide large numbers of fire alarm panels are envisaged, these panels shall be integrated to CFAP, which shall be located in fire station or in administrative control room of the building as per the job requirements. The connectivity shall be achieved using data high way or dedicated cable connection from each fire alarm panel to CFAP. Mimic at CFAP shall be provided for fire/ fault annunciation on geographical location in addition to the text/ LED. If defined, CFAP shall have provision for automatic and manual actuation of plant-wide siren as per operator's choice. Interface with other systems such as telephone exchange/ plant's public address system/Pager system shall be provided for communication required for disaster management.

6.2 Conventional/Addressable fire alarm systems

Fire alarm system shall be conventional fire alarm system or microprocessor based fire alarm system as specified in data sheet. Conventional fire alarm system shall have conventional field equipment and Microprocessor based system shall have addressable type field devices.

6.2.1 Conventional fire alarm system shall generally comprise but not be limited to the following equipment used in conjunction with conventional automatic fire alarm detectors and manual call points as a minimum.

i. CFAP with/ without mimic (as per data sheet)
ii. ZFAPs
iii. Repeater Fire Alarm Panel
iv. Plant-wide Sirens and starters
v. Hooters, exit sign and HAB in buildings
vi. Interface with Purchaser's systems
vii. Any other hardware as required to render system complete

6.2.2 Microprocessor based fire alarm system shall generally comprise but not be limited to the following equipments used in conjunction with addressable automatic detectors and addressable MCP as a minimum.

i. CFAP consisting of computer based graphic workstation and engineering station.
ii. Multi loop DGFAPs
iii. Plant-wide sirens and starters
iv. Hooters, exit sign and HAB in buildings
v. Interface with Purchaser's systems

vi. Dual redundant copper/ FO cable data highway complete with dual redundant architecture for communication hardware including communication port, switches, processor and power supply

vii. Any other hardware/ Software required for rendering system complete

6.2.3 As specified in data sheet, the system shall be provided with siren/s to be located at a suitable location/s in the plant and it shall be actuated manually and automatically as selected by operator from CFAP/ DGFAP located at fire station/ other buildings.

7.0 CONVENTIONAL FIRE ALARM SYSTEM

7.1 Design Features

7.1.1 The system shall be modular and shall facilitate future extension / modification. Panel design and component selections shall be done for future extension up to 100/0 of specified zones or one zone whichever is maximum in each panel. The design of common facility and hardware shall be provided for required future extension of zones.

7.1.2 PCBs shall have watchdog feature for self-diagnostic. Each PCB shall have LED for annunciating card failure. Following self-diagnostic features may be considered as minimum.

i. Open loop detection

ii. Short circuit detection

iii. Earth faults

iv. Power supply failure e.g. low battery voltage, main incoming supply fail

v. System faults (PCB failure)

7.1.3 Logic of operation shall be built on "Fail safe" feature i.e. NC contact of field devices shall be considered as healthy condition and NO as fire condition. 1NO+ 1NC contact of output relays shall be wired to terminal block for interface with Purchaser's other equipment.

7.1.4 It shall be possible to test lamps, hooters, flasher circuit, and functional tests etc through common "Test" push button.

7.1.5 The circuit shall be so designed that silencing of the current alarm by ACCEPT push button shall not prevent annunciation of subsequent fire alarm received from any other location

7.1.6 Signal-to noise ratio shall be high to avoid spurious actuation due to noise induced in the field wiring because of proximity with power cables. Cables for field devices shall be multicore copper conductor, unscreened, armoured, copper conductor cable. If required noise filters shall be provided at fire alarm panel.
7.1.7 Detectors and MCPs in a loop shall be wired through 1.5 mm² multi-core, Copper conductors, PVC insulated, armoured cable. Limiting distance from fire alarm panel to last detector/MCP shall not be less than 2 km or as specified in data sheet whichever is maximum.

7.1.8 LEDs shall be provided for fire/ fault visual annunciation on the panel front. LED shall also be provided for Power supply healthy, Battery backup ON, Battery/ Charger status.

7.1.9 If zone is protected with clean agent/ CO2 system, the detectors and MCPs of the zone shall be wired in cross-zones by providing minimum two loops in a zone. The last device in each loop shall be provided with end of line resistor of suitable value as per circuit design to facilitate cable open circuit and short circuit detection.

7.1.10 Scheme for FIRE/ FAULT annunciation shall be as per the following.

<table>
<thead>
<tr>
<th>SYSTEM CONDITION</th>
<th>AUDIO</th>
<th>VISUAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>NORMAL</td>
<td>OFF</td>
<td>OFF</td>
</tr>
<tr>
<td>FIRE</td>
<td>OFF</td>
<td>ON (tone 1) Flasher ON, Fire LED Steady ON</td>
</tr>
<tr>
<td>Accept</td>
<td>OFF</td>
<td>Flasher steady, Fire LED steady ON</td>

<tr>
<td>Reset</td>
<td>OFF</td>
<td>Flasher OFF, Fault LED OFF</td>
</tr>
</tbody>
</table>

7.1.11 Fire alarm panels including repeater panels and CFAP shall be certified/ approved by applicable approving agency of country of origin as required.

7.2 Zonal Fire Alarm Panel

7.2.1 ZFAP shall consist number of zones as specified in data sheet. Detectors/MCP/ heat sensing cables etc shall be connected zone wise in a loop. It shall monitor fire/ fault condition of the zone. ZFAP shall be located indoor in safe area.

7.2.2 ZFAP shall be free-standing, floor mounting vertical panel consisting of audio/visual annunciation with Alarm Accept; Test and Reset Push Buttons, Auto/Manual control of hooters provided in buildings. Provision to actuate siren shall be provided if specified in data sheet. Circuit shall be designed to provide annunciation if any detector in a zone senses fire. Annunciation scheme shall be as per clause 7.1.10

7.2.3 Audio/ Visual indication and annunciation shall be as per clause 7.1.8.

7.2.4 ZFAP shall have required interface hardware where integration with CFAP/ repeater panel is envisaged as per data sheet.
7.2.5 Output contacts (1NO+ 1NC) shall be provided for interface with Purchaser's systems as per clause 9 of this specification. The rating of output contact shall be 0.5A, 220V DC or 2A, 240V AC.

7.2.6 Input power supply and battery backup for ZFAP shall be as per data sheet and as per clause 5.1 of this specification.

7.3 Repeat Alarm Panel-Conventional

7.3.1 Repeat fire alarm panel shall be similar to ZFAP except providing zones for detector loops. Fire/ fault annunciation of ZFAP shall be repeated to repeater panel. Annunciation scheme shall be as per 7.1.10 Depending on the size Repeat Fire Alarm panel may be floor mounting type or wall mounting type.

7.3.2 Where required, input power supply from purchaser shall either be 240V or 110V, 1 phase, 50Hz. It shall be possible to select supply either 240V or 110V at site without modifying or adding additional equipment in the panel.

7.4 Central Fire Alarm Panel

7.4.1 CFAP shall be located in fire station in plants or in building control room. Fire and fault annunciation for each Zone or group of zones at ZFAP shall be repeated at CFAP. Annunciation scheme at CFAP shall be provided as per the clause 7.1.10.

7.4.2 CFAP shall be in vertical panel construction or desk type construction having controls such as Accept, Test and Reset Push Buttons, Auto/Manual control of siren etc.

7.4.3 Unless otherwise specified in the data sheet, CFAP shall have mimic to display geographical location of fire. Mimic shall form an integral part of the CFAP and shall be located at the top of the panel. When separate mimic panel is specified, it shall either be wall mounting or freestanding floor mounted type. Two LEDs shall be provided for each zone on mimic panel for display of fire alarm. Mimic panel shall be powered by CFAP. Mimic made out of plastic stickers shall not be acceptable.

7.4.4 Input supply and battery backup for CFAP and MIMIC shall be as per data sheet and as per clause 5.1 of this specification.

8.0 MICROPROCESSOR BASED FIRE ALARM SYSTEM

8.1 Design Feature

8.1.1 Unless otherwise specified Microprocessor based system shall be analog addressable type. The system shall be integrated as per 'system architecture' indicated in data sheets.

8.1.2 Microprocessor based fire alarm system shall be designed to use state of the art technology. All fire alarm panels including repeater panel shall be networked through data high way. The system supplied shall not pose any limitation for future expansion by way of networking of fire alarm panels, data transfer, parameterization of addressable field devices, graphic displays etc.
8.1.3 The system shall be modular and shall facilitate future extension/ modification. Panel design and component selections shall be done for future extension up to 10% of specified zones or one zone whichever is maximum in each panel. The design of common facility and hardware shall be provided for required future extension of zones.

8.1.4 PCBs shall have watchdog feature for self-diagnostic. Each PCB shall have LED for annunciating card failure. Following self-diagnostic features may be considered as minimum.

   i. Open loop detection
   ii. Short circuit detection
   iii. Earth faults
   iv. Power supply failure e.g. low battery voltage, main incoming supply fail
   v. System faults (PCB failure)

8.1.5 Unless specified otherwise in data sheet, system architecture shall have minimum redundancy indicated below however not limited to the same.

   i. Dual redundant at processor level (communication processor and I/O card processor)
   ii. Dual redundant communication port
   iii. Dual redundant data highway cable
   iv. Dual redundant microprocessor at CFAP
   v. Dual redundant work station/MMI (engineering station+ operator's station)
   vi. Dual redundant power supply card at all fire alarm panels (but with single source of battery backup)

8.1.6 Data highway shall be Fibre optic or twisted pair shielded copper cable as specified in data sheets. Whether specified or not, data highway shall include all necessary hardware such as modem, repeaters, network switches/ hubs etc including power supply system as required to suit the length of data highway.

8.1.7 The communication shall be peer to peer between various OGFAPs, repeater Panels, CFAP and other system components connected on fire alarm system data highway.

8.1.8 Any fault in Analog detector addressable loop and data highway shall not impair communication i.e. Communication/ flow of analog signal shall be possible from either end of the loop.

8.1.9 The loop cabling for wiring detectors and MCPs shall be class A, fault tolerant type as per NFPA 72.

8.1.10 Fire alarm logic shall be programmable type. The logic for zone protected with clean agent system/ CO₂, shall be programmed to provide output for actuation after ensuring that there
is no false alarm. Similarly logic to switch ON the exit sign and sound the hooters shall be programmable type.

8.1.11 The logic shall be so programmed that silencing of the current alarm by ACCEPT push button shall not prevent annunciation of subsequent fire alarm received from any other location.

8.1.12 Signal-to noise ratio shall be high to avoid spurious actuation due to noise induced in the field wiring because of proximity with power cables. Unless otherwise specified, fire alarm cables laid in buildings shall be twisted pair, screened and unarmoured and shall be laid in conduits while cable laid outdoor in plant shall be twisted pair, screened and armoured. If required noise filters shall be provided at fire alarm panel.

8.1.13 Unless otherwise specified in data sheet, the minimum number of detectors/ MCP/ addressable devices in a signal loop shall be 60.

8.1.14 Unless otherwise specified in data sheet, conductor size of loop cable shall be 1.5 sqmm copper. The allowable signal loop length shall not be less than 2 km. To optimize length, circuit design for loop shall allow the use of spur connection.

8.1.15 DGFAP and repeater panel shall have backlit alphanumeric LCD display to provide addresses, status of each field device. In addition LEOs shall be provided for fire/ fault visual annunciation. LED shall also be provided for Power supply healthy, Battery backup ON, Battery/ Charger status.

8.1.16 Fire station shall be provided with dual redundant PC with monitor for operator's workstation and for engineering station. Any of the two should be possible to configure as engineering station for programming off line. After Programming, the engineering station will be connected to network as online operator's workstation. Programming shall also allow activating Siren from the keyboard in manual mode as per operator's choice.

8.1.17 Scheme for FIRE/ FAULT annunciation shall be as per the following.

<table>
<thead>
<tr>
<th>SYSTEM CONDITION</th>
<th>AUDIO</th>
<th>VISUAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>NORMAL</td>
<td>OFF</td>
<td>OFF</td>
</tr>
<tr>
<td>FIRE</td>

<tr>
<td>Accept</td>
<td>OFF</td>
<td>Flasher OFF, Fault LED Steady ON</td>
</tr>
<tr>
<td>Reset</td>
<td>OFF</td>
<td>Flasher OFF, Fault LED OFF</td>
</tr>
</tbody>
</table>

8.1.18 All field devices such as detectors and MCPs shall be addressable type. If available in vendor's design, hooters and exit sign may also be connected in addressable loop. Fault isolators shall be provided to minimize outage of number of detectors/ MCPs in case of loop cable fault. For hazardous area flame proof equipment shall be used. As far as
possible, the use of intrinsically safe field devices in hazardous area should be avoided. If unavoidable, due care shall be taken care in design to avoid signal distortion and thus the mal-operation due to cable capacitance and inductance.

8.1.19 System shall provide adequate EEPROM size to store minimum of 10 events fire/ fault. The event shall be stored in LIFO structure. All events shall be time stamped. DGFAP shall have real time clock for event time stamping.

8.1.20 Software access for either Zone programming or access to plant/ building graphic on monitor shall be password protected. For viewing status of various field devices e.g. fire and fault status password protection shall not be given.

8.1.21 Fire alarm panels including repeater panels and CFAP shall be certified/ approved by an international approving agency/ approving agency of country of origin as applicable.

8.2 Data Gathering Cum Fire Alarm Panel (DGFAP)

8.2.1 DGFAP shall have basic design features as per clause 8.1 above. Number of signal loops in each DGFAP shall be as defined in the data sheet. Number of loops shall be basic part of main PCB and should not be extended by providing external electronic devices. LCD display and annunciation scheme shall be as per clause 8.1.17.

8.2.2 It shall be possible to change the reference value of detector sensitivity either manually or automatically as required during the operation to avoid false alarms prior to detector maintenance.

8.2.3 DGFAP shall have serial port for communication to data highway. It should be possible to communicate all the information to CFAP/ FA system workstation located with fire marshal. The protocol of communication shall preferably be open protocol.

8.2.4 In the event of non-availability of data highway, DGFAP shall work as stand alone intelligent panel monitoring fire in the zones connected to it.

8.2.5 It shall be possible to configure DGFAP to access data of any other DGFAP and display as per the operation requirement to be finalized during engineering/ commissioning.

8.2.6 It shall be possible to interface with existing fire alarm system consisting of conventional zone detectors and MCPs with end of line resistor as a part of retrofitting.

8.2.7 DGFAPs shall have output relays to provide interface with Purchaser's system defined in clause 9 as minimum.

8.3 Repeat Alarm Panel

8.3.1 These panels shall be required for repeat of alarm in building/ plant control rooms. These panels shall be similar to DGFAP and shall be connected to data highway through serial communication. Panels shall have programming facility to inhibit the display of information that is not required in a particular repeater panel.

8.4 CFAP/ PC based monitoring station or Work station
Based on vendor's system design CFAP shall include network PC based monitoring station directly connected to data highway with other peripherals such as network switches/ controller (HUB). Alternatively, vendor may supply CFAP similar to DGFAP along with PC based monitoring station. Application software shall be installed in PC as GUI. The graphic shall include geographical location of various plant areas including location of addressable detectors and MCPs. The navigation between various graphic pages shall be user friendly. The screen shall have defined area to display the latest fire or fault alarm and shall also have facility to pop up the graphic displaying the location of fire event.

8.4.2 Unless stated otherwise, CFAP shall have all the features and facilities of the DGFAPs. It shall monitor the status of each addressable field device indirectly from the DGFAPs connected on data highway.

8.4.3 Engineering workstation shall be used for programming off-line. After programming, the changed parameters shall be down loaded to other PC to work in synchronism as normal operation. This station shall also have two printers connected to PCs working as SOE printer and engineering printer. SOE printer shall be high-speed dot matrix printer and engineering printer shall be laser printer.

8.4.4 Unless specified otherwise, adequately rated UPS with bypass shall be provided for PC based monitoring station. Battery backup shall be sized as per criteria given under 5.1. Only normal supply shall be made available at one point by Purchaser at the location of central fire alarm panel.

8.4.5 It shall be possible to actuate plant-wide siren in auto/ manual mode. Unless otherwise specified, manual actuation shall be done from keyboard of workstation. Auto actuation shall be through software logic, which shall be finalized with end user during implementation. Auto/Manual selection shall be provided at operator's workstation. The actuation signal under manual mode selection shall be communicated serially to DGFAP to which siren starter is connected. Siren starters shall be hardwired to DGFAP.

8.4.6 The minimum requirements for the PC and other peripherals shall be as stated below:

* Industrial type Latest generation PC
* 1.44 MB Floppy drive
* CD-ROM
* Mouse and keyboard
* 21 Inch coloured monitor with flat screen
* SOE dot matrix printer
* Engineering laser jet coloured printer with 8 PPM
Application software supporting graphics with no limitation on number of graphics, events, alarms, number of field devices as required for any large plant like refinery, petrochemical complex or the large multistory building.

8.4.7 It shall be possible to provide multilevel access of fire alarm system. Read only access shall not require password protection. Access for programming and access for controls from keyboard shall be password protected. The levels of password protection shall be agreed with plant operators at the time of commissioning of system.

8.4.8 Printer

i. Printer options shall include both graphic laser printer and dot-matrix event text printer.

ii. Printer used in the system shall provide real time records of the system events and provide system reports on demand, and shall be microprocessor controlled, high speed, read only (RO) letter quality dot-matrix type 132 characters wide and 96 character set.

9.0 INTEGRATION WITH VARIOUS PLANT SYSTEMS

9.1 Fire Alarm System shall have required hardware to have interface with following plant systems as specified in data sheet.

i. Public Alarm Announcement system

ii. Paging and plant intercom systems.

iii. Plant data network

iv. ISDN telephone exchange and pager system

v. Fire suppression system

9.2 ZFAP as a minimum shall be provided with the following interface with fire suppression system unless specified otherwise.

i. Automatic signal for release of clean agent/CO₂, release for protected area and RELEASE audio/ Visual alarm for evacuation.

ii. Selector switches for primary or secondary clean agent/CO₂ supply for each protected area.

iii. Manual push button for discharge of clean agent/CO₂, in each protected area. The actual release of clean agent/ CO₂ shall however be delayed by 30 sec after the alarm.

iv. Clean agent/CO 2 Discharge inhibit push button for each protected rea.

v. Deluge valve activation push buttons, deluge valve test push buttons and deluge valve activated status lamps.
vi. Shutdown signals to various air-handling units relative to the zone of fire.

vii. Firewater pumps start push buttons.

viii. Firewater pumps running indications.

10.0 PANEL CONSTRUCTION (CFAP, DGFAP, ZFAP, REPEATER)

10.1 All fire alarm Panels shall be free standing, floor mounting type unless specified otherwise and shall be fabricated out of minimum 2mm thick CRCA sheets and doors shall be fabricated out of minimum 1.6mm CRCA sheets. The panel shall be naturally ventilated in IP-41 enclosure protection as minimum.

10.2 Equipment Mounting

10.2.1 All apparatus, display screen, instruments and indicating lamps mounted on the panel front shall be flush mounting type. The external cabling shall not be terminated directly on the base connector of PCBs but shall be terminated on separate terminal block. Further connection to PCBs shall be as per manufacturer's standard. Routine calibration, adjustments, programming and operation shall be accessible from the front of the panel without opening the door. External cabling shall preferably be done from the rear.

10.2.2 Power supply system including battery bank shall be mounted inside the panel.

10.2.3 Doors shall be provided with pistol grip handle with lock. Lamps shall be provided inside the panel to provide adequate light for maintenance of equipments.

10.2.4 Cable entry shall be from bottom unless otherwise specified in the data sheet. Terminal strip shall be provided for incoming / outgoing cables.

10.3 Wiring and Terminals

10.3.1 Wiring within the panel shall be laid in slotted plastic raceways enclosed with cover. Control connections shall be done with 660V grade PVC insulated wires having stranded copper conductors. 1.5mm² size of wire shall normally be used for circuits with control fuse rating of 10A or less. Control wiring for electronic circuits shall be through ribbon cable or through copper wire minimum of 0.5mm dia. Panels shall be supplied completely pre-wired, such that only field termination shall be required at site before it is energized.

10.3.2 PCBs for identical functions shall be interchangeable. PCBs shall be plug in type having pin/edge connectors. PCBs shall be suitable for use in tropical, humid and dusty environment. These shall be protected with anti fungus treatment.

10.3.3 Cables shall be terminated on terminal blocks. Clamp type terminals shall be of spring-loaded, stacking type, mounted on rails. Terminals shall be sized to accept, as a minimum 2.5mm² cross section conductors. Not more than one conductor shall be terminated on the outgoing side of each terminal. At least 20% spare terminals shall be provided in each panel for termination of spare cores of cables.

10.4 Earthing
10.4.1 A common earth bar of minimum 25 x 3 mm. copper or equivalent aluminium shall be provided throughout the length of the panel. All non-current carrying metallic parts of the panel mounted equipment shall be earthed. Flexible jumpers shall connect all doors and movable parts to the earth bus. Two numbers earth lugs shall be provided outside the panel.

10.5 Name Plates / Warning plates

10.5.1 All nameplates for panel shall be engraved out of 3 ply (black-white-black) lamicoid sheets or anodized aluminum. Back-engraved Perspex sheet nameplates will also be acceptable. Engraving shall be done with square groove cutters. Hard paper or self-adhesive plastic tape nameplates shall not be acceptable.

10.5.2 Labels shall be provided for every component on the cards, connecting wires as well as for the terminals in the terminal strip inside the panel. Wiring diagram shall be pasted inside the panel door as required for termination and maintenance.

10.5.3 Special warning plates shall be provided on all removable covers or doors giving access to energized metallic parts above 24 volts.

10.6 Painting

10.6.1 All metal surfaces shall be thoroughly cleaned and degreased to remove mill scale, rust, grease and dirt. Fabricated structures shall be pickled and then rinsed to remove any trace of acid. The undersurface shall be made free from all imperfections before undertaking the finishing coat.

10.6.2 After preparation of the undersurface, the panel shall be powder coated. The colour shade of final paint shall be as approved by the purchaser. The finished panels shall be dried in dust free atmosphere. Panel finish shall be free from imperfections like pinholes, orange peels, fun-off paint etc.

10.6.3 All unpainted steel parts shall be cadmium plated or suitably treated to prevent rust-corrosion. Moving elements shall be greased.

11.0 CABLE AND CABLE ACCESSORIES

11.1 Unless otherwise specified, purchaser shall supply and lay only the following cables.

i. Signal Loop/ Zone Cables from outdoor field devices to the fire alarm panel except for buildings.

ii. Loop/ Zone cables from FA panel to JB (Vendor shall provide JBs in each building for signal loop cabling. Cables from J8 to fire alarm panel is included in purchaser's scope while cable from JB to detectors and all other field devices shall be included in vendor's scope.)

iii. Exit sign and hooter cables from FA panel to JB (Vendor shall provide separate JB for exit sign and hooter. Cables from JB to fire alarm panel is included in Purchaser's scope while J8 to exit sign and hooter is included in vendor's scope.)
iv. Cable from purchaser's switchgear to siren starter and siren starter to siren.

v. All interface cables from fire alarm panels to purchaser's system.

vi. Incoming power supply cables from purchaser's switchgear to Fire Alarm Panels All other cables as required for fire alarm system including the supply, laying and termination of cables and accessories within buildings from JBs to detectors/ MCPs, exist signs, hooters and also supply, laying, termination of data high way cables, high way accessories etc as required for successful commissioning shall be in vendor's scope.

11.2 Though the supply and installation of field cabling is excluded from vendor's scope but terminations of all cables (supplied by both vendor/ purchaser) at both ends shall be in vendor's scope.

11.3 Bidder, as a part of integration and selection of fire alarm equipment, shall furnish detailed specifications for loop/zone cables, data highway cables, cables for hooter/exit signs etc giving details such as type of cables, number of pairs, size of cable, inductance and capacitance data, number of fibres/ connectors etc.

11.4 Data Highway Cables

11.4.1 Unless specified otherwise, vendor shall supply Copper cable/ FO type data highway cable to suit system design and equipment specification. Copper cables, if supplied, shall be of adequate size, twisted pair, PVC insulated, overall screened, PVC inner sheathed, armoured, FR type PVC outer sheathed as the minimum requirement. Fibre Optic cables, if supplied, shall be armoured, overall FR PVC outer sheathed and shall be as per ITU-T recommendation as a minimum.

11.4.2 Vendor shall supply and install all hardware and cabling accessories as per data high way design including modems, repeaters etc as part of the FA system. Modems/ repeaters shall be powered by the supply provided for DGFAPs / CFAP.

11.5 Cable Glands / Accessories

11.5.1 All cable glands/ lugs/ connectors as required for the equipment shall be included in vendor's scope and shall be supplied along with the system, irrespective of whether installation is to be performed by vendor or not.

11.5.2 All the cable glands for outdoor application shall be weatherproof, nickel-plated brass and double compression type, whereas those for indoor application shall be single compression type.

11.5.3 Cable glands for hazardous area equipments shall be flameproof, weatherproof and nickel plated brass double compression type.

12.0 AUTOMATIC FIRE DETECTORS AND ACCESSORIES

12.1 General Specifications
| 12.1.1 | Detectors for conventional fire alarm system shall be conventional type. End of line resistor shall be provided at the last detector in the zone. Detectors for microprocessor shall be addressable type. Detectors shall be plug-in type and shall have twist lock action fitting. Multicolour LEOs provided on the detectors shall indicate Normal and Alarm state. Essential features of detectors are indicated as below. |
| 12.1.2 | Detectors shall be supplied with mounting bases. Mounting base shall be identical for all type of detectors except special application detectors such as linear beam detectors etc. for installation as well as cable connection. Detector housing (body and cover) shall be made up of damage resistant, fire resistant polycarbonate and shall be suitable for either surface or recess mounting. Detector base shall be mounted on Junction boxes having terminals for cable termination. Where installation is included in vendor's scope, equipment such as GI conduits, GI junction box/conduit box etc. shall also be included in vendor's scope. |
| 12.1.3 | Detectors shall be suitable for storage at ambient condition specified in data sheet. |
| 12.1.4 | Detectors, which employ Radio Active source, shall be such that the strength of the Radio Active material shall not exceed 1 micro curie or as per latest standard whichever is less. |
| 12.1.5 | All detectors shall be on the approved list of LPC, UL / FM/ equivalent international approving agency as applicable. |
| 12.1.6 | All detectors shall be suitable for operation at DC power supply extended from fire alarm panel. |
| 12.1.7 | The addressable detectors shall be continuously monitored to measure changes in their sensitivity due to the environment (dirt, dust, temperature, humidity etc.). These detectors shall give an advance indication to the panel regarding the need for maintenance. The analogue reading sent by the detectors shall be sensed and if there is a rapid increase, an alarm shall be generated. However, if there is a gradual increase in the analogue reading, a maintenance alert shall be generated by the fire alarm panel. It shall be possible to generate maintenance reports from the fire alarm panel. For the addressable detectors two-wire operation shall be possible. |
| 12.1.8 | All addressable detectors shall have selectable settings for pre-alarm and alarm and preferably have the facility to set the sensitivity and address from the fire alarm panel. |
| 12.1.9 | Manual call points / break glass boxes for microprocessor based fire alarm system shall be addressable type. Each device shall have its own address module. |
| 12.1.10 | All addressable detectors shall be suitable for installation using fault tolerant wiring (class-A, style - 6 wiring as per NFPA72). T- Tapping shall not be permitted in the case of such wiring. |
| 12.1.11 | All detectors must have insect screen to prevent entry and cause false alarm. |
| 12.1.12 | All field devices shall be from the latest generation in the manufacturer's range of products. Commonly used field devices are listed below. The specification given shall be considered as the minimum requirements. |
12.2 Heat Detectors

12.2.1 Heat detectors shall use negative temperature coefficient thermisters for sensing and for reference. The detector shall be designed to give a response that depends on both absolute temperature and rate of rise in temperature.

12.2.2 The rate of rise element shall be carefully calibrated to ignore any normal fluctuation in temperature, but to respond quickly when the temperature rise is 9°C or more per minute.

12.2.3 The fixed temperature feature should be entirely independent of the rate of rise element. The operating temperature of fixed temperature element should be factory set at 57° C ± 5° C.

12.2.4 The detector shall be self-restoring type ensuring repeated use and easy maintenance.

12.3 Ionization Smoke Detector

12.3.1 Ionization smoke detector shall be solid-state type, working on ionization principle and shall preferably be of dual chamber and dual source type.

12.3.2 The detector shall be able to sense incipient fire by detecting the presence of visible and invisible products of combustion like wood, paper, ammonia processing paper, cloth, PVC, bakelite, nylon, foam, acrylic, thermocol, Photo film, nylon, polyester, painted sheets, Teflon, leather etc.

12.3.3 The sensitivity of the detector shall not vary with change in ambient temperature, humidity, pressure or permissible voltage variation. Its performance shall not be affected by an air current of 5 m/sec. It shall have an inbuilt arrangement such that puffs of smoke or hot air pockets do not inadvertently trigger the alarm. The detector shall be protected against dust accumulation/ ingress. It shall have insect resistant screen to prevent nuisance alarms.

12.3.4 Where air velocity is expected to be higher, smoke guard/ baffle shall be used.

12.3.5 Where specified, smoke detectors operating on laser diode principle shall be offered.

12.4 Photo Electric / Optical Smoke Detector

Photo electric/ optical smoke detectors shall work on the principle of light scattering utilizing a light emitting diode.

12.5 UV Flame Detectors

12.5.1 UV flame detectors shall work on the principle of a vacuum photodiode tube to detect the UV radiation that is produced by a flame.

12.5.2 UV flame detectors shall respond to ultraviolet rays of a flame. The detector shall not be actuated by artificial lights, sunlight incident through a windowpane or welding arc. False alarm check circuit shall be incorporated to prevent false alarm due to intermittent flash or lightning.
12.6 **IR Detectors**

12.6.1 IR detectors shall work on the principle of a single wavelength infrared flame detector using one of several different photocell types to detect the infrared emissions in a single wave length band that are produced by a flame.

12.6.2 IR detectors shall react to the infrared rays of a flame. It should be sensitive enough to detect smoky fires in which flame is hardly recognizable. The detector should not react to extremely glaring artificial light or direct sunlight. The detector shall be completely solid-state type.

12.6.3 Where specified combination UV-IR detector shall be used.

12.7 **Linear Beam Detector**

12.7.1 Linear beam detector shall work on the principle of obscuration of infrared light beam by particles of smoke. The sensitivity shall be such as to enable operation at 30% to 500% obscuration.

12.7.2 Linear beam detector shall consist of separate transmitter and receiver. Linear beam detector shall be suitable for application in high roofed locations such as warehouses etc. The detector shall, preferably, be powered from the loop signal itself. However, if external power supply is required the same shall be explicitly stated by the vendor, which shall be covered under common power supply for the fire alarm panel and devices connected with it.

12.8 **Heat Sensing Cables**

12.8.1 Heat sensing cable shall be analogue type. It shall consist of four copper conductors, each covered with a colour coded, negative temperature co-efficient material. The cores shall be twisted together and protected by an outer sheath of high temperature, flame retardant PVC insulation. External mechanical protection shall be provided over the sensor cables. Vendor shall provide control unit for each 100 m length of the sensor cable.

12.9 **Manual Call Point (MCP)/ Break Glass Unit (BGU)**

12.9.1 Manual break glass unit shall be fabricated out of 14-gauge cold rolled sheet steel. Alternately the break glass unit may be made of die cast aluminum alloy such as LM6. It shall have IP-55 enclosure and weatherproof construction suitable for outdoor installation. The break glass unit shall have a minimum dimension of 100x100x80mm.

12.9.2 The box shall be fabricated in such a way it can be mounted flush to the wall or on the surface without any modification. Two nos. 19 mm knockouts shall be provided at the bottom of the box to facilitate cable / conduit entry. The glass shall cover at least 30cm² area and shall have a thickness not exceeding 2mm.

12.9.3 The box shall have a push button element kept in pressed condition by a glass sheet fitted in the front of the box.
12.9.4 The enclosure shall be painted with fire red colour (shade 536 of IS-5) epoxy painting and an inscription "Break Glass in case of Fire", shall be painted in white letters or riveted on the enclosure by a steel nameplate. A suitable nickel-plated brass hammer, duly chained to the box with stainless steel chain shall be provided with each box for breaking the glass. Each box shall have a distinct identification number boldly painted on it.

12.9.5 If specified in the data sheet, the BGU shall have a suitably wired telephone hand set to facilitate communication between the BGU and the central annunciation panel. Telephone hand set mounted on hook switch shall be housed in a separate lockable weatherproof break glass window enclosure. The glass will be broken in case of fire with the hammer provided with the BGU.

12.9.6 Hazardous area Break Glass Units shall meet the requirement of clause 13 of this specification.

12.10 Response Indicator

12.10.1 If specified in the data sheet, response indicators shall be provided suitable for wall/ceiling mounting. Response indicator shall be provided where the detector is located either above false ceiling or below false floor or where detectors are not directly visible. The response indicators shall be connected to the detectors directly and shall be complete with terminal blocks suitable to accept cables with up to 1.5mm² copper conductor. In the normal state of detector, the LEO shall flicker, but in the event the detector goes into alarm condition, the LEO shall glow steadily. LEOs shall be red in colour with 5mm dia. as a minimum.

12.10.2 Use of Response indicators in addressable system is not envisaged unless otherwise specified in data sheet.

12.11 Exit Signs

12.11.1 Exit signs shall be fabricated out of 1.6mm thick cold rolled sheet steel. This shall be suitable for wall mounting or suspension from ceiling. Exit signs suspended from the ceiling shall have text/direction printed on both the side of exit sign.

12.11.2 Fire exit shall be displayed by means of 5mm dia LEOs or backlit text. It shall be powered from the fire alarm panel. Exit sign shall operate on DC power supply 12.11.3. The exit sign shall be either in red letters on white background or white letters on green background.

12.11.4 Where specified in data sheet, self-luminous exit sign shall be provided.

12.12 Hooters

12.12.1 The unit shall consist of solid-state circuitry on a printed circuit board, a loudspeaker and a flashing lamp housed in a weatherproof dust tight, wall mounting type enclosure. The hooter shall, at least, have 102 db (A) output measured at 1-meter distance. The unit shall be powered from the fire alarm panel and operate on DC power. In the event of fire, the hooter shall raise pulsating audio alarm and the lamp shall start flashing.
12.12.2 HAB shall be provided at exit doors of buildings to mute the hooters after evacuation.

12.13 **Flashing Lights (Beacon)**

12.13.1 The unit shall consist of solid-state circuitry on a printed circuit board and a red-capped incandescent lamp and audio unit housed in a dust tight, wall/ceiling mounting type enclosure. It shall derive power from the DGFAP ZFAP and shall operate on DC supply.

12.13.2 Flashing lights shall be installed in the enclosed areas where clean agent/CO₂ is to be released.

In the event a signal for clean agent/CO₂ release is given, the lamp shall start blinking with a warning sound enabling operating personnel to evacuate the area. The audio unit (hooter) shall have 102 db (A) output measured at 1-meter distance.

12.14 **Clean Agent / CO₂ Release and Inhibit Switches**

12.14.1 This unit is required to be provided at the exit of the protected buildings/rooms. If specified, this unit is integrated with DGFAP ZFAP. This shall consist of pull type release and inhibit switches clean agent /CO₂. The unit shall be fabricated out of 2mm thick cold rolled sheet steel suitable for wall mounting. Switches shall be pulled to release or inhibit clean agent /CO₂. Release switches shall have inscription:

"PULL TO RELEASE CLEAN AGENT / CO₂"

And inhibit switches shall have inscription:

"PULL TO INHIBIT CLEAN AGENT / CO₂"

12.15 **Zener Barrier**

12.15.1 Preferably flameproof (Ex'd') equipment that does not require the use of Zener barrier shall be used. When necessary, intrinsically safe (Ex 'i') detectors and MCPs, Zener barriers shall be provided. These shall be located in unclassified/non-hazardous areas.

12.15.2 Normally not more than 10 detectors shall be connected to one zener barrier. However vendor shall indicate maximum number of detectors/ MCPs that can be connected to one Zener barrier without compromising on working of loop/zone. Vendor shall also indicate the maximum loop length from zener barrier considering 1.5 mm² copper conductor, screened cable.

12.15.3 In case loop length permits, zener barrier shall be located at DGFAP itself else it shall be located in safe area nearest to the detector/ MCP.

12.15.4 Wherever zener barriers are provided in safe area outside the Zonal panel or DGFAP, these shall be housed in their own enclosure with IP-55 degree of protection as a minimum.

12.16 **Fault Isolator**

12.16.1 Fault isolator shall be installed, if specified in the data sheet.
12.16.2 Fault isolator shall be designed to provide short circuit protection to an addressable detector loop. It shall be possible to wire the fault isolator at any point in the detector loop.

12.16.3 On occurrence of a fault (short circuit), the isolator shall cut power to all devices installed between the two isolators minimizing the outage of all the detectors in a loop.

12.16.4 The fault isolator shall have the capability to continuously check the faulted side of the loop to determine if the fault still exists. On rectification of the fault, the isolator shall automatically reset itself.

12.16.5 Fault isolator modules shall be housed in an enclosure having IP-55 degree of protection as a minimum. If located in hazardous area, it shall also be tested and approved for use in area classification defined in the data sheet.

12.17 Sirens

12.17.1 Sirens shall be industrial type with minimum 2.5 km unidirectional range (i.e. 5km diametrical range) against the wind direction.

12.17.2 The decibel level of the siren shall, at least be 132 db(A) at 1 meter, to meet the audibility requirement for the above range. Unless otherwise specified, Sirens shall operate at 415 V, 3 ph. AC supply. Sirens shall be housed in weatherproof enclosure. Starter shall be DOL and shall be housed in a separate IP55 enclosure suitable for installation indoor/ outdoor.

12.17.3 For three-phase siren, wall-mounting type three-phase DOL starter shall be supplied. Starter shall be mounted indoor in a building where siren is located. The supply to the siren starter shall be provided by purchaser from Normal or Emergency power source as defined in the data sheet.

13.0 FIELD DEVICES FOR HAZARDOUS AREA

13.1 Hazardous area is classified as Zone 1/ Zone 2, gas group IIA/ IIB or IIC, temperature class T3 (200 DC) as specified in data sheet. The field devices shall be suitable for installation in hazardous area as per specified area classification.

13.2 Field devices such as detectors, MCPs, fault isolators, Beacons, hooters etc for use in hazardous area, if specified in the data sheet shall have flame proof enclosure conforming to IS 2148. All equipment for hazardous area installation shall be complete with flame proof, weather proof cable glands as specified in clause 11.5.

13.3 Equipment, which cannot have flameproof construction, shall be intrinsically safe in design and shall be used with Zener barriers located in safe area.

13.4 Equipment that are tested / certified by a recognized test laboratory of country of origin shall only be offered. The vendor shall possess valid test certificate issued by a recognized independent test house such as CMRI/ BASEEFA/ UL/ FM or Equivalent for the offered equipment.

13.5 All equipment (indigenous or imported) shall have valid statutory approval as applicable for the specified hazardous location from CCE or any other applicable statutory authority.
All indigenous flameproof equipment shall also have valid BIS license and corresponding marking as required by statutory authority.

13.6 A separate name plate shall also be provided on each equipment to indicate details of testing agency, test certificate number with date, statutory approval number with date, approval agency, BIS license number with date, applicable gas group, temperature class etc. The nameplate shall be riveted/ fixed with screws and not pasted. In case above information are embossed on the enclosure, the same need not be repeated.

14.0 ENGINEERING REQUIREMENTS

Unless specified otherwise, vendor shall design entire fire alarm system including design of system architecture with details of integration, cabling requirement and protocol selection etc. Vendor's scope shall also include basic design and preparation of layouts for fire alarm system for plant/ buildings as specified in the data sheet/ purchase documents.

14.1 Conventional Fire Alarm System

i. For conventional fire alarm system, purchaser shall provide typical block diagram. On this basis, vendor shall prepare detailed drawing giving various system component details. The design and engineering shall include sizing and selection of various equipment such as fire alarm panels, batteries, battery chargers, field equipments, siren/ siren starter etc. including preparation of G.A. drawings of various equipment.

ii. The layout engineering for buildings shall include the drawings showing location of MCP/ Detector and other field devices, cable schedules, interconnection diagram, equipment installation drawings etc as minimum.

14.2 Addressable Fire Alarm System

i. Vendor shall develop a system architecture based on purchaser's requirement showing details of various network elements such as DGFAP, CFAP, Work station, networking hardware, redundancy, protocols, data highway etc. including the maximum permissible loop length and length of data highway.

ii. The design and engineering shall include sizing and selection of various equipment such as fire alarm panels, batteries, battery chargers, field equipments, siren/ siren starter etc. including preparation of G.A. drawings of various equipment.

iii. The layout engineering for buildings shall include the drawings showing location of MCP/ Detector and other field devices, cable schedules, interconnection diagram, equipment installation drawings etc. as minimum.

iv. The parameterization facilities of various field devices along with the geographic mimic, annunciation, text messages etc shall be available on the fire alarm panel.

15.0 INSPECTION, TESTING AND ACCEPTANCE

15.1 All the equipment shall be tested to the defined specifications as per mutually agreed test plan/ FAT procedure, which shall be submitted and got approved from Purchaser at least one month before inspection. PMC/ Purchaser's inspectors shall witness all the tests.
15.2 During manufacture, the equipment shall be subject to inspection as per attached inspection plan to assess the progress of work and to ascertain that the quality controls are being maintained. Vendor shall provide all necessary assistance and information concerning the supply to PDIL/Purchaser's inspectors.

15.3 Tests shall be carried out at the vendor's works under his care and expense and Purchaser shall be informed at least 4 weeks in advance regarding this.

15.4 FAT shall include simulation of operational field conditions and test for functional adequacy. Besides all routine, and acceptance tests specified by applicable codes and standards, shall be performed on the complete system.

15.5 For bought out items, the routine and acceptance tests shall be conducted at the respective equipment manufacturer's works.

15.6 At the time of inspection, vendor shall produce original of all the type test certificates, test and approval certificates for hazardous area equipment from testing and approving authority and any other certificates as required from statutory authority for the review of inspectors.

15.7 Vendor shall submit a SAT procedure for PMC/ Purchaser's approval. All equipment and systems shall be tested at site as per the approved SAT procedure.

15.8 SAT shall be conducted by vendor after the entire fire alarm system is installed and interconnected by cables. These tests shall establish the operational correctness of the system. Vendor shall rectify deficiencies noticed during SAT with no commercial implication to Purchaser including replacement of system components and supply of new component for making system successfully operational.

16.0 PACKING AND DESPATCH

All the equipment shall be divided into several sections for protection and ease of handling during transportation. The equipment shall be properly packed for selected mode of transportation i.e. by ship/rail or trailer. The panels shall be wrapped in polythene sheets before being placed in crates to prevent damage to finish. Crates shall have skid bottom for handling. Special notations such as 'Fragile', 'This side up', 'Center of gravity', 'Weight' etc., shall be clearly marked on the package together with Tag nos., Purchase order Nos. etc. The equipment may be stored outdoors for long periods before erection. The packing shall be completely suitable for outdoor storage in areas with heavy rains/ high ambient temperature.

17.0 INSTALLATION AND COMMISSIONING

Where installation of the system is included in the scope of the vendor, vendor shall arrange all necessary manpower and equipment required for the same. Commissioning of the complete system is to be carried out by vendor in all cases irrespective of whether the installation was performed by vendor or not. All tools, test equipment etc. for the successful commissioning of the system shall be arranged by the vendor. Only the cabling specifically excluded from vendor's scope shall be installed by others. However, termination at panels for purchaser's cables shall be done by the vendor.

18.0 TRAINING

The vendor shall provide, free of cost, comprehensive training to Purchaser's personnel on various operation and maintenance aspects of the Fire Alarm system as agreed during ordering.

TRAINING REQUIREMENT

LSTK contractor shall arrange training for owner's personnel at vendor works in India. Different type of courses shall be offered for operation/process engineers and operators, instrument maintenance engineers and technician. Vendor shall indicate a detailed proposal for training in the offer. Travel and living expenses of the owner's personnel shall be borne by the Owner.

LSTK vendor to ensure proper and sufficient hardware and software equipment necessary to conduct the training are available at vendor works/site. Also detailed manual covering the entire course details in hard and soft form is provided to each of the trainees.

The instructor-designate shall have minimum of six months of formal class-room instructor experience and must have complete and thorough technical knowledge of the equipment and system supplied including programming, maintenance and operation.

The requirements of training for owner (one group consisting of operators and other group consisting of hardware/software maintenance engineers) in the operational software and diagnostic programs, are set forth herein.

These training is to be provided, if applicable.

LSTK vendor shall also be responsible for any other requirements necessary to train the engineers deputed by owner within a time limit so that they acquire the necessary expertise to operate and maintain the instruments / systems equipments supplied.

Vendors lumpsum quote shall include training at OEM works (India). However vendor shall also furnish unit rate for training at OEM’s works and site for any addition / deletion purpose.
SUPERVISORY CONTROL PANELS, SUPERVISORY CONTROL DESKS, EQUIPMENT PANELS

1.00.00 PANEL AND DESKS

1.01.00 GENERAL REQUIREMENTS

All DDCMIS system modules, power supply components, other control devices (except field mounted sensors/transmitters) and required for completeness of the system shall be housed in cabinets furnished by the Bidder. All equipment and dedicated cabinets required for termination, marshalling and proper interface within Bidder’s system and also with other systems shall also be provided by the Bidder.

The cabinet mounted equipments shall be fully assembled, installed in mounting racks, wired and fully tested as per specification requirements and Purchaser approved drawings in the manufacturing works of a qualified manufacturer prior to shipment to the project site. The Bidder shall ensure that the cabinets are complete and ready for installation before dispatch from manufacturing works. The installation work at project site for these cabinets should only involve connections through multi pair cables from marshalling cabinets (wherever provided) to system cabinets and inter-cabinet/cabinet to UCD/UCP.

The Control cabinets shall house all types of modules / hardware to achieve all functions of Control System including signal conditioning modules, controller modules, I/O modules, communication controller modules and all other requisite hardware for a complete system.

1.02.00 SUPERVISORY CONTROL PANELS AND DESKS

1.02.01 Control Desks

Supervisory control desks shall be supplied for mounting 6 no.s of works stations and keyboards. Also control desk will be provided for balance work stations – located in computer room, supervisor room etc. All furniture including chairs and tables for printers etc. shall also be provided by the bidder.

Care shall be taken to ensure ergonomically aspects so as to create ergonomically ideal work place considering physical aspects such as an average Indian person’s size and reach, physiological aspects such as line of sight and field of vision and cognitive factors such as concentration and perceptivity. Extreme care shall be taken to design the desks with correct angles and dimensions.
Control Desk for programmer's, Maintenance Engineer's & diagnostic OWSs:-

Required numbers of control desks for accommodating programmer's/maintenance engineer's/diagnostic etc shall be supplied. These shall preferably have the same dimension as that of supervisory control desks.

Two sets of Push buttons for (a) acknowledge, (b) reset and (c) lamp test shall be provided by the side of OWS consoles (one set for SG and one set for TG).

**Desks for accommodating printer:**

Adequate number of table/desks/stands for accommodating printers in bidder's scope shall be supplied. Each printer shall be on a separate table / stand.

**Supervisory Panel Unit Control Panel**

The Unit Control Panel shall be provided to accommodate instruments such as Annunciation windows, PB Stations, A/M stations, Indicators, switches, EWLI, etc and backup consoles for BTG integral control to be mounted on mosaic portion, which are required for emergency operation.

(Exact service will be worked out during detailed engineering)

**1.03.00 TERMINATION CABINETS**

Termination cabinets for the system shall be supplied for terminating all cables originating from the field and for distributing the signals to different functional panels and cubicles.

Incoming cables from the field shall be terminated in suitable terminal blocks in logical sequence.

Prefabricated cables with plug in connectors at both ends shall be used for extending the signals to the functional panels. Matching plug sockets shall be provided in the termination cabinets for terminating the plugs.

The cabinet shall have internal illumination lighting fixtures.

Terminal blocks shall be located inside the cabinets on support wings fabricated of metal plates.

The plug socket shall be mounted on hinged plates to provide an access to the rear pins of the plugs.

General features of termination cabinets and accessories shall conform to the general design and construction specification of panels. Terminal blocks shall be WAGO, Phoenix make.
1.04.00 CONSTRUCTIONAL FEATURES OF PANELS, CUBICLES & ENCLOSURES

All panels, cubicles, consoles and enclosures furnished as per this specification shall be of free standing type and shall be constructed of specified gauge of steel plates. The panel sheet thickness shall be not less than 2 mm unless otherwise specified herein.

The panels, consoles/desks shall be reinforced as required to ensure true surfaces and adequate support for instruments mounted thereon. All instrument cutouts, mounting studs, and support brackets shall be accurately located. All welds on the exposed panel surfaces shall be ground smooth. Finished panel surfaces shall be free from waves, bellies, or other imperfections. Unless specified, otherwise, panel doors shall be hinged and shall have turned back edges and additional bracing where required to ensure rigidity. Door hinges shall be of the concealed type. Door latches shall be of the three-point type to ensure tight closing. Door locks shall be furnished which will allow actuation of all locks by a single master key. All panels shall have removable lifting eyebolts for safe lifting from top during storage and installation handling.

Cabinet doors shall be hinged and shall have turned back edges and additional braking where required ensuring rigidity. Hinges shall be of concealed type. Door latches shall be of three-point type to assure tight closing. Detachable lifting eyes or angles shall be furnished at the top of each separately shipped section and all necessary provisions shall be made to facilitate handling without damage. Front and rear doors shall be provided with locking arrangements with a master key for all cabinets. If width of a cabinet is more than 800 mm, double doors shall be provided.

All panels shall be mounted on vibration dampers, which are secured to channels mounted on the floor. The channels shall be field welded to steel plates set into the concrete flooring. The steel plates shall be located such as to approximate the outline of panel bases. The exact mounting details shall be as approved by the owner during detailed engineering stage. All panels shall be provided with adequate ventilation and packaging density of components shall be restricted so as to limit the temperature rise above ambient to 10°C under the worst conditions. All panels shall have auto on/off switch for internal lighting.

Exhaust Fans with louvers & filters shall be provided in all consoles and panels.

All the panels shall be equipped with Anti vibration pad of min. 15 mm size.

Doors shall be provided with neoprene gasket only.
**1.05.00 SURFACE PREPARATION AND PAINTING**

All panel exterior steel surfaces shall be ground smooth, and painted as specified below:

Suitable filler shall be applied to all pits, blemishes and voids in the surfaces. The filler shall be sand blasted so that surfaces are level and flat, corners are smooth and even. Exposed raw metal edges shall be ground burr free. The entire panel surface shall be sand blasted to remove rust and scale and all other residue due to the fabrication operation. Oil grease and salts etc. shall be removed from the panels by one or more solvent cleaning methods. Alternatively 7 tank process shall be followed.

Two spray coats of inhibitive epoxy primer – surface shall be applied to all exterior and interior surfaces, each coat of primer surfacer shall be of dry film thickness of 1.5 mil. A minimum of two spray coats of final finish colour (Catalysed epoxy finish) shall be applied to all surfaces of dry film thickness 2.0 mil. The finish colours for exterior and interior surfaces shall conform to the following shades:

a) Exterior - RAL 7032.

b) Interior - Glossy white two coats with fire resistant paint

Paint films, which show sags, checks, blisters teardrops, fat edges or other painting imperfections shall not be acceptable and if any such defects appear, they shall be repaired by and at the expenses of the Bidder.

**1.06.00 PANEL WIRING**

Interconnecting wiring shall be provided between all electrical devices mounted in the panels, and between the devices and terminal blocks if the devices are to be connected to equipment outside the panels. The Bidder shall install jumpers between terminal blocks as indicated on the Owner’s schematic diagrams. All alarm contacts located within a panel shall be wired to terminal blocks. Thermocouple and other special circuits shall be field wires direct to instrument terminal blocks without the use of panel wiring.

All control and instrument wiring used within the panels shall confirm to NEC and NEMA standards and shall be factory installed and tested at the works of a qualified manufacturer. All interior wiring shall be installed neatly and carefully, and shall be terminated at suitable terminal blocks. Sufficient clearance shall be provided for all control and instrumentation leads, and all incoming and outgoing leads shall be connected to terminal blocks suitably located for connecting external circuits. The arrangements for circuits and terminal blocks shall agree with schematic diagrams furnished by the Owner/Technical Specialist. All panel wiring shall have appropriate ferruling.
for clear identification. Interior wiring shall be so arranged that the external connections can be made with only one wire per terminal point. Any common connections shall be made internal side of the terminal blocks. Common connections shall be limited to two wires per terminal. Instrumentation cable shield wires shall be connected to separate terminal at the terminal block.

Signal circuit shields shall be grounded at the power supply end only or as recommended by manufacturer.

All internal wiring (except low level instrument wiring) shall be National Electric Code Type SIS, Polymeric/Elastomeric insulated, 1.5mm² tinned copper stranded conductor, switchboard wire, or owner approved equal.

Panel wiring shall have a flame resistant insulation with adequately sized copper conductor based on current carrying capacities as etc forth by the National Electric Code.

Wire sizes shall be as specified herein and suitable for intended applications.

Wiring to door mounted devices shall be provided with (49 strand minimum) adequate loop lengths of hinge wire so that multiple door openings will not cause fatigue braking of the conductor.

Wiring shall be arranged to enable instruments or devices to be removed and/or serviced without unduly disturbing the wiring. No wire shall be routed cross the face or rear of any device in a manner, which will impede the opening of covers or obstruct access to leads, terminals or devices.

Panel wires shall be identified with wire number and each termination by means of Action craft products split sleeve or Borden Chemical Co. indelible tubing markers or owner approved equal. Corrections and modifications of all panel wiring shall be Bidder’s sole responsibility. Any corrections/modifications required at site for successful commissioning shall be done by the Bidder without any additional costs. Terminal lugs furnished must be of the compression, insulated sleeve, half ring tongue type. Open-ended terminal lugs will not be accepted. Wires shall not be looped around the terminal screws or studs.

Wires shall not be tapped or spliced between terminal points.

Panels, cabinets, consoles/desks will be provided with removable, gasketed cable gland plates and cable glands, for all floor slots used for cable entrance. Split type grommets shall be used for prefab cables.

Internal wiring in factory prewired electronic systems cabinets may be installed according to the Bidder’s standard as to wire size, insulation, and method of termination on internal equipment except that insulation for all wiring power supply wiring, and interconnecting cables between devices shall pass the following tests.

a) Flammability test IEEE 383/1974
b) When tested under UITPP test method or ASTM 2893/77 light transmittance of 80%
c) When tested under IEC 754-1 maximum acid gas generation shall be 2% by weight
d) Oxygen index not less than 30 as per ASTM D 2863.

All terminations for intra panel wiring inter panel cabling and connecting the Bidders panels, PB stations, control stations etc. shall be with Wago / Screwed connections. Soldered connections are not acceptable. All field side or external input connections shall also preferably of Wago / Screwed connection.

Identification of conductors may be done by insulation colour coding identified on drawings or by printed wiring lists. Terminal blocks for connection of external circuits in to factory prewired electronic system cabinets shall meet all the requirements as described elsewhere in the specification. For all multicore cables, the outer sheath shall satisfy the properties identified above. However, for panel wiring, the wiring insulation shall also satisfy the properties identified above. The internal wiring shall be done in coloured wiring.

1.07.00 INSTRUMENTS MOUNTING

1.07.01 Instruments and relays mounted on the panels shall be easily accessible for repair and replacement without disturbing other equipment their connected wiring. No special tools shall be needed for the purpose.

1.01.00 PANEL ILLUMINATION

Panels shall be provided with fluorescent illuminating lamps with door switch and three (3) point 15A, 240V AC sockets with switch for maintenance purposes. These switches shall be with quick make and break mechanism.

1.09.00 FUSE BLOCKS

Where fuse blocks rated 30 amp., 250 Volts are required by the specifications or the manufacturer’s design, they shall be modular type with bakelite frame and reinforced retaining clips. Blocks shall be class H.2 pole, screw terminal fuse blocks. Blocks for other current and voltage ratings shall be similar in construction.

8.10.00 FUSES

All fuses shall be fast acting semiconductor types for AC supply and compatible to the UPS fuses. For all DC Powered devices, similarly the fuses shall be fast acting compatible to DCDB fuse provisions.

8.11.00 MOULDED CASE CIRCUIT BREAKERS
Moulded case circuit breakers used in equipment covered under these specifications shall have not less than 5000 amp. Interrupting capacity at 220 Volts DC 10,000 Amp. Symmetrical interrupting capacity at 240 Volts AC.

8.12.00 GROUNDING
All panels and cabinets shall be provided with a continuous bare copper ground bus of minimum 6 mm x 12 mm cross section. The ground bus shall be bolted to the panel structure and effectively ground the entire structure. Each Ground bus shall have provision at each end for connection of ground leaks (6 mm x 50 mm GI Flats) by suitable bolting. All system cabinets shall be brought to a common system ground by the bidder.

Each circuit requiring grounding shall be individually and directly connected to the panel ground bus by ring tongue type compression lugs. For electronic system cabinets the system ground bus shall be insulated from the cabinet enclosure and shall be separately connected to the system ground. All system cabinets shall be brought to a common system ground by the bidder.

The Bidder shall furnish his recommendations regarding grounding requirements for all equipment/systems and shall specifically indicate the deviations if any from the above requirements as a part of his proposal.

8.13.00 TERMINAL BLOCKS
For all inputs to the system emanating from the field or other systems, the bidder shall furnish terminals suitable for correct size of field cables.

8.13.01 Screw Type Terminal Block shall be as per IEC-60947-7-1 and should be made of unbreakable Polyamide 6.6 meeting V0/V2 class acc. To UL94. All metal parts including screw should be made of copper alloy and non-ferrous nature in nature. Its screw should be captive and shall have screw locking design to prevent loosening of conductor up to Vibration level of 5G. the wire shall be terminated through hollow pin type standard lug. Cage-Clamp (Spring Type) Terminal Block shall have spring made of high grade steel with front entry and suitable for wir termination with standard lug. Screw-less TB shall have two slots for shorting/ testing with clear marking provisions at centre and both sides. Both TB’s shall comply to latest ATEX and RoHS standards. Preferable makes are Phoenix contact, Wago and Weidmuller.

8.13.02 Terminal blocks shall be provided with white marking strips and re permitted by the safety codes and standards shall be without covers.

8.13.03 Fuses shall not be mounted on terminal blocks. Neither step type terminal blocks nor angle mounting of terminal blocks will be acceptable.

8.13.04 At least 25 per cent spare unused terminals shall be provided on each terminal block for circuit modifications and for termination of all conductors in a multi-conductor control cable.

8.13.05 220V AC/DC for powering the solenoids should be through terminal with fuse protection.

8.14.00 NAME PLATES AND LABELS
Name plates of adequate size shall be provided for each panel on front and rear of the panel. Instruments/other accessories mounted inside the panels shall have identification marking clearly visible from inside.

Devices to be mounted on the panels shall also be labeled on the panels shall also be labeled on the outside of the panel. Name plates shall be of phenolic sheets with white letters on black background. Name plates shall be attached to the boards by means of stainless steel panhead screws. Fuses provided for protection of various boxes shall be accessible for replacement. Fuse boxes shall be provided with circuit label and fuse rated current and voltage.

### 8.15.00 Control Room Layout

The control room layout shall be designed in line with guidelines given below. The control room shall be partitioned to different rooms to house the following equipment:

(a) Unit Control Desk (UCD), Printers, Electrical Control Panel (ECP) in the main control room.

(b) The system cabinets, marshalling cabinets and electrical auxiliary cabinets, Electrical panels & SEE panels in the electronic cubicle room.

(c) Maintenance Engineer’s OPERATING STATIONs with keyboards, printers and other peripherals in Maintenance Engineer’s Room.

(d) Uninterrupted Power Supply (i.e., inverters and distribution boards) (UPS) in UPS room.

(e) Lighting shall be designed for maximum comfort and minimisation of OPERATING STATION/LVS glare and shall be adjustable.

(f) Co-ordinated colours and material for floors, walls and ceiling shall be provided.

(g) Room designs shall absorb noise in the control room and engineers/shift supervisor room.

(h) Positively pressurised and filtered air conditioning shall be provided for all control rooms.

(i) Designs and material will be in accordance with NFPA Fire protection for Power/Electric Generating plant.

(j) All control Rooms shall be designed to minimise dust ingress. Air locks shall be provided.

(k) Double Doors and the corridors shall be of sufficient size and layout to allow access of 2750 for equipments.
(l) Fire and Smoke detection equipment shall be located in all ceilings.

(m) Temp. & humidity monitoring system in each control room.

(n) Air Curtains at each entrance to Main Control room.

8.15.01 Item (a) to (d) referred above shall be mounted in an air-conditioned control room having false roof and false flooring. The control room will be partitioned with glass between the following rooms:

(a) Main Control Room and Maintenance Engineer’s Room.

(b) Maintenance Engineer’s Room and Electronic Cubicle Room

(c) Electronic Cubicle Room and UPS Room.

In additions to above following rooms shall be provided at operating floor-

1) Training/Meeting Room/ Conference Room.

2) Equipment Storage Room.

3) C & I Maintenance/laboratory Room.

4) Shift Supervisor room.

5) Documentation Centre for storage for all Plant O & M manuals, control system software backup, & all others operating / maintenance files, logs, records etc.

6) Toilets/refreshing room.

8.16.00 ASSEMBLY AND INSPECTION

As soon as the panel’s fabrication is over, Owner shall inspect the panels and further work on the panels, namely assembly, wiring and assembly of components shall be carried out only after the inspection.

8.17.00 DOCUMENTS TO BE FURNISHED ALONG WITH THE BID

i) Complete B.O.M.

ii) Dimensional drawings of control panel, supervisory control desks and other desks & stands indicating the dimensional details.

iii) General layout drawing of mosaic control panel (front view) indicating general arrangement of equipments and instruments mounted therein.

iv) Filled in data sheets as per section no.13.00.00.
8.11.00 DOCUMENTS TO BE FURNISHED BY BIDDER AFTER THE AWARD OF CONTRACT (DURING DETAILED ENGINEERING)

i) Complete B.O.M.

ii) Dimensional drawings of control panel, supervisory control desks and other desks & stands indicating the dimensional details.

iii) General layout drawing of mosaic control panel (front view) indicating general arrangement of equipments and instruments mounted therein.

iv) Filled in data sheets

8.19.00 ERECTION AND COMMISSIONING

8.19.01 General Requirements

8.19.01.01 The Bidder shall furnish all construction materials tools special wiring and piping accessories, air filter pressure regulators separation chambers, junction boxes compensating cables and all other special devices required for complete installation of all control and instrument equipment furnished under this specification.

8.19.01.02 Detailed installation drawings for each equipment furnished under this specification shall be prepared by the Bidder for Owner's approval. Installation of all equipment/systems furnished by this specification shall be as per Customer/ Consultant approved drawings.

8.19.01.03 The Bidder shall co-ordinate his work with the main equipment suppliers where these instruments and devices are to be installed under these specifications. The bidder shall take responsibility for commissioning of complete control loop(s)/measurement system irrespective of the supply of the primary as well as final control element.

8.19.01.04 Any special tools kits and equipment used by the bidder during commissioning including those not quoted in his offer shall be handed over to the Owner, after commissioning.

8.19.01.05 Erection tools and test kits/instruments offered by the bidder shall be sufficient for testing, commissioning and maintenance of plant. If any additional special tools/test instruments is required/brought by the supplier during testing and commissioning, the same shall also be handed over to the purchaser without price implication.
8.19.01.06 All panels shall be re-painted at the time of handing over.

8.19.02 Codes and Regulations

All erection procedures shall conform with accepted good engineering practice and with all applicable governmental laws, regulations, codes and standards.

8.19.03 Equipment Setting and Location

8.19.03.01 All field mounted instruments and accessories shall be bracket or sub panel mounted on the nearest suitable wall or building column. The brackets, stands, supports and other miscellaneous hardware required for mounting instruments and accessories such as receiver gauges, air filter regulator sets, valve manifold etc. shall be supplied and installed. No field mounted instrument shall be installed such that it depends for support or rigidity on the impulse piping or on electrical connection to it.

8.19.03.02 Indicating type field mounted instruments shall be installed in such a way that centre of indicating dial shall be about 1600-1800 mm from operating floor level. Non-indicating type field instruments shall be installed such that operating handle of that instrument comes within 1600 mm from operating floor level.

8.19.03.03 All Temperature/Pressure Switches shall be located on a wall or building column and shall be mounted to permit ease of adjustment. The connecting capillary tubing/impulse piping shall be guarded and supported in tubing race way to protect it from damage.

8.19.03.04 All brackets, stands, supports and other miscellaneous hardware required for mounting devices shall be furnished and installed.

8.19.03.05 Any required adapting hardware such as adaptors, nipples, drilled caps etc. shall be provided for complete installation of control devices into process connections.

8.20.00 Specification For Erection Hardware

The erection hardware shall meet the following specifications:
## Impulse Piping

### i) High pressure and high temperature services
- Material: Seamless Alloy Steel
- Piping: to ASTM A335 GR.P22 and furnace region (Medium: Steam & Water)

### ii) Low pressure and low temperature services
- Material: Seamless carbon steel piping to ASTM A106 Gr.B (Medium: Steam & Water)

### iii) Low pressure and low temperature services
- Material: ERW carbon steel piping to IS 1239:1973 Heavy class System (Air, Flue gas & BCW)

### iv) Steam and Water Analysis system
- Material: Seamless stainless steel piping to ASTM A312 GR. TP-321

### v) Seamless copper tubing
- Material: ASTM B-75

## Fittings

### i) Material for socket weld fittings
- Material: ASTM A105 ASTM A182 Gr. F22 6000/3000 lbs

### ii) Dimensions of fittings
- Material: ANSI B16.11

### iii) Fittings for steam and water analysis
- Material: ASTM A182 Gr. F-321

## Valves

### i) 3-way valves
- Material: SS body/Forged CS body stellited internals and SW ends as per requirement for 2500 lb/600 lb ASA ratings.

### ii) 3-valve manifolds
- Material: FAS body/FCS body 316SS stellited internals with
NPT(F) SCRD ends for 2500 lb/1500 lb/600 lb ASA ratings.

iii) 2-valve manifolds
FCS body, 316SS stellited internals, NPT(F) SCRD ends.

iv) Isolation and drain valves
Globe valves with FAS body/FCS body, 316SS stellited internals, SW ends for 2500 lb/1500 lb/600 lb ASA ratings.

8.20.04 Condensation vessels
FAS/FCS body with NPT(F) SCRD connection and vent plugs for 2500/600 lb ASA ratings.

8.20.05 Dust separating chambers
ERW carbon steel pipe to IS-1239 Heavy Class

8.20.06 Racks and Associated Equipment
ANSI C83.9-1972

8.20.07 Code for pressure piping, welding and Hydrostatic testing
ANSI B-31.1

8.20.08 Flexible conduits with fittings
Lead coated, paper insulated, heat resistant flexible metallic conduits with necessary fittings.

8.20.09 Junction Boxes
In general junction boxes shall be designed in accordance with NEC, Article 370, paragraphs 18, 19 and 20 or equivalent standards. Junction boxes for use in outdoor or damp locations shall be of FRP material with IP 65 class protection. The enclosure shall conform to NEMA-4 with hinged door lockable type. Conduit and cable shall enter the lower portion of the box in such a manner that all terminals strips are above conduit entry points. Canopy to be provided where JB's installed in area open to sky.

8.20.10.00 Transmitter Enclosures
8.20.10.01 Transmitter Enclosures shall be free standing, enclosed type offering protection against dust, moisture and vermin. Enclosures shall be suitable for outdoor installations, in thermal Power Plants.

8.20.10.02 Instrument piping inside the enclosure shall conform to the specification and in line with typical installation drawings enclosed with the specification.

8.20.10.03 Blow down header shall be provided inside the enclosure as called for.

8.20.10.04 Bulk head connection shall be provided to receive and terminate the impulse pipes from root valves.

8.20.10.05 Instrument tubing, fittings and isolation, drain valves shall be to ANSI code for pressure piping. Piping/tubing shall be subjected to hydrostatic tests at 1.5 times maximum system pressure.

8.20.10.06 Support angles shall be provided for valve manifolds, wiring trays etc. Enclosures shall be complete with necessary bulk head fittings, junction boxes, drain header and other accessories as needed on the basis of approved hook up drawings.

8.20.10.07 Sufficient spacing among adjacent transmitters shall be maintained to offer easy accessibility and operational convenience. The enclosure shall be designed with sizes to suit the grouping and to completely include all the hardware for hooking up the transmitters to the process on the basis of approved installation diagrams.

8.20.10.08 Wiring and termination practices, painting and finishing of the enclosures shall be as per procedures stipulated under control panels.

8.20.10.09 Hydrostatic tests for piping/tubing and functional checks for correct wiring shall be carried out.

8.20.11 The typical installation drawings are enclosed in Volume-III.

8.20.12 The quality of the erection equipment used for complete instrumentation and control equipment shall meet all the requirements indicated above and quantity shall be on as required basis for the complete control and instrumentation equipment as indicated in this specification. The bidder shall indicate the lumpsum price accordingly.

2.0 DESIGN PHILOSOPHY

2.1 General

2.1.1 Piping systems shall be in accordance with Clause 1.1, which permits the use of the following specifications:

ASME B31.1 Power Piping

Materials, design, construction, testing and inspection shall be fully in accordance with the selected specification.

2.1.2 The dimensions, manufacturing tolerances and marking of ferrous and non-ferrous piping components shall conform to the applicable standards. The design shall comply with all applicable codes, laws and statutory regulations prevailing in INDIA. The Contractor shall optimize the layout with the approval of the owner and include any changes resulting from HAZOP studies and taking into consideration the following:

i) General site layout taking into account the topographical geo-technical aspect of the site.

ii) Access for maintenance and fire appliances.

iii) The interdependency of units and buildings with each other within the complex.

iv) Safety escape routes for personnel based on emergency or disaster management plans in the event of environmental upset or fire.

v) Suitable drainage system of Project site.

2.1.3 Material of construction shall be suitable for specified process duty (both normal and abnormal operations) and have a projected life and corrosion/erosion allowance in excess of minimum life of the project. Piping materials specified in piping materials specification shall be used for selection of material of construction of major services.

All materials under steam service shall be supplied with proper certificates in prescribed forms as per IBR Act.
3.0 CODES, STANDARDS AND SUPPLEMENTARY SPECIFICATIONS:

3.1 General

3.1.1 The latest edition of codes listed in clause 1.1 shall be applicable for piping system design, materials, fabrication, manufacture, erection, construction and inspection etc. For any item not covered in the list of codes and standards INDIA / International Standards / proven design may be finalized based on discussion with Owner.
   i) Steam generation plant piping as per ASME B 31.1.
   ii) Fire protection system shall be designed and installed in accordance with applicable NFPA (National Fire Protections Associations) Codes.

4.0 GENERAL DESIGN

4.1 Design

4.1.1 Flanges for process and utility piping shall be in accordance with ANSI B16.5 and ANSI B16.47.

4.1.2 Wherever possible all purchased equipment shall be supplied with flanges that comply with ANSI B16.5 & ANSI B16.47.

4.1.3 The minimum size of piping to be used in pipe-racks shall be 2” NB.

4.1.4 With the exception of equipment connections the minimum size of piping shall be ½” NPS.

4.1.5 Pipe sizes 1 ¼”, 2 ½”, 3 ½” and 5” NPS shall not be used except as connections to purchased equipment.

4.1.6 Threaded pipe nipples between headers and vent, drain and instrument isolation valves shall be Schedule 160 for CS and Schedule 80S for SS in the size range ½” to 2” NPS.

4.1.7 Piping 2” NPS and above shall be butt-welded. All weld joints in piping 1½” NPS and below shall be socket welded using socket weld fittings.

4.1.8 In Class 900 and higher pressure rating block and bleed valves shall be used for systems open to atmosphere, such as vents and drains. Piping in hazardous service shall have vents, drains and bleeds routed to a safe location. The same substances shall be vented to the flare system.

4.1.9 When a line of one material specification is connected to a line of higher material specification, the connecting line shall be constructed of the higher material specification or pressure rating up to & including the first block valve.

4.1.10 As a minimum, piping systems shall have isolation facilities as follows:
   Hazardous service and Normal service (Class 900 and above) shall have double block isolation valves with a downstream drop-out spool.
   Normal service (Class 150 to 600) shall have a valve and downstream spectacle blind.
   Generally, equipment shall have provision for isolation of piping to each equipment connection by means of valves and /or blinds as determined by service conditions.
4.1.11 Piping flexibility shall be achieved by the use of piping offsets and expansion loops whenever possible. Expansion joints shall not be used without written permission of the Owner.

5.0 DESIGN PHILOSOPHY / GENERAL CRITERIA

5.1 General Guidelines

All steam generation plant piping will be as per applicable IBR / ASME standards. All piping will be aesthetically and neatly laid on pipe racks with approved colour coding.

Piping design will be as per ASME B 31.1. All piping required for effectively connecting the steam generator with the steam, feed water, and other systems shall be provided. The piping provided shall be complete in all respects including valves, fittings, supports etc. as required. Necessary supporting materials, towers and trestles to support and anchor the pipelines at regular intervals shall be supplied. Suitable expansion loops and hangers shall be provided wherever necessary.

The correct locations of hangers and supports, with as applicable spring stiffness, shall be considered for the flexibility analysis.

Suitable expansion loops restraints and anchors shall be provided so as to ensure compliance with the applicable codes and to limit the stress and reactions to within the allowable values.

All high pressure drain or vent valves or other valves to be provided with one control & one isolating valve set, to prevent any passing of the operating valve.

- Pipe fittings like elbows, equal tees and reducers shall be as given below:
  a) For pipe size 2” NB and above shall be butt welded type.
  b) For 1 1/2” NB and below shall be socket welded type.

- Branch connections:
  a) Socket welding half coupling, as per B16.11, for size 1 1/2” NB and below.
  b) Welded branch connections with proper reinforcements for sizes
above 1 1/2” NB.
All pressure tapping for pressure applications 40 kg/cm² and above shall be of size ¾” NB with two root valves. For pressures 40 kg/cm² and less the size shall be ½” NB with one root valve. All thermo-well boss shall be one(1) inch NPT.

The design of the piping system shall be based on the ANSI B31.1 code. In addition the statutory requirements Flexibility analysis shall be made for all piping systems with operating temperatures above 100ºC. The correct locations of hangers and supports, with as applicable spring stiffness, shall be considered for the flexibility analysis. suitable expansion, loops, restraints and anchors shall be provided so as to ensure compliance with the applicable codes and to limit the stress and reactions to within the allowable values.
Drains at all low points and vents at all high points shall be provided.
All local instruments shall be located on pipelines so as to render them observable from the nearest available platform

5.2     Equipment Layout
5.2.1     Basis of Equipment Layout
Equipment Layout shall be finalized based on the following data :
 a) Plot Plan of Proposed Integrated Coal Based fertilizer Complex ( Dwg. No.-PC009-0000-0001 Sh.01)
b) P&I Ds
c) Equipment Data Sheets
d) Wind Direction
e) Safety Distance and Specific Distance mentioned in Piping Design Basis and as per statutory requirements.

5.2.2     Development of Equipment Layout
The following aspects shall be considered during development of equipment layout.
a) Process Requirement -Proper interconnection between equipment as per P&IDs to achieve the intended process parameters.
b) Economy of piping material- Minimize the quantity of costly piping.
c) Erection & Construction requirements:
Erection scheme and schedule of all equipment must be considered during equipment layout to have smooth erection mainly in case of tall columns, heavy equipments like thick walled reactors, space for laying tall columns, approach roads for cranes / derricks for lifting the column or reactors and requirement of special foundation / pile etc.
d) Operation and Maintenance Requirement
   - Overhead and side clearances for exchangers and pumps
Provision of exchanger’s tube bundle pulling area Horizontal & overhead clearances for easy movement of working personnel.

- Crane approaches for air coolers/fired heaters.
- Provision of catalyst loading/unloading facilities.
- Provision of monorail for pumps and exchangers
- Provision of EOT crane for compressors.
- Provision of operator’s cabin.
- All coke chambers shall be having the lift provision.

e) Similar equipment grouping - All columns, exchangers, pumps etc. should be grouped together for convenience of maintenance and safety wherever feasible.

f) The technological structures should be interconnected for easy movement of operational personnel.

g) U/G piping corridors for main headers should be marked in equipment layout for all underground piping.

5.2.3 Plant Layout & Design guidelines

5.2.3.1 General

The plant layout shall be based on ensuring adequate access, to allow construction, inspection, maintenance and operation to be performed in a safe and efficient manner. The alignment of equipment and pipe shall offer an organized appearance. The layout shall be in accordance with, but not limited to the design practices described in this criteria.

Where dynamic loading, limited pressure drop or other severe service condition applies, particular care shall be taken in routing pipe lines.

Flushing connections shall be provided on all lines containing flammable or toxic material, slurries, and materials which solidify when the line is dead. Sufficient Nitrogen purging points shall also be provided. Supply piping of fuel gas shall be arranged for equal flow distribution.

Trolley beams, pipe davits, shall be provided with appropriate removable hoists mechanism for charging and discharging catalysts, chemicals, packing rings etc.

Piping and all other services shall be arranged so as to permit ready access of Cranes for removal of Equipment for inspection and servicing.

All utility and process piping shall be located above ground, and major lines shall be located in overhead pipe ways.

The following lines may be buried providing they are adequately protected.

i) Cooling Water Lines 18" NB and larger.

ii) Potable Water Lines.

iii) Firewater mains.

iv) Drain and sewer (oily and chemical) lines from catch basin to mains and manholes.

Lines that must be run below grade, and must be periodically inspected or replaced, shall be identified on the P & ID’s; these lines must be placed in covered
concrete trenches. Sleeper-ways shall not be used in process areas where they may block access for personnel and equipment.

Fire protection system shall be designed as per NFPA and as per local law/Civil Defense requirements.

Drip legs and dead ends shall be avoided, especially for piping where solids or fluids may congeal from corrosive condensate.

Where sleeper ways are used the elevations shall be staggered to permit ease of crossing or change of direction at intersections. Flat turns may be used when entire sleeper ways change direction. Flat turns must not be used within pipe racks.

All cooling towers should have sunshades at top distribution decks to avoid algae growth. Cooling towers should be located away from process unit area, preferably downstream direction of wind. Orient the short side of the tower along the prevailing summer wind for maximum efficiency. Locate cooling towers a minimum of 30m away from process units, utility units, fired equipment, and process equipment. All cooling tower inlet headers shall be laid at the bottom of the tower with risers going to the top of individual cells of cooling tower having proper vents.

Spacing and routing of piping shall be such that expanding/contracting lines (including insulation) will not clash with adjacent lines, structures, instruments and electrical equipment during warm up and cool down.

Piping to be sloped shall be indicated on the P&I D’s.

Operator cabins shall be provided for each unit.

5.2.3.2 Pipe-Rack/T-Post/Small Portals

In general, equipment layout shall be prepared considering straight pipe rack, however other shapes like L / T / U / H / Z etc can also be considered based on area available.

The width of the rack shall be 4M, 6M, 8M, 10M or 12M for single bay having four (4) tiers maximum. In general, the spacing between pipe rack portals (span) shall be taken as 8M for main rack. However it can be decreased to 6M depending on the size/number of the pumps to be housed below pipe rack. Intermediate Beams between two portals shall be provided to support smaller pipes <= 2". 20% extra space shall be provided on the pipe rack and portals on each tier for future expansion/modifications. Water lines more than 16" shall not be routed over rack.

- Gap between two tiers of pipe rack shall be minimum 2M.
- Clearance beneath pipe rack shall be 3.8M minimum
- Road clearance shall be 9M minimum wherever heavy duty crane movement is required during construction and future maintenance.
- Road clearance shall be 7.5 M minimum for main roads.
- Road clearance shall be 5M minimum for secondary roads.
- T-Portal's width shall not be more than 2.5 meter and height shall not be less than 3.0 meter.

5.2.3.3 Towers and Vertical Vessels

Towers and vertical vessels shall be arranged in a row with common centre line, decided by the largest vessels, placing O.D. Of the equipment minimum 4M away
from the pipe rack. A minimum clearance of 3M shall be allowed between tower shells, but in any case adjacent towers shall be checked so that platforms do not overlap considering the deflection of towers (deflection of towers shall be considered minimum L/200 MM, WHERE, (L=height of tower). A minimum 100 mm horizontal gap shall also be provided between platforms of adjacent towers after deflection and that a minimum 900mm is left between tower plinths. Also the gap between vertical vessels shall allow full opening of manhole covers without restriction.

Efforts shall be made to provide interconnecting platforms at suitable levels for adjacent towers and/or adjacent technological structure etc., Interconnections where ever feasible shall be done, after taking thermal expansions of towers into consideration.

The maximum vertical distance between platforms shall be 6 m. All level switches, LGs etc including their isolation valves shall be accessible from ladders or platforms. To handle heavy items (like relief valves, blinds etc.), davit of suitable capacity to lift higher weight of safety valves/ Blind/ Internals etc. is needed. The davit shall be on the side of the vessel away from the rack. The area at grade shall be kept clear for a dropout. Davit capacity shall be minimum 1 MT.

Chemical vessels to be located close to the dosing point to the extent possible, especially corrosion inhibitors.

5.2.3.4 Re-boiler

Re-boiler shall be located next to the tower they serve except fired heater type. The elevation of re-boiler shall be as given in the P & ID’s. Horizontal thermo siphon types are usually supported by the tower and are located on the back side to be accessible for maintenance. Large vertical types may require a supporting structure which cannot be supported from the tower/column. Re-boiler piping shall be checked for pressure drop before finalization.

5.2.3.5 Horizontal Vessels

The horizontal vessels shall be laid perpendicular to pipe rack and shall be placed minimum 4M away from the pipe rack. The clearance between horizontal vessel shells shall be minimum 2M or 900 'mm clear aisle whichever is higher.

5.2.3.6 Pumps

Wherever practicable pumps shall be arranged in rows with the centre line of the discharge on a common line. In general, pumps shall be kept inside the pipe rack. However in case of smaller racks, pumps shall be kept on one side or outside the pipe rack to provide clear access under the rack as per clause 5.2.3.11.2.

Pump foundation height shall be 300 mm above H.P.P.

Gap between each pump foundation / and foundation of technical structure should be sufficient for easy removal of equipment after piping. Clearance between two adjacent pumps shall be such that clear 900 mm aisle is available.

All pumps not open to sky with motor rating >= 45 KW shall be provided with monorail. No monorail should normally be provided for pumps outside rack and sufficient space below rack shall be available for pump maintenance.
5.2.3.7 **Exchangers**

In most of the cases floating head of exchangers are placed on a line minimum 4M away from pipe rack. Shell and tube type exchangers may have a removable shell cover with flanged head. Tube pulling or rod cleaning area must be allowed at the channel end. This shall be minimum the tube bundle length + 1.5M from the channel head. In case of vertical exchanger suitable platform shall be provided below the top flange of channel or bonnet.

Minimum clearance in between two horizontal exchangers shall be 2M or 900mm clear aisle whichever is higher.

Likewise Heat Exchanger train should be suitably spaced such that shell/tube inlet/outlet piping do not foul floating Head Covers creating maintenance problem.

Hydro extractor is considered for exchanger bundle/shell removal. Monorails to be provided for tube bundle removal only for exchangers not accessible to Hydro extractor. No special bundle removal arrangement will be provided for exchangers that are open to sky. Davit shall be provided for floating head cover for all exchangers.

5.2.3.8 **Fin Fan Exchangers**

Fin fan exchangers shall be located over the main pipe rack or on technological structure.

15.0 m horizontal distance shall be maintained from furnace/heater. The width of the structure from where Air Fin exchanger assembly is supported shall be minimum 2.0m more than the Air Fin exchanger tube bundle length so that proper supporting of inlet/outlet piping manifolds can be done from the main members of pipe rack/technological structure to transfer piping load to main structural members. Monorail shall be provided at one end of air cooler platform area for lowering the gear boxes.

5.2.3.9 **Furnaces**

Furnaces are located upwind or side wind of process units to blow any combustible leaks away from the open flame. They are located minimum / 90M away from storage tanks and 30M away from control room. Vessels / reactors directly connected to furnace are exception. Furnaces shall be arranged with centerline on a common line in case of circular furnace and wherever a common stack is furnished to cater more than one furnace the stacks shall be located at the end or side which is away from the unit. In case of individual box furnaces, the edge of the furnaces on the rack side shall be matched. F.D. fans shall be located at one corner of furnace area away from equipments handling hydrocarbons. It shall be ensured that there are no working platforms within an elevation of 6.0 M below the tip of stack height inside a 25.0 M radius of the stack. However the stack height shall be governed by statutory authority

For maintenance, vertical tube furnaces must have access to permit a mobile crane to remove and replace tubing. Horizontal tube furnaces must have horizontal free space equal to tube length for tube pulling/maintenance/cleaning.
In case of bottom floor fired heaters, there shall be adequate headroom clearance underneath the furnace for removal of burners. In case of wall fired furnaces minimum 2.0 M wide platform with escape route at each end is necessary.

Pits and trenches are not permitted under furnace or any fired equipment. Underground drain points and manhole covers shall be sealed within furnace vicinity.

APHs should be located in such a way that the modules can be removed by mobile crane.

However, layout of furnaces, ID / FD fans, stacks and APH etc shall be arranged as per final approved vendor data.

### 5.2.3.10 Compressors and their Prime Movers

Two major types of compressors used in process plants:

1. Centrifugal compressors
2. Reciprocating compressors. (Vertical reciprocating compressors for any service are not acceptable).

Compressors shall be located to keep suction lines as short as possible. Drivers for compressor may be electric motor, gas engine, gas-fired turbine or steam turbines as per P& ID. The gas compressors shall be located downwind side of furnace so that leaks are not blown towards furnace. In general compressors are kept under shed. When compressors are kept under shed, sides are fully open for the low shed or partially closed from top for high shed to avoid accumulation of heavier gases in the shed.

In case of a turbine driven compressor, if exhaust steam is condensed, turbine and compressor to be located at an elevated level and condenser to be located below turbine.

A major consideration in centrifugal compressor location is the lube and seal oil console. It must be accessible from road and must be lower than the compressor to allow gravity drain of oil to the consoles oil tank.

Intercoolers are placed near compressor and are kept within/outside shed, keeping the safe distance.

Knockout pots and after coolers where used may be kept outside the shed but near compressor house.

For compressors one Electrically Operated Crane to handle heaviest removable piece shall be provided for each compressor house. Maintenance bay for compressors shall be provided. Maintenance bay shall be accessible from road to facilitate unloading of load on to truck etc. For removal of bundles of exchangers located within building monorail arrangement shall be provided.

Compressor manufacturer may be consulted for better layout and additional requirement for maintenance. However licensor’s requirement, if any, shall also be taken into consideration.

In case the compressors are located at grade level; the finished floor level for compressor house shall be 300 mm above HPP. However if the compressors are located at elevated structure the finished floor can be same as HPP.
Main Lube Oil Pump for all Turbines driven Pumps & Compressors shall be motor driven and independent. There shall be 1+1 lube oil pumps and one shall be in line and one pump shall be standby. The stand by lube oil pump shall start automatically if lube oil pressure drops below the minimum required lube oil pressure in the system. Similarly there shall be one additional lube oil pump in addition to the two pumps which shall start in case of power failure. Provision of Coast down tank shall also be made.

Lube oil pumps driven by compressor or turbine shaft are not acceptable.

Lube oil pumps /seal oil pumps shall be mounted separately. No vertical lube oil pumps/seal oil pumps mounted on Lube oil tank are acceptable.

Lube oil tank and all lube oil related piping i.e. supply and return lube oil piping shall be of SS material only.

The inter stage coolers of compressors shall be separately provided so that they can be assessed easily for any maintenance job. The inter stage coolers of compressors mounted on the same frame or below the compressor in the same frame to make it compact structure is not acceptable.

Vertical reciprocating compressor for any service is not acceptable.

The Turbine – compressor system shall be provided with duplex type lube oil filters and lube oil coolers so that at a time one lube oil cooler and one lube oil filter will remain in line and other lube oil cooler with filter shall remain as stand by.

The Turbine – compressor system shall be provided with duplex type lube oil filters and lube oil coolers so that at a time one lube oil cooler and one lube oil filter will remain in line and other lube oil cooler with filter shall remain as stand by. Duplex type filters with smooth manual change over arrangement shall be provided. Filter material shall be corrosion resistant to water in the oil. Lube oil system shall be provided with lube oil centrifuge to remove the water in the lube oil.

5.2.3.11 Clearance and Accessibility

1. Crane Access & Tube bundle pulling

Equipment, structures shall be arranged to permit crane access to service air coolers, compressors and exchangers. All exchanger tube bundles shall be "jacked out" against shell. A clear space for tube bundle removal shall be provided. Dropout bay may be considered for exchangers at elevated structures. For high pressure exchangers, shell pulling on rails should be considered.

2. Access to Pumps

Clear access of 3.8M vertically and 4.5M horizontally shall be provided centrally under main pipe rack for small mobile equipment to service pumps, wherever these are put under pipe ways with prior specific approval. Pumps outside rack shall be approachable by small cranes etc. from under the pipe rack.

3. Access to lower items to grade (lowering Area)

Clear access shall be provided at grade on the access side for lowering external and internal fittings from tall elevated equipment by providing pipe davits.
4. Layout & Access Requirements for Platforms ladders and Stairs

For providing platform staircase following guidelines shall be followed.

- Two means of access (i.e. two stair case one ladder and one stair case) shall be provided at any elevated platform which serves three or more vessels & for B/L valves operating platform.
- Platforms, stairways shall be the minimum, consistent with access and safety requirements.
- Stairway for tanks to be provided on upstream of predominant wind direction.

i) Platform at elevated structure
   - Dual access (i.e. two stair case) shall be provided at large elevated structure if any part of platform has more than 22.65M (75 ft) of travel.
   - Air coolers shall have platforms with interconnected walk-ways provided to service valves, fan motors and instruments. Access requirements shall conform to paragraph (a) above.
   - When fired heaters are located adjacent to one another, they shall have inter-connecting platforms on the upper and lower section. Inter-connecting platforms between towers may be provided taking into consideration expansion of towers.

ii) Platforms with stair access shall be provided for:
   - Location at which normal monitoring (once a day or more) is required or where samples are taken.
   - Locations where vessels or equipment items need operator attention "such as compressors, heaters, boilers etc.

iii) Platforms with ladder access shall be provided for:
   - Points which require occasional operating access including valves, spectacle blind and motor operated valves, and heater stack sampling points.
   - Man ways above grade on equipment.

iv) Ladder location
   - Wherever practicable, ladder shall be so arranged that users face equipment or platform rather than facing open space.
   - Landings shall be staggered. No ladder shall be more than 8M in one flight.

Clearances

Minimum clearances shall be as indicated in Annexure - 5.

5.3 Unit Piping

5.3.1 Basis of Unit Piping

- Piping & Instrument Diagram
- Equipment layout
- Equipment Data sheet & Setting plan
- Line list
- Instrument Data sheet
- Structural & building drawings
- Topography of the plant
- Piping material specification
- Overall plot plan
The following objective shall be ascertained during piping layout.

- Proper access to all operating points including valves, and for all orifice tapping points and instruments in particular (refer Annexure-2).
- Proper access to interrelated operating points for specific purpose and for maintenance.

5.3.2 Pipe Ways/Rack piping

5.3.2.1 Racks shall be designed to give the piping shortest possible run and to provide clear head rooms over main walkways, secondary walkways and platforms.

5.3.2.2 Predominantly process lines are to be kept at lower tier and, utility & hot process lines on upper tier.

5.3.2.3 Generally the top tier is to be kept for Electrical (if not provided in underground trench as per electrical design basis) and Instrument cable trays. Cable tray shall be laid to take care of necessary clearances for the fire proofing of structure.

5.3.2.4 Generally the hot lines and cold lines shall be kept apart in different groups on a tier.

5.3.2.5 Generally the bigger size lines shall be kept nearer to the column.

5.3.2.6 Minimum spacing between adjacent lines shall be decided based on O.D of bigger size flange (minimum rating 300# to be considered), O.D of the smaller pipe, individual insulation thickness and additional 25 mm clearance, preferably.

Wherever even if flange is not appearing the minimum spacing shall be based on above basis only.

5.3.2.7 Actual line spacing, especially at 'L' bend and loop locations, shall take care of thermal expansion / thermal contraction / non expansion of adjacent line. Non expansion / thermal contraction may stop the free expansion of the adjacent line at 'L' bend location.

5.3.3 Column / Vessel Piping Control Valves

5.3.3.1 Piping from column shall drop or rise immediately upon leaving the nozzle and run parallel and as close as practicable to vessel. Re-boiler outlet piping shall be as short as possible with minimum bends.

5.3.3.2 Piping shall be grouped as far as possible for the ease of supports and shall run on the rack side of the column.
5.3.3.3 Manholes shall be kept on the road side of the column and approachable from the platform. Platform width shall be such that minimum 1.0 M space is available beyond manhole for movement.

5.3.3.4 Piping shall be supported from cleats welded on the vessel as far as possible.

5.3.3.5 Proper guides at intervals shall be provided for long vertical lines.

5.3.3.6 Access platforms/ladders shall be provided along the column for valves and instruments. Minimum width of platform shall be 750mm clear.

5.3.3.7 For ease of operation and maintenance, column and vessels which are grouped together, shall have their platforms at the same elevation interconnected by walkways wherever feasible. However each column \ vessel shall have an independent access also. Column vessel platforms should be designed in such a way so that all the nozzles should be approachable from platforms.

5.3.3.8 Unless specifically indicated in P&ID’s control valves shall preferably be kept at grade instead of platform.

5.3.3.9 Piping intended for vacuum services shall be routed as short as possible, with minimum bends and flanged joints.

5.3.3.10 Piping support cleats shall be designed for safety valves considering impact loading during popping off.

5.3.4 **Exchanger Piping**

5.3.4.1 Exchanger piping shall not run in the way of built in or mobile handling facilities.

5.3.4.2 Wrench clearance shall have to be provided at exchanger flanges.

5.3.4.3 Piping shall be arranged so that they do not hinder removal of shell end and channel cover and withdrawal of tube bundle.

5.3.5 **Heater / Furnace Piping**

5.3.5.1 Arrange piping to permit burner removal by providing break up flanges in the piping.

5.3.5.2 Burner valves shall be located close to peep holes for operation. Piping to burners shall be arranged in such a way to give equal and sufficient quantity of oil/gas to all burners.

5.3.5.3 Only flexible metallic SS hoses shall be used for burner piping if required.

5.3.5.4 Block valves for emergency snuffing steam valves shall be located minimum 15M away from the heater, preferably on the upwind side of the heater.

5.3.5.5 Piping from various passes of heater outlet nozzles should preferably be symmetrical. Transfer line from heater to column shall be as short as possible, without pockets, free draining and with minimum bends.

5.3.5.6 No piping shall be routed in the tube withdrawal area. If unavoidable, break up flanges shall be provided in the piping for removal.

5.3.5.7 All furnaces, if they are located in the same area they should be interconnected with platforms at different locations.

5.3.6 **Pump Piping**

5.3.6.1 Pump drives shall have clear access.

5.3.6.2 Pump suction piping shall be as short as possible and shall be arranged with particular care to avoid vapor pockets.
5.3.6.3 Reducers immediately connected to the pump suction shall be eccentric type flat side up to avoid the accumulation of gas pocket. For end suction pumps, elbows shall not be directly connected to the suction flange. A straight piece minimum 3 times the line size shall have to be provided at the suction nozzle.

5.3.6.4 Pump discharge check valve if installed in vertical lines shall be fitted with a drain connection as close as possible downstream of the valve. When a suction vessel operates under vacuum, the vent connection of the pump has to be permanently connected to vapor space of the suction vessel to allow possible filling of the pump with liquid before it is started.

5.3.6.5 Unless otherwise specified T-type strainers with drain shall be used on pump suction piping for sizes 2" and above.

5.3.6.6 Y-type strainers with drain to be used for all sizes in steam services and for pump suction lines 1½ and below.

5.3.6.7 All small bore piping connected to pump (drain to OWS & CBD, seat and gland leak drain) shall have provision for break up flanges for removal of pumps.

5.3.6.8 Piping shall be so arranged that forces and moments imposed on the pump nozzle do not exceed the allowable values as per API 610 or manufacturer’s recommended.

5.3.6.9 Pump discharge should preferably be routed away from the pump rather than towards the motor side.

5.3.6.10 Pump cooling water connection shall be taken from the top of circulating cooling water header.

5.3.6.11 A minimum straight length of suction pipe is to be provided as per manufacturer’s recommendation.

5.3.7 Compressor Piping

5.3.7.1 Suction lines shall be as short as possible.

5.3.7.2 Suction piping shall have adequate flanged joints for ease of erection and maintenance.

5.3.7.3 Lube oil cooler space shall be provided such as to facilitate tube bundle removal.

5.3.7.4 All operating valves on main suction and discharge piping shall be lined on one side as far as possible.

5.3.7.5 A minimum straight length of suction pipe is to be provided as per manufacturer’s recommendation.

5.3.7.6 Piping shall be designed so that forces and moments imposed on the compressor do not exceed the manufacturer's recommendation.

5.3.7.7 Compressor suction lines between the knockout drum and the compressor shall be as short as practicable."

5.3.7.8 Where the line between knockout drum and the compressor cannot be routed without pocket, low point in compressor line shall be provided with drains to remove any possible accumulation of liquid. In no case accumulation at low point should be allowed to go towards the compressor.

5.3.7.9 Low points in the discharge line from an air compressor shall be avoided because it is possible for lube oil to be trapped and subsequently ignited. If low points are unavoidable, they shall be provided with drains. In case of reciprocating compressor, piping shall be suitably supported to avoid vibrations due to pulsating flow. Unless specific requirements of no pockets are there from the licensor, all
the piping shall run at 500 mm above grade level so that proper supports can be provided and also to minimize vibrations.

Analog study shall be carried out for complete compressor piping including suction I discharge piping as per P&ID’s and the analog study recommendations if any, shall be implemented.

5.3.7.10 Reciprocating compressor piping should not be supported from compressor shed I platform structure.

5.3.8 Relief System/blow down System Piping (CBD, OWS, FLARE)

5.3.8.1 Relief of liquids and easily condensable hydrocarbons are usually discharged to a closed system.

5.3.8.2 Wherever the inlet line size is higher than the safety valve inlet size, reducer shall be installed adjacent to inlet of safety valve.

5.3.8.3 Relief valve discharging steam, air or other non-flammable vapor or gas directly to atmosphere shall be equipped with drain and shall be suitably piped to prevent accumulation of liquid at valve outlet. Liquid phase blow down system piping connected to a closed system shall be self draining to the blow down drum. Closed blow down header shall be sloped towards the CBD drum to assure free drainage.

5.3.8.4 Liquid-vapor phase relief valves shall discharge into the flare header at an angle 45 degrees in the direction of header flow, to minimize the effect of kinetic energy and to avoid accumulation of liquid.

5.3.8.5 Pockets in the flare header and blow down system shall be prohibited.

5.3.8.6 Relief valve discharge piping shall be taken to safe location as per following. 3M above top platform of column or structure, within 6M radius for steam and 8M for Hydro carbon / toxic discharge. 25M horizontally away from furnace.

5.3.8.7 Inlet and outlet piping of pressure relief valve shall be adequately supported to take care of the thrust induced by the relief valve during popping. Reaction forces due to safety valve popping shall be ascertained in the connected piping. The effect of these forces on the piping supports and the anchors of the piping system shall be calculated to ascertain that the allowable limits at these locations are not exceeded. The supporting structure also shall be adequately designed so that when subjected to these reaction forces the supporting elements connected to piping as well as the basic .supporting structure i.e. platform members etc. are capable of withstanding them. System stresses in the inlet and outlet piping portions at safety valves also shall be kept within the allowable limits, inclusive of the distribution branching points in the inlet portion. These reactive forces shall not lead to any leakage at the flanged joints present in the system. To ascertain these necessary calculations for checking leakage at the flanged joints shall be performed.

5.3.9 Steam Piping - Indian Boiler Regulations (IBR)

Generally steam lines with conditions listed below fall in the scope of IBR.

- Lines having design pressure (maximum working pressure) Above 3.5 kg/cm² (g)
- Line sizes above 10” inside diameter having design pressure 1.0 Kg/cm² (g) & above.
- Lines with pressure less than 1.0 Kg/cm² (g) are excluded.
• Users of steam like steam tracing lines, jacket of the steam jacketed lines, 
steam heating coil within the equipment are excluded from IBR scope.

• Boiler feed water lines to steam generator, condensate lines to steam 
generator and flash drum as marked in P&I D shall be under purview of IBR.

IBR requirements (in brief)

a) All materials used on lines falling under IBR must be accompanied with IBR 
Inspection Certificate in original. Alternatively, photocopy of the original 
certificate duly countersigned and attested by local IBR inspector is 
acceptable. Whereas for indigenous supply, only IBR is the inspection 
authority.

b) Drawings like General Arrangement Drawings (GAD) and system isometrics / 
line wise isometrics of lines falling under IBR must also be approved by IBR 
authority of State in which the system is being installed.

c) All welders used on fabrication of IBR system must possess IBR welding 
qualification certificate.

d) IBR system must be designed to comply IBR regulations as well as ASME 
B31.1. All design calculations towards the same must be approved by IBR 
authority.

e) IBR approval is obtained with requisite fees payable to Indian Boiler Board of 
the State concerned.

f) Steam generators (boilers/heat exchangers) shall require exclusive IBR 
approval along with its integral piping up to the final isolation valve.

g) The discretion of IBR authority of state is final and binding for the above 
cases.

5.3.10 Steam Header & Supply Lines / steam and Condensate Systems

5.3.10.1 Steam piping shall be designed to have complete condensate removal. Drip legs 
shall be provided with steam traps at low points in the system.

5.3.10.2 All steam branch connections shall be taken from the top of the header.

5.3.10.3 Return exhaust steam / condensate lines shall connect to the top of the exhaust 
steam Condensate header.

5.3.10.4 Where block valves have been installed in the main steam header such that 
condensate can collect either side of the valve when closed, a safe means of 
draining the condensate prior to opening the valve shall be provided.

• Steam header shall be located generally on the upper tier and at one end of 
the rack adjacent to columns.

• Branch lines from horizontal steam header, except condensate collection 
points, shall be connected to the top of the pipe header.

• Isolation valves (if provided) on the branch line shall preferably be provided on 
the horizontal run and outside the pipe rack.

• All branch lines shall be drainable.

• Drip legs & steam traps shall be provided at all low points and dead ends of 
steam header. Drip legs at low points shall be closer to downstream riser and 
shall be provided to suit bidirectional flows, if applicable.

• All turbines on automatic control for startup shall be provided with a steam trap 
in the steam inlet line.

• All traps shall be provided with strainers if integral strainers are not provided.

• Steam traps discharging to atmosphere shall be connected to storm water 

drain/storm sewer, in case of open system. In case of condensate recovery, 
traps shall discharge into condensate header.
• Expansion loops are to be provided to take care of the expansions within units.
• Wherever condensate is to be drained, proper condensate draining facility shall be provided.

5.3.11 Steam Tracing

5.3.11.1 Tracers for the individual lines shall be supplied from manifolds when there are two or more connections. Steam supply headers shall be located on continuous platform along the rack. No steam supply station shall be located at grade.

5.3.11.2 Standard module for steam distribution and condensate collection manifolds with integral glandless piston valve and thermostatic steam trap shall be used. Number of tracers shall be 4/8/12 and tracer size 0.5” NB to .75” NB depending upon the detail engineering requirement. 20% or minimum 2 no. tracer connections shall be kept spare for future use for both steam supply and condensate collection manifolds.

5.3.11.3 All manifolds shall be installed in vertical position and manifold size shall be 3” NB for conventional and 1 ½” NB for compact type.

5.3.11.4 For steam tracing balanced pressure thermostatic steam trap with 40 mesh SS strainer to be used.

5.3.11.5 Manifolds shall be accessible from grade or from a platform.

5.3.11.6 Pockets in steam tracers shall be avoided as far as possible.

5.3.11.7 Tracers shall be limited to the following run length upstream of traps:

<table>
<thead>
<tr>
<th>Size of tracer</th>
<th>Length of tracer pipe (Meters)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Steam operating pressure</td>
<td></td>
</tr>
<tr>
<td>20 psig</td>
<td>50 psig</td>
</tr>
<tr>
<td>30</td>
<td>45</td>
</tr>
</tbody>
</table>

Tracers shall generally be of 0.5”. Tracers shall be of CS steel seamless pipe and valves on the steam tracing circuit including steam station block valve shall be glandless piston type construction. Heat transfer cement shall be applied in between main pipe and tracer pipe to improve heat transfer.

5.3.11.8 Size of the lead line to manifold shall be as follows:

<table>
<thead>
<tr>
<th>Number of connections</th>
<th>Size of Lead Line</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>3/4”</td>
</tr>
<tr>
<td>3</td>
<td>1”</td>
</tr>
<tr>
<td>4-6</td>
<td>1 1/2”</td>
</tr>
<tr>
<td>7 -12</td>
<td>2” NB</td>
</tr>
</tbody>
</table>

The lead line to manifold, manifold up to the block valves of individual tracer shall be carbon steel of IBR quality and conforms to IBR act.

Tracer lines shall be provided with break up flanges for main line flange joints and valves.

All tracers shall have individual steam traps before condensate manifolds.

Condensate manifold including the last valve on individual tracer shall be of carbon steel.

All steam traps discharging to a closed system shall have a block valve upstream and downstream of the trap. A bypass globe valve shall be installed around the trap. Check valve shall be installed on the downstream of the steam trap near the condensate header in case discharging to a closed system.
Number of tracers required on a line shall be as follows:

<table>
<thead>
<tr>
<th>Size of Line</th>
<th>Number of Tracers</th>
</tr>
</thead>
<tbody>
<tr>
<td>up to 4&quot; NB</td>
<td>1</td>
</tr>
<tr>
<td>6&quot; NB to 16&quot; NB</td>
<td>2</td>
</tr>
<tr>
<td>18&quot; NB to 24&quot; NB</td>
<td>3</td>
</tr>
<tr>
<td>26&quot; NB &amp; above</td>
<td>To Calculate</td>
</tr>
</tbody>
</table>

Steam Jacketing System

A steam jacketed pipe consists of a product line which passes through the centre of a larger diameter steam line.

The nominal size of the inner pipe (CORE) and outer pipe (JACKET) in inches shall be as per table below unless otherwise mentioned in project piping material specification (PMS) or P&ID.

<table>
<thead>
<tr>
<th>Core pipe</th>
<th>Jacket pipe</th>
<th>Steam feeder to jacket</th>
</tr>
</thead>
<tbody>
<tr>
<td>3/4&quot; NB</td>
<td>1-1/2&quot; NB</td>
<td>0.5&quot;</td>
</tr>
<tr>
<td>1&quot; NB</td>
<td>2&quot; NB</td>
<td>0.5&quot;</td>
</tr>
<tr>
<td>1-1/2&quot; NB</td>
<td>3&quot; NB</td>
<td>0.5&quot;</td>
</tr>
<tr>
<td>2&quot; NB</td>
<td>3&quot; NB</td>
<td>0.5&quot;</td>
</tr>
<tr>
<td>4&quot; NB</td>
<td>6&quot; NB</td>
<td>0.75&quot;</td>
</tr>
<tr>
<td>6&quot; NB</td>
<td>8&quot; NB</td>
<td>0.75&quot;</td>
</tr>
<tr>
<td>8&quot; NB</td>
<td>10&quot; NB</td>
<td>0.75&quot;</td>
</tr>
<tr>
<td>10&quot; NB</td>
<td>12&quot; NB</td>
<td>0.75&quot;</td>
</tr>
</tbody>
</table>

For jacketed lines using high pressure steam, actual calculations for core, jacket and feeder pipe shall be performed before finalization of sizing.

Distance between steam inlet and condensate outlet shall be similar to steam tracing system. Baffle plates, flanged joints or end caps shall be used to discontinue one feed length from the next.

Flanged jump over shall be used in case of a flanged joint. In case of discontinuous jacketing simple jump-overs shall be employed. The length of jacket shall be 4 to 5 meters or as mentioned in job specification.

Intermediate partial baffles shall be provided if a separate branch portion is to be heated from the main line stream.

Steam inlet to jacket shall generally be provided from top of the pipe in case of horizontal lines. The jump over and condensate outlets shall be from the bottom.

In case of vertical lines steam inlet shall be done at the topmost points and condensate outlet shall be done from the lowest possible points. Two consecutive Slipovers shall be 180 deg. apart.

Each feed length shall be provided with individual trap before connecting to condensate recovery headers.

Balanced pressure I bi-metallic type thermostatic steam traps with 40 mesh strainer shall be used in jacketing.

To keep proper concentricity between core and jacket pipe internal guides (rods or flat bars) shall be provided at intervals depending on the size of the pipe.

Wherever anchors are provided on jacket lines proper interconnection of jacket pipe and core pipe shall have to be provided with proper jump over for steam.
5.3.12 Utility Stations

Requisite number of utility stations shall be provided throughout the unit to cater for the utility requirement. Utility stations shall have four connections [one for LP steam (SL), one for Plant Air (AP) and one for Service Water (WS)) each of 1.0” NB unless otherwise specified in P&ID.

Air and water lines shall have quick type hose connection and steam line shall have flanged type hose connection. All connections shall be directed downward. All connections shall have globe valve for isolation purpose. An inter connection with valve shall be provided between steam and service water lines shall be provided. Inert gas hose, when required, shall have built in non return valve in quick connection coupling of piping end.

Number of utility stations shall be such that all equipments shall be approachable from at least one utility station. The approach of utility station shall be considered 15M all around the station location.

The Utility stations shall generally be located adjacent to pipe-rack column. The utility stations shall also be provided on elevated structures like - technological structure, operating platforms of vertical equipments etc. Operating platforms having manholes must have a utility station. Utility station locations shall be limited to a height of 35 M from H.P.P.

5.3.13 Fire Fighting

All fire fighting facilities shall be as per statutory norms. Fire fighting points are to be provided for fighting fire at highest elevation in case of tall columns.

The following points to be considered in designing of Fire Fighting system.

i) Water sprayer for all compressors shall be provided with control valves

ii) Complete firefighting system fulfilling all the applicable requirements (as required by TAC and NFPA rules) such as hydrants, monitors, sprinklers, clean agent system, fire detection and alarm system, first aid fire fighting equipments, communication with central fire station etc. shall be designed and provided for Steam Generation plant by LSTK contractor.

iii) LSTK contractor shall finalize these firewater mains w.r.t. size and location and hook up with the Offsite fire water mains along with an isolation valve and all the requirements as mentioned above. Location of offsite fire water mains shall be mentioned in the drawing “Conceptual layout of Fire Fighting system” for Integrated Coal Based Fertilizer Complex at Talcher and shall be issued by Owner/OSBL Contractor during detail engineering.

iv) Fire water ring header shall be underground laid in the RCC trench with corrosive protective Tape coated, filled with sand and covered with RCC slab.

v) Valves on fire water mains shall be of Gate type only. Valves on fire water lines shall be located in RCC valve chamber provided with top cover to facilitate easy operation/ maintenance of valves. The top of chamber shall be 80 mm above ground level.

5.4 Offsite & Yard Piping

In general, offsite piping, electrical cable and instrumentation cable shall also be laid either on pipe rack or pipe sleepers.
Wherever piping is laid on pipe sleepers, it shall have hard surfacing below it keeping a gap of 300mm from the bottom of the pipes. Hard surfacing should be completed before start of pipe laying. Width of hard surfacing shall be about 1.0 meter more than the piping corridor. This extra hard surfacing shall be for movement of operating personnel along the piping corridor.

Pipes at road crossing shall be under culverts in general. Overhead pipe bridges may be used for areas where pipe racks are provided. Where culverts are not provided, pipe sleeves shall be used for underground road crossing. Culverts / overhead pipe bridges shall be adequately designed to take care of future requirements. Minimum 20% extra width shall be provided in all such structures.

Clearances between lines shall be minimum "C" as given below:

\[ C = \frac{(D_o + D_f)}{2} + 25 \text{ mm} + \text{Insulation thickness (es)} \]

Do - outside diameter of smaller pipe (mm)
Df - outside diameter of flange of bigger pipe (mm)

However this 'C' spacing between the offsite piping on the rack/sleeper can be suitably increased so that the lines should not touch each other after insulation / lateral thermal expansion.

Adequate clearance shall be provided for every long & high temperature lines to avoid clashing at the bends. See 5.2.2.6 also for line spacing at 'L' bends and loops.

Expansion loops for all lines shall generally be kept at the same location.

Vents shall be provided on all high points & drains shall be provided at all low points. Drain valves at sleeper piping shall be kept outside the sleeper way if the same is not accessible and valves shall be put in horizontal only.

Places where piping is extended to make drain valves accessible - 2 nos. of stiffeners, irrespective of pipe rating, shall be provided. Spacing of guides on each line on a pipe bay shall not exceed the value given in ANNEXURE-3

5.5 Flare Piping

Flare header shall be sloped towards flare knock-out drum. Only horizontal loop shall be provided as per requirement to accommodate thermal expansion. The desired slope shall be ensured throughout including flat loop. Flare header shall be supported on shoe of height ranging from 100mm to 300mm.

Proper thermal analysis temperature shall be established including the possibility of temperature gradient along the line before providing expansion loops. Efforts shall be made to minimize the number of loops. Flare line between knock out drum and water seal drum shall be designed for pressure fluctuations and adequately supported to avoid vibrations.

5.6 UNDERGROUND PIPING

5.6.1 Buried Pipes

The following points to be considered in designing of buried pipes

i) All underground metallic piping shall be coated and wrapped and provided with cathodic protection system. If sacrificial metal is used, permanent testing arrangement shall be provided.
ii) All cooling water distribution headers 18” NB and higher shall be laid underground.

iii) All Sewage lines (oily and chemical) from catch basin to mains and manholes shall be laid underground.

iv) Underground pipe crossing roads, access ways, rails shall have casing pipe (R.C.C or C.S)

v) Valve chamber wherever required shall be made of brick or concrete with waterproofing. Valve chamber should be spacious to attend valves during operation/ Maintenance.

vi) All U.G. headers shall clear equipment foundations as far as possible. Under special cases, the C.W. header may be laid over the footing of foundations.

vii) Provide break flange at +500 MM from floor level connection with cathodic protection to isolate underground pipe from above ground piping.

viii) Pipes shall be laid below electrical cables if any.

ix) Depth for Underground Buried piping shall have at least 1.0 meter earth cushion in open ground and 1.5 meters earth cushion under the roads and areas where crane movement is involved.

5.6.2 Piping in Trenches

The following points to be considered in designing of trench pipes

i) Piping located below grade, requiring inspection, servicing or provided with protective heating.

ii) Fire water lines/Process lines.

iii) Drain lines requiring gravity flow trenches.

iv) Sump for valves and trenches shall be provided.

v) Suitable draining scheme for trenches shall be provided. Underground cooling water line shall be considered with cathodic protection.

5.7 Air Systems

5.7.1 Branch connections shall be taken from the top of the header.

5.7.2 Low points shall be fitted with drains.

5.8 In-Line Instruments

5.8.1 Liquid level controllers and level glasses shall be located so as to be accessible from grade, platform or permanent ladder. The level glass shall be readable from grade wherever possible.

5.8.2 Relief valves shall be accessible. Relief valves with a centre line elevation over 4.5m above grade (except in pipe racks) shall be accessible from a platform or permanent ladder.

5.8.3 Relief valves that discharge to a closed system shall be installed higher than the collection header, with no pockets in the discharge line.

5.8.4 Relief valves that discharge to atmosphere shall have tail-pipes extended to a minimum of 3.0 m above the nearest operating platform that is within a radius of 8m.
5.8.5 Provide steam traps at pocketed low points and at dead ends of steam headers. Provide steam traps on excessively long runs of steam piping to ensure dry quality steam at destination. Steam traps located more than 4.5m above grade, except in pipe racks, and shall be accessible from a platform.

5.8.6 Control valves shall be accessible from grade or platforms. In general, the instruments or indicators showing the process variables shall be visible from the control valve.

5.8.7 Orifice runs shall be located in the horizontal. Orifice flanges with a centre line elevation over 4.5m above grade, except in pipe racks, shall be accessible from a platform or permanent ladder.

5.8.8 Orifice taps shall be located as follows:
   i) Air, Gas and steam
      Top vertical centreline (preferred)
      45 degrees above horizontal centreline (alternate)
   ii) Liquid
      Horizontal centreline (preferred)
      45 degrees below horizontal centreline (alternate)
   iii) Tap orientation shall be shown on piping isometrics.

5.9 Sample Connections
5.9.1 Sample connections shall be accessible from grade or platforms. In general, where liquid samples are taken in a bottle, locate the sample outlet above a drain funnel to permit free running of the liquid before sampling.

5.10 Vents and Drains
5.10.1 Valve bleeds shall be provided at control valve stations, level switches, level controllers, and gauge glasses.

5.10.2 Process vents and drains shall be indicated on the P&ID’s.

5.10.3 Low-point hydrostatic drains and high-point hydrostatic vents shall be added as required; locations to be determined during the Design review.

5.11 Line Strainers
5.11.1 Provide temporary conical type strainers in 2” NB and above butt weld pump suction lines for use during start-up. Arrange piping to facilitate removal of particles.

5.11.2 Provide permanent Y-type strainers on 2” NB and smaller screwed or socket-weld pump suction piping.

5.11.3 Provide temporary basket type strainers located at the suction pulsation device inlet for start-up of reciprocating compressors. Arrange piping to facilitate removal of the filter.

5.11.4 Provide temporary basket type strainers and locate them as close as possible to the compressor inlet flange for start-up of centrifugal compressors. Arrange piping to facilitate removal of the filter.
5.12 Spectacle Blinds
5.12.1 Spectacle blinds shall be provided to isolate equipment. In hazardous service flanged drop-out spools shall be provided for safety purposes. Both shall be shown on the P&ID’s.
5.12.2 Spectacle blinds shall be accessible from grade or platforms. Blinds located in a pipe-rack are considered to be accessible. Blinds that weigh over 40kg shall be accessible by mobile equipment. Where this is not possible davits or hitching points shall be provided.

5.13 Flexibility Analysis and Supporting

5.13.1 Pipe Supporting Criteria & General Guidelines.

Piping system shall be properly supported taking into account the following points:
1. Load of bare pipe + fluid + insulation (if any).
2. Load of bare pipe + water fill.
3. Load of valves and online equipment and instrument.
4. Thermal loads during operation.
5. Steam-out condition, if applicable.
6. Wind loads for piping at higher elevation, e.g. transfer lines, column over head lines, flare headers, etc.
7. Forced vibration due to pulsating flow.
8. Vibration due to two phase flow.
9. Loads due to internal pressure.
10. Any external loads/concentrated loads and cold load of springs.

Pipe supporting shall preferably follow the minimum basic span as given in Annexure-1 except for flare line in off site on trestles in which case the maximum basic span shall be restricted to 18.0 meters, irrespective of line size.

For sizes not covered in Annexure-1, basic span shall be established based on project requirement. For piping on rack or sleeper, as a minimum, providing resting support on every grid of pipe rack / sleeper is mandatory. Depending on the pipe size, as a rule, guides shall be provided on straight run of pipes at intervals as specified in Annexure-3 unless specifically becomes non-viable due to flexibility problems.

Additional supports, guides, anchors, special supports like spring supports and sway braces shall be provided after detailed analysis of piping system to restrict the forces experienced on nozzles of critical items like pumps, compressors, turbines, exchangers, air fin coolers etc.

For lines which do not need any support otherwise but become unsupported by opening of flange, etc, during maintenance and thereby may transfer the total load on a small branch off, a permanent support shall be suitably provided which may be a spring support also. Bare pipes of size 14” and above on elevated structures shall be supported with pad or shoe. While bare pipes of size 6" and above, on sleepers, corrosion pads shall be provided.

Pads shall be provided for insulated pipes before welding the shoes for sizes 8”& above.

Adequate stiffening shall be provided for the following:
a) Lines in above 600#,  
b) Lines having two phase flow,  
c) Lines having Pulsating flow such as discharge of reciprocating compressors & reciprocating pumps,

For pulsating flow lines detailed thermal and vibration analysis by analog study shall be done to decide location of anchor supports and guides etc. Pulsating flow lines shall be as identified by licensor/owner.

Wherever two phase flow in piping is expected, piping design shall be checked by dynamic analysis to prevent vibrations.

Pipe support design shall be such that deflection in piping systems due to sustained loads shall not exceed 15mm, in any case, between two adjacent supports.

As far as possible long trunnion types of supports (more than 0.5 metre) are to be avoided. In case long trunnion support is unavoidable in straight length of pipe, trunnion height to be restricted to 0.5m and balance height to be made up by providing extended structure.

In the heaters where steam air decoking provision is there, the main lines and decoking lines should be supported in a way so that either of the lines should not be in the hanging position while connected to other one. Same philosophy shall be adopted for similar type of switch over arrangement.

Piping passing through the technology structure or passing near the concrete column etc. should have adequate annular space to avoid restriction of line movement during thermal expansion. The gap should take care of the thermal expansion along with insulation thickness.

All pipes supports shall be so designed that there is no undue tension on equipment flanges. Flange joints should not move away from each other in case of unbolting of the joint.

5.13.2 Flexibility Analysis Criteria & General Guidelines

5.13.2.1 Formal computer analysis shall be performed on piping systems as per design philosophy for stress analysis (Refer Annexure-7)

5.13.2.2 The directions of forces and moments shall be in accordance with Welding Research Council Bulletin 107 (WRC 107), with the exception that the radial force (P) shall be away from the vessel. All forces and moments shall be assumed to act simultaneously and apply at the nozzle/vessel interface.

5.13.2.3 Air coolers to API 661 shall be specified with Fx forces and Mz moments increased to 1.2 times the value shown in Figure 8 of API 661 for nozzle sizes 6"NPS and larger to simplify piping flexibility analysis and facilitate piping layout.

5.13.2.4 Piping stress analysis and equipment nozzle loading analysis shall be in accordance with ASME B31.1 and the relevant API, ANSI/ISO and NEMA Codes.

5.13.2.5 The allowable nozzle loads on centrifugal pumps shall meet the load criteria of API 610. Heavy duty base plate shall be specified where the pump design temperature is in excess of 150°C.

5.13.2.6 For piping design purposes, differential settlement between items of major equipment on separate foundations shall be taken as 10mm.
5.13.2.7 Cold springing in piping shall not be permitted without written permission from the Owner/PMC. Cold springing of piping directly connected to rotating equipment is not permitted under any circumstances.

Piping shall be analyzed for expansion, contraction, differential settlement, relief, valve reaction and effects mentioned at CI. 5.12.1.

The design of piping systems shall take into account the different conditions expected during operation, start-up, shut-down, cold branch in case of standby pump, tracing, etc. Hydrocarbon lines shall be designed for steam-out conditions, if specified in line schedule. The use of expansion joints shall be considered only when space or pressure drop limitation does not permit pipe bends. Expansion joint of axial type shall be avoided.

Forces and moments due to weight, thermal loads and other imposed loads on the equipment nozzle must not exceed the allowed loads for the equipment.

Minimum analysis temperature shall be the design temperature of the line as per line list.

5.13.3 Method of Analysis

Formal computer analysis shall be performed on piping systems as per design philosophy for stress analysis (Refer Annexure-7)

The package used shall be latest version of CEASER II. Only one of these packages shall be used for the project & not a combination of the above packages.

All lines shall be analyzed at design I analysis temperature. In the absence of analysis temperature lines shall be analyzed at design temperature.

However in case of wide difference in design and operating temperature, temperature for analysis shall be established in process documents.

All non-critical lines may be analyzed using other methods.

Special analysis methods shall be followed for lines involving pulsating flow such as those connected to reciprocating pumps & compressors which require acoustical plus analog study by approved agencies and shall require entire system analysis along with piping equipments.

Seismic analysis shall be done for line sizes 12” and above.

5.14 Personnel Protection

5.14.1 Eyewash and emergency safety showers shall be provided in areas where operating personnel are subject to hazardous sprays, emissions or spills.

5.14.2 Personnel protection shall be provided on un-insulated lines and equipment operating above 70°C when they constitute a hazard to the operators during normal operation of the facility.

5.14.3 Leakage indicating tape and spray impingement shrouds shall be provided at flanged joints in hazardous service.

5.15 Mechanical Handling

5.15.1 Handling facilities such as davits and monorails shall be provided on vessels over 10m in height where the weight of removable internal and/or external equipment is greater than 35 Kg.
6.0 Materials

Basic material selection of particular line depending on its service, temperature and corrosivity shall be spelt out in process package. Material specification shall follow the requirements as specified in PMS as per Licensor's requirement. PMS / VMS shall be supplied by bidder and will be approved by owner / PMC. PMS shall generally follow the requirements given in this section.

6.1 Piping Materials

6.1.1 All materials for piping components shall conform to the relevant code and/or specification.
6.1.2 All materials shall be new.
6.1.3 All plate, sections, pipe, fittings, flanges, valves and special items shall have Material Test Certificates.
6.1.4 All alloy materials shall have Material Certificates verifying the alloy content.
6.1.5 All bolting and gasket material shall have Letters of Compliance as a minimum.
6.1.6 All alloy bolting and gasketing shall have material Letters of Conformance verifying the alloy content.
6.1.7 All interconnecting piping and weld connections shall be designed in accordance with ANSI code for pressure piping B 31.1.
6.1.8 Only piping materials listed in ASME B31.1 shall be used for various critical services and Normal Service piping. For utility piping, where scaling and impurities are to be avoided (such as instrument air, potable water and deluge water) hot dipped galvanized and threaded fittings may be used in sizes up to and including 4" NB. Galvanized piping shall not be used in environments containing acids or other corrosive commodities. In corrosive environments stainless steel piping material shall be used for such utility systems.
6.1.9 For hazardous services no socket welded or threaded construction or connections shall be used for process equipment piping systems. Construction shall be by butt-welding with a minimum 20% radiography. Flanged connections shall be minimized.
6.1.10 All insulation and gaskets shall be asbestos free.
6.1.11 Insulating flange sets shall be provided between dissimilar materials as required.
6.1.12 Aluminium or copper alloys shall not be used for any component in the piping systems.
6.1.13 The use of 1.25Cr-0.5Mo alloy shall be a minimum requirement for piping systems having a design temperature 425°C and above.
6.1.14 Nelson Curves in accordance with API 941 shall be applicable to piping system materials in hydrogen service.
6.1.15 The minimum corrosion allowance for any material, other than stainless steel, shall not be less than 1.5mm. For stainless steel it is zero.
6.1.16 All instrument air pipe line shall be of SS304.
6.2 PIPE

6.2.1 Wall Thickness

6.2.1.1 Calculation of pipe thickness and branch reinforcement shall be based on requirements of ASME B31.1. Proper corrosion allowance and mill tolerance shall be considered to achieve the selected thickness.

6.2.1.2 For carbon steel and low alloy steel pipes (except for steam tracing piping) minimum pipe thickness shall be:
- S80 up to 0.75" NB,
- XS for 1" to 2" NB,
- STD for above 2" NB

For stainless pipes minimum pipe thickness shall be 40S up to 2", 10S for above 2" NB.

6.2.1.3 The philosophy of minimum thickness/schedule is applicable for both seamless and welded pipes.

6.2.1.4 The above mentioned minimum thickness/schedule criteria is not applicable to Firewater service and specification where IS pipes or welded API 5L pipes respectively etc., are being used.

6.2.1.5 All welded pipes shall have uniform negative wall thickness tolerance of 12.5% for wall thickness calculations purpose.

6.2.1.6 For thicknesses exceeding minimum thickness/schedule criteria, Schedule XS shall be selected for CS & AS classes (for 2" & above). Intermediate schedules between STD & XS shall be ignored. Similarly for SS classes (2" & above) S10, S20, S30 & 40S may be selected beyond minimum thickness/schedule criteria.

6.2.1.7 If, the thicknesses exceed XS in CS & AS classes and 40s in SS classes, only then, the thickness shall be calculated based on actual service conditions subject to a minimum of 80% class rating. Maximum 10% of corrosion allowance may be reduced in special cases, to optimize the pipe schedules.

In general, the pressure-temperature combination to calculate wall thickness shall be as follows:

</tbody>
</table>

However, for HP steam and MP steam only seamless piping shall be used for all pipe sizes.

#### 6.3 Fittings

6.3.1 Type of fittings shall be equivalent to pipe type.

6.3.2 Thickness of fittings at ends to match pipe thickness for BW fittings.

6.3.3 SW fittings shall be 3000#, 6000# and 9000# depending on the pipe thicknesses S80, S160 and above S160 respectively.

6.3.4 All branch connections shall be as follows, unless specifically mentioned otherwise in PMS:

   - Up to 1-1/2" NB O-Lets/ Tee
   - 2" and above Tees/O-Lets / Pipe to pipe with or without Reinforcement pad up to 600# rating.
   - Only Teel Red tee/ sweepolets above 600# rating.
6.3.5 Mitred bends shall not be accepted unless otherwise specified. Only 90 Deg. elbows and 45 Deg. elbows are acceptable. In case the Bidder wants to deviate from this requirement the ground of non-availability of such forged items, bidder may submit an alternative offer for Owner's consideration with sufficient documents to justify the same. In such a case the concerned fittings shall be manufactured with necessary reinforcing pads, bend thinning allowance etc. to satisfy code requirements.

6.4 Flanges

Flanges shall be as follows.

<table>
<thead>
<tr>
<th>Rating (Lbs)</th>
<th>Size (NB)</th>
<th>Type</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>

6.6 Valves

Type
a) SW Valves up to 1-1/2 inch - up to 600# except ball & plug valves which shall be flanged for all sizes.
b) Flanged cast valve above 1-1/2” for 150#, 300#, 600#
c) Welded Valves - 900# and above

6.7 Technical Requirements of Piping Items

Over and above the requirements specified in clause 6.1 through 6.6, other technical requirement prescribed in Annexure "4" shall also be adhered to.

6.8 NDT Requirements

Depending upon the severity of application, extent of NDT shall be decided. As a rule, all oxygen, NACE and any other lethal service shall have 100% radiography on weld joints in all class ratings. Castings used in these services shall have 100% radiography.

For normal hydrocarbon service upto class 600# shall be subjected to 20% radiography & 20% DP/ MP test (for CS&AS) and 20% radiography test as well as 100% DP test (for SS).

Classes in 900# and above for normal hydrocarbon service shall be subjected to 100% radiography test.

Note: 100% DP test to be carried out for all root welding.

For fire water service, IBR, etc., radiography shall be as per statutory requirement.

7.0 THERMAL INSULATION OF PIPING, EQUIPMENT & VESSELS

7.1 Hot Insulation

This consist of insulation for heat conservation, process stabilization, temperature maintenance, insulation for steam traced lines, jacketed lines, insulation for electrical traced lines insulation for fire protection for operating temperatures above ambient temperature for all sizes of lines. Wherever insulation for personnel protection is mentioned, the same shall be provided judiciously as per insulation specifications.
Preformed pipe sections shall be used for all sizes of piping and inspection windows shall be provided in insulation at critical locations to be decided at the time of execution.

All materials shall be of high quality and good appearance. Insulation materials shall be of low chloride content, chemically inert, non sulphurous, rot proof, vermin proof, impervious to hot water and steam, non-injurious to health and non-corrosive to steel and aluminium (even if soaked in 'water at ambient temperatures for extended periods). The use of insulation or finishing materials containing ASBESTOS in any form is not permitted.

The insulation of piping, equipments and vessels shall be carried out with the recommended insulating materials and the thicknesses as per process design basis. Hot insulation over austenitic stainless steel surfaces shall be inhibited with sodium silicate as per ASTM C-795. The inhibited insulation material shall be tested as per ASTM C-692. Restriction of reachable chloride to 10ppm (max,) shall be demonstrated as per the test method ASTM C-871. The specifications of different types of hot insulating materials shall be as follows:

### 7.1.1 Bonded Mineral Wool

Lightly resin bonded Rock wool insulation shall conform to ASTM C592 class II for blanket and ASTM C547 class III for preformed pipe sections. Rock wool insulation as per IS 8183 and IS 9842 are also acceptable. The material shall be suitable for intended operational temperature range from ambient to 550 degC. The physical requirement of bulk density and chloride content, thermal conductivity and PH value of the material shall be as follows:

<table>
<thead>
<tr>
<th>Property</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bulk density</td>
<td>140-150 kg/m3</td>
</tr>
<tr>
<td>Chloride Content</td>
<td>20 ppm (max.)</td>
</tr>
<tr>
<td></td>
<td>10 ppm (max.) diffused over S.S surfaces.</td>
</tr>
<tr>
<td>Thermal Conductivity</td>
<td>0.43mW/cm°C for mean temp 50°C</td>
</tr>
<tr>
<td></td>
<td>0.52mW/cm°C for mean temp 100°C</td>
</tr>
<tr>
<td></td>
<td>0.62mW/cm°C for mean temp 150°C</td>
</tr>
<tr>
<td></td>
<td>0.68mW/cm°C for mean temp 200°C</td>
</tr>
<tr>
<td></td>
<td>0.80mW/cm°C for mean temp 250°C</td>
</tr>
<tr>
<td></td>
<td>0.90mW/cm°C for mean temp 300°C</td>
</tr>
<tr>
<td>PH Value</td>
<td>7.0 To 10.0</td>
</tr>
</tbody>
</table>

### 7.1.2 Calcium Silicate

Calcium Silicate block and pipe thermal insulation shall be composed principally of hydrous calcium silicate reinforced with mineral fibers (except slag wool).

The specification shall conform to ASTM C533 type-1 up to 550°C and as per ASTM C533 type-2 up to 760°C.

The physical requirement of bulk density, chloride content, thermal conductivity and ph value of the material shall be as follows:

<table>
<thead>
<tr>
<th>Property</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bulk density</td>
<td>240 to 280 kg/m3</td>
</tr>
<tr>
<td>Chloride content</td>
<td>20 ppm (max) &amp; 10 ppm(max) if used over stainless steel.</td>
</tr>
</tbody>
</table>
7.1.3 Polyisocyanurate

Rigid Polyisocyanurate foam block pipe fittings insulation (Confirming to ASTM 591 TYPE II & III) shall be manufactured with polyester or polyether resins, flammability retarding agents, special catalysts and fluorocarbon blowing agent. This is suitable for use up to 125 deg C. Selection of samples for testing shall be as per ASTM C390 (Class IV frequency).

The physical requirement of bulk density, chloride content, thermal conductivity and PH value of the material shall be as follows:

- Bulk density 40 to 64 kg/m³ (Tested as per ASTM C303 and C302)
- Chloride content NIL
- Thermal Conductivity:
  - 0.238 mw/ Cm°C at mean temp 10 deg C
  - 0.245 mw/ Cm°C at mean temp 24 deg C
  - 0.252 mw/ Cm°C at mean temp 38 deg C
- PH Value: Neutral

7.1.4 Cellular Glass (Foam Glass)

Cellular glass foamed and fused into unicellular foam can be used up to temperature of 350°C. The testing of samples shall be as per ASTM C552. The physical requirement of bulk density, chloride content, thermal conductivity and PH value of the material shall be as follows:

- Bulk density 110 to 150kg/m3 (Tested as per ASTM C303)
- Chloride content NIL
- Thermal conductivity:
  - 0.58 mw/cm deg C at mean temp. 10°C
  - 0.60 mw/cm deg C at mean temp. 24°C
  - 0.62 mw/cm deg C at mean temp.38°C
  - 0.73 mw/cm deg C at mean temp. 93°C
- PH Value: Neutral.

7.2 Weather Protection Jacket (Cladding) - Hot Insulation

Aluminium jacketing shall be used as weather protection over insulation unless otherwise specified and shall be as per ASTM B 209 alloy 3003 H16 or IS: 737 designation 31000 (old NS3) condition H3 for flat sheets and H4 for corrugated sheets. Cladding shall be coated on the side in contact with bitumen anticorrosive paint. Where fire safe insulation material is required cladding and bands material shall be SS. The thickness of jacket shall be as follows:

<table>
<thead>
<tr>
<th>For Rock wool</th>
<th>For all materials other than Rock wool</th>
</tr>
</thead>
<tbody>
<tr>
<td>For shell of vertical vessels, columns etc:</td>
<td>0.71 mm (22SWG) corrugated</td>
</tr>
<tr>
<td>Storage tanks &amp; Tank Roofs</td>
<td>1.22mm (18SWG) Flat</td>
</tr>
<tr>
<td>For all piping, other than grade piping in off sites</td>
<td>0.71mm (22SWG) Flat</td>
</tr>
<tr>
<td>For Horton sphere &amp; horizontal vessels shell and heads, vertical vessel heads</td>
<td>0.71 mm (22SWG) Flat</td>
</tr>
<tr>
<td>For Removable covers</td>
<td>1.22 mm (18SWG) Flat.</td>
</tr>
<tr>
<td>For Reactors and reactor piping (extent and thickness shall be decided during execution)</td>
<td>SS JACKET</td>
</tr>
<tr>
<td>For grade piping in offsite</td>
<td>0.56 mm (24 SWG) Galvanized Steel per IS 277 or equivalent with a coating requirement of 450 gm/m2.</td>
</tr>
</tbody>
</table>

### 7.3 Ancillary Materials-Hot Insulation (Band, Wires, Screws, Etc.)

#### 7.3.1 Aluminium Foil to protect stainless surfaces in Temperature below 0 degCshall be 0.1 mm (42 SWG) thick per ASTM 8209 alloy 3003 H16 or IS-737 designation 31000 (OldNS3) condition H3.

#### 7.3.2 Bands/Wires for securing insulation shall be of ASTM 8209 Alloy 3003 H16 or 18-737 designation 31000 (old NS3) condition H3 or 18/8 Stainless steel. For securing aluminium foil on stainless steel surface 24 SWG thick x 20mm wide aluminium bands shall be used.

For securing fibrous insulation on piping, 24 SWG X 12 wide, aluminium bands shall be used.

For securing fibrous insulation on equipments, 24 SWG X 20 wide aluminium bands shall be used.

For securing fibrous material on vertical storage tank, galvanized steel 40 mm wide X 3 mm thick flat shall be used.

For securing fibrous material on spheres, stainless steel bands of 25 mm wide X 0.8 mm thick shall be used.

For securing Rigid Insulation on piping up to 16” O.D., annealed galvanized steel wire of 16 SWG shall be used. Galvanizing coating shall have 450g/m2 of surface area.

For securing rigid insulation on pipe 18” O.D., and above, galvanized steel band 20 mm wide X 24 SWG shall be used. Galvanizing shall be 600 g/m2 of surface area.

For securing rigid insulation on vertical and horizontal vessels, galvanized steel band 20mm wide X 24 SWG shall be used. Galvanizing shall be 450g/m2 of surface area.

Screws required for metal jacket security shall be of Stainless Steel.

#### 7.3.3 For securing cladding on insulation on piping, aluminium band 12mm (min) X 24 SWG thick shall be used.

For securing cladding on insulation on equipment, aluminium band 20mm wide X 24 SWG shall be used.

For securing cladding on insulation for vertical storage tanks stainless steel band 25mm wide X 24 SWG shall be used.
For securing cladding on insulation for spheres stainless steel band 25mm wide X 24 SWG shall be used.

7.3.4 Rivets used for security of metal jacket shall be expanding aluminium "POP" blind eye type; 9.5 mm long x 5mm diameter.

7.4 Cold Insulation

Insulation material and specifications for cold insulation for operating temperatures up to (-)180°C and dual temperature (cold/hot) service where, upper temperature limit is 125°C shall be as given below for all sizes of piping:

7.4.1 Polyurethane Foam

Preformed pipe section's and radial lags (for higher diameter pipe) of polyurethane foam of self extinguishing type shall be in accordance with ASTM C591 TYPE-II Grade 2. The physical requirement of bulk density, chloride content, thermal conductivity and PH value of the material shall be as follows:

<table>
<thead>
<tr>
<th>Temp. Limit Bulk density</th>
<th>Up to (-)180°C &amp; 120°C (max)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chloride content</td>
<td>20 ppm (max)</td>
</tr>
<tr>
<td>Thermal conductivity</td>
<td>0.221 mw/cm˚C Cat mean temp. 10 deg C</td>
</tr>
<tr>
<td>PH Value</td>
<td>Neutral.</td>
</tr>
<tr>
<td>Closed cell content</td>
<td>95% (min)</td>
</tr>
</tbody>
</table>

High density polyurethane foam block of bulk density more than 300 Kg/m³ shall be used for supports in cold lines.

7.4.2 Polyurethane Foam Cast-in-Situ

Temp. Limit : Up to (-) 45°C and 120°C (max.)

For specification, refer Clause 7.4.1 above and for application procedure Contractor shall secure OWNER/PMC approval.

7.4.3 Polyisocynaurate

Temp. Limit : Up to (-) 180°C and 125°C (max.)

Refer Clause 7.1 c) for details.

Ancillary materials and cladding for cold insulation shall be as follows:

Adhesive for bonding sections shall be Foster Fire Resistive Adhesive 81-33 or blown bitumen type 85/25 shall be used.

Vapor seal like Foster Fire Retardant Mastic 60-30 or equal shall be used.

Filler material shall be PUF dust or mineral wool mixed with specified adhesive shall be placed lightly so as to fill irregular voids and sealant shall be Foster Foam Seal Sealer 30-45. Glass cloth to be used for vapor barrier reinforcement shall be open weave 10 mesh having glass fiber thickness of 5 mils. Aluminium sheets as follows shall be used for cladding.

<table>
<thead>
<tr>
<th>Application</th>
<th>Minimum Sheet Gauge</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pipes, vessels and equipments</td>
<td>26 SWG</td>
</tr>
<tr>
<td>Up to 500 mm nominal diameter</td>
<td>24 SWG</td>
</tr>
<tr>
<td>Pipes ,vessels and equipments</td>
<td></td>
</tr>
</tbody>
</table>
above 500 mm nominal diameter

For valves, flanges and other areas where mechanical change is likely to occur.

Where fire safe insulation is required cladding and bands material shall be SS.

7.5 **Insulation Thickness**

The insulation thickness and type of insulation (hot, cold and acoustics) to be applied on equipments and vessels shall be as per equipment data sheet.

Insulation thickness on piping shall be as per final approved line list / line schedule / insulation table in process design basis.

7.6 **Extent of Insulation**

Extent of insulation shall be as per final approved P&ID / Line list / General Arrangement drawing / Isometrics and vessel and equipment data sheets.

Insulated piping system shall have straight pipe, bends, tees and pipe fittings completely insulated.

For all cold lines, all steam and condensate lines, all hot oil lines and trace heated & jacketed lines, the extent of insulation shall include valves and flange joints also.

For bucket and float type traps the inlet piping and trap shall be insulated.

For thermostatic and thermodynamic traps insulation shall terminate at approx. 150 mm before trap.

Instrumentation such as level gauges, level controllers, level switches, DP cells, etc., shall have their fluid containing sections and associated piping completely insulated.

In case of hot insulation system, insulation shall not be applied to the following unless specifically asked otherwise.

a) Valves, including control valves, flanges in process lines below 300 °C (Safety insulation shall be provided wherein required)

b) Pipe union fittings.

c) Steam Traps, sight flow indicators.

d) Steam trap outlet piping other than closed condensate recovery system except for personal protection reasons.

e) Pumps with operating temp below 200 °C

f) Fans, compressors, blower or other rotating or reciprocating equipments.

g) Internally insulated or refractory lined equipment.

h) Turbine seal caps, shaft bearing housing, throttle valves, governors and supports.

i) Exchanger channel and covers, shell and channel flanges and expansion joints.

j) Nozzles, manholes and hand holds and flanges of equipment.

k) Surfaces of coolers and condensers.

l) Thermo well bosses and pressure tapings.
7.7 Application

All insulation work shall commence only after successful completion of hydro testing of piping and equipments including steam tracing systems. Surfaces to be insulated shall be thoroughly cleaned, dried and made free from loose scale, oil or grease. Painting under insulation shall be applied to carbon steel, low alloy steel, except stainless steel piping and equipments.

No welding or drilling of equipments and piping shall be permitted for insulation application.

All projections, such as lifting lugs, trunnion, support lugs, support cleats shall be insulated to the same extent that of equipment or piping.

Cleats used for supporting of insulation shall not project outside insulation.

Insulation windows for inspection thickness survey are to be provided for insulated equipment and piping (piping size 4” NB and above) for 20% of bend locations. However for transfer lines the insulation windows shall be provided at all bend locations.

To ensure perfect water proofing, all cladding joints shall be packed with sealing materials which may either be in the form of an elastomeric sealing compound or fibre based bituminous felt strips.

Minimum overlap in sheet metal at joints shall be 100 mm.

Support skirts of vertical vessels and columns shall be insulated both from inside and outside to a minimum distance of 600 mm from bottom tangent line. The insulations must terminate at minimum 300 mm above support concrete or steel work.

Tank shell insulation shall have continuity in insulation cladding even at stiffener retainer ring location on shell.

Proper expansion/contraction joints shall be provided to allow movement of pipe or vessel without producing random cracking of all the insulation.

Vapour barrier shall be applied on piping and all the vessels & equipments in cold services and also for services up to 125 °C.

8.0 Painting

8.1 Scope of Painting

8.1.1 The following surfaces and materials shall require painting:

a) All un-insulated C.S & A.S piping, fittings, valves, columns, vessels, drums, & storage tanks, heat exchangers etc. including painting of identification marks on insulated lines.

b) Identification color bands on all piping as required including insulated aluminium clad, galvanized, SS and non ferrous piping.

c) Pipes, fittings & valve surfaces under insulation of carbon steel and alloy steel insulated piping system.

d) Pipes, fittings, valves surfaces under insulation of stainless steel insulated piping system.

e) All structural steel works, supports, walkways, handrails and platforms etc.

8.1.2 The following surfaces and materials shall not require painting:

a) Un-insulated austenitic stainless steel and higher alloy piping.
b) Plastic and plastic coated materials.
c) Non ferrous material like aluminium, galvanized, brass, bronze piping etc.

8.2 Color Coding
Painting work shall require satisfying the requirements of the area where the plant is being setup. All painting and color coding shall be as per local painting manual.

8.3 Surface Preparation
As per local specification

8.4 Painting Application
As per local specification

8.5 Painting Materials
As per local specification

9.0 WELDING

9.1 Applicable Codes & Standards
All welding work, equipment for welding, heat treatment, other auxiliary functions and the welding personnel shall meet the requirements of the latest editions of the following accepted standards and procedures.

a) Power Piping ASME: B31.1
b) The Indian Boiler Regulations IBR.

In addition, the following codes and specifications referred in the code of fabrication shall be followed for the welding specifications, consumable qualifications and non destructive test procedures.

i) Welding and Brazing Qualifications ASME BPV- Sec. IX.
ii) Non destructive examination ASME BPV Sec. V.
iii) Material specifications: Welding rods, electrodes and filler metals ASME BPV Sec II Part C.

The additional requirements mentioned in this specification, over and above those obligatory as per codes, shall be followed wherever specified.

9.2 Welding Processes
9.2.1 Welding of various materials shall be carried out using one or more of the following processes with the approval of OWNER / PMC.
- Shielded Metal Arc Welding process (SMAW)
- Gas Tungsten Arc Welding process (GTAW).

9.2.2 Automatic and semi-automatic welding processes shall be employed only with the express approval of the OWNER / PMC. The welding procedure adopted and consumables used shall be specifically approved.

9.2.3 A combination of different welding processes could be employed for a particular joint only after duly qualifying the welding procedure to be adopted and obtaining the approval of OWNER/ PMC.

**NOTES:-**

1.0 These spacings may be varied to suit column spacing of rack. The above spacing is for straight runs of pipe & does not include guides which are used for control of thermal movements, as decided by stress group.

2.0 The guide spacings given in the above table are indicative only.
TECHNICAL REQUIREMENTS OF PIPING ITEMS

1.0 ENDS

Unless otherwise specified in PMS, the ends of piping items shall be to the following standards:

<table>
<thead>
<tr>
<th>Type</th>
<th>Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>SW/SCRD</td>
<td>ASME B 16.11</td>
</tr>
<tr>
<td>BW</td>
<td>ASME B16.25</td>
</tr>
<tr>
<td>FLANGED</td>
<td>ASME B16.5 and ASME B16.47 SERIES 'B'/API-605</td>
</tr>
<tr>
<td>THREADING</td>
<td>ASME/ANSI B1.20.1 (NPT, Taper threads)</td>
</tr>
</tbody>
</table>

1.1 Face Finish

The face finish of flanges/flanged items shall be to MSS-SP-6/ASME B 46.1 / ASME B16.5. The interpretation shall be:

- **Stock Finish**: 250-1000 μ in AARH
- **Serrated Finish/125 AARH**: 125-250 μ in AARH
- **Smooth Finish/63 AARH**: 32-63 μ in AARH

1.2 Austenitic Stainless Steel

All items/parts shall be supplied in solution annealed condition.

For all Austenitic Stainless steels, Inter granular Corrosion' (IGC) Test shall be conducted as per following:

- **ASTM A262 Practice 'B'**: with acceptance criteria of 60 mils/year (max.) for casting.
- **ASTM A262 Practice 'E'**: with acceptance criteria of 'No cracks as observed from 20 X magnification & microscopic structure to be observed from 250 X magnification for other than casting.

For IGC test, two sets shall be drawn from each solution annealing lot; one set corresponding to highest carbon content and other set corresponding to the highest rating/thickness.

For all items of stabilized SS grades, resolution annealing shall be done. It shall be carried out subsequent to normal resolution annealing. Soaking temperature and holding time for stabilizing heat treatment shall be 900 deg. Celsius and four hours respectively.

2.0 ITEM SPECIFIC NOTES

2.1 Pipes

- Unless specifically exempted, welded pipes shall be acceptable only with longitudinal weld made employing automatic welding.
- Double longitudinal seam 180˚ apart is allowed for sizes 36" NB and larger only.
- Galvanized Pipes shall be only Hot Dip galv. to ASTM A53.
- Alloy steel Pipes shall be Normalized and tempered.

2.2 Fittings

- All fittings shall be as per specified in PMS.
• For reducing BW fittings having different wall thicknesses at each end, the greater one shall be employed and the ends shall be matched to suit respective thickness.

• All welded fittings shall have maximum negative tolerance equivalent to pipe selected.

• All welded fittings shall be double welded for size 16” NB & above. Inside weld projection shall not exceed 1.6mm, and the welds shall be ground smooth at least 25mm from the ends.

• For fittings made out of welded pipe, the pipe itself shall be of double welded type, manufactured with the addition of filler material and made employing automatic welding only.

• All welded fittings shall be normalized for CS, normalized & tempered for AS; and 100% radiographed by X-ray for all welds made by fitting manufacturer as well as for welds on the parent material.

• Bevel ends of all BW fittings shall undergo 100% MP/DP test except utility services.

2.3 Flanges

• For Ring Joint Flanges, Blinds and Spacers, the hardness shall be as follows:

<table>
<thead>
<tr>
<th>Flange Material</th>
<th>Min. Hardness of Groove (BHN)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Carbon Steel</td>
<td>120</td>
</tr>
<tr>
<td>1% Cr to 5% Cr, 1/2 Mo</td>
<td>150</td>
</tr>
<tr>
<td>Type 304, 316, 347, 321</td>
<td>160</td>
</tr>
<tr>
<td>Type 304L, 316L</td>
<td>140</td>
</tr>
</tbody>
</table>

• For RTJ flanges, blinds & spacers, the hardness of the groove shall be specified on the test report.

• Bore of weld neck flange shall correspond to the inside diameter of pipe for specified schedule/thickness. Ends shall be beveled to suit the specified schedule/thickness.

• For RTJ flanges, only octagonal section ring joint flanges shall be used.

2.4 Valves

• Valves of Class 900 & above shall be pressure-seal type.

• Threaded and seal welded or welded bonnet shall be employed up to sizes 1-1/2” for valves of class 900# rating & above.

• All flanged valves (except forged) shall have flanges integral with the valve body.

• Valve Castings/Forgings purchased shall be from Local approved foundries/forging shop.

• Yoke material shall be at least equal to body material.

• Forgings are acceptable in place of Castings but not vice-versa.

• No cast iron valves to be used in firewater or any other service.

• Valves in sea water service shall be with non ferrous trims and all wetted parts other than trims shall be epoxy coated.

2.4.1 Dimensions

• Face-to-Face/End-to-End dimension shall be as per ANSI B16.10. In case the same is not covered under B16.10, the dimension shall be as per BS 2080/manufacturer standard.
- Valve under cryogenic service (temp. below -45°C) shall be as per BS-6364 and shall be procured from pre-qualified vendor.
- Generally the valves are hand wheel or lever operated. However, suitable gear operator in enclosed gear box shall be provided for valves as follows:

Gears operators shall be specified for gate, globe, angle, ball, butterfly and plug valves as follows:

<table>
<thead>
<tr>
<th>Gate Valves:</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>CL150</td>
<td>14&quot;NPS and larger</td>

<table>
<thead>
<tr>
<th>Plug Valves:</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>CL150 to 600</td>
<td>6&quot; NPS and larger</td>
</tr>
</tbody>
</table>

Spectacle blinds and paddle blinds/spacers shall be provided per the pressure class and size range divisions shown below:

<table>
<thead>
<tr>
<th>Spectacle Blind</th>
<th>Paddle Blind/Spacer</th>
</tr>
</thead>
<tbody>
<tr>
<td>CL150 14&quot;NPS and below</td>
<td>CL150 16&quot;NPS and above</td>
</tr>
<tr>
<td>CL300 10&quot; NPS and below</td>
<td>CL300 12&quot;NPS and above</td>
</tr>
<tr>
<td>CL600 8&quot; NPS and below</td>
<td>CL600 10&quot;NPS and above</td>
</tr>
</tbody>
</table>

- Hand wheel diameter shall not exceed 750mm and lever length shall not exceed 500 mm on each side. Effort to operate shall not exceed 35 kgf at hand wheel periphery. However, failing to meet the above requirement, vendor shall offer gear operation.
- Quarter-turn valves shall have "open" position indicators with limit stops.
2.4.2 By-Pass

- A globe type valve (size as per ASME/ANSI B16.34) shall be provided as by-pass for the following sizes of gate valves:

<table>
<thead>
<tr>
<th>Class</th>
<th>Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>150</td>
<td>26'' &amp; above</td>
</tr>
<tr>
<td>300</td>
<td>16'' &amp; above</td>
</tr>
<tr>
<td>600</td>
<td>6'' &amp; above</td>
</tr>
<tr>
<td>900</td>
<td>4'' &amp; above</td>
</tr>
<tr>
<td>1500</td>
<td>4'' &amp; above</td>
</tr>
<tr>
<td>2500</td>
<td>3'' &amp; above</td>
</tr>
</tbody>
</table>

- By-pass Piping, Fitting and Valves shall be of compatible material and design. Complete fillet welds for by-pass installation shall be DP/MP tested.

NDT of by-pass valve shall be in line with main valve.

2.4.3 Radiography of Cast Valves

- Quantity is considered for each size in each valve sheet.
- Radiography procedure, areas of casting to be radiographed, and the acceptance criteria shall be as per ASME/ANSI B16.34.
- All valve castings shall be of radiographic quality.
  a) The minimum requirement of radiography for service shall be as under:

<table>
<thead>
<tr>
<th>Class</th>
<th>Size</th>
<th>qty.</th>
</tr>
</thead>
<tbody>
<tr>
<td>150</td>
<td>UP TO 24</td>
<td>5%</td>
</tr>
<tr>
<td>150</td>
<td>26&quot; &amp; above</td>
<td>100%</td>
</tr>
<tr>
<td>300</td>
<td>UP TO 16</td>
<td>10%</td>
</tr>
<tr>
<td>300</td>
<td>18&quot; &amp; above</td>
<td>100%</td>
</tr>
<tr>
<td>600</td>
<td>All</td>
<td>100%</td>
</tr>
<tr>
<td>900 &amp; above</td>
<td>All</td>
<td>100%</td>
</tr>
</tbody>
</table>

b) Additional radiography requirement for casting sizes for special critical piping classes (Over and above the requirements covered in clause (a) above) shall be as follows:

c)
  i) For hydrogen / hydrogen bearing, oxygen, NACE, stress relieved caustic services:

<table>
<thead>
<tr>
<th>Class</th>
<th>Size</th>
<th>qty.</th>
</tr>
</thead>
<tbody>
<tr>
<td>150</td>
<td>up to 24&quot;</td>
<td>50%</td>
</tr>
<tr>
<td>150</td>
<td>ABOVE 24&quot;</td>
<td>100%</td>
</tr>
<tr>
<td>300</td>
<td>up to 16&quot;</td>
<td>50%</td>
</tr>
<tr>
<td>300</td>
<td>ABOVE 16&quot;</td>
<td>100%</td>
</tr>
</tbody>
</table>

  ii) For LT / CRYO services:
### 2.4.4 Ball/Plug/Butterfly Valves

- Each valve shall be supplied with a lever/wrench except for gear operated/motor operated valves.
- Soft-seated Ball, Plug & Butterfly valves shall be supplied with antistatic devices.
- The ball of Ball valves shall not protrude outside the end flanges.
- Ball valves shall be floating ball type / trunnion mounted type as per following:

<table>
<thead>
<tr>
<th>Class</th>
<th>Size</th>
<th>qty.</th>
</tr>
</thead>
<tbody>
<tr>
<td>150</td>
<td>up to 24&quot;</td>
<td>10%</td>
</tr>
<tr>
<td>150</td>
<td>ABOVE 24&quot;</td>
<td>100%</td>
</tr>
<tr>
<td>300</td>
<td>up to 16&quot;</td>
<td>10%</td>
</tr>
<tr>
<td>300</td>
<td>ABOVE 16&quot;</td>
<td>100%</td>
</tr>
</tbody>
</table>

iii) For alloy steel & stainless steel castings (Not covered in paras a, b(i) & b(ii):

<table>
<thead>
<tr>
<th>Class</th>
<th>Size</th>
<th>qty.</th>
</tr>
</thead>
<tbody>
<tr>
<td>150</td>
<td>up to 24&quot;</td>
<td>20%</td>
</tr>
<tr>
<td>150</td>
<td>ABOVE 24&quot;</td>
<td>100%</td>
</tr>
<tr>
<td>300</td>
<td>up to 16&quot;</td>
<td>20%</td>
</tr>
<tr>
<td>300</td>
<td>ABOVE 16&quot;</td>
<td>100%</td>
</tr>
</tbody>
</table>

#### 2.4.5 Special Valves (Orbit. Y -body Globe, Jacketed, Valves of all types)

- SPECIAL VALVES shall strictly follow the requirements of Valve data sheet, Process data sheet/Specialty data sheet.
- Special Valves shall be made out of 100% radiographic casting/ 100% ultrasound forging.
- Jacketed Valves shall be tested to 100% DP/ MP check on Jacket welding, 100% radiography test of valve body, 100% hydro test of Jacket.

#### 2.5 Strainer

- Allowable pressure drop when specified shall be certified by vendor along with the offer. If asked specifically, vendor shall furnish pressure drop calculations.
- All 2" & higher sized Y type strainers shall be provided with 3/4" threaded, tap and solid threaded plug as drain connection. For less than 2", this shall be ½" size.
- Bottom flange of Y-type strainer shall not have tapped hole. Full length standard size studs shall be used for joining blind flange.
2.6 Traps

- For fabricated strainers, all BW joints shall be fully radiographed and fillet welds shall be 100% DP/MP checked.
- All the strainers shall be hydrostatically tested at twice the design pressure.

- Vendor shall also furnish the performance curve indicating the capacity in mass/hour at various differential pressures across the trap.
- Parts subject to wear and tear shall be suitably hardened. Traps shall function in horizontal as well as in vertical installation.
- Traps shall have integral strainers.
- All traps shall be hydrostatically tested to twice the design pressure.

2.7 Hoses

- Manufacturer shall guarantee suitability of hoses for the service and working conditions specified in the requisition, if the material is not specified in the Material Requisition for any particular service.
- All hoses shall be marked with service and working pressure at minimum two ends clearly.
- Hoses shall be resistant to ageing, abrasion and suitable for outdoor installations.
- Complete Hose assembly shall be tested at two times the design pressure.
- Steam hoses shall be subject to steam resistance test.

2.8 Expansion Joints

- The applicable codes are ASME B31.1 and EJMA (Expansion Joint Manufacturer's Association).
- Bellows shall be formed from solution annealed sheet conforming to the latest ASTM Spec. Any longitudinal weld shall be 100% radiographed. The finished longitudinal weld must be of the same thickness and same surface finish as the parent material.
- Circumferential welds are not permitted. Bellows are to be hydraulically or expansion (punched) formed. Rolled formed bellows are not acceptable. Noticeable punch or die marks resulting from expansion operation are not acceptable.
- No repairs of any kind are allowed on the bellows after forming. Deep scratches and dents are not acceptable.
- The out of roundness shall be limited to ± 3mm. This is the max. deviation between the max. & min. diameter.
- The actual circumference of the welding end shall be maintained to ± 3mm of the theoretical circumference.
- Apart from the usual requirements, the vendor shall also furnish
  a) Design calculations to justify stiffness and fatigue life.
  b) Axial, lateral stiffness, angular stiffness, effective pressure thrust area.
  c) Installation/maintenance manual.

2.9 Supports & Spring Assemblies

- The Material, Design, Manufacture and Fabrication shall be generally as per MSS-SP-58/ MSS-SP-89 and/or BS 3974.
- Testing of springs shall be as per BS1726.
2.10 Gaskets

- Non-asbestos filler for spiral wound gasket shall not have any color or dye.
- Full face gaskets shall have bolt holes punched out.
- Non-metallic ring gaskets as per ASME/ANSI B16.21 shall match flanges to ASME/ANSI B16.5 up to 24", and ASME/ANSI B16.47 or AWWA for sizes> 24" unless otherwise specified.
- Spiral wound gaskets as per ASME B16.20 shall match flanges to ASME/ANSI B16.5 up to 24", and ASME B16.47 series 'B' for sizes> 24" unless otherwise specified.
- Inner and outer rings requirement for spiral wound gaskets shall be as per PMS General notes.
- Inner ring shall be provided for the following:
  a) As per code. (B 16.20) requirement.
  b) For sizes 26" & above in all classes.
  c) For vacuum and hydrogen service.
  d) For SS321, SS347 and H grade SS classes.
  e) For classes where temperature is higher than 427°C.
  f) For 900# rating and above classes.
- In case of RTJ gaskets, only octagonal section ring gaskets shall be used & shall have proper marking stamped. Material certificate shall be available for the gasket.
- Hardness of RJT shall be 20 BHN (min) less than the corresponding flange groove hardness.

2.11 Stud, Bolts, Nuts and Jack Screws

- All bolting shall be as per ASME/ANSI B18.2.1 for Studs, M/C Bolts and Jack screws, and ASME/ANSI B18.2.2 for nuts.
- Threads shall be unified (UNC for; 1" dia and 8-UN for> 1" dia) as per ANSI B1.1 with class 2A fit for Studs, M/C Bolts and jack screws, and class 2B fit for nuts.
- Stud bolts shall be threaded full length with two heavy hex nuts. Length tolerance shall be in accordance with the requirement of table F2 of Annexure 6 of ASME B16.5
- The nuts shall be double chamfered, semi-finished, heavy hexagonal type and shall be made by the hot forged process.
- The length of the studs/bolts should be such that minimum two threads should be out of the nut on either side.
- The entire stud bolt should have metallurgical certificates in case of Alloy/ SS metallurgy with identified color marking at the stud ends/ bolt side face.
- In corrosive atmosphere like Acid chemical storage area, cooling towers area, where SS flanges are provided, fasteners should also be SS.
- Heads of jack screws and M/C bolts shall be heavy hexagonal type. Jack screw end shall be rounded.
- Wherever bolt tensioning is specified stud bolt length shall be longer by minimum one diameter do suit bolt tensioner. Excess threads shall be protected by a threaded cap.
3.0 SPECIAL SERVICE REQUIREMENTS

3.1 IBR
IBR stands for Indian Boiler Regulation. For steam services, it is statutory obligation to meet IBR requirements.
For items under purview of IBR, composition restrictions, test reports, painting, etc. shall be as per IBR's stipulations.

3.2 NACE & Sour Service
For items under this category, unless otherwise specified in PMS, NACE-: MR-01-75 shall be followed. Hardness shall be below BHN 200 for C.S. material. Carbon equivalent (CE) shall be limited to 0.43.

3.3 CRYO & Fire-Safe
For items to be used under cryogenic conditions, temp below -45°C and those required to be fire-safe, special designs and tests would be applicable. Pre-qualification criteria need to be specified before execution of job.

3.4 Impact Tests
Welded Pipes and Fittings used below Temp. -29°C (LTCS material) shall be impact tested as per requirement of ASME B31.1.

3.5 Hydrogen & other demanding services
Vendor quality plan shall include the special quality checks and inspection requirements for these services. For hydrogen service CS material shall be normalizing and AS Materials shall be normalized & tempered.

“The SPECIAL REQUIREMENTS FOR HYDROGEN SERVICE”
(SPEC NO. API-941 “shall be followed for all Hydrogen and Hydrogen bearing hydrocarbon services.)

3.6 Inspection & Testing:
- All items and their parts shall be subjected to all mandatory as well as supplementary (wherever specified) tests and checks called for in the respective codes/standards/data sheets.
- The examining personnel shall have the requisite qualification and experience.
- Client and its authorized representative reserve the right to vet and suggest changes in vendor's procedures.
- Vendor's works and facilities shall be accessible to the Owner/PMC or their Representative at all reasonable times.
- Test reports for all mandatory as well as supplementary tests wherever specified shall be furnished.

4.0 POSITIVE MATERIAL IDENTIFICATION (PMI)
- All alloy steel, and higher alloyed piping material shall be subjected to PMI inspection.
- Extent and procedure of PMI shall be developed by as LSTK contractor based on Process Licensor’s requirement & Guide lines for shop works as well as for site inspection.
• Similar specification shall be developed by LSTK contractor for site inspection.

5.0 MARKING
  • All items shall be marked (stamped/etched) in accordance with the applicable code/standard/specification. In addition, the item code, if available, shall also be marked.
  • For ease of identification, the color of painted strip (wherever required) shall be as per the applicable standard.
  • Paint or ink for marking shall not contain any harmful metal or metal salts which can cause corrosive attack either ordinarily or in service.
  • Special items/smaller items shall have attached corrosion resistant tag providing salient features.

5.1 Dispatch
  • All items shall be dry, clean and free from moisture, dirt and loose foreign material of all kinds.
  • All items shall be protected from rust, corrosion, and mechanical damage during transportation, shipment and storage.
  • Rust preventive on machined surfaces to be welded shall not be harmful to welding and shall be easily removable with a petroleum solvent.
  • Ends shall be suitably protected, and the protectors shall be securely and tightly attached.
  • Each variety and size of item shall be supplied in separate packaging marked with the purchase order no., item code (if available) and the salient specifications.
  • Carbon steel, LTCS and low alloy steel valves shall be painted with one coat of inorganic zinc silicate primer after surface preparation.
## CLEARANCES

Minimum clearances for piping, equipment, structures, platforms, and supports shall be in accordance with the following table:

1.0 PURPOSE

This design basis deals with the subject of Identification of Stress Critical pipelines and preparation of Critical line list. This procedure also defines the minimum requirements for performing stress analysis, design and location of spring, support and level of system analysis with the extent of documentation required for flexibility analysis.

Purpose of piping stress analysis is to ensure:

- Safety of piping and piping components
- Safety of connected equipment and supporting structure
- Piping deflections are within the limits

2.0 SCOPE

This specification covers the supply of engineering services to perform a complete piping and pipe support analysis for piping systems for Steam Generation Plant.

3.0 DEFINITIONS

3.1 Critical Lines / Critical Line List

Critical lines or Critical Line List as referred to in this procedure relates to Piping Stress Critical Lines and does not include or refer to process critical lines.

3.2 Stress Analysis Temperature

Stress Analysis Temperature refers to either “Maximum Operating Temperature” or “Steam-out temperature / hot nitrogen purging temperature” of the lines under review whichever is higher. In absence of the above values, it refers to the Design Temperature of the line under review. The Line List should be strictly followed in obtaining the above temperature values.

3.3 Design Pressure

Design Pressure refers to the “Design Pressure” of the line under review as indicated on the Line List.

3.4 Temperature for Flexibility Analysis

The temperature to be used for the flexibility analysis shall be taken as the maximum / minimum temperature which the pipe will see under any combination of different normal / abnormal operating conditions. Where piping is exposed to direct sunlight, solar radiation temperature of 70 °C is considered in establishing the maximum temperature of piping. Even, for non-critical piping exposed to direct sunlight on pipe rack or elsewhere, expansion loops, wherever essential, are provided to take care of pipe movements resulting from piping skin temperature due to solar radiation.
In general, unless there is a difference of more than 50 °C between working Temperature and the design temperature, the design temperature should be taken as Flexibility temperature. Ambient Temperature shall be considered as 21°C the assumed piping installation temperature. The displacement stress range from this installation temperature to the minimum recorded ambient temperature of 0º C being less than the same from installation temperature to the maximum operating temperature of hot piping in most cases, the later governs as per ASME B 31.1

The temperature under fire condition is normally not considered for flexibility analysis.

3.0 SELECTION

A line is selected and listed as a Critical Line provided it falls under any one of the categories defined below and is intended to include the special requirements of Piping Stress Engineer. It is hence defined as any line for which a flexibility review is required or where pipe supporting is deemed to be critical and needs review by a Stress Engineer. Line DN 50 and smaller is inherently flexible and is not normally considered critical unless built from non-metallic or non-ferrous materials. In case of more than one applicable line size, larger line size governs. Lines are classified as Level I, Level II & Level III according to the criteria listed below.

4.1 Level I [Extensive Analysis]

Piping systems or lines that meet Annexure 7A criteria are deemed to be extremely critical. These lines are categorized as Level I and require careful study to ensure that the code compliance is met and the accurate determination of nozzle and support loads have been made. The routing of these lines is very important. They must be analyzed in the early stages of the project during routing studies so that the impact on the location of less critical lines is minimized. Normally, these systems require computer analysis. The general intent of the Level I analysis criteria is to study lines size DN 80 & larger that are affected by thermal expansion and / or a dynamic response, and that can’t be evaluated by a weight-only analysis (as per the general intent of Level II analysis). Consideration has to be given to other special situations that augment the Level I general intent guidelines such as for lines that are excessively large and stiff.

4.2 Level II [Normal Analysis]

Piping systems or lines that meet Annexure 7B criteria are moderately critical lines and often do not require such rigorous study to ensure code compliance or accurate determination of nozzle and support loads. These lines are smaller in size and operate at lower temperatures (in general) than the lines to be analyzed using Level I Criteria. Normally, only manual calculations, by use of appropriate monographs are required for analysis of these systems.

4.3 Level III [Minimum Analysis]

All lines that are outside the purview of Level I or Level II criteria will be classified as level III and shall be reviewed by the Piping Engineer during the squad check of the piping drawings and or fabrication Isometric drawings. If more detailed analysis is required, the Piping Engineer may change the level of analysis during
the squad check as applicable. Normally, only visual analysis is required for these systems.

4.4 Lines Deemed To Be Support Critical
Lines subjected to two-phase flow.
Cross country pipelines.
Lines with pipe thickness Sch 160 or greater.
Lines 16" NB and above with pipe thickness less than 8 mm.
Lines 10" NB and above with corrosion allowance 3 mm and above.
Lines with high concentrated loads such as heavy valves or fittings etc.
Lines downstream of Relief Valve / letdown Control Valves / bursting (rupture) discs.
Connecting to vent or flare systems or discharging to atmosphere
Liquid Blow down Lines.
Lined pipes
Non-metallic pipes

4.5 Lines Needing Dynamic Analysis
There are instances where in the frequency of the applied load is comparable to the natural frequency of the piping system. Such systems tend to store the energy and release it according to certain scientific laws. Such a system is dynamic in nature and the study of the response of such a system is referred to as “Dynamic Analysis”. Examples of such kind of systems are Relief Valve discharge lines, water hammer and surge in pipe lines, two phase flow in pipelines, reciprocating pumps and compressor piping, submarine piping etc.

5.0 RELATED DOCUMENTATION

5.1 Critical Line List Format.
The critical line list shall be prepared from the project line list document by inserting following relevant fields such as Stress level, stress package no., stress analysis temperature, support critical nature of the line, dynamic loadings, steam out / purge temperature etc.
The list shall reflect analysis status of line that includes its input received date from design & output handover date to design and specific remark if any.

5.2 Lines Affecting the Flexibility of Critical Lines
Non-critical Lines found to affect the flexibility of critical lines which have not been included during the initial review are subsequently added to the Critical Line List.
Non-critical Lines on which advice may be sought by the Lead Piping Engineer are not normally entered into the Critical Line List but covered verbally, or by a memorandum if a record is required.

6.0 PIPE STRESS ANALYSIS AND SUPPORTING

6.1 Piping system shall be properly supported taking in to account of the following points:
Piping stress analysis shall be as per requirement of ASME B 31.1 and shall be complete to prevent overstressing of the pipe during operating conditions with
wind and seismic loadings. During sustained, occasional (wind and seismic) & thermal expansion loading on piping,

The material allowable stresses shall be as per ASME B 31.1 for ASTM materials. For DIN material specifications the allowable stress values shall be calculated as per ASME.

6.2 Analysis shall include, but not be limited to the following; thermal, dead weight, internal pressure, wind and seismic, and a combination of these based on ASME B 31.1.

6.3 Piping shall be designed in accordance with the Indian Standard criteria for earthquake resistance design for structures IS: 1893 for seismic zone-III (refer project design basis). As a minimum, two (2) orthogonal horizontal components and a vertical component of ground motion will be considered in the seismic analysis. For American standard, loading applied to piping would be in accordance with uniform building code (UBC).

The equivalent horizontal static force method shall apply in general. The contractor shall also carry out special designs and provisions as necessary for piping which is considered to be dynamically sensitive to earthquake.

Seismic analysis to be performed for lines equal to and above 12”. Seismic load case shall ALGEBRIC combination with operating cases.

Heavy rigid masses like valves shall be restrained in their vicinity to avoid large seismic movements. Guides or snubbers as the case may be used for this purpose.

Horizontal seismic coefficient (Ah) to be considered as 0.26 and Vertical (Av) to be considered as 0.173.

6.4 Wind loads shall be calculated in accordance with IS-875 code of practice for structural safety of building – Loading Standards for Indian code requirement using basic wind speed as mentioned in project design basis. For American standard, wind load in accordance to ASCE 07 shall be calculated. Reduction in velocity pressure due to apparent shielding afforded by buildings and structure or terrain shall not be permitted.

Wind loading shall only be considered for lines larger than 20” OD at elevation higher than 10m above grade. Displacements due to wind and earthquake should be limited to 50 mm.

Both the horizontal directions shall be analyzed independently in two cases
+X, -X, +Z, -Z

Wind and seismic loading will not occur simultaneously.

6.5 Analysis of all nozzles loading on vessels within the piping boundaries is covered in this specification. Nozzle analysis shall follow the guidelines of ASME Section
VIII, Division 1, and WRC 297 & 107 (latest editions). Nozzle stresses shall fall within the allowable per ASME.

6.6 Piping system shall have sufficient flexibility to avoid leakage at joints. Flanged joints imposed by external moments may be analyzed and the stresses evaluated by using the methods of equivalent pressure given in the ASME boiler and pressure code section III. Flange leakage shall be assessed as per “Pressure Equivalent Method”. In case of Failure in Pressure Equivalent Method, the Flanges shall be checked for leakage using Caesar Flange leakage Module. Flange leakage shall be assessed for all PSV flanges, Control valve flanges, High Pressure lines, and all steam lines. Also for equipment flanges where loads are high.

6.7 All forces on connections to equipment shall not exceed maximum allowable as specified by equipment vendor.

6.8 Pipe supports loads shall be based on the maximum loads determined by the piping analysis. Adjustments shall be made to the piping system and model such that the pipe supports loads are within a reasonable uniformity throughout the piping system.

6.9 Various Load cases built in Caesar II to check stress in piping system are listed below.

7.0 CODES AND STANDARDS
The following codes and standards shall apply in the design and analysis of the piping systems covered under this specification:
Allowable Stress ASME B 31.1
Piping ASME B 31.1
Nozzle Loadings as per WRC297/107(Welding Research Council) / respective code & Standard/ Vendor Allowable

Wind Analysis ASCE 7 – 98

8.0 SOFTWARE USED
The package used shall be latest version of CEASER-II.

9.0 DOCUMENT REQUIREMENT
9.1 A written report shall be submitted on the piping and equipment analysis. The report shall include all pertinent information that shall include but not be limited to the following.
Location and type of pipe supports with loads and movements.
Location of expansion joints and movements.
Vertical and horizontal loads including moments at all support points.
Vertical and horizontal loads including moments on all equipment and Vessel connections.
Caesar II analysis report, which shall include as a minimum, restraint forces, movements and stresses for all load cases. For flange connection, loaded with high bending moments and/or tensile forces in piping or at equipment connections, Caesar II flange leakage report will be provided. For piping analyzed, if subjected to hydro test, hydro test load case will be made in Caesar II to check for loading under hydro test & the requirement of any additional temporary supports for hydro test.
Detailed nodal model used for the stress analysis
All assumptions and limitations applied to the analysis
9.2 All dimensions and analysis shall be performed using metric and SI units.

9.3 The final report / stress package folder shall be submitted as follows:

1. Front sheet with Approval status
2. Isometrics with following information
   - Node numbers
   - Type of supports selected by stress engineer
   - Springs / Bellows data required for procurement like spring rate, loads, tide/untied information and SM (special material) identification.
   - Maximum Expansion and sustain stress values with node number
   - Nozzle/ Anchors initial movements and piping imposed forces and moments on the same
   - Support loads (anchors, guides or rest) only they are above limit (The limit is defined in the beginning of the project in consultation with civil)
   - Design and maximum operating conditions
   - Coordinate axis system considered for inputs
   - Dimensional details for piping designer to locate supports in piping model/layout.
3. Checklist as per Work instructions.
4. Following outputs
   - Load Cases
   - Restraint summary
   - Spring hanger report, if any
5. Stress critical line list extract for the lines analyzed
6. Piping material specifications
7. Equipment drawings with allowable loads, if available
8. PID

1.0 INTRODUCTION
The LSTK Contractor shall carry out Detailed Engineering of the plant areas specified in the scope elsewhere using 3D intelligent software.

2.0 SOFTWARE
Anyone of the following two software with Oracle database shall be used by the LSTK Contractor.

i) PDS by Intergraph USA on Windows NT with design review through dynamic walkthrough.

ii) PDMS by AVEVA UK on Windows NT with design review through dynamic walkthrough.

Isometrics shall be generated using ISOGEN Software. Latest version of all the software released as on the date of ITB shall be used by the Contractor. The LSTK Contractor shall clearly specify in his bid the software to be used with version number.

3.0 OBJECTIVE
The objective of 3D modelling is to carry out detail engineering and produce deliverables using 3D tools and conduct reviews for obtaining approvals from Owner/PMC. 3D model shall be developed and demonstrated with dynamic walk through facility to check any interference requirements of operation and maintenance for getting the approval of the Owner. LSTK contractor shall deliver to Owner/PMC a complete 3D model which shall be utilised for all future maintenance, operation, revamping and any de-bottlenecking of the plant. The 3D Design Reviews through dynamic walkthrough, through LCD projector system shall assist the Owner's operation and maintenance personnel in reviewing the project prior to construction and suggest modifications for efficient operation of the plant. Owner/PMC/ shall use it for review of design.

4.0 DEFINITIONS

4.1 EXACT GEOMETRY
The geometry of the object should be exactly as shown in vendor drawings or as per standard drawings as given in codes e.g. Pipes, Flanges. Valves, beams, etc. the geometry of the items to be modelled should be such that it serves the purpose of clash checking as well as identification of object in 3D.

4.2 NEAR EXACT GEOMETRY
SPECIAL items like bellows, traps, etc does not call for exact geometry. The provision should be made for clash checking and 3D representation of the item. A box instead of bellows, traps, etc is not acceptable.

4.3 APPROXIMATE GEOMETRY
Items like transmitters, floor stand mounted instruments where boxes instead of exact shape can be shown. The nomenclature of such items should be clearly distinguishable for easy identification.

5.0 EXTENT OF MODELLING / SCOPE OF WORK

5.1 PIPING
All design within Unit, Facility battery limit above ground and underground piping inclusive of fire fighting lines and sprinkler system, big bore and small bore,
except tubing, for all piping materials shall be modelled. Details shall include all pipes, valves, flanges, fittings, reducers, spectacle blinds, drains, temperature/pressure connections, sample points, drip legs jacketed pipes, fittings and flanges etc. Existing lines inside the battery limit (If any) along with tie-in points shall also be modelled.

5.1.2 All in line instruments like control valves, safety valves, rotameters, orifice plate etc. with near exact geometry.

5.1.3 All piping special items like expansion bellows, slide valves, special valves with purge points, steam traps, strainers etc. with near exact geometry.

5.1.4 Complete vessel trims with level gauges, level switches, level transmitters, equipment, instrument, vent/draains utility connections, pressure gauges etc. with exact geometry.

5.1.5 Steam supply and condensate recovery stations up to the first valves in tracer lines

5.1.6 All pipe supports to be Physical modelled for all sizes with secondary steel sleeper way as follows.
   a) All spring hangers, roller supports to be modelled with all details.
   b) Pipe supports along with concrete pedestals ,Type of support
   c) Details of the spring hanger's i.e. operating load, travel, spring constant should be keyed in as user-defined attributes.
   d) Details of expansion bellows i.e. type, axial/lateral deflections, stiffness etc to be keyed in as user defined attributes.
   e) Structural steel members used for the pipe supports to be modelled in complete details.

5.1.7 All equipment to be modelled with exact geometry including but not limited to: manholes with davits, pipe davits on top platforms, nozzles, stiffener rings, bellows, break flanges, platforms, ladders, handrails, lifting lugs, etc. for all the equipment in the plant like vessels, columns, reactor, receivers, pumps with motors, compressors with details of volume bottles, cylinders etc., blowers, centrifugal compressors, furnaces with soot blowers, fired heaters, burners and peep holes, air coolers with motors and fans, filters, blow down drums, all equipment within packages and heat exchangers etc.
   a) Maintenance areas around equipment, davit swing areas, swing elbows sweep areas, tube bundle removal areas for heat exchangers, rotor removal areas, and drop out areas to be modelled as soft envelopes and should be used for clash detections.
   b) Equipment supports: skirts, support legs/lugs, saddles to be modelled along with the Equipment.
   c) Insulation type (hot, cold, tracing, jacketed, etc). Insulation thickness, operating/design. Pressure /temperature, hydro test medium/pressure to be given.
   d) Equipment 3D model shall include all attachments like platforms, nozzles, ladders, pipe supports, etc.

5.1.8 Skid mounted Equipment / Package units (if applicable) shall be modelled as a Block and Piping connections at Skid/Package unit battery limit to be precisely modelled depicting complete connectivity.
   a) Skid to be tagged as main equipment.
   b) All sub-equipment of all skids to have skid tag as a prefix.
   c) All sub-equipment to be modelled with exact geometry.
   d) Complete internal Piping of the skid with all inline and online instruments to be modelled as per the details in 5.1.1 to 5.1.7
e) All pipe supports with the skids are to be modelled as per para 5.1.7

5.1.9 Tagging of all line nos., Instrument nos., special items, equipment nos. shall be as marked in the P&ID’s.

5.1.10 Complete underground piping man hole vent piping to atmosphere, catch pits, cable trays etc. to be modelled. Envelopes to be modelled on top of manholes and catch pits and shall be used for interference detection.

5.1.11 Material handling equipment e.g. Catalyst loading chutes, drumsetc. to be modelled in near exact geometry.

5.1.12 Hard stands, fabrication space for tall columns, erection access for tall structures considering crane boom and movement, crane access. Unit approaches from main roads. main roads outside the units shall also be modelled.

5.1.13 Line information required in 3-D model.
The following attributes must be keyed in while modelling:

a) Line operating/design, temperature/pressure in deg. C and kg/cm2g respectively

b) Liquid state i.e. vapour, liquid, 2-phase.

c) Insulation thickness and type i.e. IH/IC/IJ/IC etc.

d) Hydro test pressure in kg/cm2g and medium.

e) Line number label should be as per the P&ID with the following attributes: Line size + unit no + line sequence no + sub-line no + piping material specification + insulation type. User Defined Attributes (UDA’s) to be generated for keying in this information in PDMS.

5.1.14 Incorporation of site changes during fabrication and erection with 3D Model in order to deliver a complete as built model to Owner.

5.1.15 General Arrangement Drawing Extraction

a) Piping General Arrangement Drawings are to be extracted from the 3D model on AO size with a scale of 1 :33 / 1 :50 for rack Vital installations and battery limits shall be marked with coordinates.

b) All locating dimensions like spacing for equipment, structural columns, pipe-to-pipe etc. shall be marked on the GAD’s. Equipment tag numbers, line numbers, instrument and speciality item tag numbers shall be marked on the GAD’s. Electrical instrument ducts shall be marked and labelled. Access ways, maintenance corridors, dropout areas, bundle removal areas catalyst-handling areas shall be marked on the GAD’s.

5.1.16 ISOMETRIC EXTRACTION

Isometrics shall be extracted from 3D model using ISOGEN Software along with Bill of Material and logical pipe supports.

5.1.17 Interference Detection shall take care of Hard-Hard clashes and Hard-Soft clashes for all the disciplines.

5.2 STRUCTURAL

The scope of modelling for structural shall include but not limited to the following:

i) Main steel/secondary steel equipment support beams, bracing, columns with footings, stiffener plates, platforms, ladders, pipe racks, stair cases, walkways, supporting structure for all coolers with operating platforms, handrails and staircase, monorails, EOT support, including fire proofing shall be modelled in exact geometry. Existing structures inside the working battery limit to be modelled.

ii) Equipment and structure foundations, technological buildings, equipment supporting structure, flue gas stack and any other concrete structure to be modelled in exact geometry with exact locations of all insert plates.
iii) Foundation and structure for platforms, gratings, handrails etc. for packaged item and items are also included.

5.3 INSTRUMENTATION
i) Instrument ducts, cable trays greater than or equal to 300 mm width, Instrument Junction boxes to be modelled in exact geometry.
ii) Transmitters and other floor stand mounted instruments on grade/platform to be modelled in approximate geometry with tag nos. as per P&ID's.

5.4 ELECTRICAL
i) Electrical cable trays greater than or equal to 300 mm width. Electrical cable trenches all sizes, junction boxes to be modelled in exact geometry.
ii) Electrical stop/start switches for motors, to be modelled in approximate geometry.
iii) Lighting details, earth pits.
iv) Fire alarm system, e.g. fire detection point, hooters, etc.

6.0 MODEL SPLIT
6.1 Separate models to be generated for each discipline.

<table>
<thead>
<tr>
<th>Discipline</th>
<th>Model Identifier</th>
</tr>
</thead>
<tbody>
<tr>
<td>Piping above ground</td>
<td>P</td>
</tr>
<tr>
<td>Piping underground</td>
<td>U</td>
</tr>
<tr>

<td>S</td>
</tr>
<tr>
<td>Architectural</td>
<td>A</td>
</tr>
<tr>
<td>Electrical</td>
<td>L</td>
</tr>
<tr>
<td>Instrumentation</td>
<td>I</td>
</tr>
</tbody>
</table>

6.2 Within each discipline models are to be generated based on the area division in piping key plan. The naming conventions for model in the PDS and Database in PDMS shall be as follows.

\[
\begin{array}{cccc}
X & X & = & XX \\
\text{Model Identifier as Levels} & \text{Under score} & \text{Area number} & \text{form Key Plan} \\
\text{given below} & & & \\
\end{array}
\]

- A – Grade
- B – First Level above grade
- C – Second Level above grade
- X – All levels in one model
- U – Under ground

- Above ground and underground piping shall always be in different models.

6.3 Database Hierarchy in PDMS

6.3.1 Piping
a) PIPE

<table>
<thead>
<tr>
<th>Line no. Label Specified in 5.1.15)</th>

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
b) Branch
  PIPE NAME / B1, B2

c) TAX NOS. For all Inline Instruments, Special Items as component Name in PDMS. Same tag numbering philosophy to be followed in PDS.

XXX = XXX XXXX X
UNIT No. DASH INST. INST. No. / Only if same
Type i.e. PSV, FV, special item no. no. is getting
PV repeated.

- Comments to be written in components S Text attribute.

6.3.2 Other Disciplines
Basis shall be similar to that given for piping. LSTK Contractor shall develop the Hierarchy and submit it for Owner/PMC approval prior to start of modelling

7.0 DELIVERABLES

7.1 Complete 3D model along with as built GAD's, Isometrics, and MTO reports, all extracted from the model, nozzle orientations for Piping and 3D models for all disciplines as specified in 7.1 to 7.6 with any other document generated from 3D model and naming conventions as per 7.0 to 7.3 with "As built" updates along with complete reference databases, component catalogues for all the size range in the approved specifications shall be furnished by the LSTK Contractor in electronic form.

In addition, contractor shall submit the 3D model in electronic form after completion of final review of 3D model duly updated as per comments/observations and agreed of MOMs of review sessions.

7.2 Review Models shall be installed at site having latest version of design review software and all other pre requisite software and any other software required for smooth running) and minimum configuration as stated in by the Contractor sufficiently at start of Mechanical work and & plotter at site shall be decided in consultation with Owner.

PDS and Isogen will not be installed at site. Only review data will be available on review station.

In addition LSTK Contractor to Minimum Install.
  ► One number of A3/A4 duplex laser printer
  ► One number of A0 inkjet plotter

7.3 Reference Data Bases

7.3.1 P.D.S.
The complete reference Data base developed for the FACILITIES by the LSTK Contractor on PDS and delivered shall include but not limited to the following:

7.3.1.1 Piping
1. Piping material class
2. Piping Commodity data files.
3. Short or Long material description library.
4. Specialty material description library.
5. Standard note library.
7. Piping assembly library.
8. Graphic commodity library.
10. Formats files for MTO
11. Isometric set-up (option) files.
13. Write-up of all project specific code lists, which have been, added to the standard code lists.

7.3.1.2 Other disciplines
Complete reference database with all the libraries. LSTK Contractor shall prepare a comprehensive list of these files separately for each discipline and submit it for PMC review prior to start of 3D modelling.

7.3.2 PDMS
The complete material specifications and component catalogues developed by the LSTK Contractor on PDMS and delivered shall include but not limited to the following.

7.3.2.1 Piping
1. Piping material specifications.
2. Insulation specifications
3. Bolt specification
4. Nozzle specifications
5. Complete Piping component catalogues with write-up on naming conventions used for CATALOGUE references, component references for Property Database. Bolt References for single and multiples.
6. Detail texts along with the symbol keys & R Texts
7. Material texts with X Texts
8. Any symbol key library developed for special items where Isometric Symbols by CAD Centre were not available.
9. Property database with nominal bore and outside diameter developed for the project.

7.3.2.2 Other Disciplines
Complete reference database with all the libraries. LSTK Contractor shall prepare a comprehensive list of these files separately for each discipline and submit it for PMC review prior to start of 3D modelling.

7.4 During the period of construction the above workstations and software at site shall be manned and maintained by LSTK Contractor personnel up to the completion of the Project.

7.5 Costs for all the hardware, software, networking, model transfers, ISDN link etc shall be borne by the LSTK Contractor.

7.6 Review by PMC/Owner/Licensor.
LSTK Contractor shall be responsible for arranging 3D review sessions at his design center with Dynamic walkthrough with overhead projector system, for Owner/ PMC/ Licensor comprehensive review of the 3D Models. Simultaneously a Technical Audit of the Reference Database, Component Libraries and Project Database shall be carried out by PMC. LSTK Contractor shall make one workstation available for the entire duration of the Technical Audit to the audit team along with Contractors support team, without any extra cost to PMC/Owner.
Incorporation of the comments of the Technical Audit shall be done by the LSTK Contractor without any cost or time impact. LSTK contractor shall send fortnightly updates of the model using latest version of 3D modeling software (compatible to the one at OWNER /PMC Office) for the review status monitoring of the models. LSTK Contractor shall propose the dates and duration at least 4 weeks in advance for these 3D reviews by Owner/PMC.

7.7 Review Stage

There shall be minimum 3 review stages to be done as follows. 4th and 5th further reviews shall be required after all comments are incorporated by the LSTK Contractor.

1. Equipment layout review from erection, construction, operation and maintenance point of view & Conceptual review of critical lines (thermal & process critical) (30%).
2. Before issue of model for engineering (60%).
3. Before issue of model for construction (before isometric generation commences) (90%).

3-D modeling review for sprinkler system for pumps where monorail is provided. Shall be done with sprinkler system in place.

3-D modeling review for material requirement has to be fine tuned as per 3D modeling and report of such material requirement shall be forwarded to PMC/OWNER for their information on regular interval.

Any operational requirements such as platforms, approaches for equipment & technological structure if required during the 3D model review as above, the same shall be provided by the LSTK contractor without any time delay and cost implications.

8.0 PROVEN TRACK RECORD

The LSTK Contractor or his Engineering sub-Contractor must have carried out extensive 3D modeling and data base management for a project of similar nature with the following as a minimum.

LSTK Contractor should demonstrate their capability through walk through of one such 3D model developed by them.

Owner/PMC reserve the right to verify the above at the premises (as applicable) including experience of personnel deployed on the project Owner/PMC decision shall be final and binding on the LSTK Contractor in this regard.
Section-VI-5.3.2

DESIGN PHILOSOPHY – STATIC EQUIPMENT

PLANT : STEAM GENERATION PLANT

PROJECT : INTEGRATED COAL BASED FERTILISER COMPLEX, AT TALCHER, ANGUL DISTRICT, ODISHA

1.0 GENERAL

1.1 SCOPE

1.1.1 This document defines the design philosophy to be applied to the design of various types of static equipment i.e. Pressure Vessels, Heat Exchangers, Power and Waste heat Boilers, Storage Tanks, and Vessel Internals e.t.c for Steam Generation Plant for the M/s TALCHER FERTILIZERS LIMITED.

1.1.2 The complete design, material of construction/fabrication (shop/site as applicable), inspection, testing, painting, supply, transportation and erection of equipment etc. at project site shall conform to the specifications, drawings and internationally accepted codes / standards duly accepted by the Owner. In addition, all statutory rules & regulations shall also be complied with.

1.2 CODES AND STANDARDS

1.2.1 The equipment shall be designed & constructed as per the latest edition of the following codes and standards:

<table>
<thead>
<tr>
<th>Code**</th>
<th>Description</th>
</tr>
</thead>
<tbody>

* Except for heat exchangers, while for heat exchangers the expansion bellows shall be designed as per TEMA standard.
NOTES:

1. LSTK Contractor may select DIN, BS or any other well known international materials as substituted materials to ASTM/ASME ones, if they are equivalent or superior to ASTM / ASME ones. The chemical & mechanical properties of such equivalent or superior offered materials preferably comparison w.r.t. ASTM materials shall be furnished along the bid. LSTK Contractor shall also submit the references of past supplies of similar type of equipment w.r.t. the proposed materials offered by them in their bid.

2. OEMs guidelines / standards may be adopted complying minimum requirements of this design philosophy of static equipment. Details of such selected guidelines/standards along with the list shall be furnished in the bid.

3. Specifications of all critical equipments including those specified by the OEM shall be furnished in the technical bid.

4. The work falling under the purview of Indian Boiler Regulations (IBR) shall completely meet or exceed all the requirements of the latest edition of IBR. Any other standard acceptable to IBR can also be considered, provided the requirements of that standard are equivalent or exceed IBR requirement

**Any conflicts between documents, including regulations and codes, shall be brought to the Purchaser’s attention for resolution.

1.3 REGULATIONS

All items of equipment shall comply with the latest Indian Boiler Regulations and stipulations of Inspectorate of Factories, Chief Electrical Inspectorate and other statutory bodies as per the requirement. Wherever required, the LSTK Contractor has to obtain the necessary approvals from statutory authorities and other concerned agencies. All cost, on these accounts shall be borne by the LSTK Contractor. Static and Mobile Pressure Vessel (SMPV) rules as applicable shall also be complied with.

PUBLICATIONS:

WRC Bulletin # 107  Local Stresses in Spherical & Cylindrical Shells due to External
Loadings.

WRC Bulletin # 297 Local Stresses in Cylindrical Shells due to External Loadings on Nozzles

1.4 SITE CONDITIONS

1.4.1 Climatic and other site conditions as defined elsewhere (as per design philosophy- Process/Civil).

1.5 OPERATING DUTY

1.5.1 Service shall be twenty-four (24) hours per day, seven (7) days per week, and fifty-two (52) weeks per year.

1.6 DESIGN DOCUMENTATION

1.6.1 Detailed design calculations considering different loadings shall be made as per code/standards and the additional requirements as mentioned below:

1.6.2 Design of equipment inside the Steam generation plant complex shall be in accordance with the OEM's data sheets and specifications.

1.6.3 LSTK Contractor shall consider the interfaces with other engineering disciplines w.r.t.

- Piping Layout/Location Drawings
- Civil / Structural Drawings
- P & ID’s
- Materials
- 3D PDS Model for Piping and Equipment Layout
- Hazardous Area Classification

1.6.4 Design philosophy of other disciplines shall be observed and shall be relevant to the extent applicable.

- Civil/Structural Design Criteria
- Piping Design Criteria
- Process Design Criteria
- Electrical and Instrumentation Design Criteria

1.7 SAFETY

1.7.1 Safety standards and features which are inherent in the specific mechanical equipment design codes, standards and regulations are applicable to this criterion. Job Hazard and Operability [HAZOP] as per OHSAS-18001 & Factory Act shall be done during design stage the equipment.

1.7.2 Safety features to be incorporated into the design include, but are not limited to, the following features for equipment:

- Ladder cages
- Safety chain across platform access
- Step-off platforms with Hand Railing where necessary
- Platform grating with adequate thickness
- Toe plates

1.8 EQUIPMENT FABRICATION

1.8.1 Equipment design shall be based on maximizing shop fabrication and assembly where deemed practical. Fabrication in open yard shall be avoided.

1.8.2 The LSTK Contractor shall comply in all respects with the provision of the applicable codes / standards and specification during fabrication.

1.8.3 Impact test, when required as per code and specifications, shall be carried out on parent metal, weld and HAZ.

1.8.4 Production Control coupons, when required as per code and specifications, shall be subjected to all tests like impact, inter granular corrosion test etc., in addition to mechanical test as required. In case of heat treated equipment test coupons shall be given similar heat treatment as for the equipment.
1.8.5 Due provisions must be kept for venting out entrapped gases during welding of pads, flanges and liner plates etc.

1.8.6 In case of equipment involving site assembly/fabrication the entire site job including loading & unloading at site, fabrication, radiography, heat treatment, Inspection & testing etc. shall be included in the scope of supply.

1.8.7 All nozzle connections up to DN 10” size shall be made of seamless pipes. For sizes above DN 10” nozzles connection may be rolled from plates with full radiography of welds.

1.8.8 No welding, hammering or deforming is permitted on the pressure retaining parts after post weld heat treatment except as permitted by the codes or standards and when approved by the Owner/PMC.

1.8.9 Flange facing and thread connection shall be protected against oxidation during Heat Treatment.

1.8.10 All welding shall be done by metal arc welding. For welding on thinner gauge sheets TIG welding is preferred.

1.8.11 Gas or Carbon arc welding shall not be used.

1.8.12 Welding electrodes of composition similar to Internals material shall be used except austenitic electrodes of higher chromium and nickel content such as AWS A5.4, ASME SFA 5.4 class E309 and E310 may be used for 12-Cr stainless steel. For dissimilar material welding, electrode composition shall be similar to nobler material being welded. Following electrodes shall be used unless specified otherwise:

- E 7018 for all CS materials
- E 308 for all SS 304 to SS 304
- E 308L for all SS 304L to SS 304L
- E 309 MoL for SS 410S to SS 410S, SS to CS, SS 410S to SS 304, 304L, 316, 316L
1.8.13 Welding wherever specified, is to be done by qualified and approved welders using the suitable fillers and fluxes recommended for the materials in the fabrication drawings. For welding the stud on tray decks and support beams, use of stud welding gun with suitable flux is acceptable. In manually welding of studs, care should be taken to minimize the weld spatter and the outside diameter of the weld so that it should not foul with tray deck or washer. For stud welding, proper welding procedure shall be established. Torque required for welding failure shall be higher than the torque required for failure of the stud.

1.8.14 A proposed Welding Procedure Specification (WPS) shall be submitted to Third Party inspection agency for approval. On approval, a Procedure Qualification Test (PQT) shall be conducted which shall be witnessed by Third Party inspection agency. On acceptance of all tests as per ASME Section IX, a final WPS along with Procedure Qualification Record (PQR) shall be submitted. Production welding shall start only after approval of final WPS/PQR and qualification of welders as per ASME Section IX.

1.8.15 Longitudinal and circumferential welded seams shall not interfere with nozzle openings, reinforcement plates, saddle pads, and other attachments as far as possible.

1.8.16 MISCELLANEOUS

1.8.16.1 All parts fabricated shall be smooth, true, clean and free from burrs, grease and dents. Openings for passage of workman must have exposed edges rounded.

1.8.16.2 All support rings, bolting bars, beams support brackets and other components which are integral and therefore welded to the column shell inside, shall be supplied and installed by column fabricator.

1.8.16.3 Total draw-off trays shall be designed for zero leakage construction and may be seal welded (if required) at site to attain zero leakage.
1.8.16.4 Seal welds shall have a throat thickness at least equal to the specified Corrosion allowance.

1.8.16.5 All stainless steel tray assemblies/internals and their components (e.g. Bubble caps, valves etc.) shall be pickled and Passivated. Pickling and Passivation shall be as per ASTM A380.

1.8.16.6 All parts shall be fabricated in accordance with good engineering practice and in uniformity so that all corresponding parts will be inter-changeable.

1.9 CONSTRUCTION & ERECTION

1.9.1 LSTK Contractor shall follow standard established procedures for handling storage, construction & erection. LSTK Contractor shall strictly follow Manufacturer’s/Principal’s instructions, approved drawings and procedures for construction & erection and satisfy Principal in all respects of storage, handling, construction & erection of Package. All erection work shall conform to the working/erection drawings (to be prepared by LSTK Contractor) and shall be in conformity with codes & standards as applicable. The LSTK Contractor shall supply & arrange all necessary construction & erection tools and tackles, machinery, scaffolding etc.

1.9.2 LSTK Contractor shall perform the following:

i) Before installing the equipment, the foundations shall be checked and wherever necessary, chipping shall be done by the LSTK Contractor. All grouting materials, packing plates/wedges required for the levelling and alignment of equipment, structures & pipelines etc. shall be provided.

ii) Top of the foundations shall be thoroughly cleaned to the satisfaction of Principal / LSTK Contractor before placing base plates.

iii) All equipment & structure etc. shall be checked and inspected for its proper levelling and granting (grouting) shall be done with suitable grouting material as required.

iv) After tightening the foundation bolts, the final level / alignment shall be rechecked and redone, if required.

v) Installation of all supports and hangers, including concreting or welding as necessary.

vi) To check correctness of the piping, instruments and other connecting points in the equipment and piping installed.

vii) The welding joints shall be stress relieved wherever necessary as per applicable codes, standards & specifications.
1.9.3 The following shall be arranged and supplied by LSTK Contractor for completion of job. Any other item whatsoever required shall also be included by LSTK Contractor in their scope.

i) All construction & erection materials, equipment & machinery, scaffolding, consumable, and test equipment etc.

ii) Cranes/Hydra, temporary lifting beams and spreaders etc.

iii) Procedures for site assembly, construction & erection including lifting methodology for Owner/Third party approval.

1.9.4 As a minimum contractor shall comply the requirements indicated below:

i) Fabricate, erect and align the equipment & internals as per applicable codes, standards & specifications. All internals shall be inspected before and after installation.

ii) Carry out all NDT’s required. The Personnel performing NDT’s should have a minimum qualification as “NDT LEVEL-II” in the relevant Technique, certified by American Society for Non-destructive Testing.

iii) Perform non-operating field pressure tests and leak tests on field fabricated equipment in accordance with the applicable codes, standards and specifications, ensuring disposal of test media in accordance with instruction/recommendations.

iv) Notify Owner / Third party of the test schedules for witness the tests by concerned inspector.

1.10 MATERIAL OF CONSTRUCTION

The minimum requirement of the materials shall be as per the plant equipment metallurgy covered under specific process design guidelines. However superior materials as per the recommendation of OEM’s may be selected which shall be indicated in the Bid by the LSTK Contractor.

1.10.1 All materials, whatsoever, required to complete the supplies shall be procured by LSTK Contractor and all such materials shall be covered with due identifiable material test certificate.

1.10.2 Materials used in low temperature service shall be impact tested (charpy V) if required as per design code & specification. Impact test & energy value shall be in accordance with code requirement, unless specified otherwise.
1.10.3 For coarse grained & high tensile materials in carbon steels (UTS>45 Kg/mm²) & low alloy steel, guaranteed impact strength shall be ensured at a temperature 15 °C below envisaged hydraulic test temperature as a precaution against brittle fracture during hydraulic test.

1.10.4 **HEAT TREATMENT**

Heat treatment of formed parts shall be carried out as per following:

**For Carbon Steel:**

a. Cold formed dished ends or knuckles upto 16 mm nominal thickness shall be stress relieved.
b. Cold formed dished ends or knuckles above 16 mm nominal thickness shall be normalised.
c. **For Low alloy Steel:** Cold Formed Dish ends or Knuckles shall be stress relieved.
d. Hot formed dished ends or similar parts, which have not been uniformly heated in the normalising range in the final stages of manufacture shall be normalised.
e. When the completed vessel involves post weld heat treatment, heat treatment recommended in (a) above shall not be applicable.
f. Vessels in caustic service, Amine or Sour gas service shall be stress relieved.
g. All internal and external attachments, clips, insulation studs, name plate bracket, and the like Shall be welded to the vessel before post weld heat treatment.

1.10.5 All CS materials including forging used for pressure parts shall be procured in fully Killed and normalized condition. All LAS materials including forging used for pressure parts shall be procured as permitted in ASME sec. II part A.

However CS & LAS materials above 50 mm thickness shall be Vacuum degassed except for plate ring flanges.

1.10.6 All SS plates shall be hot rolled & solution annealed and pickled as per SA 480.

1.10.7 All plates above 50 mm thickness shall be examined by UT as per ASTM-A435 at mills for both at surface & edges.
1.10.8 Cladded plates shall be supplied as per ASTM A264 material specification. All clad plate shall be UT examined at the steel works in accordance with ASTM A578 level S8.

1.10.9 The minimum thickness of weld overlay material shall be 1/8 inch (3 mm-undiluted) except clad or weld overlay tube sheets and gasket surfaces.

1.10.10 Tube sheets shall have a nominal clad or weld overlay thickness of 3/8 inch (10 mm) but not less than 5/16 inches (8 mm-undiluted) regardless of shell side or tube side face. The minimum thickness of clad or weld overlay at a pass partition groove shall be 1/8 inch (3 mm-undiluted) minimum.

1.10.11 Weld overlayed nozzle and girth flange gasket faces shall have a minimum thickness of 3/16 inch (4.8 mm) after machining.

1.10.12 All forgings except for flanges as per ANSI shall be UT tested as per ASTM A 388 for the thickness greater than 50mm and shall be procured in normalized / annealed condition. Acceptance standards shall be as per AM 203.2 of ASME Section VIII Div. 2. In case any defect is found, no repair by welding shall be allowed.

1.10.13 All forgings including nozzle flanges shall be examined for surface defects by MP/PT testing after machining as per ASTM A 275.

1.10.14 Tube sheet and Girth flanges must be made in one piece. Segmental butt-weld construction shall not be accepted.

1.10.15 Unless more restrictive prescription given by material specification the max. Carbon Content for carbon steel used for fabrication as shown by ladle analysis shall be 0.23% for plates, pipes & tubes 0.25% for forging.

1.10.16 In order to minimise the effect of temper embrittlement for material to 2¼ Cr 1 Mo specifications in the temperature range of 375-575°C, the embrittlement factors 'X' & 'J' shall be limited to:

\[
X = \frac{(10P + 5Sb + 4Sn + AS)}{100} \leq 15
\]

The elements above are expressed as ppm.
J = (Si + Mn) (P + Sn) \times 10^4 < 160

The elements above are expressed as percentages

A stimulated PWHT followed by step cooling shall be performed on a sample of material. Acceptable toughness shall be demonstrated by means of a Charpy V Impact Test.

1.10.17 Top portion of skirt (min. 500 mm height) welded to the bottom dished head shall be of same material as that of shell /head for LAS & SS materials.

1.10.18 All directly welded external/internal attachments shall be of same materials as that of equipment, unless specified otherwise.

1.10.19 Unless otherwise specified, all internal parts shall be removal type. Internal shall be designed in units as large as can be installed through the nearest upper manhole or opening. The weight of unit shall not generally exceed 40 Kg. except for support beams.

Trays, distributors, baffles and support beams shall be designed in such a way that deformation of shell due to operating pressure and thermal expansion does not occur.

Bolts and nuts for fixing internals shall be 18/8 S.S and minimum size of bolts shall be M10. All internal bolts shall be provided with locking nuts

1.10.20 External parts which are not strength welded to the shell, such as clips for insulation support rings, may be of carbon steel, provided if SS 304 stainless steel pads are furnished between shell & external parts.

1.10.21 PWHT of complete vessel shall be carried out in one go in a furnace. Local stress relieving of weld joint in piece meal shall be avoided as far as possible.

1.10.22 Steel for Hydrogen service at elevated Temperature & pressure shall be selected as per API 941 & API 934. The following special requirements shall be met with for Hydrogen/Sour gas as per NACE standard.

a) All pressure parts shall be post weld heat treated.

b) All pressure retaining welds shall be 100% radiographed. (Root run shall be Liquid
penetrant tested however, 100% radiography shall be carried out after completion of full welding of joint.)

  c) Hardness of base metals, weld and HAZ shall not exceed 22 HRC.

1.10.23 For high pressure equipments, in shell & heads, the impurity limit shall be Copper ≤ 0.20% & Nickel ≤ 0.30% for Mo & Cr- Mo low alloy steels while Copper shall be ≤ 0.20% & Vanadium ≤ 0.15% for carbon steels.

1.10.24 For equipment designed as per Power Boiler code ASME SECTION I, materials shall strictly comply with the requirements of the code. All material must be procured from well known recommended steel makers. All documents & Drawings shall be approved by IBR authorities.

1.10.25 Girth flanges must be made in one piece. Segmental butt-weld construction shall not be accepted.

1.10.26 For gaskets following shall be considered:

  a) Gaskets used for hydro test shall be same as service Gaskets specified for Operating conditions.

  b) Gaskets shall be replaced only where flanges need to be opened after hydro test. Balance places where flanges are not opened, Gasket need not to be replaced.

  b) Welded, lip seal type, double conical gaskets, RTJ and Lens gasket will not be replaced after hydro test as the same are reusable. These gaskets to be replaced, if they are found damaged during or post hydro test.

1.10.27 For equipment designed as per IBR, materials shall strictly comply with the requirement of the IBR code.

1.10.28 Hydro testing of equipment shall be as per UG-99b of ASME Section VIII Div.1. Design pressure for each nozzle shall be sum of maximum allowable working pressure and static head of corresponding nozzles.

1.10.29 All directly welded external/internal attachments shall be of same materials as that equipment, unless specified otherwise.
1.11 QUALITY ASSURANCE & CONTROL

1.11.1 The quality assurance shall be as per the approved procedures, test methods & facilities to be developed by the LSTK Contractor to ensure that the supplied equipment shall be of highest quality.

1.11.2 Quality Assurance (QA) shall mean the organizational set up, procedures as well as test methods and facilities developed by LSTK Contractor in order to assure that Equipment leaving LSTK Contractor’s shop are of the highest possible quality i.e. either equal to or better than the requirement specified.

1.11.3 Quality Control (QC), shall mean all the tests, measurement, checks and calibration which are to be carried out in LSTK Contractor’s shop in order to compare the actual characteristics of the equipment/unit/system with the specified ones, along with furnishing of the relevant documentation (certificates/records) containing the data or result of these activities.

1.11.4 LSTK Contractor shall submit a comprehensive description (manual) of QA/QC measures contemplated by him for implementation with regard to this specification. It is contractual obligation of the LSTK Contractor to develop and implement adequate QA/QC systems.

1.11.5 QA/QC system shall cover all products and services required for the equipment as per scope of work including job sub contracted by the LSTK Contractor.

2.0 EQUIPMENT DESIGN BASIS

2.1 GENERAL

2.1.1 Design conditions for all equipment shall be in accordance with the OEM data sheets/specifications. However, in any case design pressure shall not be lower than 10% over the maximum anticipated operating pressure and design temperature should be 25°C higher than the maximum anticipated operating temperature for all equipment unless otherwise specified.
2.1.2 Design pressure is normally specified at the top of vertical vessel or at the highest point of horizontal vessel. The design pressure at any lower point shall be determined by adding the maximum operating liquid head and any pressure gradient within the vessel.

2.1.3 Wind forces shall be increased by 20% to cater for the effect of piping system, platforms and ladders etc. Vertical vessels with height/diameter ratio equal to or greater than 10 shall be analyzed for vibration due to vortex shedding when critical wind speed does not exceed 30m/s. For guidelines of Dynamic Wind Analysis refer Annexeure-I.

2.1.4 Forces and moments acting on nozzles shall be considered in the equipment design. The exact forces & moments shall be indicated after piping layout which shall be considered by equipment supplier/LSTK contractor without any commercial implication to Owner.

2.1.5 All Carbon Steel (CS) and Low-Alloy Steel (LAS) pressure parts shall have 3 mm corrosion allowance unless specified otherwise. All internal CS & LAS parts shall have at least 1.5 mm Corrosion Allowance on either side. No corrosion allowance shall be considered for SS. The recommendation of OEM shall be adopted, if found more stringent.

2.1.6 Design of supports and anchor bolts considering soil and importance factors shall be performed for compressive and tensile loading. In no case shall diameter of anchor bolts be less than M24 for skirt support and M16 for other type of support.

2.1.7 Lifting lug, lifting trunion, tailing lug etc. shall be designed with shock factor 2.

2.1.8 Bolt of size M 36 and above shall be designed and spaced so as to permit tightening with a hydraulic stud-tensioner. The bolts shall have an extra threaded length at one end of approximately 1 bolt diameter, and shall be provided with threaded protection caps. Hex nuts shall have suitable holes for manual tightening. The requisite no. of hydraulic stud-tensioner device with necessary adopters/insertions based on varying sizes of studs shall be supplied by LSTK Contractor as per mechanical design of the equipment.

2.1.9 When design pressure is more than 600# class and/or shell thickness is 50 mm and above, selfreinforced forged nozzle shall be provided. Shell to SR nozzle welding shall be set-in type welding.
2.10 In case of nozzle with butt-end construction, extra length shall be provided to facilitate hydraulic testing and subsequently cutting and edge preparation to suit piping welding at site.

2.11 Orientation of longitudinal seams and position of circumferential seams shall be clearly marked in the fabrication drawing. Nozzles, support and other attachments shall be located clear of welded joints.

2.12 LSTK Contractor shall mark tangent lines, the position of the main axis and the center of gravity for orientation in a clearly identifiable and permanent way on the vessel. Centre of gravity shall be clearly marked.

2.2 INSPECTION AND TESTING

2.2.1 Equipment shall be inspected by TPIA. The Inspection and testing shall be in accordance with the relevant codes, standards, specifications, including mandatory NDT requirements indicated under Inspection and Testing clause 2.2.3 & Inspection guidelines (Annexure-2). All equipment & bought-out items shall be inspected during various stages of manufacturing starting from identification of materials to final completion as per agreed QAP which shall be prepared by LSTK Contractor and shall duly approved by Owner/ It’s authorised representative. In case of site fabricated/assembled equipment same inspection agency shall be responsible for inspection and testing at site. The guidelines for minimum inspection requirements are listed in Annexure-2 & also defined under Inspection & Testing clause of the design philosophy.

2.2.2 All testing accessories, measuring instruments including NDT testing equipment, etc. shall be arranged by LSTK Contractor.

2.2.3 The following NDT requirements are mandatory in addition to code/spec requirements:

   a) UT examination:

      i) All butt-welds in thickness greater than 50mm as supplement to radiography.
      ii) FPW of nozzle attachments of thk. above 50mm as supplement to radiography
      iii) Clad Plates and formed heads from clad plates in all thicknesses
b) **MP/PT examination**

i) All edges of plates and opening in shell of CS having thk. above 40mm and LAS/SS having thk. More than 25mm  
ii) Root and final layer of all butt welds  
iii) Fillet welds of 3.5% Ni & SS  
iv) Each layer of weld deposit in SS overlay  
v) Knuckle surfaces of dished ends, expansion bellows and pipe bends

c) **Radiography:**

i) All weld seams of formed head, if made in more than one segment shall be fully Radiographed after forming.  
ii) All the welded T- Joints shall be fully radiographed.  
iii) When spot radiography is specified all T-joints & min. 10% of total weld length excluding T-joints shall be radiographed  
v) Radiography of welds in C- 1/2 Mo & Cr- Mo - Steel preferably is carried out after heat treatment

d) Hardness test on welds of Cr-Mo, Materials after final heat treatment. The value shall not exceed to:

i) 215 HB for steel having Cr content less than 2%  
ii) 240 HB for steel having Cr content more than 2%

2.2.4. All completed equipment shall be tested hydraulically as per the requirements of Specification/codes in presence of the inspecting authority. Pneumatic test of completed Equipment shall be carried out only when specially mentioned in the specification sheets. Chloride content in water used for testing shall not exceed 30 ppm for SS equipment and 40 ppm for CS and low alloy steel equipment. Duration of test shall be 1 hour minimum. After hydro testing stainless steel vessels shall be dried thoroughly immediately after draining to prevent the possibility of evaporation & concentration of chlorides
2.2.5 All process equipments shall be supplied with Nitrogen filled. In case of equipment assembled and welded at site, it shall be filled with N₂ after testing at site. Dry Nitrogen shall be filled at a pressure of 0.5 Kg/cm² and equipment shall be fitted with a pressure gauge and valve along with nitrogen cylinder.

2.2.6 Special tools/tackles as recommended by equipment manufacturer shall be included in the scope of contractor. Hydraulic bolt tensioners where specifically recommended by Process Licenser’s specification shall be supplied with 4 bolt tightening heads.

2.2.7 Equipment under preview of statutory bodies shall be inspected during various stages of fabrication by their authorised inspecting agency. It is the responsibility of the LSTK Contractor to get the design calculations and fabrication drgs. approved by concerned statutory bodies before commencing fabrication.

2.2.8 Bidder will provide EN 10204 Type 3.2 certification for all high pressure equipment except IBR equipments.

Further, other than high pressure equipment, Bidder will provide EN 10204 Type 3.1 certification, Where, Bidder considers equipment having design pressure of equal or more than 100 kg/cm² G or thickness greater than 50 mm as high pressure equipment.

Further material from traders and stockists for static equipments is not acceptable.

2.2.9 After hydrostatic testing, the tightness of lining welds shall be tested by helium. The sensitivity of leak detection shall be as per ASME SEC V.

2.2.10 No preservative or paint will be allowed to cover any joint, mechanical or welded, before the pressure test is completed.

2.3 PAINTING

2.3.1 All external surfaces of shop fabricated equipment shall be painted in the vendor’s shop. For guidelines of painting refer TS-2001 attached with construction & erection philosophy.

2.4 PICKLING AND PASSIVATION

All SS material equipments shall be Pickled & Passivated as per following procedures:
2.4.1 PICKLING

Aqueous pickling solution shall be as follows:

Nitric acid (Tech grade)-10 to 25% plus Hydrofluoric acid-1 to 8% (to be used only for stabilized SS grades). Temperature 50 to 60°C for 10% Nitric acid and 20°C for 25% Nitric acid. When size and shape of product permit, total immersion in the pickling solution is preferred. Where immersion is impractical, pickling may be accomplished by wetting the surface by

i) Swabbing or spraying

ii) Partial filling the item with pickling solution and rotating or rocking so that the entire surfaces receive the required chemical treatment.

The maximum period for which the pickling solution shall be allowed to remain on the surface is 30 minute. During pickling removal of oxides may be hastened by brushing with a hard fiber or SS wire brush. Over pickling shall be avoided.

The pickling agent shall be washed off with plenty of water so as to leave no trace behind.

2.4.2 PASSIVATION

After pickling and water rinsing, an aqueous caustic permanganate solution containing NaOH 10 weight % and KMnO₄ 4 weight % shall be used for neutralizing pickling solution. This shall be followed by thorough water rinsing.

Water used for pickling and washing shall not have chloride contents exceeding 30 ppm.

2.5 FIRE PROOFING

2.5.1 Fire proofing, if required shall be considered as per OEM’s recommendations.

2.6 INSULATION
2.6.1 The equipment shall be insulated as defined in Piping Design philosophy.

2.7 OPERABILITY AND MAINTENANCE

2.7.1 Equipment design and layout shall provide for ease of access, operability and maintenance.

2.8 DESPATCH

2.8.1 Equipment intended for ship transportation shall be transported in the hatch of the ship. Suitable seaworthy packing/painting shall be applied to avoid any damage during transportation.

2.8.2 The complete transport, packing & forwarding of equipment shall be the responsibility of LSTK Contractor. In case of inland transportation, equipment shall be properly lashed/fixed on the wagon/trailer to avoid any damage due to shocks during transport. In case of ODC (Over Dimensional Consignment) movement, ODC sanction for movement either by rail/road shall be arranged by LSTK Contractor from appropriate authorities.

2.8.3 All spares shall be properly packed, marked & sent separately along with equipment.

2.8.4 Equipment shall be despatched with nitrogen filling. Dry nitrogen shall be filled at a pressure of 0.5 kg/cm² and equipment shall be filled with a pressure gauge and a valve along with nitrogen cylinder.

2.9 GUARANTEES

2.9.1 MECHANICAL GUARANTEE

LSTK Contractor shall guarantee the equipment & their components against faulty design with regard to their mechanical adequacy, improper material of construction & poor workmanship for the period specified in contract.

2.9.2 PERFORMANCE GUARANTEE
LSTK Contractor shall stand Guarantee of equipment as per respective technical specifications/Process Data sheets.

3.0 TECHNICAL REQUIREMENTS

PART A - DESIGN PHILOSOPHY FOR PRESSURE VESSEL

3.1 GENERAL

SCOPE

This specification covers the minimum requirements for the design, materials, fabrication, and inspection of welded pressure vessels which are defined in U-I of ASME Code Section VIII, Division 1 Latest Edition and Addenda.

3.2 REGULATIONS, CODES AND STANDARDS

3.2.1 Unless otherwise specified, the design, materials, fabrication and inspection of welded pressure vessels shall comply with ASME Code Section VIII, Division 1 latest edition.

OEM guidelines/standards may be adopted complying minimum requirements of this design philosophy of static equipment. Details of such selected guidelines/standards along with the list shall be furnished in the bid.

Unless specifically required, ASME Code stamp is not required.

Vessels will be sized according to inside diameter and 2:1 elliptical heads or hemispherical heads. Minimum inside diameter shall be 500 mm. Top cover shall be flanged if the ID is equal or less than 900 mm.

3.2.2 Vessels shall conform to the requirements of ASME Section VIII Division 1 & 2 Pressure Vessels codes and Technical Specifications mentioned in the design criterion.

3.2.3 Design of vessel skirt shall be based on seismic/wind/thermal considerations and fireproofing/insulation requirements.

3.3 ALLOWABLE STRESS
3.3.1 Vessel stresses during hydrostatic tests shall not exceed 90% of the minimum yield strength of the material.

3.3.2 Vessels to be hydrostatically shop tested in the horizontal position shall be supported adequately to keep local stresses in the shell not exceeding 90% of the yield strength of the material.

3.4 CORROSION ALLOWANCE

3.4.1 For an intermediate head, corrosion allowances shall be added to both sides.

3.4.2 For the inside of shells, heads, nozzles and manholes, the specified corrosion allowances shall be added.

3.4.3 For non removable internal parts, the specified corrosion allowances shall be added to both sides.

3.4.4 For removable internal parts, the specified corrosion allowances shall be added to one side only.

3.5.1 HEAD / DISHE D ENDS

a) Dished ends shall be of seamless construction. However, dished ends with one chordal weld seam are acceptable. In such cases, the chordal seam shall preferably be in the middle one third of the blank. Intermediate heat treatment, if considered necessary, shall be carried out by the LSTK Contractor.

b) Whenever a dished end is made of more than two plates, it must have a crown plate. Whenever a nozzle or a manhole is positioned at the centre of the dished end, the crown plate should be larger than the nozzle /manhole reinforcing pad.

c) Tori spherical heads shall be used for Pressures up to 6.86 bar (g). For tori spherical heads, ratio of Knuckle to Inside Crown Radius shall not be less than 6 %.

d) Beyond 6.86 bar g, heads shall be of ellipsoidal type having a ratio of major axis to minor axis 2:1 or hemispherical type. Alternatively, Hemispherical Heads with minimum weld joints may also be used.

3.6 Vessel skirts for carbon steel vessels shall be designed from the same material as the shell or the head. Vessel skirts for other than carbon steel vessels shall be the same material as the shell or the head for the top 500mm. All skirt supported equipment shall be provided with templates.
3.7 All nozzles above 24” NB shall comply with ASME B16.47 Series B (API 605).

3.8 Local vessel stress calculations for external structural attachments, such as platform clips, pipe support clips and lifting lugs shall be performed.

3.9 Vessels with skirts having eight or more anchor bolts shall be required to be supplied with an anchor bolt template. The template shall be of box type (no annulus type) to avoid problem during final erection and installation. The template shall have adequate strength against deformation.

3.10 Maximum permissible deflection for tall vessels/columns when subjected to design wind loadings shall not exceed 0.005 x Vessel height. For guidelines of Dynamic Wind Analysis refer Annexure-I.

3.11 For vessels, the minimum thickness of shell & heads, including corrosion allowance shall be as indicated below:

<table>
<thead>
<tr>
<th>S. No.</th>
<th>Shell Diameter (mm)</th>
<th>Thickness (Min.) mm</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>CS / LAS</td>
<td>HAS</td>

</tr>
</tbody>
</table>

CS = Carbon Steel  
LAS = Low-Alloy Steel  
HAS = High-Alloy Steel

3.12 Use of structural steel shall be limited to non-pressure parts only.

3.13 Horizontal vessels of large size and thin wall shell on saddle supports shall be investigated for buckling, local circumferential bending and shear stress. The method of L. P. Zick (Supplement to Welding Research, 1971) may be used for this investigation.
3.14 Manhole/hand hole/blind holes covers shall be equipped with davits or hinges to facilitate handling.

3.15 Manhole size of 24" is preferred. However, for shell dia. 1000 mm & above minimum size of manhole shall be 20" and for shell dia. 1000 mm & below 18" manhole size shall be minimum.

3.16 **INTERNALS**

3.16.1 For Tray design worst of the following conditions shall be considered:

   a) For tray design minimum loads of 100 kg/m\(^2\) in active areas and 320 kg/m\(^2\) in downcomer area shall be considered.

   b) For atmospheric, pre flash & vacuum distillation columns for trays under flash area uniform load of 500 kg/m\(^2\) shall be considered. This loading shall be applicable to first three trays above flash section.

   c) A concentrated live load of 150 kg at any point on the installed assembly independent of other design live loads.

   d) Maximum horizontal deflection at effective tray loading shall not exceed 1/900 of the span or 7 mm. whichever is less.

   e) Corrosion allowance shall be added to both sides of trays, support rings and other fixed internal non pressure parts.

3.16.2 All internal bolting shall be of corrosion resistant material.

3.16.3 Support for packing and internal shall be designed for the worst condition. In the condition of packing liquid hold up of minimum 20% of packing volume shall be considered. Tray support beams shall have height not exceeding 20% of distance between trays for diameter up to 2400 mm and 15% of the distance between trays for higher diameters.

3.16.4 Each tray shall be so designed as to ensure liquid tight construction. Each tray shall be provided with a man-way suitable for opening both from top and bottom unless otherwise specified.
3.16.5 MINIMUM THICKNESS OF INTERNALS SHALL BE ASfollowS:

<table>
<thead>
<tr>
<th>S. No.</th>
<th>Parts</th>
<th>CS &amp; LAS (MM)</th>
<th>HAS (MM)</th>

</tr>
<tr>
<td>6.</td>
<td>Non-integral main &amp; secondary supporting beams</td>
<td>5.0</td>
<td>2.0</td>
</tr>
</tbody>
</table>

Note: - 1) All bolting size shall be minimum of M10. All nuts shall be hexagonal.
2) Allowable stress criterion for design of internals shall be as per ASME Section VIII Div. 1

3.16.6 All necessary approval on Hydraulic design and internal drawings shall also to be obtained from Process Licenser as applicable.

3.16.7 All removable internals shall be designed so that they can pass through the vessel man-way internal diameter / shell flange if any.

3.16.8 The LSTK Contractor shall meet the process and hydrodynamic guarantee of towers along with their internals. All instruments including of special instruments required to verify the above requirements shall be arranged by the LSTK Contractor.

3.16.9 For an intermediate head, corrosion allowances shall be added to both sides.

3.16.10 Internal distribution pipes shall have flanged connections with gaskets unless otherwise specified. Internal pipes shall be divided into suitable lengths to pass freely through the vessel manholes and internal man ways, and shall be suitably supported from shells or tray decks.

3.16.11 Demisters shall be securely fastened to support ring by bolting or clamping.
3.16.12 Internals (trays, distributors, support beams) shall be so designed that any expansion of it wouldn’t affect shell deformation.

3.16.13 Hiccups load in vapour flow up the column shall be taken into account in the tray design.

3.17 CLADDING AND LINING

3.17.1 Cladding & lining is allowed only if specified in Process data sheet of OEM. Integrally clad metal and weld overlays shall not be considered as contributing to the strength of the vessel wall thickness of the Equipment. It should not be considered in the minimum thickness calculation.

3.17.2 Strip liners shall not be used in vessel shell for hydrogen service.

3.17.3 Cladded plates shall be supplied as per ASTM A 264 material specification. All clad plate shall be UT examined at the steel works in accordance with ASTM A 578 level S8.

3.18 ACCESSORIES

3.18.1 Clips for platforms, ladders and piping supports shall be furnished and attached to the vessel by the vessel manufacturer.

3.18.2 Top davits of vertical vessels shall be so designed and fabricated so that heavy valves around the vessels and internal parts of vessels can be removed and grounded without being interrupted by piping and steel structures.

3.18.3 INSULATION SUPPORT RINGS

1) Insulation support rings shall be suitable provided as per the specified insulation thickness.
2) Maximum longitudinal interval of insulation support rings shall be 3600 mm when preformed insulating material are used.
3) Stiffening rings may be used as insulation support rings.

3.18.4 Lifting lugs of appropriate size shall be provided to ensure complete safety during erection of the Vessel.

3.18.5 Grounding lugs shall be attached to the vessel support for the ground connection.
3.18.6 TEMPLATES

1) Templates for vertical vessels with skirts shall be provided for lying out of anchor bolts at site. The template shall have adequate strength against deformation. Template shall be identical to the Vessel Base Frame having double ring.

2) It shall be confirmed that markings of the bolt hole orientation on the templates coincides with those shown on the approved drawings.

3.19 PLATE LAYOUT

1) Shell plate shall be laid out so that there will be minimum of welded seams.

2) Longitudinal and circumferential welded seams shall not interfere with nozzle openings, reinforcement plates, saddle pads, and other attachments as far as possible.

3) Longitudinal welded seams on adjacent shell segments shall be separated by at least 4 times the wall thickness of the thicker plate but not less than 100 mm.

3.20 CONNECTIONS

3.20.1 Unless shown in data sheets, nozzles, manholes, and hand holes shall be ground flush and smooth inside the vessel. The edges of internal projections for both nozzles and manholes shall be rounded to a radius of 2 mm minimum. Reinforcement pads shall be external.

3.20.2 Main vessel seams shall not pass through openings for connections as far as possible. When unavoidable, the portion of the weld seam covered by a reinforcing pad shall be ground flush with the parent metal and 100% radio graphed prior to attachment of the pad.

3.20.3 All reinforcing pads shall be provided with at least one telltale hole of NPT 1/8".

3.21 HEAT TREATMENT

3.21.1 Fabricated vessels shall be post weld heat treated in accordance with ASME Code Section VIII, Division 1, and requirements specified in the data sheets.

3.21.2 The complete post weld heat treatment procedure including temperature and holding time shall be submitted to the Owner/PMC for review.
All machined surfaces shall be protected against scaling during post weld heat treatment.

3.21.3 All internal and external attachments, clips, insulation studs, name plate bracket, and the like shall be welded to the vessel before post weld heat treatment.

3.21.4 No welding, hammering or deforming is permitted on the pressure retaining parts after post weld heat treatment except as permitted by the codes or standards and when approved by the purchaser.

3.21.5 Simulation Heat Treatment for the Alloy Steel Material shall be carried out as per the CODE Requirement.

3.21.6 PICKLING

When specified, all internal / external surfaces of stainless steel shall be cleaned by pickling before hydrostatic test.

1) Care shall be taken so that stainless steel surfaces shall not be subject to any scratch or damage during pickling.
2) Weld scale and other foreign material deposited on the surfaces shall be removed.
3) Pickled surfaces shall be completely neutralized, and washed by freshwater

3.22 FABRICATION TOLERANCE

Dimensional tolerances shall be in accordance with the design codes or standards, whichever is more stringent.

3.23 PREPARATION FOR SHIPMENT

3.23.1 All vessels shall be drained, clean, and free of grease, oil, scale, weld spatter, and any other foreign substance.

3.23.2 All flange faces and other exposed machined surfaces shall be properly protected with substantial metal shields or covering against damage during shipment.
3.23.3 All inside surfaces and internal parts of carbon steel shall be coated with suitable rust preventive before shipment.

3.23.4 All openings shall be provided with metal closures.

3.23.5 Test holes of reinforcing pads for nozzles and manholes shall be plugged with steel or plastic plugs.

3.23.6 Vent holes of saddle pads shall be plugged with plastic sealant or hard grease prior to shipment.

3.23.8 All threaded connections shall be plugged with threaded round bars or covered with standard pipe caps of the same material as the equipment. Covers, flanges, gaskets, bolts, and nuts furnished by the fabricator shall be shipped in place.

Internals shall be tied or braced as necessary to avoid damage or dislodgment during Shipping and installation.

Baselines indicating four directions with figures of 0°, 90°, 180° and 270° shall be marked by paint on the shell. The paint colour shall be white for carbon steel and black for stainless Steel.

PART B - DESIGN PHILOSOPHY FOR HEAT EXCHANGERS

3.24 SHELL AND TUBE HEAT EXCHANGERS

3.24.1 General

a) SCOPE

This specification covers the minimum requirements for the design, materials, fabrication and inspection of shell and tube type heat exchangers.

b) The Design Philosophy for the Shell & Tube Heat Exchangers shall be read in conjunction with the Design Philosophy for Pressure Vessels, as per Part – A above.
3.24.2 All tubular heat exchangers shall be of the type specified and shall be designed for the service and performance conditions given in the specification or data sheets.

Design of the Shell & Tube Heat Exchangers shall be as per TEMA – R only. (TEMA Class ‘C’ may be used for auxiliary heat exchangers for rotating and packaged equipment exchangers.)

3.24.3 Gaskets shall be used for, Hydrogen & other lethal services only after recommendation by OEM.

3.24.4 Tubular heat exchangers of auxiliary component for machine units such as lube oil coolers is to be designed, fabricated, inspected and tested in accordance with the manufacturer's standards and ASME Code Section VIII, Division 1, provided written approval is obtained from the Owner/PMC.

3.24.5 Mean metal temperature of tube & shell be considered in the design of fixed tube sheet exchangers.

3.24.6 Parts such as tubes, tube sheets, floating heads etc. which simultaneously come in contact with both shell side and tube side fluids, shall be designed considering pressure acting on one side only or the combination of pressures, whichever results in higher thickness of parts.

3.24.7 Attachment of tube to tube sheet will be rolled and expanded (with seal welding), strength welded or seal welded as specified on data sheets. However, as a minimum following shall be adopted:

For tube sheet joint, tubes shall be expanded in grooved holes into the tube sheets. The expanding operation shall extend from the outer face of the tube sheets to a depth not < 90% of the tube sheet thickness. Welding shall be done in minimum two passes and each pass shall be DP checked. For tube-to-tube sheet joint GTAW (Gas-Tungsten Arc Welding) welding is required.

(A) Tubes shall be expanded and light seal welded if all the following conditions occur simultaneously:

a) Design pressure of shell/tube < 20 kg/cm2
b) Shell / Channel design temperature < 350 °C
c) Fluid not containing lethal substances.
c) Hydrogen partial pressure <7 bars

(B) Tubes shall be strength welded & light expanded for any condition other than listed under (A).

3.24.8 Procedure shall be qualified for tube-to-tube sheet joints. Mock-up test shall be carried out for heat exchangers having shell/tube side design pressure 100 Kg/Cm2 & above to establish all the requirements.

3.24.9 The sample for tube sheet and tube for mock up test shall be drawn from the same heat material from which the equipment shall be fabricated.

3.24.10 Process Shell and Tube Exchangers will comply with the requirements of ASME SEC VIII Div I & TEMA Class ‘R’. TEMA Class ‘C’ may be used for auxiliary heat exchangers for rotating and packaged equipment exchangers.

3.24.11 ASME Section VIII, Div. 1, Appendix “S” shall be considered mandatory for bolted flange connections.

3.24.12 All tube sheet for the exchangers shall be designed as per ASME Sec VIII Div 1 & also comply the requirement of section UHX of ASME Code.

3.24.13 Tube sheets in vertical exchangers shall be provided with drain and vent arrangement with threaded plug seal welded.

3.24.14 Exchanger saddle and foundation design shall include additional loadings generated from bundle pulling. The load shall be 1.5 times the bundle weight.

3.24.15 Shell side “hot” nozzles shall be located at the top of the shell at the channel end whenever possible.

3.24.16 Lifting lugs for heads or bonnets shall be specified where frequent dismantling is required.

3.24.17 Bundle weights shall be limited to 10 tonnes. In case the bundle weight increases by 10 Tones, Bidder shall take care necessary precaution in the design and fabrication of exchanger e.g. by providing rollers arrangement, support plates etc. to avoid excessive loading on shell while
Pulling of tube bundle, proper reinforcement in equipment support etc.

3.24.18 Saddle wear plate material shall be the same as the shell material.

3.24.19 Tube sheets and Girth Flanges shall be shall be of Forged Quality & Ultrasonically tested. It shall not have any segmental joint.

3.24.20 All heat exchanger tubes shall be seamless, cold drawn and formed from single length. CS tubes shall be normalized. LAS tubes shall be normalized and tempered.

3.24.21 The minimum radius of U tubes shall be not less than 2xOD of tube. Thickness of 2 inner most rows will be higher than other rows with minimum difference of 2 gauges.

3.24.22 For U tube bundle, the following requirements shall also be met:
   i) Each U tube shall be formed from a single straight length.
   ii) All U tubes shall be cold bent.
   iii) All C.S, C-Mo, Cr-Mo tubes shall be heat treated after bending.
   iv) Bent portion of all U tubes shall be examined by PT (Dye Penetrant test) and hardness check on four opposite points of bent portion shall be carried out.
   v) Unless otherwise specified, after bending each tube shall be tested hydraulically.

3.24.23 Where fixed tube sheet heat exchangers are specified, thermal stress shall be checked in accordance with the TEMA standard to determine if an expansion joint is necessary.

3.24.24 Tube to tube sheets joints shall be leak tested with air & soap solution at pressure of 2.0 kg/cm2 g wherever specified leak testing with halogen shall be carried out.

3.24.25 Impingement plates shall be provided if required by TEMA or indicated as a part of OEM’s requirement.

3.24.26 Impingement baffles shall extend at least 1.1 times of the inside diameter of nozzles, or nozzle inside diameter plus 50 mm, whichever is the larger.

3.24.27 For stack type of heat exchangers, nozzles shall be designed to carry the loads of shells after installation in operating conditions. Saddle shall be used for erection purpose only. However, If required no. of nozzles to act as support is not available, Saddle should be the primary support.
3.24.28 For stack type Heat Exchangers, complete assembly shall be hydraulically tested as a single unit except when the test pressures for individual heat exchangers are different.

3.24.29 Stacked exchangers shall have the lower shell(s) designed to withstand the superimposed load of the upper exchanger(s) full of water without distorting the shell and causing binding of tube bundle(s).

3.24.30 The lower fixed support of stacked exchangers shall be designed for bundle pulling loads for removal of the upper bundle.

3.24.31 When two or more exchangers are stacked, the entire stack shall be shop-assembled and checked for accuracy of saddle and nozzle fit-up.

3.24.32 Horizontal exchangers with removable tube bundles shall have the supports designed to withstand a horizontal pulling load equal to 150% of the bundle weight, applied at the centerline of the exchanger. The lower supports of stacked exchangers shall be designed for the loads of removing the upper bundle.

3.24.33 Bolts for connecting nozzles of stacked exchangers shall be removable without moving exchangers.

3.24.34 Removable tube bundle shall be provided with pulling York and suitable sliding arrangement.

3.24.35 Flow induced vibration analysis shall be carried out for all process heat exchangers.

3.24.36 Process Heat exchangers tubes shall be Eddy current tested at mill and the specified thickness of tube shall be minimum (and not average).

3.24.37 Floating head exchangers with test ring shall be procured as per TEMA for locating tube leaks. Drawing and calculations for test rings and test gland shall be provided by vendor for all Exchangers of applicable type.

3.24.38 Tube sheets shall have the corrosion allowance on each side. Tube Sheets from Plates shall not be used.
3.24.39 Slip-on flanges are not permitted for exchangers in hydrogen service, lethal service or low-temperature services below -29°C.

3.24.40 Pass partitions shall be provided with a weep hole of about 6 to 12 mm in diameter at low points of pass partitions.

3.24.41 Dowels or match marks shall be provided to prevent misassemble of floating head covers and channels with pass partitions, channel covers with grooves, and stationary tube sheets to shell flange.

3.24.42 In horizontal exchanger cross baffles and support plates shall be provided with notches for draining and venting.

3.24.43 Minimum SS 304 as MOC for tubes shall be used for Heat Exchangers having Cooling Water. All tubes shall be seamless only.

3.24.44 All heat Exchanger Tubes shall be Eddy Current Tested in addition to Hydro testing.

3.24.45 Copper & Copper Alloy tubes shall not be used for any Exchangers.

3.24.46 Corrosion allowance shall be added to the inside diameter of flanges. Gasket surfaces of flange shall have no corrosion allowance.

3.25 EXPANSION JOINTS

3.25.1 Where fixed tube sheet heat exchangers are specified, thermal stress shall be checked in accordance with the TEMA standard to determine if an expansion joint is necessary.

3.25.2 Expansion joints shall be designed for the most severe conditions of differential expansion that can occur during normal operations, start up, shutdown, or upset conditions.

3.25.3 Expansion joints shall be of the single layer standard one-piece construction unless otherwise approved by purchaser. Length of the bellow and preset shall be specified on the manufacturer's drawings.
3.25.4 For floating head type exchangers with single pass which are provided with bellows, permanent restraining bars or other means shall be fitted to allow the tube side of the exchanger to be pressure tested with the shell cover removed.

3.25.5 Expansion bellows shall be designed for min. 5000 cycle, as per TEMA.

3.26 GIRTH FLANGES

3.26.1 All girth flanges joining two parts with different design conditions shall be designed for the severer condition.

3.26.2 All girth flanges for carbon and low-alloy steel exchangers shall be integrally forged welding necks, unless otherwise specified in the data sheets. i.e. Girth Flanges shall be WNRF / WNRTJ type only.

3.26.3 Lined Flanges shall not be used.

3.26.4 All flanges designed with bolts greater than M 36 & above shall have sufficient clearance to permit the use of hydraulic bolt tensioning instrument. Bidder has to supply such hydraulic bolt tensioning instrument along with the supply of exchangers & its spares.

3.26.5 The Contractor shall guarantee tightness compatibility of closure designs. The differential thermal growth of gasketed joints of dissimilar materials (including gaskets) shall be considered.

3.26.6 All girth flanges shall be provided with jack screws to facilitate dismounting.

3.27 PASS PARTITIONS

3.27.1 All pass partitions shall have a gasket contact surface of 9 mm width minimum, and shall be machined to a common plane at the gasket face.

3.27.2 The depth of pass partition grooves in tube sheets and flat cover plates shall be a minimum of 5 mm. For alloy cladding or facing, there shall be at least 3 mm of alloy after machining beneath the pass partition groove or gasket face.
3.27.3 When space permits, pass partitions shall be continuously welded from both sides. In cases where space is too small for both side welding, weld shall be continuous on one side in so far as possible.

3.27.4 Pass partitions shall be provided with a weep hole of about 6 to 12 mm in diameter at low points of pass partitions.

3.28 TEST RINGS

Floating head type heat exchangers as well as U-tube type without full diameter stationary tube sheets shall be provided with test rings and test gland so that the exchanger shells may be pressure tested with the channels removed. Drawing and calculations for test rings and test gland shall be provided by vendor for all exchangers of applicable type.

3.29 HYDRO TESTING

3.29.1 Each heat exchanger shall be hydro tested in accordance with applicable codes and standards.

3.29.2 The shell side test shall be performed in such a manner that the Tube–to-tubesheet joints can be adequately inspected during testing.

3.29.3 Hydro Testing sequence & procedure for testing Exchangers having Lip Seal Gasket shall be approved by the Owner/PMC.

3.29.4 Stacked units shall be hydraulically tested in the fully assembled condition.

3.29.5 Air leak test shall be performed for tube to tube sheet joint for all exchangers. However Helium leak test shall be performed for critical heat exchangers/ wherever specified by OEM.

3.29.6 After testing, all exchangers shall be completely dried.

3.30 PLATE TYPE HEAT EXCHANGER

3.30.1 The plate type exchanger shall be designed in accordance with" API 662"
3.30.2 All plates shall be pressed from a homogeneous single metal sheet in one placing and normal thickness of plate being pressed shall not be less than 0.5 mm

3.30.3 Nozzle neck attachments shall be with full penetration weld. Set on nozzles are not permitted.

3.30.4 Lock washers shall be provided for all rotated nuts.

3.31 STORAGE TANKS

3.31.1 The following design codes shall be adopted for tank design as applicable:

a) API 620:- Design and Construction of Large Welded Low Pressure Storage Tanks.
b) API 650:- Welded Steel Storage Tanks for Oil Storage.
c) API-625 Tank Systems for Refrigerated Liquefied Gas Storage.

3.31.2 For Storage tanks the minimum thickness shall be based on stability considerations. Minimum thickness for roof & shell shall be 5 mm, and bottom plate 6 mm, excluding corrosion allowance.

3.31.3 Storage tanks up to 4 meter in diameter shall be shop fabricated items. Tanks with diameters greater than 4 meter shall be field erected.

3.31.4 Tanks constructed of stainless steel shall comply with API 650, Appendix S.

3.31.5 Shell seams shall be located to clear openings to the maximum extent possible in accordance with API 650.

3.31.6 Bottom plates may be lap-welded with the lap toward the direction of drainage. Buttwelded bottom plates shall be furnished when specified on the tank drawings or data sheets or when tanks are specified to have rubber lining.

3.31.7 For each surface in contact with product/vapor, the specified corrosion allowance shall be added to the required thickness of all load-carrying components including shell, roof, bottom and roof supports. & One-half the specified corrosion allowance shall be added to each surface of nonload-carrying internal components.
3.31.8. All walkways, stairways, and platforms shall be furnished with handrails on open or exposed sides.

3.31.9 Tanks having design temperature more than 100 °C shall have thermal isolation barrier (Suitable fire bricks) between tank bottom and foundation.

3.31.10 Anchor bolts shall be provided based on design considering wind/seismic loads, uplift due to internal pressure etc. However, tanks having diameter ≤10 meter shall be provided with anchor Bolts and shall be spaced at approximately 1.8M of circumference.

3.31.11 Maximum height of unstiffened shell shall be calculated based on the corroded thickness of shell courses. Section modulus of wind girders shall also based on corroded thickness of shell courses.

3.31.12 All storage tanks shall be designed as per code considering liquid height up to top curb angle of shell.

3.32 DESIGN & SELECTION OF RUBBER LINING

3.32.1 The type of rubber (i.e. Natural, Butyl, Nitrile, Ebonite, and Hypalon etc.), its minimum Thickness & hardness shall be decided as per design code/specification.

3.32.2 For vacuum service, the Triplex lining shall be adopted. It shall consist of 3 layers:

1st layer : 60 ±5 shore A
2nd layer : 35 ±5 shore B
3rd layer : 60 ±5 shore C

3.32.3 In general for all other services the preferred hardness of rubber shall be 65 ±5 shore A.

3.32.4 Lining up to 3 mm may be applied in single layer. Above this thickness it shall be applied in 2 or more layers. All sheets shall be drawned from calendaring machine only.

3.32.5 The surfaces which are to be covered with rubber shall be easily accessible & free from pitting or other physical imperfection.

3.32.6 Spark testing, bonding test & hardness test shall be done for Lining.
3.32.7 The internal surfaces requiring rubber lining shall be prepared by Tank Fabricator to suit rubber lining. All welds shall be ground smooth and radiused to min. rubber lining thickness. All welds shall be free from pin holes, pits, pockets and nipples. Porous welds are to be peened until tight. Since the internal surface preparation of the tank including roof (like grinding of the weldments etc.) is to be done by the tank contractor, the same surfaces will also be inspected and approved by the rubber lining contractor during tank fabrication and/or on handing over of the tank to him for rubber lining.

In the event of any surfaces found unsuitable, the tank contractor shall carry out necessary rectifications and make all surfaces suitable as per instructions of the rubber lining contractor or his authorised representative without any implication.

4.0 SPARE PARTS

4.1 COMMISSIONING SPARES

4.1.1 All commissioning spares shall be included by LSTK Contractor in their scope of supply and shall be part of the main equipment.

4.2 SPARES FOR 2 YEARS OPERATION

4.2.1 2 years operation spares shall be supplied by the contractor as per Section-10 of ITB.

5.0 DOCUMENTATION SCHEDULE

5.1 Documents shall be submitted as per “Documentation schedule” in Section-9 of ITB.

6.0 VENDORS LIST

All equipment shall be procured/fabricated as per approved vendor list (Section -15). Any equipment for which vendor list is not enclosed, the LSTK Contractor may furnish a list of their proposed vendors along with their references for supply of similar type of equipment along with bid. However all the additional proposed vendors shall have well proven track record and shall be subjected to consultant/owner’s approval.
ANNEXURE-1

CALCULATION METHOD

DYNAMIC WIND ANALYSIS (GUIDELINES)

FOR VERTICAL EQUIPMENT

Check of the towers for dynamic wind moments due to vortex shedding shall be performed based on following assumptions:

\[ V_{cr} = f \times \frac{D}{St} \]

- \( V_{cr} \) = Critical wind velocity
- \( D \) = Outside diameter of tower
- \( F \) = First natural frequency of tower considering foundation complete rigid (s-1)
- \( St \) = Strouhal number, may be taken as 0.15 for \( Re > 10^6 \) and 0.2 for \( Re < 10^6 \)
- \( Re \) = Reynolds number at critical wind velocity

For \( V_{cr} < 30 \text{ m/s} \) following shall be considered:

The tower shall be checked for additional moments due to vortex shedding in 2 cases.

1. Operating condition
2. Shut down condition

Dynamic wind moment shall be calculated as follows:

\[ M_d = P_d \times C_k \times S \times \frac{\pi d}{2} \times H \]

- \( P_d \) = Wind pressure at critical velocity = \( 0.5 \times \text{den}^2 \times (V_{cr})^2 \)
- \( C_k \) = Crosswind oscillatory force coefficient may be taken as \( 0.5 + \left(4 - \log_{10} Re\right)/5.7 \) for \( Re < 10^6 \) and 0.17 for \( Re > 10^6 \)
- \( d \) = The logarithmic decrement of damping. For towers with trays or packing it is estimated 0.035
- \( S \) = Surface on which dynamic wind forces are acting (height \(*\) diameter)
- \( H \) = Height from base ring of point of application for dynamic wind force
\[ \pi = 3.14 \]
\[ \text{Den} = \text{Density} \]

For tapered construction only the tip diameter shall be considered in calculation.

Moments to be considered for dynamic wind:

\[ M_{res} = \sqrt{(Md^2 + Mst^2)} \]

\[ Mst = \text{Static wind moment at critical wind velocity} \]

Only if \( M_{res} \) exceeds moments due to static wind or earthquake moments, it shall be considered for equipment design.
ANNEXURE-2
INSTRUCTION GUIDELINES

1.0 GENERAL

The min. Inspection to be carried out by Authorized approved Inspection agency:

1.1 VESSELS
a) All carbon steel plates shall be identified against mill-test certificates at the VENDOR’S works before commencement of fabrication.
b) Establish that welding procedure and welders are qualified and welding electrodes are approved before commencement of fabrication.
c) Check fit-up and witness chipping-back of welded seams.
e) Witness any crack detection, hardness checks, ultrasonic tests etc. which may be specified. (1)
f) Review radiographs and in case it is unsatisfactory re-radiograph. (1)
g) Witness hydrostatic test.
h) Dimensionally check and carry out final internal and external inspection for quality of workmanship.
i) Check that all material test certificates and, where applicable, heat treatment charts are in order. Ensure that VENDOR is familiar with the requirements regarding data books and ensure that the documentation is submitted without any delay.
j) Check internal lining of reactors and vessels (if applicable) to specifications.
k) Witness any further test recommended by Process Licenser/Inspection agency and/or OWNER.

Note (1): X or Gamma rays

1.2 VESSEL INTERNALS
a) Leak testing & final inspection only is required.
b) Check one tray of each diameter and type, mock assembled in the shop.
c) Spot check for interchangeability of parts, where applicable.
d) Ensure that any uncommon down comers are fully assembled and offered along with their respective trays.
e) Where new designs and/or new VENDOR's are concerned, check that any applicable leakage tests have been carried out on prototype.

f) Check that materials including welding electrodes are in accordance with the requirements of the order and all applicable specifications and standards.

1.3 STORAGE TANKS

a) Shell plates to be dimensionally checked (including diagonals for square-ness) before rolling to curvature.

b) All shell plates to be inspected and dimensionally checked after rolling to curvature.

c) Check material test certificates and ensure that all shell plates are clearly stamped with the cast and plate number, so that they can be identified against the relevant test certificates.

d) Check material test certificates for roof and bottom plates.

e) Select the spot radiographs, D.P & M.P test as per codes.

f) Review the radiographs. (1)

g) On completion of inspection of shell plates ensure that VENDOR provides a chart giving all plate numbers, tier by tier.

h) Inspect fabrication of all fabricated fittings. This is to include checking of material test certificates also.

i) Inspect tank gauging equipment.

j) For shop fabricated tanks, witness hydrostatic tests to applicable standards.

k) Check welding material electrodes.

Note (1): X or Gamma rays

1.4 HEAT TRANSFER EQUIPMENT

1.4.1 SHELL AND TUBE EXCHANGERS

a) All carbon steel plates shall be identified against mill test certificates at the VENDOR'S works before commencement of fabrication.

b) Establish that welding procedure and welders are qualified before commencement of fabrication.

c) Check fit-up and witness chipping-back of welded seams.

d) Wherever applicable, select spots for radiography.
e) Witness any crack detection, hardness checks, ultrasonic tests etc. which are specified in drawing, specification, data sheet etc.

f) Review radiographs. (1)

g) Witness all hydrostatic tests on shell and tube sides.

h) Complete dimensional check for stacked units. This is to be carried out in the full assembly stage.

i) Check that all material test certificates and where applicable, heat treatment charts are in order. Ensure that VENDOR is familiar with the requirements regarding data books and see that the documentation is submitted without any delay.

j) Witness any further test recommended by OEM/Inspection agency and/or OWNER.

Note (1): x or Gamma rays

1.4.2 VACUUM EQUIPMENT, INCLUDING CONDENSERS

a) Tests on ejectors to be witnessed.

b) Inspection and tests of condensers shall be done as for shell and tube exchangers as far as applicable in addition applicable codes and standards shall be taken into account.

c) Check all material test certificates for tubes, plates etc.

d) Check and witness other tests as applicable as per the Tender documents as well as applicable codes and standards, for rotary equipment.

1.4.3 STEAM GENERATORS AND BOILERS

a) Inspection of drums as for vessels.

b) Mill certificate shall be provided for tubes.

c) All mountings to be inspected and hydraulic tests witnessed at sub-supplier's works.

d) Check test certificates for all materials and identify the same at VENDOR'S works before start of fabrication.

e) Check fit-up and witness back chipping of weld seams.

f) Establish that welding procedure and welding electrodes as are qualified before start of fabrication and welding.

g) Steel stacks to be finally inspected and dimensionally checked. Spots for radiography to be selected, where applicable, and radiographs reviewed.

h) Ducting to be inspected for quality of workmanship and spot checked for dimensional accuracy.

i) Shop hydrostatic test to be witnessed and final inspection to be carried out on fully assembled packaged boilers.

j) Witness all tests applicable for steam generators.

1.0 SCOPE

1.1 General

1.1.1 This Philosophy states that contractor’s scope of work shall include basic & detailed engineering, procurement, supply, manufacturing, fabrication, Inspection & testing, transportation, loading, unloading, insurance during transit, storage, construction, erection/ installation of all Mechanical Rotating Equipment with allied electrical, instrumentation and civil works, testing, mechanical completion, pre-commissioning, commissioning, performance guarantee test runs including total project management and handing over of ‘Steam Generation plant’ on LSTK and Single-Point responsibility basis at Talcher, Angul District, Odisha, India for M/s Talcher Fertilizers Limited (TFL).

1.1.2 In addition, all statutory rules & regulations in force shall also be complied with.

2.0 DESIGN PHILOSOPHY FOR MACHINERY

2.1 Codes and Standards

The Latest Edition of codes and standards as listed below shall be followed for design, manufacturing, inspection & testing of different machinery items.
Contractor to note that stand-alone OEM-standards for critical equipments are not acceptable.
Contractor to also note that requirement mentioned in API & other relevant codes & standards regarding any optional requirement or any bulleted points mentioned in the applicable codes, owner's decision shall prevail.

### 2.2 Design Life

All equipment shall be designed for a minimum service life of 25 years. Equipment shall have proven uninterrupted operation adhering to IBR prevailing norms & requirement for the industry.

### 2.3 Essential Project Reference Documents

The following documents shall be observed, and relevant aspects incorporated into specifications and datasheets:

- Process Description, Specifications and Data Sheets from Licensor
2.4 Regulations

Besides codes & standards, LSTK Contractor shall follow National Laws and Regulations in force together with Laws of state including statutory requirements as applicable.

2.5 Site Conditions

Site conditions shall be as defined in NIT Section 4.0.

2.6 Material of Construction

Generally Materials of construction shall be proven ones. However, applicable Codes & standards guideline to be adopted to the extent applicable.

Use of equivalent & superior material may be selected & shall be furnished with the offer along with chemical composition. LSTK Contractor shall furnish reference documents in the support of the same.

2.7 Quality Assurance & Control

2.7.1 The quality assurance shall be as per the approved procedures, test methods & facilities to be developed by the LSTK Contractor / vendor to ensure that the supplied equipment shall be of highest quality.

2.7.2 Quality Assurance (QA) shall mean the organizational set up, procedures as well as test methods and facilities developed by LSTK Contractor in order to assure that the machines & associated auxiliaries leaving LSTK Contractor’s/Vendor’s shop are of the highest possible quality i.e. either equal to or better than the requirement specified.

2.7.3 Quality Control (QC), shall mean all the tests, measurement, checks and calibration which are to be carried out in LSTK Contractor’s / Vendor’s shop in order to compare the actual characteristics of the equipment/unit/system with the specified ones, along with furnishing of the relevant documentation (certificates/records) containing the data or result of these activities.

2.7.4 LSTK Contractor shall submit a comprehensive description (manual) of QA/QC measures contemplated by him for implementation with regard to this specification. It is contractual obligation of the LSTK Contractor to develop and implement adequate QA/QC systems.
2.7.5 QA/QC system shall cover all products and services required for the complete machine unit as per scope of work including job sub contracted by the LSTK Contractor.

3.0 DESIGN REQUIREMENTS

3.1 General

3.1.1 All machines shall be directly coupled to their prime movers. V-Belt drives shall be avoided. If not, specifically mentioned, the drivers shall have rated output at least 10% greater than the power requirement of the driven equipment and also compliant to respective API codes / standards whichever is more stringent.

3.1.2 MOC used in the equipment required to be proven one.

3.1.3 All process pumps shall have Mechanical Seals. Single seals will be used in most cases, however, for ignitable or hazardous fluids, double, or Inside Wet and Outside Dry running seals will be used. Non-process/ non-critical pumps shall also have mechanical seal.

3.1.4 Special tools and tackles required for installation and maintenance shall be necessarily provided.

3.1.5 For approval of additional vendor (other than list enclosed with the NIT) during detail engg, LSTK contractor/ vendor has to furnish the reference list, copy of PO/ end user certificates for similar equipment's models (minimum 2 nos.) supplied in past for similar duty conditions. Reference list must contain at least the following: Fluid handled Capacity, Suction Pressure, Discharge Pressure, Model No., Power consumption, Client Name, Address, and Year of supply.

3.1.6 Lube oil system philosophy for critical / major equipment (ie. Turbines , BFW Pumps) shall have motor driven main oil pump, motor driven standby oil pump and DG power backed up emergency oil pumps with coast down tank in order to safe functioning of package. Lube oil system to also comply API-614.

3.1.7 Dedicated portable oil clarifiers with all hose & piping connection to be provided for major/ critical equipments (ie. Turbines , BFW Pumps).

3.1.8 Noise level for all rotating equipment shall be limited to 85 dBA measured at 1meter distance from the equipment.

3.1.9 All machines must have the details related to lubricants used written e.g. name of the lubricants, tank capacity (where it is used), level measurement with high - low marking, flow direction on the oil pipe line, trip values for oil pressure low, auto start pressure etc. marked at appropriate locations.

3.1.10 Lubricants storage section having minimum emergency stock of all required lubricants to take care of any emergencies. It shall have lubrication drum loading / unloading facility, for transportation of oil drums with associated facilities like a electrical or
hand operated oil pump (For transfer of lubricant to machines), with oil collection pits in case of any spillages with adequate illumination.

3.2 Centrifugal Pumps:

The process pumps shall be designed as per API 610, latest edition. The pumps shall be of robust design to ensure long service life and minimum maintenance requirement. The pumps shall be designed for easy access for inspection and maintenance. In addition to codes & standards, following points shall also be applicable:

3.2.1 All pumps shall have continuously rising head curve from any specified operating point to shut off point. Pumps running in parallel shall have equal head rise to shut off point.

3.2.2 The pumps should have stable operating characteristics. The pump head at shut off shall be approximately 110% of head at rated capacity and not exceeding 120%.

3.2.3 Best efficiency point shall be as close as possible to normal operating point.

3.2.4 Impellers of multistage pumps shall be secured positively against axial movement.

3.2.5 For multistage pumps, a lateral critical speed analysis shall be carried out.

3.2.6 Pumps with centre line support shall be provided for pumps handling fluids of operating temperature more than 177°C.

3.2.7 Pumps shall not be offered or supplied with minimum impeller diameter. Selected impeller diameter shall be with a margin of at least 5% from minimum impeller diameter.

The maximum calculated axial load shall not in any operating condition exceed 50% of bearing manufacturer's load rating.

3.2.8 Shim pack dry flexible coupling from reputed coupling manufactures like M/s Turboflex, Euroflex & KOP Flex shall be used. Coupling guard shall be non-sparking for pumps located in hazardous area.

3.2.9 Mechanical seal of John crane / Flowservel / Eagle-Burgmann make shall be provided.

3.2.10 Bearing Isolators of reputed & established make shall be provided for equipment & its driver motor/ turbine & gear box.

3.2.11 For API governed pumps with forced lubrication system, the lubrication system shall be designed as per API 614 latest edition as covered in clause no. 3.1.6. Steam turbine driven Cooling water pumps, if any, shall also have lube oil system as prescribed in clause 3.1.6.

3.2.12 All continuous and Intermittent running pumps shall have a stand-by pump.
3.2.13 Cooling water pumps shall be horizontal split casing type with mechanical seals. Emergency CW pumps shall also preferably be horizontal split casing type with mechanical seals.

3.2.14 BFW Pumps shall be API 610- BB5 type and OEM shall have proven operational experience for the same. MOC for BFW pumps shall be minimum S-6 material class as per API 610. Condensate handling pumps shall also be API compliant.

3.2.15 NPSH test shall be carried out for all critical pumps (BFW Pumps, CW Pumps) including Stand-by also irrespective of margin between NPSHA and NPSHR. For other misc pumps NPSH test to be carried out where margin between NPSHA and NPSHR is less than 1 mtr.

3.3 **Reciprocating Pump / Metering Pumps** :

Reciprocating pump shall be designed as per API 674 latest edition and metering pump shall be designed as per API 675 latest edition.

3.3.1 The metering pumps shall be suitable for continuous capacity variation. The capacity variation should be possible while the pumps are working.

3.3.2 Hollow plungers are prohibited. Repacking should be possible without removing plunger from the cylinder.

3.3.3 Enclosed crank cases, gear units and similar mechanisms shall be sealed. Removable covers shall be provided for inspection, cleaning and minor adjustments of parts.

3.3.4 Performance testing shall be carried out in accordance with ASME PTC 7.1/ Hydraulic Institute Standard.

3.3.5 All accessories i.e. gear box, coupling etc. shall be inspected and tested as per the applicable codes / standards.

3.3.6 Instruments and control panels shall be tested and inspected as per the applicable instrument specifications.

3.3.7 Electric motor drivers shall be tested and inspected as per the respective motor specification sheet and the applicable engineering standard specified.

3.4 **Steam Turbine** :

3.4.1 Steam turbine as drive for BFW pumps shall be designed as per API 611 (general purpose), latest edition, if applicable.

3.4.2 Steam Turbine Casings:

   a) The casing shall be designed for hydrostatic test pressure of at least 50% more than maximum working pressure. The casings shall be free from sharp corners; sudden changes in section and other features, which may result in unnecessary stress concentration.
b) Each turbine casing shall be provided with efficient draining facility. The parts of the turbine casing, which may come in contact with wet steam in normal operation or during start-up, shall be provided with an inter-stage drainage system whereby extracted water shall be prevented from re-entry to the blading and shall be transferred to either a convenient heater extraction branch or the condenser. The casing drains shall be provided with temperature sensing devices to ensure proper evacuation of drains.

c) Bolts, nuts and studs used for the turbine casing flanges and main turbine valve bonnets etc., shall be with threads and of special alloy steel appropriately heat treated. Provision shall be made for electrical heating of the bolts to facilitate setting & loosening. In addition, the supplier shall indicate the design feature incorporated to prevent the seizure of nuts and studs and features, which will facilitate their easy removal after operating the machine. Bolts shall be designed to distribute the load evenly on all the threads without stress concentration. All the joints shall have sufficient flexibility to remain tight with rapid changes of temperature. Before shipment, each bolt shall be thoroughly examined and inspected to ensure freedom from any defects.

d) Necessary quantities of assorted bolt heaters, torque or other wrenches, extensometers, bolt thread lubricator shall be included in the proposal as part of maintenance tools and tackle. The proposal shall specify bolt loading and strains and shall state the estimated period in which retightening or replacement of the bolts will be required and shall furnish detailed data, method and instruction for this purpose.

e) The supports of the turbine on the foundation shall be designed considering the expansion and contraction of the machine during thermal cycling. Axial movements shall be allowed by anchoring at one point and central position shall be maintained by fitted keys.

f) The casing design shall permit inspection of all the bearings without dismantling the casing.

g) All special insulation, paints, sprays along with equipment required to apply these on steam turbine shall be included in the Contractor's scope of supply.

h) The steam extraction branches shall be located on the lower half casings.

3.4.3 Steam Turbine Rotors:

a) Forged alloy steel rotor shall be provided.

b) Ensure uniformity of material composition and strength by examining adequate number of test specimen.

c) Ensure heat stabilization of the rotor as per ASTM-A472, or approved equivalent standards.

d) Ensure static & dynamic balancing of composite rotor and blade assembly.

e) Maximum permissible vibration measured at bearing housing will be as per ISO 10816 and API .

f) Critical speed of composite rotor and blade assembly shall not be within ±20% of operating speed. LSTK contractor to furnish studies carried out for combined
critical speeds for offered TG set. Further, LSTK contractor shall furnish at least two such studies for earlier supplied TG sets along with their field data, in order to establish the validity of such studies.

3.4.4 Turbine driver and driven equipment shall be mounted on a common base plate unless otherwise specified. Turbine manufacturer shall provide dimensional and load data to driven equipment supplier for design and supply of common base plate by driven equipment supplier.

3.4.5 Piping connected to turbine shall be designed to limit forces, stresses, vibration and noise to acceptable limits as per relevant codes on account of flow, pressure and temperature conditions of fluid flowing through them. Adequate anti-vibration supports, springs, etc. shall be provided to limit vibrations and accommodate thermal movements.

3.4.6 Noise level shall be limited to 85 dBA at one metre distance by provision of silencers/acoustic insulation and/or noise hood as may be necessary.

3.4.7 Special provisions for emergency lube oil supply to bearings and gears shall be made in case of power failure. This shall require overhead reserve oil tank to supply lube oil at adequate pressure when there is breakdown of power. Necessary control circuit shall also be provided for this system.

3.4.8 Efficient Shaft sealing of reputed make to be provided to prohibit leakage of steam from the turbine. Suitable bearing Isolators of reputed make shall be provided.

3.4.9 Shim pack dry flexible coupling from reputed coupling manufactures like M/s Turboflex, Euroflex & KOP Flex shall be used. Any other established equivalent coupling may also be proposed by Vendor for owner's approval along with PTR. Coupling shall comply to API 671.

3.4.10 All main and auxiliary piping shall be laid out in neat fashion to allow adequate clearances for operation and maintenance (Min 900 mm), and head rooms (Min 2200 mm) for working personnel. Design shall allow maintenance of parts without dismantling piping or supports.

3.4.11 The turbine and auxiliary equipment shall be designed for outdoor operation totally unprotected from weather, but due to grouping of equipment they may be installed in a common building for convenience in operation. Several compressors, turbines shall be placed at common operating platform and maintained by an overhead travelling crane. The crane capacity shall be decided based on maximum weight of maintenance part to be lifted. A loading bay shall be kept open for erection and maintenance purposes.

3.4.12 Local control panel shall be adjacent to turbine for easy operation.

3.4.13 All valves and controlling devices shall be within easy reach for convenient and quick attention by operators.
3.4.14 Turbine auxiliaries such as lubrication circuit with tanks and exchangers, stage heaters, safety valves, etc. shall be arranged with economising space and provided with suitable devices for removal and maintenance.

3.5 **Oil Purification System/ Centrifuge**:

3.5.1 Dedicate Portable Oil Purifier shall be provided for major/critical equipments as applicable. The oil purifier/centrifuge should be portable with suitable pipings/fittings which can be moved and fitted to the number of equipment’s intended.

3.5.2 Purification system consisting of:
- Unit oil tank drain piping through level indicating type seal box.
- One (1) centrifuge oil purifier with drive and accessories.
- One (1) electrically heated water bath oil heater.
- Two (2) dirty oil pump with drive.
- Two (2) clean oil pump with drive.
- One (1) polishing filter.
- Necessary interconnecting piping, valves, strainers, flow meters, gauges, hangers, supports, controls, instrumentation etc. shall be provided with purifiers.
- All electrical accessories, wiring, starters, switches etc. including one control panel complete with annunciation system. All base plate, foundation bolts, sleeves etc.

3.5.3 **Performance Requirement**:

a) Each purification system shall have a flow capacity per hour of 20% of the total oil in the unit oil system (i.e. the total quantity of oil required to fill the oil system of turbo-generator unit).

b) The oil at the outlet of the polishing filter shall not contain any free moisture & particles of size higher than two (2) microns.

c) Oil at the outlet of centrifuge shall not contain free moisture and particles of size higher than five (5) microns when the oil is heated to a temperature of not more than 65°C. The equipment shall be suitable for continuous operation round the clock.

d) Shall serve continuously as per steam generation plant stipulated period of turnaround philosophy described in NIT.

e) The centrifuge shall be complete with drive motor and transmission shall be through gears.

f) The centrifuge shall be equipped with suitable anti-seal loss device to prevent loss of oil with heavy phase drain beyond the limit guaranteed by the supplier.

g) The material for the rotating parts of the centrifuge shall be high-grade stainless steel AISI-316 or equivalent. Other parts in contact with the oil shall be of stainless steel or of other corrosion resistant material. The Outer casing may be carbon steel construction. The construction shall be vapour tight.

h) The arrangement of the assembly must enable easy removal of the collected solid particles within a short time.
i) The centrifuge shall be equipped with sight glasses both for the purified oil and the separated water from collecting pan.

j) The mounting arrangement of rotating parts must be designed to eliminate undue imbalance and vibration. The rotating parts shall be statically & dynamically balanced.

k) Necessary annunciation, interlock and safety devices shall be provided for safe and trouble-free operation.

3.6 Centrifugal Fans:

3.6.1 Centrifugal fans shall be designed as per API 673, latest edition for critical services i.e. FD and ID fan for Boilers. For non-critical services manufacturer’s standard based on national / international standards may be applicable.

3.6.2 Forced and induced draught fans shall be coupled to drivers through shim pack dry flexible coupling, and the complete assembly shall be mounted on a single base frame.

3.6.3 First critical speed of the rotor shall be higher than 120% of rated speed.

3.6.4 Capacity control shall be achieved by means of dampers (Preferably on suction side) specially for constant speed fans.

3.6.5 The fan casing shall be suitably split such that impeller assembly can be removed for maintenance without disturbing inlet and outlet ducting.

3.6.6 SS bolts and nuts shall be provided for the split casing joints of fans for corrosive service also must be suitable for prohibiting the undesirable elongation and loosening of fasteners during operation.

3.6.7 The drive motors of the fans should be designed with additional capacity to take care of surge loading. However Motor rating shall be minimum 125 % of Fan shaft power up to 22 KW, 115 % of shaft power for shaft power between 22 – 55 KW and 110 % of shaft power for shaft power above 55 KW.

3.6.8 Bearing shall be preferably oil lubricated.

3.7 Centrifugal and Rotary (Screw) Compressors (if applicable):

3.7.1 Compressors (for air services) shall be oil-free type and shall be supplied as per the requirements of API 672 / Equivalent national or international standards. Screw Compressor shall be conforming to relevant IS/ISO standards.

3.7.2 Compressor filtration hood and suction piping shall be SS material only. Air compressor suction to be provided with suitable measures to avoid moisture ingress during rainy season.
3.7.3 All machines shall have stable operating characteristics. The head generated shall rise continuously from choke point to surge point.

3.7.4 Vendor shall provide maximum range of capacity control without air venting. However a surge control shall also be provided so that the operation at low capacity is not limited.

3.7.5 Compressor shall be designed to deliver the rated head (i.e. rated discharge pressure) @ rated capacity without negative tolerance. Vendor to consider pressure losses in the air intake system & compressor discharge up to after cooler while performing compressor sizing.

3.7.6 The BKW at rated conditions shall be guaranteed with zero positive tolerance.

3.7.7 Driver rating shall be at least 110% of Compressor rated BKW at rated condition or BKW at unthrottled min. ambient temp. & maximum Atm. Pressure, whichever is higher.

3.7.8 Extra/Over-design margin in Compressor capacity shall be as per process design philosophy of NIT.

3.7.9 Compressor package shall be provided with Hydrodynamic Radial & Thrust bearings and Pressurized lubrication system (as applicable) meeting requirements of relevant codes & standards.

3.7.10 Couplings shall be non-lubricated, all metallic flexible type with spacer with a non-sparking coupling guard. The coupling shall have min service factor of 1.5 over the maximum capability of compressor.

4.0 INSPECTION & TESTING

Machines shall be inspected by nominated / approved Third Party Inspection Agency (TPIA) as indicated in commercial part of NIT. The Inspection and testing shall be in accordance with the all relevant codes, standards, specifications, including the minimum guide line given in Annexure – 1 (attached). Applicable codes / standards for inspection & testing to be duly followed and mentioned in ITP/QAP documents by LSTK contractor.

4.1 All testing accessories, measuring instruments including NDT testing equipment, etc. shall be arranged by LSTK Contractor. DM water shall be used for hydro testing of the equipment.

4.2 Job driver / Motor shall preferably be used for MRT and performance test. However, any limitation regarding use of Job driver / motor shall be submitted to owner with due justification for owner’s approval during detail engg on case to case basis.

4.3 String test to be performed at Vendor’s shop. If not possible at vendor’s shop, then LSTK Contractor may perform the same at Owner’s site. However, Contractor shall submit to owner due justification for owner’s approval during detail engg on case to case basis.
4.4 Witness test (by TPI) for all rotary equipment including stand-by to be done. LSTK contractor shall furnish project specific QAP/ ITP (Inspection Test Plan) for all equipment during detail engg for owner's approval.

4.5 In general, following tests shall be conducted for all rotating equipments:
   - Material test
   - Non-destructive test
   - Hydrostatic test for all the pressure containing parts
   - Dynamic balancing of rotor
   - Over speed test of impeller / Rotor
   - Helium leak test of compressor casing (if required as per API Code)
   - Mechanical running test
   - Barring over check for reciprocating compressor
   - NPSHR test for pumps
   - Performance Test
   - String Test
   - Disassembly Test
   - Impeller / casing inspection
   - Vibration Test

The tests required to be conducted and witnessed shall be specified in the equipment data sheet by LSTK contractor. Disassembly test for Fans, Blowers & small Pumps can be waived –off in case no problem occurs during mechanical / performance Test.

5.0 SPARES

5.1 All erection, pre-commissioning & commissioning spares including spares consumed during testing / PGTR till handing over the plant to owner shall be supplied by LSTK Contractor free of cost. Any unused commissioning spares shall be owner's property.

5.2 Mandatory spares shall be supplied by the LSTK contractor as per NIT.

5.3 LSTK Contractor to also furnish separate recommended list of 2 years operation & maintenance spare part list along with budgetary offers, valid for 2 years from the date of submission of offer for owner’s consideration. Recommended spares and their quantities should take into account related factors of equipment reliability, effect of equipment downtime upon production or safety, cost of parts and availability of vendor’s service facilities around the proposed location of equipment.

5.4 Detail List of special tools & tackles shall be furnished by the LSTK bidder along with the bid and shall be in scope of supply of the LSTK contractor.
6.0 PAINTING

6.1 All exterior non-stainless steel surfaces subject to atmospheric corrosion with the exception of machined surfaces shall be epoxy or polyurethane painted.

6.2 All exterior machined surfaces shall be coated with suitable rust preventives.

7.0 VENDORS LIST

All equipment shall be procured / fabricated as per approved vendor list enclosed with NIT.

LSTK Contractor to also note that any other vendor or item which are not mentioned in NIT, successful LSTK bidder may furnish list of proven sub-suppliers with PTR subject to owner’s approval during detail engg. Document (PTR) shall be in English language only.

8.0 LSTK CONTRACTOR / VENDOR DOCUMENTATION:

Drawings & Documents of machinery items/ rotating equipment shall be as mentioned in NIT.

Contractor to furnish Complete List of all rotating equipment with their quantity, tag numbers and Power consumption along with the bid. Material Requisition(MR) for all machinery/ equipment to be submitted by contractor for PMC’s/Owner’s review & approval. Owner’s/ PMC comments are to be duly incorporated by contractor and afterwards contractor shall proceed with procurement activity with respective OEMs. Technical Bid Evaluation (TBE) documents are to be furnished by bidder to PMC’s/Owner’s for information.

The un-priced or priced copies of purchase requisition / purchase orders detailing both technical and commercial aspects for all items shall be submitted to PMC’s/Owner’s for review & comments. Contractor to proceed for placement of order on corresponding successful OEM only after receipt of CLEARANCE from Owner against the subject PR/PO.
ANNEXURE-1

INSPECTION & TESTING GUIDE LINES – ROTATING EQUIPMENT

1.0 SCOPE

This document covers the minimum guide lines for the Inspection & Testing for the rotating Equipments.

All rotating Equipments shall be inspected by Third Party Inspection Agency. The Inspection and testing shall be in accordance with the all relevant codes, standards, and specifications as specified in Specification sheet. Applicable codes / standards for inspection & testing to be duly followed and mentioned in ITP/QAP documents by LSTK contractor.

2.0 PUMPS, TURBINES AND GEAR BOX

2.1 Pump and turbine casings to be identified against foundry test certificates and thickness checked to conform to approved drawings.

2.2 Witness hydrostatic test on casings.

2.3 Dynamic balancing of rotor

2.4 Witness running tests on pumps including N.P.S.H. where applicable.

2.5 Non-destructive test

2.6 Strip inspection of pumps on completion of running tests. Wearing surfaces to be checked and recorded. As a general principle, mechanical seals will not be dismantled after running tests. This necessity will be discussed on a case to case basis if abnormal noise or temperature has need records during testing. All materials to be checked against test certificates or VENDOR'S bill of materials.

2.7 Final inspection and dimensional check of pump (including driver, when mounted on base plate).

2.8 For Gear boxes all requisite test regarding material inspection viz. Radiography, UT, PT, MPI to be conducted.

2.9 Mechanical run test along with Full speed/ Full or part load test , Full torque/ slow roll test, Sound level test to be performed and witnessed for gear boxes.
2.10 For steam turbine drivers, hydrostatic test on pressure parts to be witnessed.
2.11 Running tests on steam turbines to be witnessed.
2.12 If spare rotating assembly is ordered, running test to be conducted and witnessed for spare rotor also as applicable for the job rotor.
2.12 Final inspection and dimensional check on steam turbines to be done.
2.13 Check all test certificates.

3.0 COMPRESSORS, FAN & BLOWERS AND DRIVERS

3.1 Material of casings or cylinders to be checked against test certificates.
3.2 For fabricated casings, inspection shall be as per codes & standard mentioned in NIT.
3.3 Hydrostatic test on casings or cylinders to be witnessed.
3.4 Dynamic balancing of rotor
3.5 Non-destructive test
3.6 For fabricated impellers, welding procedure and welder's qualifications to be established and impellers to be inspected before assembly. Impellers overspeed, NDT after overspeed and dimensional inspection.
3.7 Ensure that overspeed tests on impellers have been carried out and related certificate for dynamic balancing of impellers and subsequently the complete rotating assembly shall be provided. The over speed test shall be carried out to prove the impeller proper balancing and relevant certificate shall be provided.
3.8 Witness leakage test on lube oil tank and carry out internal and external inspection. Tank to be finally inspected after internal coating and/or painting.
3.9 Inspect prefabricated lube oil piping.
3.10 Witness performance tests shall be done and check all safety and alarm devices when contact instrumentation is fitted.
3.11 If spare rotating assembly is ordered, running test to be conducted and witnessed for spare rotor also as applicable for the job rotor.
3.12 Strip inspection on completion of running tests. To include examination of all running surfaces, checking of critical clearances, and examination of lube oil filters in the tests.
3.13 Final inspection and dimensional check of compressors mounted on base plates.
3.14 Gearing, pinion forgings and main wheel forgings or castings to be inspected at forge shop or foundry.

3.15 Any dynamic balancing of gearing rotors to be witnessed.

3.16 Fabricated gear cases to be inspected at sub-supplier's works.

3.17 Light or full load running tests, as specified to be witnessed on gearing.

3.18 Final inspection and dimensional check of gearing to be done at manufacturer’s works.
SECTION VI – 5.3.4

DESIGN PHILOSOPHY -
COAL AND ASH HANDLING SYSTEM

PLANTS: STEAM GENERATION PLANT

PROJECT: INTEGRATED COAL BASED FERTILISER
COMPLEX AT TALCHER, ANGUL DISTRICT,
ODISHA (INDIA)

1.0 PURPOSE

This document lays down the guidelines for design, engineering, erection, commissioning, inspection & testing requirements for Coal and Ash Handling System of Steam generation Plant of M/s Talcher Fertilizers Limited for Coal based Fertilizer Plant.

2.0 CODES AND STANDARDS

The design, manufacture, inspection and testing of Coal and Ash Handling System for Steam generation Plant shall comply with all the currently applicable statues, regulations and safety codes in the locality where the equipment is to be installed. The equipment shall confirm to the latest edition of the following standards & codes. Other internationally acceptable standards/codes, which ensure equal or higher performance, shall also be accepted.

3.0 RAW MATERIAL HANDLING SYSTEM

3.1 COAL CRUSHING AND SCREENING

LSTK’s contractor scope shall be started from Coal Crusher House of Coal Gasification Plant. Coal (-) 30mm / fluxant (-) 30mm shall be received through conveyors from Coal Crusher House (Coal crusher house of Gasification plant not in LSTK’s contractor scope) of Coal Gasification Plant and shall be transferred to Coal/Fluxant feeding Bunkers of Boilers through series of conveyors, Crushers/Vertical Rollers Mills, screens, feeders etc. Capacity of belt conveying system at battery limit of Steam Generation Plant is 1000TPH (Rated)/ 1200 TPH (Design). Bidder to design Material Handling system as per steam generation plant process requirement for two shift operations i.e. 14 hours to fill all raw materials to steam generation plant.

The size of the coal / fluxant received is normally (-) 30 mm from Coal Crushing House of Coal Gasification Plant which is not in bidder’s scope. The received coal/fluxant is sized in crusher house/Vertical Roller Mills from (-) 30 mm to size as required by boiler manufacturer. Crushing system/Milling system (Crusher/Vertical Roller Mill, screen, vibrating feeder & conveyors, gates etc.) is in scope of LSTK contractor.

Travelling tippler conveyors/shuttle conveyors shall be used at the bunkers inlet flange to feed crushed/sized Coal/Fluxant to respective bunkers.

In case of CFBC Boiler, 1 working + 1 standby crusher for coal and 1 working + 1 standby crusher for fluxant shall be considered for Steam Generation Plant. In case of PFBC Boiler, dedicated milling system shall be considered for each boiler of steam generation plant.

Dedicated coal bunker and fluxant bunker shall be used to feed each boiler. The capacity bunker for coal shall be minimum 12 hours of operation and the capacity of bunker for fluxant shall be minimum 24 hours of operation for each boiler. Rack & pinion gate/Rod gate/suitable arrangement and weigh feeder shall be installed at bottom of each bunker for measurement.
of flow rate of coal / fluxant.

The Project shall be so designed and the equipment shall be sized so that the specified material through-put is achieved without equipment overloading, material degradation or spillage.

All erection & commissioning spares including spares consumed during various tests including performance guarantee test, till handling of all material handling equipment to owner shall be supplied by contractor free of cost. Any unused commissioning spares shall be owner’s property.

Mandatory spares shall be supplied by the contractors as per NIT.

Contractor to also furnish separate recommended list of 2 years operation & maintenance spare part list along with budgetary offer, valid for 2 years from the date of submission of offer for owners consideration.

4.0 TECHNICAL SPECIFICATION

4.0 BELT CONVEYORS

1. Conveyor capacity shall be such that it shall be adequate to handle raw material for Steam Generation Plant capacity. Design capacity shall be considered as min. 20% more than the rated capacity.

2. All conveyors shall include adequate structural supports, transfer towers, all drives, pulleys, idlers, chutes, belting, skirt boards, belt cleaners, hold backs(for inclined conveyors), emergency switches, protective devices etc.

3. Conveyor supporting structure should be closed gallery with walkway on both sides.

4. All the equipment of coal handling system shall be designed to operate on continuous duty i.e., 24 hours per day and 365 days in a year.

5. All conveyors outside buildings shall be in enclosed galleries having main walk-way of 1100 mm clear width on one side and 750 mm clear width on other side (maintenance way) of conveyors.
6. All belt conveyors shall have suitable gravity take-up unit, except material weigh feeder which have short length and wherever agreed by owner/consultant.

7. The belt speed shall be optimum so as to minimise material degradation, spillage and generation of dust. Belt speed shall not exceed 2.5 m/sec.

8. Continuous belt weigher shall be installed on conveyor at suitable locations. Display of this weigher would be connected through control panel.

9. Electro Magnetic separator arrangement of adequate capacity to be provided at suitable location to separate any unwanted particle from the feed coal and fluxant.

10. All the conveyors shall be provided with identical designed frame size, roller size, pulley size etc. as far as possible to have better interchangeability and reducing the inventory spare parts.

11. The belting shall be of either synthetic fabric such as Nylon-Nylon / Polyester Polyamide, Steel Cord etc. with rubber covers of adequate flexibility to give a troughing angle of 35 deg. For all the conveyors the number of plies, cover thickness, factor of safety etc. shall be as per the recommendation of belt manufacturer of adequate strength.

12. Conveyor drive shall be directly coupled through suitable helical gear box.

13. Minimum service factor for coupling shall be taken as 2.0 on the absorbed power.

14. Minimum service factor on gear boxes shall be taken as 1.5 over the absorbed power.

15. All conveyor belts shall be fitted with belt cleaners/scrapers which will be located between the head and snub drums, on the return belt side. All conveyors’ belts shall be fitted with multi-blade sprung type external belt scraper below head pulley and V-type internal belt scraper. All cleaned material from the belt shall fall within the head chute.

16. The skirt boards and sealing with overlapping block design shall be provided with labyrinth seals.
17. All equipment’s / assemblies shall use antifriction bearing fitted in Plummer block.

18. All discharge Chutes shall be lined with material Tiscral /Sailhard (Adequate thickness minimum 12 mm).

19. In Belt conveyor system, Deck plate shall be provided 4 m length (min.) at receiving end and 2 m length (min.) at discharge end.

20. In Double stream conveyors central walk way width shall be minimum 1100mm.

21. Self-aligning training idler spacing to be considered as maximum 15m for carrying side & maximum 30m for return side.

22. Return idler shall be with rubber rings or rubber lined. Vertical guide rollers shall also be rubber lagged type.

23. Impact idlers (minimum 5 nos.) shall be provided at loading points at spacing of 300 mm. Impact idlers shall be of rubber lagged type.

24. All pulleys shall be lagged in herring-bone pattern. Head/Drive pulleys shall be lagged with 12 mm thickness Neoprene and Tail & Snub pulleys shall be lagged with 12 mm thickness Neoprene.

25. All diverter & gate shall be electrically or pneumatically operated.

26. For safety of conveyors and personnel, all conveyors shall be provided with safety switches like zero speed switch, belt sway switch and pull cord. In addition to these there shall be provision of audible warning (Hooter) of starting of conveyor.

27. Suitable hold back devices for preventing running back of the conveyor belt in case of conveyor being stopped in loaded conditions due to power failure or during normal operational delays shall be provided to give positive protection. The hold back shall instantaneously engage without shock and be capable of protecting equipment and personnel. It shall be released instantly when ‘power’ resumes or the ‘delay’ is removed. The holdback devices shall be integral with gearbox.
28. All Conveyor galleries shall be provided with dust sweeping chutes covered with removal chequered plates. There shall be one dust hopper for each walkway of gallery and the same shall be provided at the middle of walkway near trestle location.

29. All over ground conveyors are provided with covered galleries. Crossover shall be provided at 100 m intervals (no cross over for conveyors less than 100 m). Gallery shall be designed to accommodate cable & pipes including fire water, Dust Suppression pipelines.

30. Walkway shall be of chequered plate construction with anti skid arrangement. Both sides of the central and side walkway shall be provided with pipe hand rail with kerb plate using pipe of ‘medium’ class as per IS: 1239 having 32mm nominal size. Handrail shall not be connected to conveyor supporting stringer.

31. Bidder to consider redundancy / stand-by for belt conveying system (1W+1S) from battery limit to bunkers for boilers feeding.

32. Angle of surcharge of coal shall be considered as 20 deg. Maximum moisture content during rainy season shall be considered for design of equipment as 20% including surface moisture.

33. The inclination of conveyors inside the tunnel shall be limited to 10 degree. The inclination of conveyors above the ground level shall be as per CEMA / IS11592. The conveyor shall be horizontal at the feed point as far as possible. In case the same is not possible, the inclination at the feed point shall be limited to 6 degree. Conveyor system shall be designed with zero leakage of coal.

34. Repose angle of coal shall be considered as 37°.

35. All the equipment shall be suitable for handling damp and sticky coal during monsoon season with moisture content of 20% and fines upto 40%.

36. The type of high speed coupling between motor and gear box shall be as follows:
(a) For motor rating up to 30 kW - Resilient type
(b) For LT motors between 30 kW and 175 kW - Traction type fluid coupling
(c) For HT motors - Actuator operated scoop type fluid coupling

If scoop type fluid coupling is applicable, fan cooling arrangement shall be provided and water cooling shall not be provided.

37. Wherever the conveyor crosses the road, a minimum clearance of 8 M shall be provided below the structure.

38. Minimum 3.15 mm thick seal plate shall be provided at all locations wherever conveyor crosses the road / building / any other facilities.

39. For over ground conveyors take-up shall not be provided in the pits. Sand pit shall be provided at the ground level.

40. In case of CFBC Boiler, bidder to consider interchangeability in crusher house to feed both the crusher from each conveyor and each crusher have provision to feed both the conveyor (1W+1S).

4.2 HOPPERS
The hoppers shall be fabricated from Carbon steel plates (min. 10 mm thickness.) conforming to IS : 2062 or equivalent / ISO and to lined with Tiscral / Sailhard (Adequate thickness minimum 12 mm) from inside not only on bottom portion but also on vertical portion for free flow of material.

4.3 FEEDERS
1. The design of the feeder shall be sturdy and robust in construction to withstand worst duty conditions and given uninterrupted flow of material. The unit shall have unbalanced motors with vibration control and variable control mechanism for controlling the rate of flow. The design shall be such that it consumes less power per ton of material handled, with less maintenance.

2. The feeder shall be able to start at full load quickly, stop smoothly and shall operate at an
extremely low noise level. With the empty tray the noise level shall be less than 85db within one meter radius of the unit.

3. Whenever the feeder shall be suspended from the top, the design of the suspension gear shall be such as to provide maximum isolation of vibrations and ensure very little transmission of spurious vibrations into surrounding structures. Turn buckles shall be provided in the suspension gear for adjusting the heights.

4. The width of the deck and height of skirts shall be sufficient to suit the duty conditions. The length of the deck shall be suitable for arresting the flow from hopper efficiently when the feeder is stopped or not in working condition.

5. The deck and skirts shall be provided with abrasion resistant liners. The through shall be suitably stiffened to avoid bending.

6. The mounting springs shall be made of high quality chrome steel.

7. No portion of the driving mechanism shall be lower than tip of the discharge point, so that sufficient clearance is available between the feeder and the belt conveyor.

8. The trough shall be inclined to give maximum output and this shall not be more than 5 degrees.

9. The feeder shall be able to deliver the coal at varying capacities (continuous variability) by varying amplitude and frequency. This variation shall be able to be controlled from the central control room with the help of a rheostat or any other contrivance.

10. All the parts of the equipment which need regular check-up / maintenance lying very close to the moving / rotating parts shall be provided with guards made of expanded metal.

11. The vibrating mechanism shall be of electro-mechanical.
   The feeder shall be able to operate round the clock and able to start in full load conditions. The feeder shall be able to operate at ambient temperatures from 4 to 50 degrees Celsius. Relative humidity of 100% and in dusty atmosphere
12. Adequate capacity feeder shall be selected by bidder at all locations. Design capacity shall be considered as min. 20% more than the rated capacity.

4.4 BUCKET ELEVATORS

1. Chain type Bucket elevator to be used wherever required.

2. The bucket elevator shall be designed for continuous duty at full load as specified under operating conditions and the various components shall conform to relevant codes.

3. Top cover shall be in pieces for easy to disassemble for the maintenance and inspection of complete drive assembly. The housing shall be provided with inspection opening at appropriate location.

4. Dust proof labyrinth metallic seal for the drive & return shaft shall be provided.

5. Bucket chain shall be of heavy duty and the chain specification with manufactures designated type/ number shall be specified in the bid.

6. Elevator shall be provided with Heavy duty positive holdback in order to prevent it from rotating backwards.

7. Hoods & safety guard shall be provided for the coupling and any other exposed rotating components. All safety switches shall be provided.

8. Adequate capacity bucket elevator shall be selected by bidder at all locations. Design capacity shall be considered as min. 20% more than the rated capacity.

4.5 VIBRATING SCREENS

1. Bidder to consider adequate capacity vibrating screen. Adequate capacity screens shall be selected by bidder. Design capacity shall be considered as minimum 10% more than the rated capacity

2. The deck of vibrating screening feeder shall have continuous solid deck section in the impact zone under direct coal fall and remaining deck shall be fitted with perforated deck
3. The solid deck section shall be provided with replaceable Tisral /Sailhard (Adequate thickness minimum 12 mm). The perforated deck shall be wear resistant and shall be rigidly fixed with main frame along the length of grizzly deck.

4. The vibrating screening feeders shall be mounted on the floor with the help of helical springs made of alloy steel. No rubber/synthetic material for the support shall be acceptable.

5. Vibrator bearings shall be grease lubricated, double spherical roller type suitable for vibrating equipment. The bearings shall be sized for minimum 8,000 hours of operation.

6. Suitable sealing arrangement shall be provided between the vibrating structure and chute work to avoid dust nuisance in the surrounding area.

7. Proper arrangement to avoid dust ingress into lubricant of eccentric shafts shall be provided.

8. Necessary arrangements shall be provided for maintaining / replacing the complete vibrator assembly.

9. In case of V- belt drive, suitable arrangement like taper bush or coupling shall be provided, to avoid loosening of sheave mounted on eccentric shaft. Dust hood shall be provided over the deck of screening feeder to avoid dust nuisance.

4.6 CRUSHER AND VIBRATION MONITORING SYSTEM (VMS)

1. Crusher shall be provided for sizing the input coal and fluxant. Crusher shall be supplied complete with accessories and subsystems.

2. Oversize raw material coming from the screen shall be transferred to the crusher. Bidder to consider adequate capacity crusher. Design capacity shall be considered as min. 10% more than the rated capacity.

3. The crusher design should be such that the crushing action is accompanied by the
minimum of attrition.

4. Uniform crushing impact shall be assured.

5. The crusher shall be capable of delivering the normal rated output even when handling damp sticky coal having maximum moisture content. No clogging or building up of material on the crushing element shall develop.

6. Temperature sensing devices shall be installed on both bearings of each of the crusher to trip the crusher in case temperature goes beyond limit.

7. The entire inside surface of crusher coming in contact with coal shall be provided with abrasion resistant steel liners.

8. The Plummer block shall be of ‘Split Type’ design and shall be fixed with minimum four numbers of high tensile steel bolt studs of adequate size complete with adequate locking device and locating arrangement. In addition, the jacking screw shall be provided for easy lifting of top part of the plummer block. The same shall be of solid base with flat machined bottom surface all around having maximum contact on the foundation plate.

9. Maximum accessibility shall be provided for routine inspection and replacement of parts. For these purposes, the doors shall be of hinge connection with effective dust sealing arrangement. Hydraulically operated top cover of crushers shall be provided for quick inspection.

10. Crusher shall be mounted on independent foundation with vibration dampring device like GERB springs and dampers.

4.7 VERTICAL ROLLER MILL

1. Vertical Roller mills shall be supplied complete with accessories and subsystems.

2. Design capacity shall be considered as min. 10% more than the rated capacity. The vertical roller mill shall be used for grinding, drying, separation and transportation.
3. Vertical roller mill shall have following features like better utilisation of grinding area, even distribution of load on the table, comparative less dynamic forces on table due to lesser mass of single moving part, variable speed mill drives and “hydraulic loading system” for maximum flexibility to vary grinding pressure.

4. Roller swing-out device for quick and easy changing of grinding components shall be provided or other facilities shall be used for quick and easy maintenance.

5. Bevel Planetary gearbox with full lubrication and gear system shall be used.

6. High efficiency dynamic classifier shall be used.

7. There shall be no metallic contact between the grinding rollers and grinding tracks.

8. Mill feed shall be sealed through rotary air lock

4.8 TRANSFER CHUTES

1. Chutes transferring Coal from one conveyor to another shall be designed in such a way that material fall height is minimum and the change in direction is achieved as smoothly as possible.

2. All the chutes shall be provided with IS: 2062 material of construction of 8 mm thickness.

3. Inspection holes / window with covers shall be provided at all convenient locations.

4. Speed of the material falling on conveyor belt in the direction of belt travel should be almost the same as that of the conveyor.

5. The angle of chutes shall be 55° as far as possible but in no case less than 50° for proper flow of material.

6. All Chutes shall be lined with material Tiscral /Sailhard (Adequate thickness minimum 12 mm).
4.9 BUNKERS

1. The bunkers shall be of round shape and fabricated from Carbon steel plates (min. 10 mm thickness) conforming to IS : 2062 or equivalent / ISO and to lined with Tiscral /Sailhard (Adequate thickness minimum 12 mm) from inside not only on bottom conical portion but also on vertical portion for free flow of material.

2. Bunkers shall be provided with load cells, vibrators/poking hole, ultrasonic level indicator etc. The angle of conical portion of bunkers shall be kept as 55° with the horizontal.

3. Feeding to bunkers shall be automatic with the help of series of conveyors system.

4.10 FLAP GATES

1. The motor operated 2 position flap gates shall be provided in transfer chutes as specified and shall be complete with electrically operated actuators. The gates shall be of robust construction and suitable for trouble free operation.

2. The motor rating for the actuator shall be so selected as to provide sufficient thrust for operation of the flap gates against the moving weight of coal and/or flap gate. The flap gate travel shall be 60 deg. The motor shall be completely dust proof.

3. Lever arm shall be provided between actuator and flap gate shaft for obtaining required thrust.

4. The actuators shall be capable of preventing any over travel. These shall be placed internal to the drive unit and shall be completely dust-proof. The limit switches shall be capable of adjustments to vary the total length of travel of the gates.

5. Provision for alternative manual operation shall also be made using de-clutch able hand wheel. The diameter of hand wheel shall be selected considering convenient force to be applied by a single operator. However, minimum diameter of hand wheel shall be 500 mm. Limit switch for safety of person operating the hand wheel shall be provided. Manual effort required to operation the flap gate shall not exceed 25 kg.
4.11 RACK & PINION GATES / ROD GATE

1. Rotary actuator operated rack and pinion gates shall be provided at various locations as required. The gate shall be mounted such that coal load does not act vertically on gate.

2. Suitable manually operated rod gates shall be provided over rack and pinion gates for their easy operation and maintenance. The rack and pinion gate shall be guided properly and suitable rollers with bearings sealed for life and dust proof shall be provided.

3. The rack and pinion gates shall be of carbon steel construction with liner plate of Tiscral /Sailhard (Adequate thickness minimum 12 mm). The gates shall be operated by means of double rack and pinion. The material for rack & pinion wheel shall be cast steel and shaft shall be EN.-8.

4. Provision for alternative manual operation of motorized rack and pinion gates shall also be made. Limit switch for safety of person operating the hand wheel shall be provided.

5. Manual effort required to operate the rack and pinion gate shall not exceed 25 kg.

4.12 BELT SCALE

1. Belt weigh scale for measurement of coal flow rate and quantity shall be provided at specified locations. System shall be complete with flow rate indicator, totaliser, control panel etc.

2. The weigh scale shall be automatic and electronic type. It should be designed for continuous automatic weighing, metering and printing of coal flow.

3. Each belt weigh scale shall comprise of a belt weigh scale platform with minimum 4 nos. weighing idlers. It shall have unitized construction for ease of installation and shall be fully floating type (without pivot points). Minimum 4 nos. hermetically sealed load cells of precision strain gauge type shall be applied in tension to support the weigh bridge. The load cells shall have 100% overload protection and shall be structurally safe upto to 250% of rated belt scale capacity.
4. Belt scale shall be electronic microprocessor based with its program stored in non-volatile memory.

5. It shall be provided with self-diagnostic features for trouble shooting of the entire belt scale system. Fully automatic zero and span calibration facility shall be provided.

6. The electronic systems offered by the Contractor shall include all signal conditioning, power amplifiers and printed circuits etc. The printed circuits shall be encapsulated against dust and moisture.

7. The flow rate indicator shall have minimum 4 digits. The flow totalizer should have 8 digits display scale with reset facility.

Complete belt scale system shall be suitable for 50°C ambient temperature and 100% relative humidity. It shall be suitable for outdoor installation in a dusty area. The electronic circuit enclosure, sensors housing shall be dust and watertight.

8. Accuracy of belt weigh scale shall be ± 0.5% of actual weighment.

**4.13 INLINE MAGNETIC SEPARATOR / SUSPENDED MAGNET**

Inline Magnetic Separators shall be provided for continuous and automatic extraction and discharge of tramp magnetic pieces from coal being discharged from conveyors as specified. The sets shall be complete in all respects with drives, magnets, inline belts, hoppers, chutes, tramp-iron boxes and all electrical ancillaries like control panels etc. Suspended Magnetic Separator shall be provided for picking up tramp magnetic pieces buried under coal from moving coal over Conveyor as specified.

**4.14 TRAVELLING TRIPPER UNIT / SHUTTLE CONVEYOR & BUNKER SEALING ARRANGEMENT**

1. Rail mounted movable travelling Tripper / shuttle conveyor shall be provided to feed coal to overhead bunkers of Boilers.

2. Mobile Trippers on bunker conveyors along with belt sealing arrangement shall be furnished and erected complete with rails, including necessary supporting structures,
approach/maintenance platforms with ladders and hand railings, trailing cables, all electrical including machine mounted local control panel & control panel on one end of bunker, location of which shall be decided during detail engineering.

3. The Mobile tripper conveyors shall be motor driven type. It shall consist of structures, supports, walkways, rails, belt scrapper with adjustable rubber strip, rubber lagged head and bend pulleys complete with shaft bearings, chutes, stops, limit switches, brakes etc. The rating of tripper travel motor shall be adequate to move the tripper smoothly either in same or opposite direction to belt direction under fully loaded conditions. Minimum two drive axles shall be provided for tripper travel. Arrangement shall be provided at the starting point of the tripper to avoid folding of belt.

4. Supply of adequate length of rails to cover the runway length for the motor driven tripper shall be included. Suitable belt hold down guide pulley shall be provided over the concave curve of belt over tripper.

5. The travelling trippers shall be provided with fail safe A.C. thruster operated brake of totally enclosed type which shall engage as soon as tripper travel motor stops. A.C. thruster operated rail clamps along with manual Rail clamps on both side of the tripper shall also be provided.

6. Monorail & electric hoist shall be provided for lifting conveyor drum to floors. Monorail all along the tripper travel length to facilitate maintenance of tripper shall be provided.

7. Suitable dust cover shall be provided over tripper head pulley. Serrated rubber seal shall be provided at open side to prevent dust nuisance. Suitable dust tight access doors shall be provided. Spring loaded scraper type belt cleaner shall be provided below the tripper head pulley for cleaning the carrying side of the belt.

8. The tripper shall run on rails with double flanged wheels. Rails for tripper travel shall be mounted on supporting structure of respective conveyors.

9. Suitable system having encoders for monitoring position of tripper in DCS shall be provided. In addition, travel end limit switches and end stops shall also be provided.
10. Suitable access platform of chequered plate with ladders, hand railing and walkways on both sides shall be provided for access/maintenance of equipment on tripper. In addition, crossover platform shall be provided with tripper so that operator can cross the belt through the same.

11. Suitable rail cleaners shall be provided on leading and trailing edge of tripper for either track.

12. In case of bunker feeding, the tripper shall have provision for dropping coal from conveyor onto one side of tripper to the bunker or back to the conveyor for the purpose of skipping intermediate bunkers. Complete Bunker Sealing arrangement shall be provided over the bunkers to prevent dust emission into tripper bay.

5.0 DUST EXTRACTION SYSTEM
Dust control system shall be of dry / wet / extraction type and as well as dust suppression type to suit at the application point.

The Contractor shall require providing suitable dust control system at suitable location for coal screening, crushing, coal crushing and feeding system etc.

The dust control system to be furnished under this specification is required for control of fugitive dust emissions from dust generation points such as transfer points, feeders, crushers etc. Dust control is achieved by dust suppression/extraction system.

Dust control system which shall not allow a dust concentration in the ambient air inside the buildings more than acceptable limits as per the approved guidelines or any internationally recognized hygienic Standards/Codes.

Dust extraction system shall include but not limited to following- hoods, duct/ pipes (duct thickness shall be considered as per calculation but min. 5mm thickness), centrifugal fans/blowers, motors, rotary valve etc.

6.0 ASH HANDLING SYSTEM
6.1 SCOPE
The scope shall include complete ash handling system comprising bed ash handling system, fly ash handling system, bed ash storage silo, fly ash storage silo and equipment below silo. The ash handling system and equipment to be supplied shall be as per the system description and flow diagram enclosed. The ash handling system shall be complete in all respects with all mechanical, civil, structural, electrical and instrumentation.

The extent of supply under the contract includes all items shown in the drawings, notwithstanding the fact that such items may have been omitted from the specifications or schedules. Similarly the extent of supply also includes all items mentioned in the specification and/or schedule notwithstanding the fact that such items may have been omitted in the drawings.

6.2 SYSTEM DESCRIPTION

6.2.1 Bed ash handling system

Bed ash formed due to the combustion of coal in the boiler. After that ash collected in various bed ash cooler outlet, shall be automatically and sequentially extracted. Below each bed ash cooler outlet, adequately sized water-jacketed surge hopper shall be provided to reduce the ash temperature below 200 degree Celsius. Ash collected in the surge hopper shall be conveyed through a dense phase pneumatic conveying system up to bed ash silo for storage and further disposal.

The ash removal system below each ash hopper shall consist of MS adaptor, knife gate valve, metallic expansion joint, and ash intake valve and ash vessel. The ash vessel receives ash from respective hoppers and conveys it to the ash conveying pipeline provided below each of the ash vessels. Required compressed air shall be supplied to ash vessel for conveying ash from the ash vessels to the ash silo. The ash conveying air collected in the ash silo shall be vented to atmosphere through bag filter/vent filter mounted on silo top.

Occasional lumping of ash due to clinker formation should be considered in bed ash handling system and hence the surge hopper shall be provided with lump separator (if applicable).

Dry bed ash shall be collected in RCC silo having adequate storage capacity (24 hrs of ash generation) from where dry bed ash shall be unloaded into open/closed trucks for ash utilization facilities.
Contractor to ensure zero leakage of ash from bed while designing bed ash handling system.

6.2.2 Fly Ash Handling System

The fly ash collected at the air preheater hoppers, economiser hoppers, ESP hoppers and stack hopper any other fly ash hopper if applicable shall be gravity fed into individual transmitter vessels provided below each hopper. On initiation of dry fly ash collection system, the inlet valve shall open and allow the fly ash to be fed into the transmitter vessel for predetermined time after which the inlet valve shall close. Afterwards, the compressed air shall be allowed to flow into the transmitter vessel by opening the air inlet valve. Once the desired conveying pressure is reached inside the vessel, the fly ash shall be conveyed to the fly ash storage silo through transport piping. The conveying air shall be vented through the bag filters mounted on top of the silo in order to limit the dust concentration in the vented air below 30 mg./N.cu.m. The hoppers if connected to a common conveying line along the gas path, they shall be cleared one after another. The clearance from any hopper shall continue cycle after cycle till ash in the hopper reaches to low level. Removal of fly ash from any particular hopper shall be initiated whenever the level of ash in that hopper reaches predetermined level. This level is fixed in such a way that the volume of ash collected will be adequate for conveying in one cycle. Thus in this system, the fly ash hoppers are always kept empty. Therefore the removal and conveying of fly ash to the fly ash silo shall be done in cyclic manner on a continuous basis. The dry fly ash collected in storage FA silo will be disposed into the open trucks/closed container through conditioner/retractable chute in dry form for further disposal to ash disposal area or for utilisation in nearby cement plants/brick plants by others.

The total ash removal system shall be divided into parallel paths. There shall be separate line (Path) connection for 1st field ESP hopper and 2nd field hopper and third field and common line (path) connection for other field provided for proposed ESP. For ECO and APH hopper there shall be common line connection and for cyclone shall be separate line connection. Provision of conveying cyclone ash shall be provided in fly ash silo. Shifting of ash clearance cycle from one hopper to the next shall be automatic and based on level.

Normally the fly ash conveying system shall operate continuously but with time gaps between cycles. The vessel sizes are selected in such a way as to get specified capacity. The fly ash
removal system shall be designed on a continuous basis with 20 cycles per hour and during emergency with 40 cycles per hour (i.e., ash collected in 8 hours time shall be evacuated in 4 hrs time). The level probe shall be provided in each hopper in such a way that the ash collected in the hopper shall be equal to the volume of the ash transmitter vessel. This level probe shall initiate the ash evacuation cycle from any hopper. The timer based operation shall back up in case the level probe fails to initiate the ash evacuation cycle. There shall be one manually operated isolating valve (knife gate type) below each fly ash hopper which shall be used during maintenance of the ash transmitter vessel.

Two (2) Screw compressors, one standby, one operating for the unit during normal and rapid evacuation operation shall be provided to meet the conveying air requirements of fly ash handling system of Unit.

6.3 Storage Silos and Disposal of ash from silos

6.3.1 Bed Ash Storage Silo
There shall be one bed ash storage silo for all boilers. The silo shall be sized to store bed ash generated in a day from the proposed unit based on firing of worst coal at BMCR condition. Silos shall be of RCC construction. Silo shall be of flat bottom design. Silo area shall be paved and drain shall be provided at the periphery of the paved area.

Silo shall have four (4) Nos. of outlet connections in which 3 nos. of outlets are with rotary feeder for unloading of ash in different form as mentioned below.

a) One opening for unloading of ash in dry form to closed tank carriers through Telescopic chute.

b) One opening for unloading of ash through ash conditioner into open truck.

c) One opening for ash transportation directly to Ash/slag pond in slurry form (by others).

d) One opening for blind flange with chain wheel operated for future use.

6.3.2 Fly Ash storage silo
There shall be one fly ash silo for all the boilers. The silo shall be sized to store fly ash generated in a day from the unit based on firing of worst coal at BMCR condition. Silos shall be of RCC construction. Silo shall be of flat bottom design. Silo area shall be paved and drain shall be provided at the periphery of the paved area.
Fly ash silo shall be provided with four (4) outlets.

a) One outlet shall be used to load ash into the open trucks (open trucks by others) in conditioned form for further disposal by others into the disposal area. For this purpose a rotary feeder and ash conditioner shall be provided.

b) The other outlet shall be used to dispose ash in closed containers (by others) for utilisation. This outlet shall be provided with rotary feeder and a motor operated retractable chute.

c) One opening for ash transportation directly to Ash/slag pond in slurry form (by others).

d) One opening for blind flange with chain wheel operated for future use.

The silo shall be sized to store fly ash generated in a day (24hrs) from the proposed unit based on firing of worst coal at BMCR condition.

Note- Bidder to consider instrument system including additional bag/vent filter for flyash transfer of Coal gasification plant in both Flyash silo and Bed Ash silo.

6.4 SYSTEM CAPACITY

6.4.1 Bed Ash Handling System

The minimum rate of generation of bed ash shall be considered as 20 % of total ash generated from worst coal at BMCR condition. The rated capacity of the bed ash conveying shall be based on 150 % margin over bed ash generation rate based on worst coal at BMCR condition.

6.4.2 Fly Ash Handling System

The rate of generation of fly ash shall be considered as 90 % of total ash generated from the worst coal at BMCR condition. Normally the fly ash conveying system shall operate continuously with time gaps between cycles. However, the capacity of fly ash handling system shall be designed to clear the ash collected in 8 hours in about 4 hours time considering worst coal. Accordingly all the equipment shall be sized.

6.5 DESIGN & OTHER GENERAL REQUIREMENTS

6.5.1 Bulk Density of Ash

(a) For Volumetric Calculation

For selection of pneumatic handling system: 500-800 kg/cu.m

Type of material: Abrasive

6.5.2 The pneumatic handling system for fly ash shall be of dense phase and the velocity of air ash mixture shall not exceed 10 m/s.

6.5.3 All the bends in the pneumatic handling system shall be provided with wear back of either Ni-hard or stone box type.

6.5.4 High and low level probes shall be provided in each ash hopper for measuring the evacuation rate during PG test.

6.5.5 In case vent valves are provided for the transmitter vessels this vent connection shall be provided above the highest ash level in the hopper.

6.5.6 The movements of the ash hoppers, due to the expansion shall be considered and the Contractor shall include suitable expansion joints as necessary in the ash pipe lines. The expansion joints shall be of stainless steel construction.

6.5.7 The radius of 90 deg. bends shall be minimum 5 times the pipe diameter.

6.5.8 Fluidising pads in fly ash silos, ESP hoppers and other vessels shall be preferably of woven stainless steel and should withstand temperature upto 200°C. Platforms shall be provided for fluidising pads and ESP ash level indicators.

6.5.9 Ash silos shall be provided with access ladder inside the silos and external staircase from ground level to different platforms.

6.5.10 The material of construction of all parts of rotary feeder coming in contact with ash shall be of alloy CI as per IS-4771 type 1a with minimum hardness of 340 BHN.
6.5.11 The motor rating for all the equipment shall have a margin of 10% over the BKW. The service factor for selection of gearboxes, resilient couplings, flexible couplings, brakes etc., shall be 1.5 minimum on the motor rating.

6.5.12 The type of high speed coupling between motor and gearbox shall be as follows:
   (a) For motor rating upto 30 kW : Resilient type
   (b) For LT motors of above 30 kW rating : Traction type fluid coupling

6.5.13 The emission level at the outlet of the bag filter shall be limited to 30 mg / Nm3.

6.5.14 Ash Handling system shall be fully automated.

6.5.15 All Equipment shall be designed for continuous duty of 24 hours per day.

6.6 Dust Conditioning Water Pumps at Terminal Silo Area
Two (1W+1S/B) dust conditioning water pumps shall be provided by bidder to moist dry ash in order to avoid nuisance during open truck unloading. Ash water sump, from which dust conditioning water pumps will take its input, shall have minimum 30-minute effective storage capacity.

6.7 Drain Pumps at Terminal Silo Area
Two (1W+1 S/B) drain pump shall be provided by Bidder at terminal silo area. Drain pit shall connect the peripheral drain of silo-paved area.

6.8 Conveying Air Compressor
Bank of Conveying Air Compressors shall be provided common for all the Units. The conveying air compressor shall be Oil injected Screw type. Necessary conveying air pipe work shall be MS ERW.

6.9 Silo Fluidising Blower and Heater
Two numbers Silo fluidising blower (1W+1 S/B) and two numbers Silo fluidising blower heater (1W+1 S/B) shall be provided to heat air discharged through Silo fluidizing blower. Each Silo fluidizing blower discharge shall be connected with one heater and lines shall be interconnected so that any heater can be utilized by any blower.

7.0 ACCESS TO MACHINERY

Special attention shall be given in providing adequate access to all machinery for safe operation / maintenance and cleaning purpose.

Provision shall be made for lifting out and replacing equipments such as motors, gearboxes, and other heavy machinery with the help of electric hoist. Capacity of the hoist would be based on the weight of the heaviest part to be lifted.

8.0 ELECTRICAL SYSTEM

Bidder to consider all Electrical systems and items for material Handling Portion as per Electrical Design Philosophy / Specification.

9.0 CONTROL AND INSTRUMENTATION SYSTEM

Bidder to consider all instrumentation systems and items for material handling portion as per Instrumentation Design Philosophy / Specification.

10.0 CIVIL WORK

Bidder to consider all Civil & structural work for material handling portion as per Civil Design Philosophy / Specification.

1.0 PURPOSE

The purpose of this document is to establish the design basis of the complete fire fighting system.

2.0 DEFINITIONS

Owner - Talcher Fertilizers Ltd. (TFL)
LSTK- Lump Sum Turn Key Contractor
CCE - Chief Controller of Explosives
NFPA - National Fire Protection Association
IS - Indian Standards
TAC- Tariff Advisory Committee

3.0 SCOPE

3.1 This specification covers design basis and execution requirements for fire protection system as per statutory regulations NFPA codes. The design and construction of the fire detection and protection equipment shall be of internationally accepted standards and in compliance with the regulations of the Tariff Advisory Committee (TAC) and other relevant statutory requirements for steam generation plant of TFL. Any other Standard which are not mentioned in the technical specification but are found necessary to meet the requirement of TAC and also for safe and sound operation of the plant are to be included at no extra cost to the Owner.

3.2 The LSTK CONTRACTOR shall design, supply and erect complete fire fighting network / system inside and around Steam Generation Plant.

3.3 The Bidder shall confirm that the fire fighting system is complete with all facilities whether specified in this specification or not.

3.4 A comprehensive fire detection and alarm system and fire protection system shall be designed for the whole of the proposed steam generation plant to provide a high degree of protection for plant, equipment and buildings and employees. Interfacing with other systems (e.g. fuel and air handling plants, ventilation systems, etc.) will be required.

3.5 Taping/s with the fire water mains provided at plant battery limit (adjacent to the proposed plant location) shall be provided as per requirement. The same (tie-in location/s) shall be decided during the detail engineering.

3.6 The CONTRACTOR'S design and engineering activities listed in this specification are the minimum requirements to be complied with preparation of detailed design basis, specifications, standards and list of codes for each system based on guidelines given in subsequent clauses of scope of work.

3.7 The term 'Fire Fighting System' referred here generally covers various equipments and facilities being provided for controlling fires. These include facilities such as fire water network accessories and fire detection & control system, fire water piping network together with hydrants, monitors, detectors/alarm, various kinds of portable fire extinguishers like Dry Chemical Powder type, etc., as well as sand and water buckets and sign boards.

3.8 The Fire Fighting System shall be designed to provide adequate facilities for extinguishing any fire in the entire area of Steam Generation Plant and associated facilities of the proposed
Scope of work. The system shall be designed and installed as per TAC / NFPA/ API/ IS standards and also as per latest applicable standards/ codes. The system shall be complete in all respects essential for proper installation operation and maintenance, irrespective of whether such systems are specifically mentioned in this specification or not.

3.9 Hydraulic analysis of fire water ring main network including line size, flow and pressure at various section of the system shall be submitted for Owner/Consultant’s approval.

3.10 The detail design shall take into consideration of all stipulations, practices followed by Statutory Regulations/Authorities for all types of jobs of this package.

3.11 Preparation of PFD/ P&ID’s and equipment data sheets. Preparation of material take-off, material requisitions and purchase requisition of bought out items. Design calculations for the respective fire protection system. Installation drawings and documents. Operating maintenance and spare parts manuals wherever applicable.

3.12 Taking approval from statutory authorities.

3.13 The following latest Codes and Standards shall be followed.

<table>

</tbody>
</table>

Also LSTK Contractor shall follow the following manuals/ references for fire fighting system:

- Rules of Water Spray System
- Rules for Automatic Sprinkler Installations

3.14 All equipment in the entire fire protection & detection system shall have the approval from one of the followings:

a) UL of USA
b) LPCB-UK
c) BIS-India
d) FM-USA
However, the design and installation of complete system and requirement shall be approved by statutory authorities.

### 4.0 SPECIFICATION FOR FIRE PROTECTION SYSTEM

#### 4.1 System Requirement

The fire protection System is required to ensure protection of the facility in order to combat an outbreak of fire so as to reduce damage and consequential losses. The fire Protection system includes fire detection, containment and suppression system. The Proposed fire protection system will be designed to provide adequate safety measures in the areas susceptible to fire in the steam generation plant in compliance with the recommendations of the Tariff Advisory Committee (TAC). The Entire Fire fighting system will have a centralised panel housing the required Electrical, mimic of the system and will be hard wired to the centralized DCS to show the Mimic and provide alarms.

The Indicative Area wise requirement of fire detection and protection system will be as given below.

<table>
<thead>
<tr>

</tbody>
</table>

Apart from the above station building, transformer yard, boiler area, pumps, compressor and fuel handling plant will be protected with hydrant system.

Following types of Fire Protection system shall be provided.

i) Hydrant System.

iii) Automatic Fixed Foam system for Fuel Oil storage Tanks.
iv) Automatic inert Gas system.
v) Portable and Mobile Fire Extinguishers.
vi) Automatic CO2 Fire Fighting system.
vii) Jets/portal curtains/DCP/special DCP etc.

4.1.1 Category under TAC

The steam generation plant falls under “ordinary” hazard category. Boiler house building, control room, switch gear room in control and other electrical building, battery room, pumps and other area will be provided with only portable fire extinguishers.

5.0 FIRE WATER DISTRIBUTION SYSTEM

5.1 General

i) Fire water ring header shall be extended to all the process plants and storage areas. Material for fire water piping shall be outer wrapping/coating carbon steel with cathodic protection for underground piping and carbon steel for aboveground piping.

ii) Underground fire hydrant ring main facility, with strategically placed hydrant connections, shall be provided to suit the site/plant/building configuration.

iii) Indoors hydrants for plant and non-plant buildings shall be provided as required.

iv) Risers shall be provided for internal protection to boiler galleries at various levels. All hose connection points shall be fitted with landing type valves with instantaneous female connections. Top landing valves shall terminate at the boiler house roof levels.

v) Hydrants shall be spaced at 30 m for high hazard occupancies, at 45 m for moderate hazard occupancies and at 60 m for low hazard occupancies.

vi) Fixed Water Spray Systems (Sprinkler / High Velocity Spray Water / Medium Velocity Spray Water) shall also be considered for establishing the conformity of fire protection system.

vii) For process units, external ring header with hydrants and an internal distribution with monitors and hose reels shall be installed.

viii) Along the network, a number of block valves shall be located in such a way that the various areas of the plant can be fed with fire water even during maintenance operations on part of the fire water network.

ix) Fire water pressure at the farthest point shall be a minimum of 7 Kg/cm2 after installation of headers and sub headers.

x) F.W. header/line shall be laid in RCC trench on pedestal supports with sand filled and covered with pre-cast slab. Cathodic protection also to be considered for underground/trenched piping.

xi) Fire water shall not be used for any other purpose.

6.0 FIRE WATER SYSTEM
Fire Water System shall be designed as per TAC guidelines / NFPA Code and complied with Local Law/ Civil Defence requirements.

6.1 Fire Fighting System

1) Fire Hydrant shall be provided in a ring round the facilities of all process plant area in the LSTK scope.

2) Fire Fighting System design and layout is subject to review and approval by Local Authorities.

3) LSTK contractor shall calculate the fire water requirement for their scope and tie-in for LSTK scope shall be taken from the OSBL fire water network. Offsite fire water network (OSBL scope) shall be available around the unit. Contractor shall take two nos. of tapings from Offsite header with an isolation valve for each tapings.

4) Valves on fire water mains shall be of Gate type only. Valves on fire water lines shall be located in RCC valve chamber provided with top cover to facilitate easy operation/ maintenance of valves. The top of chamber shall be 80 mm above ground level.

5) The bidder shall identify the fire risks for the proposed plant and provide appropriate fire protection equipment accordingly. It is expected that these will include (but not necessarily be limited to) the following:
   i) Fuel (coal, oil & natural gas) handling and storage plant including oil pump house, coal conveyors, terminal buildings, crusher house/ coal mills and coal bunkers.
   ii) Boiler feed pump set oil systems
   iii) Oil filled transformers
   iv) Records / library rooms
   v) Control rooms
   vi) Cables, Electrical Bays (switch gear room, MCC room, cable cellar/ cable spreader room etc.)
   vii) Ash Handling Area
   viii) Diesel engines and fuel tanks
   ix) Boiler light up gas store and pipe-work
   x) Hydrogen filled machines, store and pipe-work
   xi) All other indoor and outdoor stores where any inflammable substance may be present
   xii) All Buildings, equipments coming under scope of LSTK Contractor's Battery Limit.

7.0 Technical Requirements

7.1 Hydrant System

Pressurized fire hydrant system will consist of a pipe network and hydrants positioned around the station in sufficient numbers and so located that all buildings and risks are readily protected. Necessary number of loops will be formed around various risks. The loops will be interconnected for better reliability of the system. To isolate a portion of the ring main because of damage/repair, suitable nos. of valves will be provided.

The hydrant network will be sized and analysed to ensure that about 7.0 Kg/cm² pressure is available at the hydraulically remotest point in the system with the hydrant pump discharging at
rated head and capacity. The velocity in the hydrant main will not exceed 3 m/sec. Hose pipes of suitable lengths along with standard accessories like branch pipes, nozzles, spanners, etc. will be provided. These will be kept in a central hose house for the outdoor hydrants. Each internal hydrant valve will be provided with individual hose box having glass front containing hose pipes, hose reel, branch pipes and nozzles etc.

- The general design of Double headed hydrants valve shall conform to IS:5290 type A and material of construction shall be stainless steel.
- The general arrangement stand post assembly, consisting of a column pipe and a hydrant valve with a quick coupling end shall be as per requirement of TAC with respect to outdoor and indoor operation suitability.
- Material of construction for Branch pipes shall be Stainless steel (SS-304) and it shall have rings at both the ends. One end of the branch pipe will receive the quick coupling while the nozzle will be fixed to the other end.
- The general design and construction of instantaneous couplings, branch pipes and Nozzles shall be as per IS: 903 (latest edition). Metal couplings at both ends of hose pipes shall be of SS.
- 2 Nos. 15m long RRL type Hose pipe 63 mm size conforming to IS: 636, fitted with quick coupling ends, branch pipes, nozzles, spanner etc. shall be kept in a hose box, which shall be located near point of use.
- Fire Water Monitors shall be provided when height of the structure, tower exceeds 15 mtr and the same shall be as per IS:8442.
- There may be cases where due to horizontal obstruction, a particular vessel/ process column may not be approachable by ordinary monitor or hydrant, elevated long range monitors shall be provided to take care of such conditions.
- Fire hose reels shall be considered at strategic locations around block as first aid fire contingency. These shall be floor mounted type and shall have water connection from hydrant network. Each hose reel shall have 30 meter long hose with nozzle. Hose reel shall be located as per Std. (IS 884) and should cover all process areas in ground floor. Additional hose reels shall be provided with each landing valve. Hose reel shall be 30m x 20mm bore.

7.2 Water Spray System

Water spray systems provided shall meet the requirements of NFPA /TAC, and job specifications. The rate of water applications and mode of operation shall be as per TAC/Standards. Low point drains shall be provided in the water spray network.

Linear heat sensing device shall be provided for all floating roof tanks, if applicable. Automatic fixed water spray system shall be provided for the cable cellars of Sub-station and the oil filled transformers and Diesel/LDO/Fuel Oil Tank. The system shall be designed in accordance with NFPA 15/TAC.

7.3 Clean Agent System

The Automatic clean agent protection system shall be provided in control rooms as Per NFPA 2001. The system shall be designed to meet the minimum requirement of total flooding, fire detection, actuation extinguishing requirements as per NFPA 2001. The actuation of clean
agent system shall be indicated in the control panel located in the fire station control room & CCR. Preferred clean agents are either Argonite or Inergen only.

7.4 Portable Fire Extinguishers

Following types of portable and mobile CO2, dry chemical powder and foam type fire extinguishers shall be provided for the entire Steam generation plant area at agreed locations as per NFPA requirements. Contractor shall specify the numbers and location for Owner's review and approval.: 

- 2 kg capacity dry chemical powder fire extinguisher.
- 6 kg capacity dry chemical powder fire extinguisher.
- 9 kg capacity dry chemical powder fire extinguisher.
- 2 kg capacity CO2 type fire extinguisher.
- 4.5 kg capacity CO2 type fire extinguisher.
- 50 litre capacity Foam type fire extinguisher

8.0 Piping System and Valves

Complete piping, valves, fittings, specialties and pipe supports and necessary electrical item for the fire protection system shall be provided by LSTK Contractor inside the Battery limit of Proposed Steam generation plant.

Hydrant, monitor and spray system piping will be run underground and through Hume pipe at road crossings. Piping will be of carbon Steel pipes (galvanized or ungalvanized) of 'Medium' grade confirming to IS: 1239/3589 or equivalent acceptable international standard and coating and wrapping as per IS: 10221. Provisions will be made for extension of hydrant and spray system piping for future extension of the project.

Piping for compressed air, breaching connections, drains, downstream of deluge valves will be of heavy grade galvanized type.

Pipes shall be provided with vent connection and vent valves at all high points and drain connection & drain valves at all low points. All firewater piping shall be capable of being drained completely and provided with drain cocks / valves at low levels.

Isolation Valves at every 300 m and at crossings (junctions) to ensure easy maintenance and uninterrupted water supply in case of break down. All isolation valves in Hydrant system shall be non rising spindle type Gate valve only (For Under Ground Pipelines) and OS&Y type (for Aboveground headers). Isolation Valves above 200 mm NB shall be gear Operated. Material of construction of Gate/Globe/Check valves & strainers shall be carbon steel. No Cast iron valves & strainers shall be used.

At every 300m and at crossings (Junctions) to ensure easy maintenance and uninterrupted water supply in case of break down and shall be planned in such a way that outage of any section of fire water line should not affect other section. Isolation valves shall also be provided below monitor and at all hydrants. Landing valves on tech structure, platforms, columns, buildings, shall have individual 4" isolation valve at each hydrant. Isolation valve shall be provided at all tapping points on firewater headers.
9.0 SAFETY EQUIPMENTS

LSTK contractor shall provide the following safety items (BIS approved) with minimum qty. specified for their scope of work:

a) Safety helmets – 10 nos. per control room & per substation.
b) Stretcher – 4 nos.
c) Fibre glass First Aid Box with all necessary items/kit & Anti snake serum - 2 nos.
d) Rubber hand gloves for electrical jobs – 10 pairs for each substation and each control room.
e) Explosimeter - 2 nos.
f) Fire Proximity suit – 4 nos.
g) Rescuscitator – 2 nos.
h) Electrical siren (3 Km range) - 1 no.
i) Hand operated siren – 2 no.
j) Water jel blanket – 4 nos.
k) Red/Green flag for fire drill – 10 nos. each color
l) Positive Pressure type self contained breathing apparatus – 4 nos. per control room & per substation.
m) Hand held battery loaded Emergency light, each with 1 set spare battery - 4 nos.

10.0 SAFETY IN SYSTEM DESIGN

10.1 Spacing and Layout

CONTRACTOR to finalise hydrant layout on plot plan, with all the requirements such as number of Hydrants, Monitors, Foam system, sprinkler system etc., based on all statutory requirements & TAC Guidelines, considering ease of maintenance and safe approach for fire fighting. Due consideration is to be given for providing Emergency escape routes also. Hydrants are to be strategically located to obtain maximum advantage of layout.

11.0 EXECUTION, INSPECTION AND TESTING

All execution, inspection and testing for completion of fire protection system shall be carried out based on Codes, standards and specifications. LSTK Contractor shall develop a detail inspection, and testing procedures based on codes, standards and specifications. Following minimum tests but not limited to, shall be carried out after completion of the system testing Fire water network piping:
a) Demonstration test for system capacity requirements
b) Demonstration test for auto start and stops for the main fire pumps and jockey pumps, if applicable.
c) Demonstration test for foam application
d) Demonstration test for water spray
e) Demonstration test for CO2 system (using N2 in place of CO2), if applicable.

The LSTK Contractor shall meet all requirements for inspection and testing of the system.

12.0 APPROVAL OF DRAWING

Drawings and documents shall be prepared as required by approval authorities in all respects and submitted by the LSTK Contractor. The LSTK Contractor shall make arrangement for inspection and testing for statutory authorities at various stages of the work.
1.0 Detection, Actuation, Alarm and Communication System

For detail refer electrical and instrumentation specifications attached with the bid document

1.1. General Features Design

a) An addressable type of Fire Alarm System shall be provided for the plant. The design shall be as per NFPA and applicable local requirements.

b) The fire protection facilities for the Project shall meet the local rules and requirements. These facilities include providing smoke and heat detectors in the buildings.

1.2 Salient Features

1.2.1 Smoke/Heat Fire Detection

The fire detection system shall be made by means of optical smoke detectors, ionization smoke detectors and heat detectors. The above system shall be installed in the control room, electrical substations and other buildings. The signal coming from the above detectors shall be sent to Local Fire Alarm Panels at various locations and in turn to the Main Fire Alarm Panel.

1.2.2 Alarm Push Button Outdoor/Indoor

Outdoor/indoor Alarm push button shall be located in the plant area/buildings so that the maximum travelling distance is no more than specified as per NFPA Code. The push buttons shall send the signal to the respective Fire Alarm Panel at various locations.

1.3 Fire Alarm Monitoring System

1.3.1 General

Fire Alarm Main Control Panel shall be provided in Fire Station Building and Sub Control Panels (Local Fire Alarm Panels) shall be provided, one each in control room, and other agreed location. Fire alarm control panels shall be provided in the respective Non-plant buildings. Interconnection of these fire alarm panels to the main fire alarm shall be done by the Contractor. Summary of Fire alarm to be connected to DCS shall be prepared and approved by Owner.

1.3.2 Each fire alarm panel shall be suitable for the following tasks:

a) To receive signals coming from:

- Smoke detection and heat detection systems
- Manual push buttons to actuate audible and visible alarm for each received signal and a siren for general alarm.
b) The control panel shall supply operating low voltage D.C. to the system and have an in-built charging system to maintain in-built batteries, which shall operate the system in the event of mains failure. EDG/UPS power connection shall be provided the fire alarm system.

c) There shall be sufficient zones on the panel to quickly identify the area of alarm. Such zones shall either indicate the area on the panel in English with standard model available in the market. NFPA code for zone classifications shall be followed.

d) The panel shall be capable of supervising faults on the alarm lines, battery leads, batteries, sounders, and contain both audible and visual warnings of such faults within the panel. Only the use of a supervisory key should control such fault indications. Fire conditions must always overcome faults. Indicating lamps shall be dual filament type, having twin lamp circuits or LED type.

e) It is preferred that the panel shall have an "alarm" and "evacuation" circuit on an automatic basis so that the "alarm" signal shall move to "evacuate" signal within a given period unless controlled with key by a responsible person.

f) The alarm shall be by electronic hooter and siren capable of giving two distinct sounds - one "alarm" the second "evacuate". The number and location of such hooter and siren shall be determined by a qualified fire protection engineer and be designed to be clearly heard above background noise of the operating plant. The cable feeding the alarm system shall be monitored and protected from fire. Cables for fire alarm system will be fire retardant type. However, the cables and components shall comply with the local regulation requirements.

g) Manual alarm shall be given by break glass call points which shall be located beside all exits to the open air, or from the department to a safe route, and at all points of high risk. The glass shall be of the fiber glass reinforced plastic type and of copper free aluminium in hazardous area and a test facility shall be incorporated. The instructions shall be in English.

h) Alarm points in external conditions shall be weather proof and where conditions require this, be explosion proof.

i) In areas of high background noise, flashing or rotating lamps shall be placed alongside hooter /siren to give visual as well as audible warning.

j) The system shall also be capable of:
   - Accepting automatic detection systems.
   - Closing down air conditioning or similar functions.
   - Having repeater mimic panels added to the system.
   - Serial interface between main fire alarm panel and DCS (to be displayed F&G console) shall be provided. Necessary alarms shall be repeated on DCS.

k) The use of taped voice messages in English in conjunction with alarm sounder shall be provided.
SECTION: VI – 5.3.6

DESIGN PHILOSOPHY – HVAC SYSTEM

PLANT: STEAM GENERATION PLANT

PROJECT: INTEGRATED COAL BASED FERTILISER COMPLEX, AT TALCHER, ANGUL DISTRICT, ODISHA (INDIA).

1.0 GENERAL

1.1 Intent:

1.1.1 This Philosophy states that LSTK Contractor’s/ Bidder’s scope of work shall include basic & detailed engineering, procurement, supply, manufacturing, fabrication, inspection & testing, transportation, loading, unloading, insurance, storage, construction, erection/ installation of all HVAC (Heating, Ventilation, Air Conditioning) System / package with auxiliaries viz. chiller units, chilled water pumps, condenser water pumps, cooling towers, air handling units, package/portable AC units, Ventilation system, piping, electrical, instrumentation and civil works, obtaining all necessary statutory approvals from concerned government authorities as applicable, testing, mechanical completion, pre-commissioning, commissioning, performance guarantee test runs including total project management and handing over of complete HVAC System / package for Steam Generation Plant for Talcher Fertilizer Limited at Talcher, Angul District Odisha (India).

1.2 Scope of work:

1.2.1 LSTK Contractor shall provide suitable HVAC system for all process / non-process buildings/ facilities mentioned in the NIT as well as for other buildings/structures also, which are not specifically mentioned in the NIT, however, required in view of plant’s operational needs, shall be in the bidder's scope.

Indicative list wherein HVAC system are required:
1. Control room(s)
2. Sub-station(s)
3. Lab Tech Building(s)
4. Field Maintenance office(s)
5. Operator cabins
6. Lift machine rooms
7. Chemical storage shed
8. Feeder panel rooms
9. Other miscellaneous building, if any.

1.2.2 Type of Air conditioning system and Ventilation system are preferably required as under for various above mentioned buildings / facilities:

1. Control room (s): Central AC system with complete auxiliaries with 100% stand-by chillers & AHUs are required with chemical filters.
2. Substation Buildings: Central AC system with complete auxiliaries with 100% stand-by chillers & AHUs are required with chemical filters.

3. Lab Tech Building(s):
   a) Gas analyzer room, Chemical testing room, inst analysis room, chemical storage room in lab building shall have central AC system/package ACs with 100% stand-by.
      The treated air shall be distributed by ducts from air handling unit to each room and the return air from laboratory rooms shall not be mixed.
   b) Laboratory fume cupboards exhaust by ventilation fans along with standby units. Individual ventilation system with draught chamber shall be provided for laboratory room as necessary.
   c) Office in lab tech buildings shall have portable ACs with stand-by units.

4. Field maintenance offices: shall be air-conditioned through portable ACs with stand-by units.

5. Lift machine room: shall be air-conditioned through portable ACs with stand-by units.

1.2.3 Ventilation system with adequate stand-by equipment to be provided not limited to the following buildings:

- Battery rooms (explosion proof fans with 100% stand-by)
- Maintenance rooms
- Pantry room
- All Toilets
- Plant room
- Clean agent room
- AHU (Air Handling Units) Rooms
- Locker rooms
- Electrical room
- Cable cellar (explosion proof fans with 100% stand-by)
- Store rooms
- Change rooms
- Chemical, Lube oil and Bulk storage shed

Bidder to please refer ISHRAE/ASHRAE guidelines for Industrial Ventilation as prescribed in NIT. However, minimum assumption shall be:

i) 20 ACPH for toilet
ii) 20 ACPH for Battery Room
iii) 10 ACPH for Cable cellar area
iv) Actual ventilation required by Fume cupboards
v) 20 ACPH for plant room

1.2.4 Philosophy for Split AC/Cassette AC/portable AC/package units shall be opted as:

Bidder to note that for centralized AC system 100% redundancy shall be there as per NIT requirement. Moreover, for package AC/Split ACs dedicated for ‘plant equipment’ shall have 1W + 1Standby (100% standby) concept.

Split ACs/Portable ACs dedicated for human habitation/officer’s cabins shall have no redundancy.

1.2.5 Noise level shall be limited to 70 DBA at 1 meter distance from the equipment complying national & state regulation.
1.2.6 Bidder to assure that HVAC system and auxiliaries shall be complete in all aspect complying to national / international / statutory requirement and bidder shall furnish their selection and design calculation of HVAC system w.r.t various buildings/ facilities during detail engg for owner’s review and approval. 
**Bidder to also note that atleast 20% extra Design margin for HVAC to be considered above peak load requirement.**

2.0 CODES AND STANDARDS:

2.1 The *Latest Edition* of codes and standards as listed below shall be followed for design and manufacturing of different machinery / package items.

2.2 Other international standards may also be acceptable subject to their being equivalent
or superior to those listed above, with prior approval of owner.

2.3

For provisions not covered by the above codes and standards, applicable good engineering practices and norms shall govern.

3.0

TECHNICAL REQUIREMENT:

3.1

Duty

3.1.1

HVAC system/package to be designed considering continuous 24 hours operation for all concerned areas. The plant shall be suitable for maintaining inside design conditions all the year round. Notwithstanding the duty specified, all equipment shall be suitable for continuous operation for 8000 hrs. per year.

3.1.2

Heat load calculation of entire area of plant Building/Facilities shall be done by bidder and AC plant shall be selected on the basis of heat load calculation. Bidder has to submit heat load calculation of the various building including different area and bidder to furnish type of HVAC plant with technical details in his offer.

3.1.3

Outside atmospheric condition shall be referred as given elsewhere in process design philosophy of NIT.

Inside condition of various major areas under all weather condition i.e. summer, monsoon and winter shall prevail as under:

<table>
<thead>
<tr>
<th>Area</th>
<th>Required Inside temperature</th>
<th>Required Relative Humidity</th>

</tr>
</tbody>
</table>

Other plant building/facilities shall also be equipped with adequate HVAC system by LSTK contractor.
3.2 Refrigerant:
R-134a / equivalent and Eco-friendly refrigerant to be supplied & filled in the chiller units by LSTK Contractor.

3.3 Chilled units (with Centrifugal Refrigerant Compressor):
The compressor shall be of proven design based on national / international standards unless otherwise mentioned in specification.
Chiller units shall have proven track record of satisfactory operation for a minimum period of 8000 hours for process / power plant industry.
Casing hydraulic/pneumatic test pressure shall be at least 125% respectively of design pressures.
Refrigerant gas/water cooled oil cooler, thermostatically operated electric oil heater, oil pressure regulator, oil filter, shall form part of lubrication system.
Automatic capacity regulation feature is desired on compressor along with manually operated device.
Purge recovery unit, if required, shall be provided to efficiently separate out non-condensable gases and moisture from refrigerant as per Manufacturer's Standard.

3.4 Chiller units (with Screw Refrigerant Compressor- hermetic or semi hermit sealed units):
The compressor shall be of proven design based on national / international standards unless otherwise mentioned in specification and the offered model shall have proven track record of satisfactory operation for a minimum period of 8000 hours for process / power plant industry. The compressor shall be equipped with automatic unloaded starting arrangement. It shall have automatic sliding valve capacity control arrangement actuated through suction pressure sensor.
Compressor unit shall be complete with base frame, control desk with gauges, suction strainer, suction and discharge valves with check valves, drive motor, drive arrangement, motor driven oil pump / rotor shaft driven built-in oil pump.

Reciprocating Chiller Units shall not be acceptable.

3.5 Water cooled Condenser:
The tubes shall not be less than 12.5 mm diameter and shall be adequately supported to prevent tube vibration.
Condensers for rated AC plants shall have water boxes and covers to that each tube sheet can be exposed without disturbing the piping connections.

3.6 Evaporator / liquid cooler:
Tubes shall not be less than 12.5 mm diameter and Tubes shall be adequately supported to prevent tube vibration.
Condensers for rated AC plants shall have water boxes and covers to that each tube sheet can be exposed without disturbing the piping connections.

3.7 Refrigeration Packaging Assembly:
Skid shall be designed so as to provide maintenance accessibility and operation ease of valves and controls. Instruments shall be easily readable.
Lifting hook/eye shall be provided for handling of equipment during maintenance.
Steel structural members of the skid shall conform to IS-2062 / ASTM A 36.
3.8 Air Handling Unit:

Air-handling unit shall be of double skin with insulation in sectionalized construction for convenient transportation and installation. The air handling unit shall comprise of filter section, damper section, heating section (if required), humidifier section (if required), cooling coil section, fan section and drain pan.

Cooling coil shall be minimum 4 rows deep.

Dampers section shall have face and bypass damper. Bypass area shall not be less than 1/4th of the face area.

Filter section shall be provided with Chemical filters, as applicable.

Filters shall be selected for a pressure drop of maximum 4mm WG in clean condition.

Filters (prefilter + fine filter assembly) shall be capable of filtering up to 5-micron dust particles with an efficiency of more than 95%.

Inclined tube manometer with tubing shall be provided on AHU for indication of pressure drop across the filters.

Fan selection will have centrifugal type with electric motor. Fan rotating assembly shall be dynamically balanced. Flame resistant flexible bellow connection with metallic flanges shall be provided between fan outlet and duct.

Taper lock pulleys shall be provided with wedge type belts for drive. However, Direct coupled Fan with motor with flexible coupling shall be more preferred.

Grease cups shall be provided for fan bearings.

Drain pans for condensate shall be of stainless steel (18/8 grade) construction and thermally insulated. Water seal shall be provided in the drain outlet.

Ribbed neoprene rubber pads shall be provided as vibration isolators for the Air handling unit.

3.9 Chemical Filters:

Chemical filters shall be designed & selected by bidder for the indoor condition for Control room(s) and Sub-station(s) considering the worst surrounding atmosphere of plant.

Chemical filter shall be selected for the chemical media life of minimum 2 years.

Outside gas concentration shall be considered while evaluating the life. Chemical filter’s nomographs etc to be submitted by LSTK Contractor in support of the chemical media life.

Chemical air filter unit shall be skid mounted cubicle for horizontal installation.

Three stage chemical filter shall be provided.

Chemical filter shall have adequate provision for easy removal & servicing of filter packs. Bidder to provide differential pressure indication across filters and velocity across the filter shall be in range of 100-110 FPM.

3.10 Heating Unit:

Heating shall be preheating and / or Reheating as per psychometric Process requirement.

Heating shall be with electrical heaters.

Electric strip heaters, if provided, shall be complete with heating thermostats/humidistat, safety thermostats and contractors.
3.11 Humidifier Unit:
Humidifier shall be steam pan type or water spray type.
Pan humidifier shall be complete with immersion type electric heaters actuated by humidistat, water float valve, stop valve in water make up line, level switch interlocked with heaters. Pan/ storage shall be fabricated with 18/8 grade stainless steel. The outer surface shall be thermally insulated.
Water spray type humidifier shall comprise of spray header, nozzles, arms, pump sets, humidistat, solenoid valve etc. Make up tank, water collecting trough complete with drain, quick fill, overflow, strainer make up connection with ball and float valve and isolating valves shall be provided.
Drain pan/water collecting trough of water spray humidifier shall be of stainless steel construction and thermally insulated.
The humidifier shall be sized to deliver 110% of capacity required.

3.12 Cooling Tower:
Cooling tower shall be natural or induced draft type in FRP construction. Cooling tower fan shall be of FRP blades directly mounted on the shaft of totally enclosed weather-proof (IP-55) motor with suitable weather proof canopy hood. The fan shall be protected by guard. The fan assembly shall be dynamically balanced.
Service ladder shall be provided for the cooling tower.
Water basin shall be made of F.R.P. and provided with suction strainer.
The cooling towers shall be provided with drift eliminator.
Supporting framework for the cooling tower shall be made of galvanized steel and further lined with FRP.
Cooling tower structure shall be designed to withstand wind load as specific, per IS-875.
Local lockable push button station in weather-proof enclosure with a canopy cover shall be provided.

3.13 Water Pumps:
Pumps shall preferably be back pullout type with mechanical seals.
Pumps shall be designed and selected by considering overall requirement of the AC plant, condenser water circuit and chilled water circuit, NPSH, pressure & temperature of the liquid etc and shall be provided with mechanical seal.
The pumps shall be complete with drive motor, coupling with non-sparking guard, common base plate, fixing and hold down bolts.
Bidder to note that nos. of chilled water pump & condenser water pump sets shall be selected as the numbers of chiller units plus one set of chilled water & condenser water pumps shall be operated as in standby mode. However, chilled water pumps and condenser water pumps shall have their respective common headers at inlet/outlet to ensure availability and interchangeability of pumps in all condition.

3.14 If not specifically mentioned, all continuous operating machine shall have 100% standby.
3.15 Refrigerant Piping:
All piping network shall be leak tested with nitrogen at 1.25 times of design pressure using soap water solution followed by electronic / halide torch leak detection. The piping network shall be further pressure tested with nitrogen at 1.25 times of design pressure for minimum 24 hours. After establishing the capability to withstand test pressure, the piping network shall be dried and vacuumized to 2.5mm Hg absolute. Vacuum shall be broken with dry nitrogen and the system shall be revacuumised to 2.5 mm Hg absolute. This vacuum shall be held for 12 hours before charging the refrigerant.

3.16 Water Piping:
All water piping shall be of Carbon steel and all chilled water and condenser water piping shall be complete with, flanges, fittings, valves, strainers, gasket & fasteners, hanger/supports etc.

3.17 Fire Dampers:
Fire dampers shall be installed in supply air and return air path. These shall conform to UL555 for 1.5 hour fire rating. The fire dampers shall be spring return, motorized & fail safe type with indication for open and Close position. Fire damper operation shall be interlocked (through HVAC Panel) with the Signal from purchaser's fire and gas panel.

3.18 HVAC system interlocks with plant Fire and Gas system:
Unless otherwise specified, all the HVAC system of project will be interlocked with plant Fire and GAS system as follows complying to statutory requirement:
Fire alarm signal from fire and gas system to HVAC control Panel: Whole HVAC system shall shutdown.

3.19 Equipment Automatic Change over requirement:
Change –over from duty to stand-by equipment, in case of failure of the duty unit, shall be fully automatic. Automatic Change over shall be provided to switch, on weekly basis, the duty and stand-by equipment, in order to ensure an even number of running hours for each units.

3.20 Expansion Tank (for Chilled Water System only):
Expansion tank shall be provided by vendor and installed at-least 1 m above the highest point of the system. Tank shall be of minimum 500 liter capacity (unless otherwise required because of System design requirement) fabricated from 18/8 grade stainless steel min 3 mm thick with all requisite stiffeners. The tank shall be complete with float valve assembly backed up with Gate valve for make up, quick fill gate valve, drain with valve and overflow. Tank shall have rigid supporting arrangement. All piping and instrumentation shall be in scope of contractor only.
3.21 Portable AC/ Split AC/ Package AC shall be used wherever required with optimization of energy consumption. Minimum 3 star BEE-Star rating to be used for the same. Window AC shall be avoided. Adequate stand-by units are to be provided as per this specification.

3.22 **Plant Room Ventilation:**

A.C. Plant room shall be forced ventilated by wall mounted exhaust fan(s) complete with electric motor, louver shutter and 18/8 grade stainless steel wire protection guard on intake side of exhaust fans. The capacity shall be decided based on 20 air changes per hour. Air intake weather protection louvers along-with bird protection screen shall be provided with suitable structural steel frame in wall.

3.23 **Air Distribution, Ducting, Diffusers /Grilles:**

Ducts shall be designed, fabricated and flanged as per IS-655 for static pressure up to 65 mmWG. In case, static pressure is more than 65 mmWG, SMACNA code shall be followed for design and fabrication of duct. Duct hangers shall be supported with anchor fasteners in the roof. Anchor fasteners shall be provided by vendor. All flange joints shall have minimum 6 mm thick Neoprene packing as gasket stuck to the flanges with adhesive (viz., resins like araldite or equivalent). All the duct shall be made air tight with the help of sealant.

Ductwork shall be provided with following accessories.
- Turning Guide Vanes.
- Extractor with operating lever.
- Splitter Damper with control rod & locking device.
- Volume control Damper (opposed bladed type with 16 gauge with ~ 250 mm wide blades and 14 gauge casing of Galvanized Sheet Steel).
- Fire resistant flexible connection between duct chute and diffuser (if required).
- Access doors for heaters, fire dampers and filters.

Supply air diffusers or grilles, as required, shall be provided and shall be fitted with sponge foam tape. Volume control damper shall be provided with each supply air diffuser/grille. Volume control damper shall be key operated from the front of diffuser/grille. Supply air grilles shall be provided with vertical & horizontal adjustable louver

All return air diffusers/grilles, if required, shall be without volume control damper. Diffusers/grilles shall be of powder coated steel construction with angle frame. Diffusers/grilles shall not be supported from False Ceiling. All ducting shall be designed and laid out as per requirement of various area of CCR Building so that an efficient layout may be done. LSTK Contractor to submit a complete P&ID,GA of entire AC plant and duct layout proposed/ envisaged by LSTK Contractor for Owner’s review and approval.

3.24 **Insulation:**

Surfaces to be insulated shall be thoroughly cleaned and allowed to dry. Pneumatic/hydraulic test, if any, shall be carried out before insulation. Insulation material shall be high class fire resistant material and ‘Non Combustible’.
a) **Hot Insulation:**
Bare surfaces of pipe/equipment shall be provided with one coat of 20 micron min. (dry film thickness) heat resistant primer up to 125°C operating temperature. Resin bonded mineral wool conforming to IS-8183 shall be used for hot insulation. Preformed pipe sections/mattresses of min. density 120 kg/m³ shall be used. Hot insulation shall be cladded with 24 SWG aluminium sheeting.

b) **Cold Insulation:**
The pipes and duct shall be insulated and finished as per this specification. Sound Attenuators shall be installed in ducts, as required.

For all inspection covers and hatches on equipment, pump casing, valve bodies & flanges more than 100 mm dia, the insulation shall be applied so as to facilitate removal without its damage. This shall be achieved by encasing the insulation in 24 gauge aluminium sheet metal sections, which are screwed together around the equipments to permit easy removal and replacement maintaining continuity of vapour seal.

The insulation materials shall be:
- i) Resin bonded fiber-glass of 24 kg/m³ density to IS: 8183.
- ii) Poly isocynurette of 32 kg/m³ density to IS: 12436.
- iii) Phenolic Foam of 32 kg/m³ density to IS: 13204.
- iv) Polyurethane Foam of 32 kg/m³ density to IS-I2436.

The application, insulation material and recommended thickness are given in Appendix of this tech specification.

c) **Underdeck insulation:**
Phenolic foam underdeck insulation shall be of rigid slab of 25 mm thickness and approx. 1000 mm x 500 mm size and shall conform to IS:13204. It shall have density of 32 kg/m³ and K value of 0.0034 w/mk at 53 deg. Mean temperature. The insulation shall be classified as ‘Non Combustible’ as per BS 476. It shall be pre-laminated on both sides with kraft paper.
Entire surface of slab and beams shall be thoroughly cleaned. Bituminous primer or zinc chromate primer shall be applied evenly @ 0.5 kg/m² over the entire surface. Hot bitumen or CPRX adhesive shall then be applied on the insulation panel @1.5 Kg/ m². The panels shall be pressed in position and further secured by dash fasteners.
Underdeck insulation shall be fixed only after all fixtures like hooks, clamps, cleats etc for light fixtures, ducts etc. have been fixed in the ceiling.
3.25 Controls And Instrumentation:

Vendor shall include all controls & instruments as required for safety & operational requirements of the plant.

Automatic operation of all controls wherever feasible is required, with manual overdrive for maintenance etc.

All control shall be suitably interlocked for safe & sequential operation of plant generally in the following order:

a) Start AHU blower.
b) Start Cooling tower fan.
c) Start Condenser water flow/condenser fan.
d) Start Chilled water pump.
e) Start Refrigeration unit/compressor.

While shutting down the plant, equipment will stop in the reverse order as listed above.

Humidifier heaters shall be actuated by humidistat.

Potential free contact shall be provided by vendor for closing motorised fire dampers and simultaneously tripping the AHU blower motor on receiving the fire signal from purchaser's Fire & Gas Panel. On expiry of fire signal, fire dampers shall open manually through reset button.

A) Requirements for Centrifugal compressor / chiller package:

The control panel shall be machine mounted In cubicle construction per manufacturer's standard design and shall have protection against following situation as a minimum.

i) High condenser pressure.
ii) Low oil pressure.
iii) High bearing temperature switch for compressor.
iv) Low evaporator pressure.
v) Low chilled water flow.
vi) Low condenser cooling water flow
vii) Overload protection for all motors.
viii) Low chilled water temperature.
ix) Excessive vibration switch.
x) Purge pump high discharge pressure.
xi) High lube oil temperature to cut off heater supply.
xii) Anti freeze.
xiii) High Compressor discharge temperature.
xiv) Oil Filter differential pressure.
xv) To ensure opening of inlet guide vanes after compressor motor has stabilized.
xvi) Motor current limiter.
xvii) To ensure close guide vanes at start-up.
xviii) Low water level in humidifier tank.
xx) Air heater change over switch.
xx) Air flow switch.
B) **Requirements for Screw compressor/ chiller package:**

Local Control desk with gauges shall be machine mounted in cubicle construction provided with:

i) Suction & discharge pressure gauges.

ii) Suction & discharge pressure switches.

The control panel shall be either machine mounted or floor mounted in cubicle construction as per manufacturer's standard design and shall have protection against following situations as a minimum:-

i) Low oil pressure.

ii) High bearing temperature switch for compressor motor.

iii) Low oil temperature.

iv) Low chilled water flow.

v) Low condenser cooling water flow.

vi) Overload protection for all motors.

vii) Low chilled water temperature.

viii) High lube oil temperature to cut off heater supply.

ix) Anti freeze.

x) High Compressor discharge temperature.

xi) Oil Filter differential pressure.

xii) Motor current limiter.

xiii) To ensure minimum position of slide valve at start-up.

xiv) Low water level in humidifier tank.

xv) Air heater change over switch

The control panel shall be fully wired and factory tested before dispatch. The Control panel shall contain at-least the following control for the automatic operation of chilling unit.

i) Compressor capacity control device.

ii) Start/stop push button station for the machine.

iii) Automatic temperature controller for oil temperature and Chilled water temperature controller shall be of PID type.

iv) Start/stop push button station for chilled water pump set.

v) Operation indicating pilot lamps.

vi) Vane opening indicator calibrated in percent (for centrifugal package).

vii) Pressure Gauges for purge unit (for centrifugal package).

The entire control panel shall be factory wired and factory tested before dispatch.

All controls such as fire damper motors, face and bypass damper motors, modulating type thermostat; high/low pressure switches, oil pressure switches, controls for actuating capacity control solenoid valves, thermostatic expansion valves, pilot solenoid valves flow/pressure switches, heater, heating thermostats, humidistat, and all necessary instruments for automatic, regulated and safe operation of the plant shall be included in the scope of supply and installation. All controls shall be suitably interlocked to operate the equipment in their proper sequence.
Flow meters in chilled water and, condenser water lines signal to control panel, temperature and Pressure Gauges in inlet and outlet of cooling water and chilled water shall be provided locally.

All electric motor driven equipments shall be provided with local Start/Stop Pushbutton stations for operational and statutory requirements. Stop push button shall be lockable type.

Vendor shall provide thermowells in- refrigerant circuit so as to enable to take readings for temperature of refrigerant at various places of the circuit during performance testing. Exact locations shall however, be finalised by Owner and vendor mutually during drawing approval stage.

Calibration of all instruments shall be done by Vendor. Pressure gauges shall be provided with bleed and block valves.
3.26 Audio-visual Annunciation Section:

It shall consist of facia type Annunciators having translucent plastic window of 35 mm x 50 mm (min.) size engraved with appropriate function in block letters for each ‘alarm trip point. Annunciators shall be suitable for operation on 24V D.C. and shall have a single alarm buzzer common to all points. Three push buttons ‘for audible alarm acknowledge, reset and test with appropriate name plates shall be provided common to all alarm points. Annunciators shall be solid state type of, reputed make. Annunciators shall operate satisfactorily between 80 and 110% of rated supply voltage.

Annunciators shall be provided for all faults covering at least the followings:-

a) Low oil pressure.
b) Low chilled water flow.
c) Low condenser cooling water flow.
d) Low chilled water temperature
e) Low evaporator pressure.
f) High condenser pressure.
g) Compressor motor overload.
h) Low water level in humidifier tank.
i) Chilled water pump motor over load.
j) Condenser cooling water pump, motor over load,
k) Air handling unit motors overload.
l) Cooling tower fan motors overload.
m) Treated water plump motors overload (in case ~water softening plant is furnished).
n) Crankcase heater / heaters.
o) Open/close position of fire/smoke dampers.
p) Fresh Air fan status.
q) Any other as necessary.

In the event of a fault, the particular window shall glow and the window will remain lighted till the fault is rectified. Minimum 20% spare windows shall be provided on annunciator.

3.27 Motor / Driver rating :

Electrical drivers (Motors) shall have power ratings at least equal to following percentage of rated absorbed power for all equipments :

<table>
<thead>
<tr>
<th>Absorbed power ( in kW )</th>
<th>Motor rating percentage of</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt; 22</td>
<td>125</td>
</tr>
<tr>
<td>22 - 55</td>
<td>115</td>
</tr>
<tr>
<td>&gt; 55</td>
<td>110</td>
</tr>
</tbody>
</table>

4.0 INSPECTION AND TESTING
Equipment shall be subjected to expediting, inspection and testing at vendor's/sub-vendor's Works by Third Party Inspection agency (TPI) as per NIT COMMERCIAL PART. Vendor shall submit Quality Assurance (QA) plan before commencement of fabrication. Approved QA plan by owner shall form the basis for equipment inspection. **TPI Cost shall be in vendor’s scope.**

For Inspection and Testing at Site, vendor shall comply with the following procedures:

I. All electrical items will be subjected to inspection at any stage. Routine electrical test as per relevant codes. Inspection of Manufacturer's test certificates.

II. Inspection of raw materials to be used for fabrication and assembly and inspection of manufacturer's test certificates.

III. Inspection of welding including welder's qualification as desired by inspection engineer. Inspection of fabricated items.

IV. Pressure testing of pipe fit ups for refrigerant and water services.

V. Pressure testing, leak testing of complete piping network for chilled water/brine, condenser water & refrigerant services.

VI. Vacuumising & gas/oil charging for refrigeration system.

VII. Checking of electrical circuits (Power and control) and checking functioning of controls of refrigerant system and other circuits of air conditioning plant.

VIII. Checking of assemblies for MCC, control panel, local panel (dimensional & functional), annunciation panel etc.

IX. Checking of calibration of controls and instrumentation.

X. Inspection of complete electrical installation at site and clearance from local authorities.

XI. Installation of main equipments like compressor, condenser, chiller, evaporator, AHU etc.

XII. Mechanical run test of AHU.

**NOTE:**

Inspection & testing procedure mentioned above is for general guidance & information of vendor and inspection by purchaser/consultant is not limited to these. Inspection engineer of Purchaser/consultant will have full right to have detailed inspection of vendor shop/works. Co-ordination of inspection agency / purchaser/consultant with his factory/erection site will be sole responsibility of successful LSTK Contractor after placement of order for complete air conditioning plant covered under these specifications.

However, such inspection by Ownerside, shall in no way absolve the vendor of his responsibility.
5.0 PERFORMANCE TESTING AND GUARANTEES:

Performance Testing

Vendor shall give two seasonal tests for (i) summer or monsoon (More stringent of the two) & (ii) winter to determine the equipment capacity and performance of the system in accordance with applicable Standards and as agreed with owner. For chilling package, performance test at site shall be as per ARI Standard based on the available load and cooling water temperature/ambient conditions. Period of each test shall be at least 48 hours or as agreed by Owner and time for each test will be fixed up mutually with the purchaser and/or his authorised representative.

The vendor shall operate, test and adjust all equipment and balance the system.

Following test readings shall be recorded during the performance testing:

<table>
<thead>
<tr>
<th>Test Readings</th>

</table>
Flow rate (m³/hr.)
Discharge pressure (kg/cm² g)
Suction pressure (kg/cm² g)
Operating speed (rpm)

5. Air handling unit

Refrigerant liquid temperature at inlet to coil
Air temperature - entering (D.B) (°C)
Air temperature - entering (W.B) (°C)
Air temperature - leaving (D.B) (°C)
Air temperature - leaving (W.B) (°C)

In case of chilled water coils:
Water pressure - entering coil (kg/cm² g)
Water pressure - leaving coil (kg/cm² g)
Water Temperature - entering coil (°C)
Water Temperature - leaving coil (°C)

Velocity of air in various sections of air handling unit.

6. Electric motor

Starting current/ No load current (A)
Motor terminal current (A)
Power factor
Supply voltage (volts)
Kwh for Compressor motors

7. Supply Air Grilles / Diffusers

Air flow rate (m³/hr.)
Air temperature (D.B) (°C)
Air temperature (W.B) (°C)

8. Room conditions

D.B. & W.B., temperature, RH at different points

9. Air handling unit blower

Speed, static/total pressure, outlet velocity and air flow.

Vendor shall bring all required testing instruments at site duly calibrated. Plant shall be formally taken over by owner after witnessing the seasonal performance tests successfully as per terms & condition prescribed in NIT.
Guarantee for Supply and Workmanship (Defect Liability):
LSTK Contractor shall provide guarantee against workmanship, standard performance parameters and materials of their supply as per provision available in NIT. Guarantee shall be provided by LSTK Contractor for their supplied materials/equipments and workmanship. In this period, if contractor's supplied item(s) fails during operation or not meeting standard performance parameters, then LSTK Contractor shall have to replace with new parts/equipments without any additional cost to owner.

6.0 PROTECTION AND PAINTING:

All exposed carbon steel parts to be painted. Non-ferrous materials, austenitic stainless steels, plastic or plastic coated materials, insulated surfaces of equipment and pre-painted items need no painting.
Stainless steel surfaces, both inside and outside, shall be pickled and passivated.
Machined and bearing surfaces shall be protected with varnish.
Painting Specification shall be as per manufacturer standards.
The color of finish coat may be intimated to vendor, after placement of order.

7.0 PACKAGING AND IDENTIFICATION:

All packaging shall be done in such a manner as to reduce the volume. The equipment shall be dismantled into major components, suitable for shipment and shall be properly packed. To provide adequate protection during shipment. All assemblies shall be properly match marked for site erection.
Attachments, spare parts of the equipment and small items shall be packed separately in wooden-cases. Each item shall be appropriately tagged with identification of main equipment, item denomination and reference number of the respective assembly drawing.
Detailed packing list in water-proof envelope shall be inserted in the package together with equipment.
Each equipment shall have an identification plate (made of SS material) giving salient equipment data, make, year of manufacture, equipment number, name of manufacturer etc

8.0 SPARE PARTS REQUIREMENT:

All erection, pre-commissioning & commissioning spares including spares consumed during testing / PGTR till handing over the plant to owner shall be supplied by LSTK Contractor free of cost. Any unused commissioning spares shall be owner’s property.
Mandatory spares shall be supplied by the LSTK contractor as per NIT.
LSTK Contractor to also furnish separate recommended list of 2 years operation & maintenance spare part list along with budgetary offers, valid for 2 years from the date of submission of offer for owner’s consideration.
Recommended spares and their quantities should take into account related factors of equipment reliability, effect of equipment downtime upon production or safety, cost of parts and availability of vendor's service facilities around the proposed location of equipment.
Detail List of special tools & tackles shall be furnished by the LSTK bidder along with the bid and shall be in scope of supply of the LSTK contractor.

9.0 SPECIAL TOOLS & TACKLES:

Vendor shall provide one set of special tools & tackles as a minimum for operation & maintenance along-with HVAC plant.

10.0 TECHNICAL DOCUMENT REQUIREMENTS

Bidder shall furnish design calculations, Heat Load Calculations for all three seasons (Summer, Monsoon & Winter) with Psychrometric plots specifying the design TR capacity, dehumidified air quantity and Monsoon & Winter heating capacity. Any other data over & above that furnished by Owner shall be referred from Handbook of ASHRAE and Climatological Data Book.

Bidder has to submit all Equipment list with power consumption, GA, Plant layout, Cross sectional drg, technical Drawings of all equipment, Data Sheets, specifications, catalogues, O&M Manual, QAP/ITP, pamphlets and other documents of all equipments in AC plant with their installation and operation & trouble shooting manuals. Bidder has to provide training to purchaser’s engineers / operation team for the operation and maintenance of the entire plant as mutually agreed with Owner.

11.0 ENGINEERING RESPONSIBILITY OF THE SYSTEM:

The responsibility of complete system design, manufacturing, erection, working and safety will solely be responsibility of the LSTK Contractor for the parameters as mentioned in the tender document and this philosophy. The system after commissioning shall be offered to owner for PGTR with mutually agreed period/ duration. Thereafter, Owner will monitor the performance for standard designed parameters for the period agreed with owner. In case, during this period, performance is not found satisfactory and rectification / replacement, design improvement or any other change as felt necessary, will be made by the LSTK Contractor at no extra cost. Though, these improvements can only be done after getting the approval from the owner.

Contractor shall provide supervision services from OEM (original equipment manufacturer) during erection, commissioning and PGTR of the system.

1.0 GENERAL

This document covers minimum requirements for design, engineering, manufacture & assembly, inspection, erection, testing, commissioning and performance testing of coal fired PF/CFBC steam generators and auxiliaries (with 2W+1S configuration) including FGD/SCR/SNCR (as required) to meet statutory requirements to well established engineering practices, safety codes and other relevant codes and standards for the Steam Generation Plant for TFL Fertilizer Complex at Talcher, Angul, Odisha.

The overall design, layout and disposition of equipment, system set shall provide a clean layout arrangement with adequate access/space for O&M and safety considerations.

Items though not specifically mentioned but needed to complete the equipment and systems to meet the intent of specification, shall be deemed to be included in the scope of work of Contractor. The scope of supply and services for each steam generating unit shall necessarily include all items and will not be limited to this specification only.

2.0 SCOPE

2.1 The complete design, material of construction/fabrication (shop/site as applicable), inspection, testing, painting, supply, transportation etc. at project site for Steam Generators shall be in scope of LSTK Contractor. All materials shall conform to the specifications, drawings and internationally accepted codes / standards duly accepted by the Owner. In addition, all statutory rules & regulations shall also be complied with.

2.2 LSTK Contractor shall consider the interfaces with other engineering disciplines w.r.t.

- Piping Layout/Location Drawings
- Civil / Structural Drawings
- P & ID's
- Materials
- 3D PDS/PDMS Model for Piping and Equipment Layout
- Hazardous Area Classification

2.3 Design philosophy of other disciplines mentioned below shall be observed and shall be relevant to the extent applicable.

- Civil/Structural Design Criteria
- Piping Design Criteria
- Process Design Criteria
- Electrical and Instrumentation Design Criteria
- Material Handling Design Criteria

2.4 Each steam generator shall consist of:

2.4.1 Boiler drum/s with all internals and fittings.

2.4.2 Complete water cooled welded water wall system, evaporation system, with all associated piping, headers etc.
2.4.3 Complete circulation systems, including all connecting piping, headers, suspension/supports etc.

2.4.4 Complete superheater system including superheater coils, all headers and connecting pipes etc.

2.4.5 De-superheater systems complete, including spray control stations, as required.

2.4.6 Economizer system, including all headers and connecting pipes, casing, supports etc.

2.4.7 Complete boiler integral piping’s, valves and fittings, drains vents, safety valve exhaust piping, startup vent with silencer, blow down systems (both IBD & CBD) sampling systems etc; Pressure reducing stations and piping, for soot blowers. Piping upto turbine ESV inlet and associated instruments.

2.4.8 Tubular air-heater system completes, including casing, structural steel supports etc.

2.4.9 Spray water piping and tapping point upto de-superheater.

2.4.10 Fuel bunkers including complete, platforms, bunker top cover flooring materials, bunker inside lining material, isolating gates etc. complete. Necessary poking holes including level sensor, Load cell for weight measurement, vibro-system in hoppers.

2.4.11 Fuel down take chute system connecting bunker outlet isolating gate to Feeders, and from feeders to the fluid bed as applicable with all auxiliaries.

2.4.12 One sand silo/bunker system for boiler, including support steel, rotary air lock feeder for flow control, discharge piping system to combustor.

2.4.13 One Limestone silo/bunker system for boiler, If required, including support steel, rotary air lock feeder for flow control, discharge piping system to combustor.

2.4.14 Fluidized bed combustor unit (if required) proper including all related fuel feed systems, windbox, air distribution and control systems, water cooled floor distribution panels and nozzles (all as applicable), thermal expansion systems, ash removal/drainage systems, along with required supporting steel etc.

2.4.15 Complete and required number of ash coolers with related valves/gates, piping and control system for automatic operation.

2.4.16 Complete system of buck stays and tie bars for the boiler.

2.4.17 Structural steel, platforms, stairway set for the main boilers, auxiliaries, bunkers and fuel feed system ducting, piping and other systems complete.

2.4.18 Complete roof and side cladding along with structures for protection against rain and other climatic conditions for operating floors, drum floors and other floor levels including gutter and rain water down pipes.

2.4.19 Complete foundation bolts, anchor channels, sleeves, packer plates, soleplates and any other associated material for all supports and equipment.

2.4.20 All supports, suspension system etc for all pressure part systems, components etc; Non pressure parts, auxiliaries, piping etc all within the terminal points specified.
2.4.21 Common base plates, soleplates, frame foundation material complete for all driven and drive equipment, systems.

2.4.22 Support structures covering materials and supports for all fans and drives; as well as other critical equipment/system.

2.4.23 All miscellaneous structural steel required, including handling arrangements for all heavy equipment for maintenance (including all fan impellers, drive motors etc).

2.4.24 Draft system (for each boiler unit) comprising:

2.4.24.1 2x60% Primary air fan, control mechanism and suction hood and silencer.
2.4.24.2 2x60% Secondary air fan, control mechanism and suction hood and silencer.
2.4.24.3 2x60% Induced draft fans, control mechanism.
2.4.24.4 2X100% capacity sealpot blowers (1W+1S)

2.4.25 Complete air ducting, gas ducting upto ESP inlet, ESP outlet to ID fans, ID fans to stack all with required dampers and actuators, expansion joints, steelwork, supports, hoppers, thermal insulation with cladding etc.

2.4.26 Outer casing for the main boiler shall be of suitable material as per OEM recommendation.

2.4.27 Complete requirements of refractory (Normal and special grade for all high temperature locations/equipment system and with special fixing materials etc. complete), lining and insulation material; fixing material for all equipment and systems.

2.4.28 Boiler mountings including access doors/ inspection doors peep holes.

2.4.29 Access platforms and convenient operating gears for manually operated dampers, valves etc.

2.4.30 Bidder to note that Indian Coal shall be used as fuel source, hence worst coal firing shall considered for providing soot Blowers(if required).

2.4.31 Complete piping, valves and fittings as required.

2.4.32 Intermittent blow down tank and continuous blow down tank with complete piping system including drain headers, drain, vent piping and controls.

2.4.33 All required piping, valves, fittings, controls, instruments, supports, steel works, suspension systems, insulation and outer casing etc. for the various equipment/ systems within the terminal points specified.

2.4.34 Chimney steel wall frame unit complete including embedments and fasteners for connecting flue gas duct.

2.4.35 Commissioning spares.

2.4.36 Mandatory /Insurance spares and Special maintenance tools and tackles.

2.4.37 Two (2) years O&M spares:

- LSTK contractor shall submit/provide recommended 2 years O&M spares (other than Mandatory spares) list with budgetary offers valid for 2 years from the date of submission of offer for Owners consideration.
• Supply of Mandatory Spares/Insurance spares- to be included in the scope

2.4.38 First fill of lubricants & chemicals:
First fill of oil, lubricants, chemicals and all consumables during Pre-Commissioning, Commissioning, Sustained Load Test Run and Guarantee Test Run (GTR) till handing over to Owner.

2.4.39 Paints and painting of all components at shop, before dispatch and at site on completion of erection.

2.4.40 Boiler pressure parts alkali boil out cleaning system at site including all required materials, chemicals etc.

2.4.41 Chemical dosing systems

2.4.42 N2 blanketing system for Boiler preservation with manifold to be installed and terminated in one terminal point at ground level near Boiler area. The Nitrogen blanketing equipment including adequate number nitrogen cylinders shall be in Bidder’s scope.

2.4.43 To avoid flow problems in Limestone Bunker, necessary system such as Hammer/air cannon/Proven methodology shall be considered.

2.4.44 Any other Special Equipment and System required for the PF/CFBC boiler system proposed by bidder.

3.0 CODES AND STANDARDS

3.1 All equipment, systems and work covered under this specification shall comply with all latest statutes, regulations and safety codes, as applicable in the location where the equipment will be installed.

3.2 All the parts of the steam generator including pressure parts, vessels, piping, valves including safety valves and fittings shall meet or exceed all the requirements of latest editions of Indian Boiler Regulations (IBR).

3.3 Any other standards acceptable to IBR can also be considered, provided the requirements of those standards are equivalent or exceed the IBR requirements.

3.4 Wherever the specification stipulates requirements in addition to those specified in IBR, the same shall also be complied by the Contractor.

3.5 In cases where IBR does not govern, other international standards established to be equivalent or superior to the codes and standards specified, are also acceptable. However, in the event of any conflict between the requirements of the equivalent Codes and standards, and the requirements of the Indian standards/ regulations, the latter shall govern, unless, specified otherwise in the specification.

3.6 It shall be responsibility of the Contractor to obtain the necessary approvals of Inspection Authority/ Chief Inspector of Boilers on behalf of the Owner, as may be required for designing and design calculations, manufacturing and erection procedure, Testing etc. as called for under the IBR. It includes Registration of boiler erection and inspection fees to be paid, obtaining certificates to use the boiler, steam testing and obtaining Register no including Co-ordination with Boiler inspector ate, arrangement of visit to site by Director of Boiler ,Deputy Director of boiler, etc,. All such documentation submitted to statutory authorities shall also be submitted to the Owner for his review. It shall also be the...
responsibility of the Contractor to furnish the requisite documentation as required by the Owner for getting the Steam Generator registered under IBR.

3.7 Codes/Standards for integral piping and valve shall be ANSI B16.34 and ANSI B16.25 (valves), ANSI B31.1 (for piping) and ANSI B16.5 (flanges), ASTM-A-335, ASTM-A-106, SA210 and SA213 (High Pressure/ temperature piping and tubing). Wherever definite design stipulations are not available in the IBR, the ASME Section- I and IBR (for Steam Generator Integral Piping) shall be referred.

3.8 The steel structures and foundations shall be designed for earthquake conditions as per IS-1893 and wind loads as specified in IS-875.

3.9 Boiler efficiency shall be calculated based on ASME PTC-4.0 (Energy Balance method).

3.10 The work falling under the purview of Indian Boiler Regulations (IBR) shall completely meet or exceed all the requirements of the latest edition of IBR. Any other standard acceptable to IBR can also be considered, provided the requirements of that standard are equivalent or exceed IBR requirement.

3.11 Order of Precedence of Documents

In case of any conflict between standards, codes and specifications, the stringent of all shall be followed.

Where conflict occurs, the order of precedence shall be as below:
Local Statutory Regulations like IBR etc.;
This specification;
OEM’s drawings & specifications;
Other Technical Specifications or Design Specifications or Technical Standards enclosed, if any.

3.12 Regulations

All items of equipment shall comply with the latest Indian Boiler Regulations and stipulations of Inspectorate of Factories, Chief Electrical Inspectorate and other statutory bodies as per the requirement. Wherever required, the LSTK Contractor has to obtain the necessary approvals from statutory authorities and other concerned agencies. All cost, on these accounts shall be borne by the LSTK Contractor. Static and Mobile Pressure Vessel (SMPV) rules as applicable shall also be complied with.

3.13 Site Conditions

3.13.1 Climatic and other site conditions as defined elsewhere in ITB.

3.14 Design of equipment inside the Steam Generation plant complex shall be in accordance with the OEM’s data sheets and specifications.

4.0 SAFETY

4.1 Safety standards and features which are inherent in the specific mechanical equipment design codes, standards and regulations are applicable to this criterion. Job Hazard and Operability [HAZOP] as per OHSAS-18001 & Indian Factory Act shall be done during design stage the equipment.
4.2 Safety features to be incorporated into the design include, but are not limited to, the following features for equipment:

- Ladder cages
- Safety chain across platform access
- Step-off platforms with Hand Railing, where necessary
- Platform grating with adequate thickness
- Toe plates

5.0 EQUIPMENT FABRICATION

5.1 Headers shall be manufactured by seamless process. Headers shall be provided with access arrangements to allow full internal visual inspection and cleaning.

5.2 Membrane panel construction shall be either made by a fusion-welded fin or of integral fin type. Resistance welded fin construction will not be allowed unless appropriate satisfactory reference experience can be demonstrated.

5.3 Tests for the qualification/approval of welding procedures and welders shall be carried out as per the Indian Boiler Regulation/applicable ASME code. Where no standard is specified, an internationally recognized standard shall be used subject to the Owner/PMC approval.

5.4 Permanent backing rings shall not be used.

5.5 Oxy-acetylene welding shall not be used.

5.6 Equipment design shall be based on maximizing shop fabrication and assembly where deemed practical. Fabrication shall not begin until the Contractor has received written approval for the drawings/documents from Owner.

5.7 The LSTK Contractor shall comply in all respects with the provision of the applicable codes / standards and specification during fabrication.

5.8 Impact test, when required as per code and specifications, shall be carried out on parent metal, weld etc.

5.9 Production Control coupons, when required as per code and specifications, shall be subjected to all tests like impact test etc., in addition to mechanical test as required. In case of heat treated equipment test coupons shall be given similar heat treatment as for the equipment.

5.10 Due provisions must be kept for venting out entrapped gases during welding of pads, flanges and liner plates etc.

5.11 In case of equipment involving site assembly/fabrication the entire site job including loading & unloading at site, fabrication, radiography, heat treatment, Inspection & testing etc. shall be included in the scope of supply.

5.12 Flange facing and thread connection shall be protected against oxidation during heat treatment.
5.13 Nozzles and manholes shall be joined to the shell and to their reinforcements with full penetration welds. All nozzles shall be set-in type, unless otherwise specifically accepted.

6.0 MATERIAL OF CONSTRUCTION

6.1 In selecting material of construction of various equipment, the contractor shall pay particular attention to the atmospheric conditions existing at the site and the nature of material/fluid handled. Moreover materials offered shall be consistent with the proven units under specified service conditions. All materials shall be new and shall be of quality most suited to the proposed application.

All parts, which could deteriorate or corrode under the influence of site/working conditions, shall be suitably and effectively protected to minimize such effects. In as far as possible, materials shall be in accordance with national or international standard specifications and shall be used in accordance with national or international codes of practice. Where such standards or codes of practice are not available, sufficient information shall be provided to allow the engineer to assess the suitability of the material for the particular application.

6.2 The minimum requirement of the materials shall be as per the plant equipment metallurgy covered under Process Design Specifications / guidelines. However, superior materials as per the recommendation of OEM's given in their Specifications shall be selected which shall be indicated in the Bid by the LSTK Contractor.

6.3 All materials, whatsoever, required to complete the supplies shall be procured by LSTK Contractor and all such materials shall be covered with due identifiable material test certificate.

7.0 QUALITY ASSURANCE & CONTROL

7.1 The quality assurance shall be as per the approved procedures, test methods & facilities to be developed by the LSTK Contractor to ensure that the supplied equipment shall be of highest quality. The quality control shall mean that all the tests, measurements, checks & calibration which are to be carried out may be compared with the actual specified characteristics of the equipments/unit/system.

7.2 Quality Assurance (QA) shall mean the organizational set up, procedures as well as test methods and facilities developed by LSTK Contractor in order to assure that Equipment leaving LSTK Contractor’s shop are of the highest possible quality i.e. either equal to or better than the requirement specified.

7.3 Quality Control (QC), shall mean all the tests, measurement, checks and calibration which are to be carried out in LSTK Contractor’s shop in order to compare the actual characteristics of the equipment/unit/system with the specified ones, along with furnishing of the relevant documentation (certificates(records) containing the data or result of these activities.

7.4 LSTK Contractor shall submit a comprehensive description (manual) of QA/QC measures contemplated by him for implementation with regard to this specification. It is contractual obligation of the LSTK Contractor to develop and implement adequate QA/QC systems.

7.5 QA/QC system shall cover all products and services required for the equipment as per scope of work including job sub contracted by the LSTK Contractor.
8.0 EQUIPMENT DESIGN BASIS

8.1 General

8.1.1 Design conditions for equipments shall be in accordance with the OEM’s data sheets/specifications for TFL steam generation plant duly approved by PMC.

8.1.2 Wind forces shall be increased by 20% to cater for the effect of piping system, platforms and ladders etc. Vertical vessels with height/diameter ratio equal to or greater than 10 shall be analyzed for vibration due to vortex shedding when critical wind speed does not exceed 30m/s. Design of equipments shall also consider very high velocity cyclone wind speed.

8.1.3 Forces and moments acting on nozzles shall be considered in the equipment design. The exact forces & moments shall be indicated after piping layout which shall be considered by equipment supplier with out any commercial implication to Owner.

8.1.4 All Carbon Steel (CS) and Low-Alloy Steel (LAS) Steam Drum shall have 3 mm corrosion allowance unless specified otherwise. No corrosion allowance shall be considered for SS. The recommendation of OEM shall be adopted for construction, if found more stringent. For heat transfer area tubes, corrosion allowance shall as per code.

8.1.5 Design of supports and anchor bolts considering soil and important factors shall be performed for compressive and tensile loading.

8.1.6 Lifting lug shall be designed with shock factor 2 (minimum).

8.1.7 The requisite no. of hydraulic stud-tensioner device with necessary adopters/insertions based on varying sizes of studs shall be considered by Contractor as per mechanical design of the equipment.

8.1.8 Local stress analysis around nozzles and other external attachments shall be calculated according to WRC Bulletin 107 and 297.

8.1.9 Manhole cover with weight over 20 kg shall be supported by davit.

8.1.10 Nozzle for drain & vent shall be trimmed flush with inside surface of vessel. Other nozzle may extend inward within limits for welding.

8.2 Design Loads

Design loads shall comply with the requirements of IS: 875 and IS:1893 as minimum. The following types of loads in addition to Dead Loads (DL) shall be considered in special type of loading depending upon the type of equipment and operating conditions is likely to be imposed, the same shall also be considered.

8.2.1 Live loads

The minimum loading shall be 300 kg/m2.

For operating Platforms, the loading shall be 500 kg/m2.

8.2.2 Equipment loads
Equipment causing heavy concentrated loads shall be considered separately. The loading considered for tanks and piping shall include hydraulic test loads.

8.2.3 Wind loads

Wind Loads shall be estimated as per the design philosophy - Civil.

8.2.4 Seismic loads

Seismic Loads shall be estimated as per the design philosophy - Civil.

8.2.5 Thermal loads

Thermal loads as per the operating conditions and support conditions shall be considered.

8.2.6 Load combinations

A judicious combination of load keeping in view of the probability of their acting together, their disposition in relation to other loads and severity of stresses caused by combinations of various loads shall be considered for the design. Wind load and earthquake shall be assumed not to act simultaneously. The bidder shall spell out the load combinations considered separately.

9.0 SPECIFICATION FOR BOILER

9.1 General

9.1.1 The steam generators (PF/CFBC) shall be of semi-outdoor type and designed and constructed according to the latest version of Indian Boiler Regulation and Acts. The materials and the design of pressure parts including pipes shall be approved by Chief Inspector of Boilers' and shall be inspected and certified by the inspecting authorities approved by Indian Boiler Regulation during fabrication and construction. The Contractor shall submit to the Owner and Chief Inspector of Boilers' the calculations of all pressure parts including pipes showing that the requirements of Codes and Acts have been fulfilled.

9.1.2 The boiler shall be of natural circulation drainable type and shall be so designed that at all boiler loads, an adequate water circulation takes place throughout all sections of water walls and there is no starvation in any section.

9.1.3 Continuous blowdown shall be done to limit total dissolved solids (TDS) and silica in boiler water.

9.1.4 To provide adequate strength against pressure, flow vibration and shock, tube banks of all sections shall be adequately supported by tube support plates with intermediate baffles to minimize flow induced vibrations.

9.1.5 Nozzle Connections:

9.1.5.1 Drums and headers shall be fitted with machined holes for inserting tube stubs and weld end nozzles. All nozzles shall be welded to the drums and headers in the shop and designed to extend through insulation where applied. All drums and headers shall be located outside the gas path. The Contractor shall provide sufficient nozzles for each of the following and as required to meet IBR stipulations:

   a) Safety valve
b) Steam gauges
c) Feed water piping
d) Blowdown piping
e) Vent valves
f) Independent water column at both ends
g) Steam gauge test connection
h) Chemical feed piping
i) Boiler blow off piping
j) Feed water regulator controller
k) Drum level indicator
l) Steam sampling/water sampling to draw representative samples from drum
m) Acid cleaning and hydro test connection
n) Steam outlets
o) Air release etc.
p) Thermocouple
q) Purge Gas Connection
r) Boiler fill connection

9.1.5.2 The contractor shall be agreeable to provide at no extra cost, any additional nozzles that the owner may consider necessary for proper operation, if so requested prior to commencement of manufacture.

9.1.6 Drums shall be provided with manholes in each end to permit access to the drum interior.

9.1.7 The Steam Generation plant shall be capable of delivering net sent out power after deduction of internal consumption for it's auxiliaries and BOPs.

9.1.8 There shall be dedicated Steam Generators for process steam (a) for supplying HP Process Steam at required parameters (b) for superheating low temperature HP Process Steam from Ammonia plant to the required temperature and returning back for Process consumption. Steam parameters shall be as per OEMs specifications of main process plants.

9.1.9 In addition to above boilers, there shall be a Standby Common Boiler for Process Steam Generation. Capacities of all the boilers shall be as per process design philosophy (Section-1 & Section-4.0) enclosed with ITB.

9.1.10 The steam generator shall be either Pulverised Fuel (PF) or Circulating Fluidized Bed Combustion (CFBC) type. Basically the boiler shall be a radiant furnace, non-reheat, Single Drum, natural circulation, semi-outdoor type with stage superheater(s). The boiler shall be designed with water cooled membrane / fin welded walls and the refractory work shall be kept to the barest minimum possible.

9.1.11 No header shall be placed in the flue gas path. All headers in the boiler shall have flat end covers. A minimum of two handholes for the purpose of cleaning and inspection shall be provided, for each of the headers, either on the end covers or on the body of the headers.

9.1.12 The drive motor rating for all pumps and fans shall be as per datasheet of the respective driven equipment.

9.1.13 The boiler shall be top supported with adequate provisions for the thermal expansion of the boiler in all directions.
9.1.14 Steam generator shall be designed for the complete range of fuel (Indian Coal) specified elsewhere in ITB.

9.1.15 The steam generator shall be designed to generate rated capacity of superheated steam as mentioned in Process ITB.

9.1.16 The steam generator shall be designed for balanced/induced draft operation as per type of Boiler.

9.1.17 The complete pressure part system of boiler, piping & valves, design shall fully comply with the Indian Boiler Regulations (IBR).

9.1.18 The requirements specified are the minimum design and sizing requirements for the steam generator and its auxiliaries. Contractor's utilization of various values and requirements indicated in this specification shall in no way relieve the Contractor of his responsibilities to meet all guarantee requirements or of providing completely safe and reliable operating equipments/systems.

9.1.19 The specified requirements shall be complied for the most stringent conditions resulting either from the range of coals specified or from the range of operating conditions specified or from both occurring simultaneously, unless otherwise specifically mentioned by the Owner.

9.1.20 Steam Generator and its auxiliaries shall be sized for 60% to 100% BMCR condition for single stream operation.

9.1.21 Typical characteristics of specified range of coals/limestone such as high abrasive, slow burning, high ash resistivity etc shall be given due consideration while designing Steam generator and its auxiliaries.

9.1.22 The design of Steam Generator shall comply with the design requirements set out in this section and also meet the requirements specified in specified Design Data.

10.0 BOILER DESIGN & CONSTRUCTION

The unit shall be semi-outdoor type and designed and constructed according to the latest version of International Codes & Acts. The material and the design of pressure parts shall be approved by Statutory Authorities (Indian boiler regulations) and shall be inspected and certified by IBR authorities during fabrication and construction. The contractor shall submit to the Owner and the Inspection Authorities, the calculations of all pressure parts showing that the requirements of Code & Acts have been fulfilled.

The boiler shall be of natural circulation type and shall be so designed that at all boiler loads, an adequate water circulation takes place throughout all sections of water-walls and there is no starvation in any section.

The efficiency of the unit shall be minimum 85%, based on gross calorific value of coal. Boiler of higher efficiency may be offered. The PG test shall be done by either direct method and or relevant PTC code.

The gas velocities shall be low, bearing in mind the ash content of the fuel and the gas passages designed to ensure a smooth flow without any abrupt change in direction. Continuous blowdown shall be regulated, to limit the total solids in the concentrated boiler.
11.0 FURNACE

Furnace design shall be compatible to the latest proven technical advances/upgrades in the relevant PC/CFBC technology.

11.1 Furnace shall have maximum of water-cooled surface with minimum of refractory being exposed to heat. It shall be designed to ensure efficient and complete fuel combustion with no accumulation of slag and no impingement of flame on its parts. Water wall shall be made of Hot finished seamless steel tubes.

11.2 Furnace cannot be free from refractory with the fluidisation of bed material having high erosion potential. The water wall tubes will be adequately protected in the fluidisation zone, if applicable. The height of refractory lining will be as per the designer and the water wall tubes at the interface point where the refractory line ends to be suitably protected with some special metal spray or through any other design standard as per vendor. Besides the refractory will be preferable at the cyclone entry point, if applicable. These are the main erosion prone areas in the combustor.

11.3 The furnace shall be fed with coal from a coal bunker of suitable capacity, the supply & installation of which shall be in the scope of LSTK bidder.

11.4 The furnace shall be designed with sufficient volume, to provide for complete and efficient combustion of fuel. There shall be no flame impingement on any part of the furnace and no accumulation of slag on the walls.

11.5 The furnace shall be provided with the maximum water cooled surface (membrane water walls). The furnace shall be enclosed by water walls with welded membrane type construction of seamless steel tubes of proved composition. The side walls, front walls, roof and floor tubes shall be site assembled into panels of welded construction. Minimum allowance of 0.6 mm over and above the calculated thickness as per ASME/International codes shall be provided for entire water wall.

11.6 The furnace shall be provided with protective measures such that under all expected operating conditions, the pressure condition in the furnace does not exceed the furnace safe design limit. Contractor shall indicate the pressure withstanding capacity of the furnace and furnish the details of co-ordinated operation of system components like fans, damper, etc., to establish the above requirement.

11.7 Entire furnace shall be suspended from a suitable supporting structure, allowing free expansion in downward direction.

11.8 Adequate number of access and observation openings/doors shall be provided in furnace, superheaters. Doors shall be hinged & air tight and meet all safety requirements and have approach platforms. Access doors on water walls will preferably be from both sides for approach to superheater, economiser areas, etc.

12.0 FURNACE LINING

12.1 Floors, walls, and arches shall be lined internally by refractory and/or insulation materials so that the outside casing temperature shall not exceed as per Process Design philosophy. Modular Refractory Material (Ceramic Blankets) shall be used for walls and arch for
maximum energy conservation. Brick Insulation can be used for Floor of the furnace.

12.2 Walls shall be sectionally supported from furnace casing and arch-suspended from arch steel. Bridge walls not supporting tubes may be of self-supporting solid brick.

12.3 Material specifications and test methods of refractory should conform to ASTM Standard. However, proprietary goods by qualified manufacturers may be used if specified in the drawings and/or data sheets.

13.0 FURNACE OPENINGS

13.1 Access doors shall be provided at suitable position for internal inspection.

13.2 All doors shall be made of cast iron or structural steel lined with refractory.

13.3 Instruments and Auxiliary Piping Connections

(a) Draft gauge piping connections shall be in the number required by design at the location as per detail engineering.

(b) Flue gas thermocouple connections shall be provided at least for each radiant section and exit of convection section.

(c) Thermo well to measure process temperatures shall be provided according to process requirement.

(d) Flue gas sampling connections shall be at least at two places at two opposite ends/intermediate places (if possible) at the exit of the convection section wherever necessary for measurement and monitoring.

14.0 DUCTING AND DAMPERS

14.1 All flue gas and air ducts shall be fabricated from carbon steel sheets. Ducts shall be properly reinforced and of welded construction for gas tightness. Suitable supports, expansion joints and access doors shall be provided in all ducts wherever required. Hangers for ducts and connections to the supporting steel for ducts shall be included. Duct shall have bolted connections to equipment and access door. Ducts shall be insulated.

14.2 All dampers shall be of multi blade type having frames made of heavy channel sections. Dampers shall be designed to prevent sticking and leakage and to allow for heavy erosion.

14.3 All the hot gas ducts shall be insulated & cladded so that skin temperature shall not be more than 20 degree C form the ambient temperature.

14.4 All critical dampers including at the suction and discharge of the draft fans will be either motorised or pneumatic. Pneumatic ones will be preferred.

14.5 The material of flue gas duct shall resist corrosion due to condensation of SO2 in flue gas, or suitable lining to be provided to prevent corrosion.

14.6 The Ducts and Duct work components shall be as per the detailed specifications and drawings prepared by the Contractor. This specification indicates minimum
requirements in order to ensure satisfactory performance for the fluid service under the operating pressure and temperatures. In general, the raw materials used should be of good quality and proven for the intended use.

14.7 All ducts and wind boxes shall be fabricated from steel sheet not less than 5 mm thick (with zero tolerance for min. thickness).

14.8 Ducts shall be properly reinforced and of welded construction for gas and air tightness. The inlet air ducting to the FD fans shall contain an aerofoil for air flow measurement and shall be of carbon steel.

14.9 Suitable supports, expansion joints and access doors for cleaning, shall be provided in all ducts, wherever required. Hangers for ducts and connection to the supporting steel for ducts and hoppers shall be included.

14.10 Ducts shall have bolted connections to equipment, expansion joints, access door frames.

14.11 The air duct may contain deflector plates, as necessary, to promote good air distribution.

14.12 Minimum thickness of duct casing plate material shall be minimum 5 mm, unless found to be of higher thickness as per design calculations.

14.13 Following material shall be used unless otherwise specified elsewhere in ITB:

<table>
<thead>
<tr>
<th>Material</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stainless Steel</td>
<td>ASTM A 240</td>
</tr>
<tr>
<td>Structures for Support</td>
<td>Confirming to IS</td>
</tr>
</tbody>
</table>

14.14 The Contractor may install shop fabricated ducts in modular design also.

14.15 Reinforcement rings should be provided for ducts of rectangular cross section and round ducts of large sizes wherever negative operating pressures are indicated.

14.16 Contractor shall provide fastening cleats on ducts where insulation is required to be provided. On C.S. ducts, cleats should be of C.S. and on S.S. ducts, S.S. pads shall be welded to duct and C.S. cleats on pads shall be welded. Alternatively, the entire cleat may be provided of S.S. material for S.S. duct. C.S. washers shall be provided for cleats.

14.17 Shot blasting with one coat of primer on carbon steel ducting shall be provided. Further, painting shall be as per specification provided elsewhere in ITB.

14.18 Testing of furnace ducting:

14.18.1 Welded joints and prefabricated components shall be randomly dye penetrant tested.

14.18.2 Pressure testing of the ducting is generally not required. However, TPIA / Owner may use their discretion and direct the vendor to test some of the items, as and where considered necessary.

14.19 Ducting design shall consider besides internal pressure, maximum temperature, dead load, ash load (where applicable), live load, seismic load etc. Further, load factor corresponding to temperature rise shall be taken care in duct design.
14.20 Hot flue ducting system at furnace outlet, if applicable, shall be of special design with material and insulating system of proven type for duty conditions. Special expansion arrangement and supporting system shall be provided. These shall be detailed in the offer. Expansion bellow in flue gas and air duct shall be heavy duty metallic expansion bellows.

14.21 Complete flue ducting from AH outlet to ESP inlet funnel and from ESP outlet onwards to ID fan(s) and from ID fans to stack inlet shall be provided, with required dampers, supports etc. Changes in ESP elevation, location and arrangement of ESP inlet outlet funnel shall be envisaged and connecting gas duct adjusted as required.

14.22 100% Gas tight isolation dampers of motor/pneumatic operated type (make and design to approval) shall be provided to enable maintain equipment, when the unit is on load, e.g.:

- PA fans outlet (isolating, damper)
- SA fans outlet (isolating, damper)
- ID fans inlet and outlet (isolating, damper)

For any other equipment/ system proposed, such requirement shall be provided as a part of the offer.

14.23 The ducting layout shall be such that it does not interfere with the operating personnel movement.

15.0 STRUCTURAL STEEL, PLATFORMS, WALKWAYS, STAIRS ETC.

15.1 The structural design shall be in accordance with Design Philosophy - Civil & Structural Works, provided elsewhere in NIT, unless otherwise specified. Some salient features of structural design are as below:

Structural members shall be designed in accordance with IS (Indian Standard).

15.2 The contractor shall furnish necessary platforms, walkways and stairs to provide access for proper operation and maintenance of all parts of the equipment. Cat ladders shall be avoided. Each major platform shall have double access/exit as required under Factories Act.

15.3 The unit shall be carried on a self-contained steel framework built up from +300 mm level. The shop connections can be welded. Field connections shall be Welded / bolted with high strength bolts.

15.4 All tubes, headers and burners shall be supported from furnace steel framework, independently from the insulation or refractory lining.

15.5 A minimum steel plate thickness of furnace casing shall be 5.0 mm for wall and 6 mm for floor and arch, and those plates shall be suitably stiffened.

15.6 Floor plate of platforms or walkways shall be of Gratings and shall be of 5.0 mm minimum thickness, unless otherwise specified in ITB.

15.7 Roofing and siding, if any, shall be of colour coated metapoly sheet or other suitable weather resistant roofing materials. Roofing shall have arrangement for exhaust/ventilation for hot air exhaust.

15.8 Header boxes shall be constructed of stiffened steel plate with 5.0 mm minimum thickness.
and lines internally with insulation materials.

15.9 Stairway

15.9.1 Minimum vertical headroom clearance shall be 2100 mm and minimum perpendicular clearance shall be 1800 mm unless otherwise specified in ITB.

15.9.2 Maximum vertical run for a single flight of stairway shall be 4000 mm unless otherwise specified in ITB.

15.9.3 Unless otherwise shown in the drawings, stairway shall have a maximum angle of 45 degrees and a preferred rise of 200 mm.

16.0 DRAFT SYSTEM

16.1 The draft system for the boiler shall be suitable of producing a balanced draft with sub-atmospheric pressure conditions in the furnace.

**Induced Draft Fan, Forced Draft Fan and Primary Air Fan** making up the complete draft system for the boiler.

17.0 AIR HEATER

17.1 The contractor shall furnish tubular type or regenerative type of air heater, one for primary air and one for secondary air. Regenerative air heater can be common for both secondary air and primary air. If tubular air heater is offered, one number for each secondary air and primary air shall be offered by vendor.

17.2 The air heater shall be designed for 100% firing of the fuel in the boiler. The sizing shall also consider the exit flue gas temperature limit as per Process Design philosophy.

17.3 The air heater shall be complete with steel casings, access doors, necessary duct hoppers, etc., for complete installation.

17.4 The heater shall be so designed as to permit washing down with water and hopper shall be manufactured with appropriate material to suit operating conditions.

17.5 The air heater shall be designed with flanged connection for the air and gas inlet and outlet ducts. The heating surface shall be proportioned to obtain an optimum flue gas outlet temperature as per required process conditions. Provision shall be made for low load operation to assure a minimum flue gas outlet temperature above the acid dew point.

17.6 The cold end of the air heater tubes shall be made of corrosion resistant material. The last bend shall be made of Corten steel of 1.2 mm thk (Min.). Hot/intermediate end shall be made of carbon steel Min. 0.8 mm thk.

17.7 The layout and arrangement of any of the air heater blocks shall be such that when required the tubes can be removed for replacement, without any major disturbance, to the adjacent equipment or systems.

17.8 The air heater shall be complete with all casing, supporting structures, ducting systems etc. A suitable air or gas bypass ducting system with regulating type damper, of appropriate size shall be provided, for use during plant start-up/part load conditions and to ensure rated temperature to the ESP for its optimum performance.
17.9 The bypass dampers shall be provided for control room operation, equipped with drive unit.

17.10 The AH casing shall have a minimum thickness of 4.0mm. Required access doors, platforms, walkways, etc shall be provided as required. Clear gap between any AH blocks on air/gas side shall not be less than 600mm.

17.11 Bidder shall make provision of space for future installation for heating surface of 10% or two loops, whichever is higher.

17.12 Only metallic hoses shall be used for bearing, cooling/lubrication. Rubber hoses are not acceptable.

17.13 Rotary Air preheater shall be driven by electrical motor with an air motor as stand by unit.

17.14 An air receiver tank of adequate storage capacity to operate air preheater using air motor for 10 minutes (Min.) with no air make up during this period.

17.15 Air preheater rotor stand still sensing device with alarm to control room shall be provided.

18.0 ECONOMISER

18.1 The section shall be of non steaming design with bare tube construction and drainable type and shall be arranged in sections and be provided with all tube elements, headers, connecting tubes, casing and accessories required for complete installation.

18.2 The casing shall be gas tight and provided with access doors for entrance to locations between each sections of the economiser for inspection and easy replacement of tubes. All economiser headers shall be located outside the gas path.

18.3 In the economiser the gap between the banks and between the coils should be such that those can be easily inspected and repaired. The correct pitch between the coils to be ensured and the gap between the coils and casing plate to be kept uniform to prevent formation of any eddy bubbles in flue gas path.

18.4 The economiser shall be provided with all tube elements headers, connecting tubes, casing and accessories required for complete installation. Uniform flow and heat distribution shall be ensured throughout. The economiser shall be of seamless bare tube, drainable type complete with inlet/outlet headers. The tubes, headers and all connecting piping shall be of seamless type.

18.5 Tube spacing in economiser shall be 0.8 mm Min.

18.6 Proper draining arrangement shall be provided for Economiser.

18.7 Material selection and proper design shall receive special attention where water turbulence is caused by change of flow direction leading to erosion / corrosion.

18.8 The casing shall be gas tight and be provided with access doors for entrance to locations between each section of the economiser for inspection and easy replacement of tubes. The ECO casing shall be of minimum 5.0 mm thick plate suitably stiffened/reinforced. Minimum clearance between any two blocks of ECO and or ECO and AH shall be 610 mm.
18.9 Provision for easy removal/replacement of ECO elements shall be taken care, in the design and arrangement. Economizer coils shall be independently supported with separate structure.

18.10 Economiser shall be provided with minimum 3mm thick SS erosion shield for leading tube of economiser.

19.0 SUPERHEATER

19.1 The boiler shall be equipped with suitable drainable/Platina/Pendant type superheaters of sufficient capacity and surface to superheat the steam to the required condition specified as per OEM proven facts. Superheater outlet temperature shall be maintained within the limit specified.

19.2 The superheater shall be designed for maximum accessibility and types so arranged as to permit easy replacement. Superheater shall be convection type seamless bare tube construction. Use of girdling loops not permitted.

19.3 All superheater headers shall be liberally sized and located outside the gas paths.

19.4 Adequate provision shall be made in the design of all superheater tubes, supports, expansion of various components. The tube elements design shall be such that the tubes will provide flexibility to aid in relieving pipe stress.

19.5 A suitable number of permanent thermocouples in observing tube metal temperature during starting up shall be provided.

19.6 Following connections and accessories shall be provided for each header:
Drains : 40 mm minimum size
Vents : 25 mm minimum size, except superheater outlet vent shall be 50 mm minimum size. Test gauge connection 25 mm sizes.

19.7 Protection SS shields to be provided in the leading rows of economiser and superheater coil bends and hanger tubes where the high velocity flue gas can possibly erode the tubes.

19.8 The total superheater surface area shall be sized, distributed and located to maintain the superheated steam temperature at superheater outlet over the entire steam temperature control load range as specified. The superheater sections shall be of drainable type and shall permit dry running during start-up and transient conditions. Further, care shall be taken to reduce header diameter and hence thickness, reducing possibility of fatigue damage by increasing the number of header outlet steam pipes.

19.9 A spray attemperator shall be provided between primary and secondary super heater with necessary control valves controls. A thermal sleeve fitted with removable liners shall be provided in the attemperator pipe, to ensure that spray water cannot impinge on the pipe wall and cause cracking. The spray water shall be taken from the feed system, upstream of the feed control valves. A spray control valve, operated by the automatic steam temperature controls shall be included.

19.10 The superheater shall be designed with the saturated and superheated steam headers outside of the boiler setting for maximum accessibility and tubes so arranged as to permit easy replacement.
19.11 Steam temperature at superheater outlet shall be maintained within limits, as specified by attemperation as mentioned in Process design philosophy by means of remote manual and automatic control devices. The Superheater system shall preferably combine the radiant and convective surfaces, to achieve the rated steam temperature as specified in the process design basis.

Manufacturer shall provide sufficient nozzles for each of the following:

1. Superheated steam (outlet header)
2. On main Safety valves (outlet header)
3. Superheater drains & vents (inlet & outlet headers)
4. Start-up Valve
5. Sampling (outlet header)
6. Soot Blower Steam (if required)
7. Superheater attemperator vent
8. All others required for complete installation, including tape for thermo walls and steam gauges

19.12 Suitable number of permanent thermocouples for use in observing tube metal temperature during starting up shall be installed. These thermocouples shall be terminating in a suitable junction block.

Contractor shall elaborate design features for preventing thermal stresses during start arrangement of support and spacers to take care of differential expansion of various components. Superheater tubes shall be seamless and tubes and supports shall be of suitable material for long service.

19.13 Molybdenum wherever used in alloy for super heater material, should be suitably stabilized with requisite amount of vanadium and chromium. Alloys containing molybdenum will not be accepted.

19.14 Liberal margins shall be provided over calculated metal temperatures and well over the IBR stipulations, to ensure trouble free and reliable SH surfaces, and assured cooling under all operating conditions.

19.15 The super heater system design shall provide provision for future addition of heating elements to the extent of atleast two loops in primary super heater. The location of headers and primary SH tubing shall be so arranged that this additional surface addition shall be made possible with least disturbance to the existing pressure part system.

20.0 STEAM DRUM

20.1 Steam drum shall have adequate storage capacity (minimum storage of 1 minutes between recommended normal level and permitted low low level) so that in the event of tripping of running feed pump, the standby feed pump starting automatically shall be able to prevent tripping of the boiler from low low drum level while boiler was operating at MCR and with normal drum level.

20.2 Drums and headers shall be located away from the hot exhaust gas path.
The longitudinal and circumferential welds shall be properly heat treated and 100% radiographed during manufacture. The interior of the drums shall be cleaned to remove mill scale, rust, corrosion products, dirt, grease, moisture or other loose foreign materials, after fabrication at works either by shot blasting of nonsilica bearing grit or as per the manufacturer's standard cleaning process meeting the Owner's approval.

20.3 Steam drum shall be equipped with suitable moisture eliminators, screens and other necessary internals to ensure adequate dryness. The drum internals along with the steam-separating device shall direct the flow of steam and water so as to obtain an optimum distribution of drum metal temperature over the entire operating range. The arrangement and fabrication of the drum internals shall permit easy removal and replacement of parts through drum manholes. The drum dished ends shall be provided with properly sized manholes and hinged manhole covers of forged steel secured by forged steel yokes and bolts. The feed water pipes from the economizer entering the drum shall be spaced suitably so that there is no uneven distribution of flow over the entire length of the drum.

20.4 The steam drums shall be designed and fabricated in accordance with IBR latest edition.

20.5 The drum internals shall be of steel & bolted construction and shall be such as to allow parts to be removed single handed. The steam drum shall be provided with suitable type separators, screens and other necessary internals, to guarantee adequate dryness of steam.

20.6 The steam drums shall contain the following minimum connections:
   a. Safety Valves with silencers
   b. Pressure Gauge
   c. Steam Outlet
   d. Chemical Feed
   e. Riser Connections
   f. Down comer Connections
   g. Feed water Inlet
   h. Drum Vent
   i. Drum drains
   j. Continuous Blow-down
   k. Drum level indicators
   l. Test Gauge
   m. Nitrogen blanketing
   n. Manhole doors on either side of drum.

20.7 Drums shall be fusion welded, and constructed in accordance with the applicable codes stress relieved, and 100% radio graphed. All nozzles shall be welded to the drums. The nozzles shall be long enough to ensure that the base welds are not affected by any subsequent welding at site and that valve, mountings and fittings can be cut off and re-welded without damaging the lagging and the drum body.

20.8 The drum shall be of circular cross section and of sufficient diameter to ensure easy access for repairs and inspection.

20.9 Dryness fraction of the steam at the outlet of moisture eliminator shall not be less than 0.999

21.0 BLOWDOWN VESSELS
21.1 Continuous blowdown tank (CBDT) shall be designed for continuous blowdown of boiler operating at M.C.R. The continuous/intermittent blow down shall be taken as 3% minimum. The continuous blowdown tank shall be designed for a pressure mentioned in Process Design Philosophy and shall meet IBR requirement.

21.2 The continuous blow down from the steam drum shall be brought to the flash tank, operating at low pressure. The flash vapour shall be connected to deareator.

21.3 The vessel inside shall be equipped with multi nozzle distributor for efficient spray and flashing of the blow down water.

21.4 The sizing of vessel shall take into consideration the continuous operation of boiler at MCR conditions. It shall be a vertical cylindrical vessel. The Flash Vessel shall be kept at a suitable elevation for proper draining of same under maximum blow down to Atmospheric Blow Down Vessel under all operating modes and even during start-up when there is possibility of pressurisation. However, the pressurization shall be such that maximum drainage from Flash Vessel to Atmospheric Blow Down Vessel is not affected.

21.5 The vessel shall be complete with all appurtenances, like:

- Level gauge
- Level transmitter and controller
- Pressure gauge
- Pressure transmitter
- Drain control valves
- Manhole with cover
- Pressure safety valve

21.6 The internals of the Vessel shall be designed to prevent entrainment of water particles in the vapour as it is vented out and the walls shall have extra thickness at and around the point of entry of blow down.

21.7 The continuous and intermittent blow down lines from each steam drum shall be led independently to the Flash Vessel.

22.0 SOOT BLOWER CONTROLS & PIPING

22.1 Soot Blower (If required) shall be as per proven Technology.

22.2 Suitable arrangement for pressure reduction and temperature adjustment (if needed) shall be furnished to obtain steam for soot blowing. All soot blowers located in high temperature zone shall be retractable type located on both sidewalls of boiler and covering half the effective boiler width when fully extended.

22.3 This shall permit operation of any group of soot blowers repeatedly in sequence as necessary and also permit omission of any soot blower(s) in a cycle.

22.4 The contractor shall furnish soot blowers for superheater, economiser and the air heater, complete with all piping and accessories, including valves, controls, panels, motor control centre, complete with starter and wiring.
22.5 All soot blower elements located in a temperature zone of 815 Deg. C (1500 Deg. F) or higher, shall be of the retractable type. The retractable blowers shall be located on one/two side walls of the boiler and shall cover effective width of the boiler.

23.0 BURNERS

Burners selection shall be compatible to type of Boiler technology selected i.e. PF/CFBC.

23.1 Burners consisting of gun assembly, air nozzle assembly, combustion air damper assembly, refractory lined muffle block assembly, fittings, nuts & bolts. Nozzle tip material specification shall be minimum SS310. Material specification of other metallic parts shall be minimum SS304.

23.2 Each burner shall be easily removable for ease of maintenance.

23.3 Burner flame shall not impinge on furnace water wall.

23.4 Inspection & Testing of Burners:
   a) Burner performance tests, witnessed by Owner and/or Owner’s representative.
   b) Pressure testing.
   c) 100% radiography of butt joints.
   d) Dye penetrant test of all welds.
   e) Complete dimensional check.

23.5 Low NOx Burners shall be provided.

24.0 STACK

24.1 Dedicated stack for each boiler is envisaged for the Steam Generation Plant Stack design shall be as per Process & Civil Design Philosophy (ITB section 5.1 & 5.5).

24.2 The stack shall be of self supporting type and shall be of RCC material. The minimum height of stack above grade level and the exit gas velocity must confirm to the requirements of both National and Local authorities.

24.3 The stack design shall be such as to prevent flue gas inversion.

24.4 The stack shall be equipped with approved lightning protection system, aviation warning light (with re lamping provision) along with suitable access platforms and ladders for the measurement points and others. The ladders in the stack shall be provided as staggered one.

24.5 The Stack entrance and exit velocities of gases shall be as per standard design practice.

24.6 Stack pollution control monitoring system and sampling arrangements shall be inline with CPCB and state pollution board norms/guidelines.

24.7 Drain shall be provided so that rain water doesn’t collect at the bottom of boiler exhaust stack.

25.0 Lime Handing System:
25.1 Lime handling system (if required) for sulphur catch up should be provided. Sulphur capture is influenced by various factors i.e. fuel properties, sulphur content, calcium to sulphur molar ratio, lime stone reactivity, furnace temperature, gas and solids residence lime and lime stone particle size. For detail design, refer Design Philosophy-Material handling.

26.0 Steam Generator Enclosure:

26.1 The entire steam generator shall be constructed to form a complete gas tight construction without any perceptible leakage of exhaust gas from within the setting under any condition of operation.

26.2 The design and construction of enclosure shall prevent distortion of steel work due to thermal expansion and deterioration of insulation. The primary objective of enclosure design shall be to achieve reliability and long life.

26.3 Observation ports, doors and all other openings shall be provided with sealing air to prevent hot gases from blowing out when these items are opened or operated. All inspection doors and access manholes shall be of the quick opening type and provided with safety features to prevent opening of the doors without seal air pressure when the boiler is in operation.

26.4 A complete system of walkways, galleries, platforms and stairways shall be provided on all sides of the unit as required for proper operation and maintenance and easy access to inspection doors and manholes.

Provision shall be made in the steam generator casing and access platforms for the rapid and convenient installation of the inspection scaffolding furnished for maintenance and inspection.

26.5 For all temperature measurements within the steam generator casing, the bidder shall furnish temperature elements and wiring to junction boxes outside the casing in respect of local as well as remote measurement. All necessary access, observation, and cleaning doors with frames shall be provided. The doors shall be insulated and be perfectly gas tight under all working conditions. The design and construction of the doors shall be rugged and shall ensure freedom from distortion.

27.0 ELECTRO STATIC PRECIPITATOR (ESP):

27.1 Introduction:

The ESP design and sizing shall specifically take into account, the probable characteristics of flue gas and the range of particle size and distribution of flyash entering ESP, with the type of PF/Fluid Bed Combustion process proposed, and duly considering the equipment and systems installed as part of boiler ahead of the ESP units. ESP shall be designed considering N-1 philosophy, where N is the number of installed streams of ESP.

27.2 Dust Collecting System and its Sizing:

It has been proposed to install Independent Electrostatic Precipitator system per boiler of single stream gas pass design, with adequate no. of independent electrical fields, optimally located in the layout to match the boiler.

The contractor shall furnish along with his offer the detailed calculations & data for ESP efficiency, ESP power consumptions and T-R set rating etc.
All the design procedures, systems and components proposed shall have already been adequately developed and have demonstrated good reliability under similar or more arduous conditions elsewhere.

The bidder shall submit with the offer, comprehensive information on the how the specific collection area, effective migration velocity or total migration velocity of the proposed design has been arrived at. Contractor shall submit along with offer, a detail write-up on the proposed design features with recent design modifications, if any, and the specific advantages over the previous design.

The design of ESP shall permit the installation of ash handing equipment at the inlet & outlet of ESP. Further, Ash extraction system will be installed at the bottom of ESP hoppers. 

Minimum 2 m wide platform shall be provided between two casings of the ESP to facilitate maintenance work and minimum 1.5 m wide platform shall be provided all around the ESP passes at intermediate and T-R set elevations. Minimum 1.0 m wide platform hall be provided all around the Hopper at hopper level.

The protection for rapping motor from exposure to rain shall be provided.

ESP Requirements:

The flyash dust collecting system shall be designed conservatively and liberally sized, to handle ash dust. The Electrostatic Precipitator design and technology offered shall be of well proven type to handle the dust concentration content in flue gas. Accordingly, the ESP design offered should have demonstrated excellent performance and operational reliability over the years, for similar or larger applications.

Ducting System at ESP Inlet & Outlet:

The complete inlet and outlet funnel duct work system of ESP shall form part of ESP proper, which shall be provided with required gas distribution devices to ensure uniform gas flow across ESP cross section, under all operating conditions.

Also the ESP supplier shall recommend, for providing any guide vanes in the inlet ducting section from the boiler for improving the gas flow and for achieving improved ESP performance.

ESP, ducting and structures design shall be as per IS-875 latest standards for wind loads.

The entire ESP system, and all auxiliary equipment including all Electric, HVTR sets etc. shall be designed for "Outdoor" duty conditions.

Very special care shall be, accordingly taken to protect all critical equipment, with weather proof enclosure etc. as required.

Parameters for ESP Design and Guarantees:
The main parameters for ESP design and sizing, corresponding to "BMCR parameters" shall be based on the predicted flue gas parameters as per the fuel analysis furnished, in this specification.

27.3 Specific Requirements:

The "ESP design" shall consider maximum sulphur content as per fuel composition.

The outlet dust concentration shall not exceed 30mg/Nm³ in first field OUT condition of ESP.

The maximum flue gas velocity through the ESP shall not exceed 1.0m/sec, at rated design parameters, to ensure efficient collection without re-entrainment losses.

The maximum draft loss across the complete ESP section, shall not exceed 25 mm WC, under its rated conditions.

Minimum aspect ratio of the ESP (electrode zone) shall be 2, so as to minimise re-entrainment and carryover of the collected dust, and ensure better ESP performance.

The treatment time of flue gases shall be sufficiently long enough for proper unit performance with the specified duty conditions. Further, Treatment time of flue gases shall be minimum 20 seconds.

The ESP shall be selected and sized with optimum dimensions (width, height, length) etc. to ensure reliable performance and high collection efficiency, even under conditions of one of the fields out of service.

The casing shall be provided with required number of gas tight access doors, for maintenance. The ESP casing near inlet and outlet funnel sections shall also be equipped with access doors.

The minimum required steel plate thickness for casing, ash hoppers etc. shall be as below:

For ESP side walls and roof - 5mm
Inlet and outlet funnel sections - 5mm
Complete Ash hopper - 5mm

ESP structure shall be provided with Corten (Weathering) Steel

Precipitator Casing and Insulator compartments:

Precipitator and equipment shall be functionally and structurally designed to with stand all of the following without exceeding the maximum allowable stresses of the AISC code.

Continuous operation with a flue gas temperature upto 55°C above the specified inlet temperature, and operation for one hour with a flue gas temperature of 400°C in the case of a cold precipitator.

The precipitator shall be designed and suitably reinforced to eliminate detrimental vibration.
Suitable inlet and outlet connections shall be supplied for welding or bolting to connecting ducts.

The precipitator shall be equipped with necessary hinged inspection and access doors properly key interlocked with “Danger-High Voltage” signs for safe operation and maintenance. All inspection and access doors shall be capable of gas-tight sealing even after repeated openings and closings.

Internal baffling shall be provided to prevent gas and dust leakage above, below and around the active precipitator zones (if required).

Walkways between series fields shall be provided to facilitate inspection and maintenance at the bottom of the precipitator collecting plates. Access to the top of the precipitator in the region of discharge electrode connections shall be provided.

All horizontal surfaces shall be sloped to ensure drainage of rainwater. Wherever required, external gutter or drain pipes shall be provided to drain out accumulated water.

**Ash Hoppers:**

All ash hoppers shall be of pyramidal type of identical size and capacity to avoid arching or clogging. Storage Capacity shall be minimum eight hours corresponding to the minimum 70% ash collection rate in the first field.

Specific weight of ash shall be assumed 650 kg/m³ for calculating the storage capacity and 1350 kg/m³ (Minimum) for structural design.

Each hopper shall be complete with an access door, ash outlet flange terminated at 2.75 M above +0.00EL Hopper valley angle shall not be less than 55 Deg. To the horizontal and ensure free flow of ash from hopper outlet.

Each hopper shall be provided with a hopper heating system (thermostatically controller type) in order to facilitate smooth ash flow.

All hoppers shall be equipped with suitable gas tight key-interlocked hinged access doors with “DANGER-HIGH VOLTAGE” sign.

Platform at the bottom of each hoppers shall be provided.

Ash storage capacity shall be at least 10% higher than the ash storage capacity theoretically required for each dust hopper.

The number and arrangement of dust hopper shall be such that there is at least one dust hopper per T-R set.

Hopper shall be of welded steel pate construction with 5 mm minimum plate thickness. The lower one third or 1.5 m whichever is higher shall be lined with 16 Gauge or heavier, type 304 SS.

The dust hopper shall be electrically heated up to a minimum of lower one third (1/3) of dust hopper height but not less than 1.5 m by thermostatically controlled panel type heating element to prevent ash bridge formation in addition to panel heater, wrap around
heater/pad heater suitable for curved surface i.e. curved foil based heating element of required KW size (about 0.5 KW min.) to maintaining minimum ash temperature of 104 degree C above knife edge gate valve shall be provided on conical portion of hopper or adaptor as applicable. All heaters on each level shall have same wattage capable of maintaining internal hopper temperature in excess of 140 degree C. Heating element shall be of sturdy construction and made with inconel 600(punched type) or flat type nichrome foil suitable for ESP application. These heater shall have design life of 25 years.

Each hopper shall be provided with Two(2) nos. of hundred (100) mm diameter poke hole in mutually perpendicular direction with threaded caps. The cap shall have flat iron bars suitable for striking with a hammer, to assist in breaking free in any seized threads. The hopper adaptor piece, spool piece and bend up to knife edge gate valve shall also be provided with suitably designed and located rapping anvils for loosening the fly ash by striking with sledge hammer.

Each dust hopper shall be provided with high level & low level dust monitor on proven radio frequency measurement system. The level monitoring control system shall incorporate all the necessary accessories including two no. Level switches per hopper (1 for high & other for low level) each with 2 NO+ 2 NC contacts, local & remote signally lamps and high & low level alarms.

The high level ash switch will provide contact closure and activate the alarm when the ash level reaches a level high enough to cause deterioration of ESP performance and possibility of damage to ESP structure if not corrected. After a preset time elapse with the ash under high alarm activated, the logic shall have provision to de-energize the T-R set of the particular field of the effected ash hopper. The level control device shall be unaffected to by ash built up, due to moisture or charged ash on either the hopper valve or on the probe itself.

Each hopper shall be provided with a quick opening access door of not less than dia. 600 mm. Suitable access ladder shall be provided from the walkway beneath the hoppers to facilitate approach to the access doors.

27.4 The "ESP design" shall consider maximum sulphur content as per fuel composition. The percentage of carbon in the fly ash entering ESP shall be considered upto 3% of fly ash by weight for design.

27.5 Collecting Electrodes

The collecting electrodes shall be fabricated from Cold Rolled Cold Annealed (CRCA) steel plates of minimum 1.2mm thickness suitably profiled for good corona Characteristics, rapping characteristics, ash collection and disposal with minimum e- entrainment.

The plates shall be designed to withstand the high energy impacts involved in rapping without permanent distortion or overstressing. The plates shall also be capable of withstanding the stresses involved in field handling and shipping without damage.

The collecting electrodes and their supporting assemblies should be capable of continuous service at 55°C above the normal operating temperature and at 200°C for one hour in the case of a cold precipitator.

The collecting electrode system shall be electrically grounded to the precipitator shell and structure.
The collecting electrode assembly shall be designed and manufactured to the erected plumb and to remain so aligned for the life of the equipment.

The profile of the collecting plate (single piece construction) shall be such as to minimise the reentrainment of collected dusts at the time of rapping.

27.6 Discharge Electrodes

The discharge electrode design, geometry, size arrangement and material shall be of well-proven type, considering specified duty conditions and for achieving uniform corona power, reliable operation, performance and long life.

Discharge electrodes shall be constructed from durable, corrosion and erosion resistant material. In case, spiral type discharge electrodes are being offered, the material for the same shall be UHB904L or equivalent.

The discharge electrodes are to be mounted in rigid frames. The frames are to have sufficient intermediate bracing.

Mechanical terminations and connections of discharge electrodes to support frames, shall provide sufficiently positive electrical contact to prevent pit arcing and premature failure, and shall eliminate undue mechanical stress leading to metal fatigue and breakage, particularly those stresses associated with high-tension rapping operations, or mass flow of gas.

Electrodes designed to operate in tension shall have this tension verified prior to commissioning the precipitator. Adequate precautions shall be taken to ensure good electrode stability, straightness and current-density distribution under normal precipitator operating and design conditions as covered in these specifications.

Discharge electrode system and high-tension rapping arrangement shall be designed and constructed to avoid nodal regions where some discharge electrodes do not receive adequate rapping energy to remove dust deposits.

High tension electrode frame and support system shall be such that no swinging, rocking, or oscillation occurs during normal operation, either in the frame or in the discharge electrodes themselves.

High-voltage insulators electrically isolating the discharge electrode system from the shell and ground shall be of adequate length, strength and electrical properties for proper operation of the precipitator under all design and specified conditions of service.

A suitable high-voltage bushing or insulator heating system shall be provided to prevent moisture condensation during start-up sand during operation where dew-point problems may occur. A system to supply clean, dry air shall be provided (where necessary) to keep high-voltage support insulators free of excessive dust deposits.

Measurements determining electrode alignment shall be made at the top and at the bottom of the plates and at such other places between top and bottom as may be required to ascertain the true nature of the quality of electrode design, construction and assembly to achieve proper alignment.
27.7 Rapping System

The rapping arrangement and system shall be independently arranged for the collecting electrode system and emitting electrode system. Electromagnetic/MIGI/Tumbling hammer type of rapping system shall be employed to provide required acceleration in all sections of the collecting electrode for the specified duty conditions.

Provision shall be made in the design for adjusting the frequency of the rapping system. Provision for rapping adjustment shall be made and such adjustment shall be feasible, while ESP is operating.

Rapper Controller (RPC)

a) Each stream of ESP shall be provided with a separate, microprocessor based Rapper Controller (RPC). However, any other proven standard design of rapper controller integral to TR set controller is also acceptable.

b) It shall have proven noise immunity and shall be suitable for ESP application.

c) It shall control the sequence and frequency of operation of the rapping mechanisms of collecting and discharge electrodes of the different fields of the precipitator.

d) The unit shall control and survey the operation of rappers in the ESP. It shall start and stop the rappers as programmed and shall give an alarm if a rapper fails.

e) It shall be possible to start or stop manually each rapper, without interfering with the other rappers from the controller. The operation status of each rapper shall be indicated with LEDs on the rapper controller panel.

f) It shall be possible to change the three timings (viz. Start time, repetition time and run time), intensity (if applicable) and frequency of rapping independently for each rapper, without need for opening the panel or any alternation in programme.

g) The range of rapping frequency available shall be up to 24 hours. Additionally, the rapper controller shall have adequate Pre-programme sequences of rapping stored in its memory so that the operator can select any of them according to his judgement or the controller itself can choose them based on feedback from boiler load.

h) In case one separate rapper controller is provided for each stream, one standby working rapper controller shall be provided so that in case of failure of any one of the working rapper controllers, the standby controller shall immediately and automatically take over the control functions of this rapping without affecting the operation of ESP.

i) The system shall have the following minimum features:

   (i) Display of all adjustable parameters, rapping modes, time settings and intensity of rapper/group and rapper status, rapper alarm and controller alarms.

   (ii) Key board for operator interface.

   (iii) Local/ Remote selection: In local mode all commands and adjustments shall be from RPC. In remote mode all commands and adjustments shall be from EPMS.

   (iv) Communication port with protocol for communicating with EPMS.

   (v) Remote on/ off capability from EPMS.

   (vi) The controller address (field programmable), logic programmes and other adjustable parameters shall be stored in non-volatile memory and shall not be affected by power loss.
(vii) All internal part of rapping mechanism shall be accessible for inspection and they shall be placed on wide access passages and shall be easily accessible for operational and maintenance purposes. Major part of rapping mechanism shall be located external to the precipitator. Necessary lubrication system shall be provided for the rapping mechanism.

27.8 Transformer Rectifier

The Transformer Rectifier (TR) sets shall be optimally sized and shall have the required electrical ability under sparking conditions. TR sets shall be three phase. Technical requirements of Electrostatic Precipitator (ESP) Electrical equipments like motors, cables, ACP/MCC etc., which are not covered in the following clauses, shall be as per specifications of PDIL attached with this specification.

Transformer Rectifier (TR) Sets.

a) Transformers shall conform to IS: 2026. The transformer oil shall meet the fire safety requirements specified in paragraph 450-23 of National Electric Code. All other equipment/ accessories shall conform to relevant Indian Standards. Equipment conforming to equivalent International Standard like IEC shall also be acceptable.

b) Equipment Description

i. Type: Silicone oil filled, free standing transformer rectifier assemblies in steel housing with HV disconnect and ground switch for each section of the ESP field.

ii. Tank: Welded type construction. Tank cover shall be sloped to prevent retention of water and shall be provided with bi-directional skids, lifting lugs and four jacking pads.

iii. The TR enclosure access doors shall be key interlocked with the main power supplies and adequate grounding provisions for personnel safety shall be provided.

iv. The rectifier shall be of Class IP-55 and panel shall be of Class IP-4X.

v. Core: High grade non aging cold rolled grain oriented sheet steel laminations.

vi. Oil: The transformer oil shall be non toxic and shall have high flash point (above 300 Deg Celsius) sealed type construction without breather.

vii. Winding: Electrolytic Grade Copper.

viii. LV Connection: Cable.

ix. Cable Box: Degree of Protection IP-55.

x. Bushings: Made of Porcelain.

xi. Marshalling Box: Degree of Protection IP-55, provided with thermostatically controlled space heaters.

xii. TR Set Controller Panel: Provided with isolating switch, power contactor, thermal overload relay, fuses for protection of Silicon Controlled Rectifiers, etc.

c) Fittings

i. Temperature Indicator: Dial Type oil temperature indicators with alarm and trip contacts.

ii. Drip Trays: To contain total volume of cooling fluid.
iii. Drip Trays: To be connected to a separator chamber through drain pipes. The separator chamber located at ground level to be sized to contain oil from drainage of any two TR sets.

iv. Pressure Relief device: Spring Loaded Type.

v. Oil Level Indicator: Magnetic with low level alarm contact.

vi. Oil Level Gauge: Prismatic/ toughened glass.

vii. Buchholz Relay: Double float type with alarm and trip contacts.

viii. Winding temperature Indicator.

d) Operating Conditions

Operation of precipitator shall not be affected when one rectifier unit is taken out of service.

i. Flux Density: Flux density not to exceed 1.9 Wb/m²

ii. V/f: Designed for 1.1 continuous.

iii. Noise level: Not to exceed the values specified in NEMA-TR-1.

iv. Protection: Suitability for working under transient sparking conditions and occasional short circuit load. Protection against surge, excess temperature rise and under voltage to be provided.

Oil : 50 Degree Celsius

All required mounting brackets, grounding and mounting materials shall be furnished for attaching the TR assemblies to the precipitator. The supporting structure for the TR assemblies shall be designed to contain the fluid that could leak from damaged set. Output terminal grounding switches that are interlocked with the overall system shall be included.

27.10 ESP Insulators

a) High voltage insulator shall be located outside the gas stream, suitably housed in the insulator compartments to facilitate maintenance when the precipitators are on load.

b) High-voltage insulators electrically isolating the discharge electrode system from the shell and ground shall be of adequate length, strength

c) Each insulator compartment shall be provided with insulator heaters or hot air ventilation system to avoid moisture condensation on insulators. In case of hot air system, it shall include fans, air filters, heaters etc.

d) The insulator compartment shall be provided with thermal insulation. The compartment shall be designed such as to prevent ingress of flue gas into compartments.

e) Insulators for supporting emitting frame and roof bushing shall be of porcelain suitable for long life, in ESP internal environment (highly polluted with flue gas temperature of 200 Degree Celsius and going up to 300 Degree Celsius for 5 minutes).

f) A suitable high-voltage bushing or insulator heating system shall be provided to prevent moisture condensation during start-up sand during operation where dew-point problems may occur. A system to supply clean, dry air shall be provided (where necessary) to keep high-voltage support insulators free of excessive dust deposits.
27.11 Earthing and shielding

a) A complete earthing system with double path to the ground for all equipment and ESP structure shall be furnished. Each casing shall be provided with two earthing pads located on diagonally opposite corners of each casing. The pad surfaces shall be tinned drilled and shall be connected to earthing mat by 50x6 galvanised steel flats.

b) Manual safety earthing devices shall be furnished so that individual equipment can be grounded during maintenance. All access doors, gas distribution baffles or perforated plates located in the inlet or outlet nozzles of the precipitators shall have ground straps connected to the precipitators casing if they are not welded permanently to the casing.

27.12 Safety Interlocks

a) A full proof manual key sequence type interlock system for the safety of operating personnel from contacting energised high voltage equipment shall be provided. Key interlocks shall be provided such that for a particular ESP casing any TR set cannot be energised until all insulator housing compartments, disconnect switch boxes, casing inspection doors are locked and emitting and collecting electrode rapping motors are prevented from energisation. It shall also prevent opening of any inspection door unless all TR sets of that stream are de-energised and all HV disconnect switches are opened to earthed position. Rapping motors operation shall be prevented under this condition unless interlock is specifically defeated for testing.

b) Key interlock system shall be simple, robust, weather proof construction suitable for outdoor mounting.

27.13 ESP Control System

a) The control system shall be designed for automatic and manual local/remote operation.

b) ESPs serving one boiler shall be provided with a complete control system consisting of microprocessor based Electrostatic Precipitator Management System (EPMS), TR set controllers, rapper controllers, communication controllers, hopper heater controls, insulator heaters and pressurization system controls and all other controls required for safe, efficient and reliable operation.

27.14 Electrostatic Precipitator Management System (EPMS):

a) The EPMS shall be connected to the Transformer Rectifier Set Controllers (TRC) and Rapper Controllers (RPC) through duplicate data highway. However, any other standard, proven system of communication through balanced current loop is also acceptable.

b) EPMS shall accept the feedback analogue signals and issue control parameters to the TR Controllers and Rapper Controllers. It shall also control, monitor and display the status of each stream i.e. status of TR Controllers, Rapper Controllers, hopper heaters, hopper levels, insulator heaters/pressurization air blowers etc.

c) The EPMS shall include, but not be limited to, the following features:

(i) A PC based master controller with non-volatile memory and report storage capabilities for a period of 6 months.

(ii) TR Set Controllers and Rapper Controllers.

(iii) High resolution 21” colour CRT.
(iv) Communication ports and protocol for data transfer between EPMS Master Control Unit and the TRC/ RPC/ other controllers.
(v) Keyboard for operator interface.
(vi) Colour inkjet printer for alarms and reports.
(vii) Facility for Auto operation of ESP with Energy Management.
(viii) Necessary Input/ Output points for interfacing with distributed digital controls and Management information system (DDCMIS).
(ix) Self surveillance and self diagnostic features.

d) The EPMS display unit shall display at least the following:
(i) A summary of the status of all the controllers.
(ii) A summary of the readings of all the TR sets.
(iii) A summary about each TRC i.e. settings, limits, voltage and current readings, alarms and the controller status.
(iv) A summary of each RPC i.e. controller status, rapping frequency, alarms and indication of the rapper being operated.
(v) Status reading Energy Management System such as charge ratio of each field etc.
(vi) Necessary alarms as decided during detail engineering stage.
(vii) Status of hopper level, hopper heaters and insulator heater/ blower.
(viii) ESP TR set power supply status and alarm.
(ix) Potential free contact for ESP trouble shooting etc. as required shall be provided.
(x) The PC based master controller i.e. operating and monitoring station together with 21" colour TFT, keyboard and colour inkjet printer shall be located in the unit control and equipment room/ programmer’s room for each unit. Necessary links with the DDCMIS shall be provided so that all the functions of the master controller can be performed from operator’s work station of DDCMIS.

27.15 TR Set Controllers:
A separate free-standing control cabinet shall be supplied for each TR unit. It shall be designed to permit the control equipment to operate properly at ambient temperatures up to 50°C in a dusty indoor environment.

a) Each Transformer rectifier set shall be provided with a separate microprocessor based controller (TRC) for regulation and control of the electric power input to electrostatic precipitator fields.

b) It shall be designed for minimum charge ratio of 1:99.

c) It shall automatically optimise the charge ratio and maintain the spark rate at a suitable level for variations of gas temperature, dust composition, gas flow etc.

d) It shall regulate the rectifier in such a way, that the current through the electrostatic precipitator is corrected as the conditions for sparking are changed. It shall be able to monitor filter functioning and shall give an alarm when values are lower or higher than preset values.

e) It shall automatically regulate the charge ratio of each field/ TR set based on V-I characteristics of the respective electrical fields.
f) It shall have alternative arrangement of optimising the charge ratio based on Opacity Monitor signal also for monitoring dust emission in terms of mg/Nm³. The system shall include all devices, software necessary for computing Dust and shall be designed to operate with flue gas temperature between 100 to 200 degree C continuously.

g) The controller shall have proven noise immunity and shall be suitable for ESP application.

h) It shall be capable of maintaining the optimum voltage and current in ESP under all regimes of boiler operation.

i) Full-rated output load current shall be available over full output voltage control range.

j) A current-limit control adjustment shall be available over full rated current range. There shall be no interaction between this control circuit and any other automatic control circuit (e.g. average spark rate, or threshold sparking level).

k) Precipitator voltage control shall be fully automatic from 0-100% rated output. For testing and maintenance, an Automatic-Manual switch shall be provided with provisions for manually regulating voltage at the control cabinet.

l) Automatic voltage control system must be capable of reliable, stable operation, including precipitator sparking, over the full output control range. System must be capable of adjustment for continuous operation, automatically maintained at threshold sparking level up to low average sparking rates (e.g. 5-10 sparks per minute maximum). The controller shall be suitable for back corona, spark rate, semi-pulse control.

m) The system shall have the following minimum features:

   (i) Display unit for:
       - All the operating values like field DC voltages and currents
       - Spark rate
       - Semi pulse current limit
       - Voltage low limit
       - Charge Ratio
       - All other adjustable parameters and limits

   (ii) Keys for operator interface and potentiometers local control and adjustments.

   (iii) Serial communication with protocol for communicating to EPMS.

   (iv) Local / Remote Selection.

   (v) Spark Counter.

   (vi) Alarms as mentioned below:
       - TR set oil level low.
       - TR set temperature high.
       - AC current high.
       - Low DC voltage.
       - High DC voltage.
       - Back Corona.
       - Management command failure.
       - TR set Buccholz/ PRV trip.
       - TR set Buccholz alarm.

27.16 High Voltage Wiring
All equipment needed to connect the transformer-rectifiers to the discharge electrodes shall be provided. This shall include weather proof metal-enclosed bus ducts.

The bus ducts shall be furnished with all necessary insulators, fittings and gaskets and shall be formed to exact length and flanged for bolting to the precipitator.

A system for heating and ventilating the high voltage insulators shall be provided. Automatic control devices for the heaters shall also be provided. A stand-by fan shall be provided for each system.

27.17 Voltage Controls and Cabinets

A separate free- standing control cabinet shall be supplied for each TR unit. It shall be designed to permit the control equipment to operate properly at ambient temperatures up to 50°C in a dusty indoor environment.

All adjustments needed for normal operation of the precipitators shall be made at the control cabinets and shall not required e-energizing the bus sections.

Solid state control hardware shall be provided to determine and monitor the electrical performance and to automatically regulate the high voltage current to the TR sets.

Precipitator voltage control shall be fully automatic from 0-100% rated output. For testing and maintenance, an Automatic-Manual switch shall be provided with provisions for manually regulating voltage at the control cabinet.

Full-rated output load current shall be available over full output voltage control range.

A current-limit control adjustment shall be available over full rated current range. There shall be no interaction between this control circuit and any other automatic control circuit (e.g. average spark rate, or threshold sparkling level).

Automatic voltage control system must be capable of reliable, stable operation, including precipitator sparking, over the full output control range. System must be capable of adjustment for continuous operation, automatically maintained at threshold sparking level up to low average sparking rates (e.g.5-10 sparks per minute maximum). The controller shall be suitable for back corona, spark rate, semi-pulse control.

Suitable breakers, switches, indicating lights, system overload, under-voltage, high voltage ground return, key interlocks, alarm circuits control and/or protection systems, etc. shall be consistent with good industrial practice and in conformity with all applicable codes.

27.18 General Requirements

To ensure uniform gas flow and distribution throughout the ESP cross section, gas distribution screen system shall be provided at inlet and outlet section of the ESP.

The roof inspection floor of ESP shall be provided complete with patterned type (raised / teared drop) aluminium sheet cladding.

The minimum clear width of Platform and stairs shall be 900 mm. The stairways shall be arranged at one side of the ESP (with maximum slope of 37Deg. to horizontal) from ground...
level to the roof with all required handrails, toe plates etc. Minimum width of tread of stairs shall be 250mm and the rise shall not exceed 200 mm.

The ESP housing shall be of gas and pressure tight envelope. Necessary sealing arrangements to prevent moisture ingress into the casing shall be provided. The housing shall be provided with structural steel supports and shall be stiffened to withstand the system draft satisfactorily.

The ESP TR set lifting/handling arrangement shall consist of a monorail system, with an electrically operated hoisting system for operation from the ground level to ESP roof level. Special tools and tackles for adjustment and maintenance shall be provided.

The ESP design shall be envisaged as a single stream gas pass, with minimum 4No. field arranged in the direction of gas flow. Each field shall have independent HVTR sets with all associated electricals, controls, cables, panels, etc. All TR sets and field arrangements, “mechanically and electrically” shall be of identical design and arrangement.

The Transformer Rectifier (TR) sets shall be optimally sized and shall have the required electrical stability under sparking conditions.

Manufactured materials and sub vendor items shall be despatched to site, on an agreed delivery schedule programme of material supply. It is to be specifically noted that all the supplies shall be made in an acceptable sequence to facilitate smooth erection work.

The ESP sub deliveries and accessories components of similar duty shall be identical and interchangeable. This is also applicable for all mechanical and electrical systems.

For Insulation design conditions a differential temperature of min. 20°C between ambient and casing temperature and wind velocity of 0.25m/s shall be considered.

28.0 BRICKWORK, INSULATION AND CASING

28.1 The Contractor shall design and furnish all brickwork, insulating and other materials required for the complete setting including necessary stiffeners, supports etc.

28.2 All exposed boiler, economiser and flue gas duct surfaces shall be insulated with block insulation so that the surface temperature does not exceed 60°C.

28.3 The complete setting shall be air tight as will be evidenced by pressure decay test at site.

28.4 Suitable taps shall be provided for instruments.

28.5 Steam, feed water piping, various drain and blow down piping etc. shall effectively be insulated.

28.6 All insulated surfaces shall be covered with aluminium sheet as per details specified elsewhere.

28.7 Facility shall be provided for Nitrogen gas preservation with necessary valves, piping etc.

29.0 ELECTRICAL EQUIPMENT:

29.1 General specification for electrical equipment shall be as indicated in Electrical Design Philosophy (ITB Section 5.4).
30.0 Acid Cleaning:

30.1 Provision shall be made to facilitate acid cleaning of the pressure parts. Vents shall be provided for feeding acid and flushing after the wash. Diagrams of connections shall be furnished. All valves shall be furnished by Contractor. Steam requirement for acid and alkali cleaning for new boilers will be supplied by the Purchaser.

31.0 INSPECTION AND TESTING

31.1 Equipment shall be inspected by TPIA/IBR (as applicable). The Inspection and testing shall be in accordance with the relevant codes, standards, specifications. All equipment & bought out items shall be inspected during various stages of manufacturing starting from identification of materials to final completion as per agreed QAP which shall be prepared by Contractor and shall duly approved by Owner/ it’s authorised representative. In case of site fabricated/assembled equipment same inspection agency shall be responsible for inspection and testing at site. The guidelines for minimum inspection requirements are listed & also defined under Inspection & Testing clause of the design philosophy.

31.2 All testing accessories, measuring instruments including NDT testing equipment, etc. shall be arranged by Contractor.

31.3 When spot radiography is specified all T-joints & min. 10% of total weld length excluding T-joints shall be radiographed.

31.4 Radiography of welds in C- 1/2 Mo & Cr- Mo - Steel preferably is carried out after heat treatment.

31.5 Hardness test on welds of Cr-Mo, materials after final heat treatment shall comply to ASME requirements.

31.6 All completed equipment shall be tested hydraulically as per the requirements of specification/codes in presence of the inspecting authority. Pneumatic test of completed equipment shall be carried out only when specially mentioned in the specification sheets. Chloride content in water used for testing shall not exceed 30 ppm for SS equipment and 40 ppm for CS and low alloy steel equipment. Duration of test shall be 1 hour minimum. After hydro testing stainless steel vessels shall be dried thoroughly, immediately after draining to prevent the possibility of evaporation & concentration of chlorides.

31.7 When specified, equipment shall be dispatched from manufacturer’s shop filled with nitrogen at positive pressure, fitted with a pressure gauge and valve.

31.8 Equipment under preview of statutory bodies shall be inspected during various stages of fabrication by their authorised inspecting agency. It is the responsibility of the Contractor to get the design calculations and fabrication drgs. approved by concerned statutory bodies before commencing fabrication.

31.9 Unless otherwise stated gasket during testing shall be same as specified for operating conditions. After testing, gaskets used during testing shall be replaced by new gaskets.

31.10 The temperature of test water shall comply with the construction code, but not less than 70°C.
31.11 All SS plates shall be hot rolled & solution annealed and pickled as per applicable code requirement.

31.12 All forgings including nozzle flanges shall be examined for surface defects by MP/PT testing after machining as per code.

31.13 For equipment designed as per Power Boiler code ASME SECTION I, materials shall strictly comply with the requirements of the code. All material must be procured from well known recommended steel makers. All relevant and applicable documents & Drawings shall be approved by IBR.

32.0 FIRE PROOFING
32.1 Fire proofing, if required shall be considered as per OEM's recommendations.

33.0 PAINTING, MARKING & SHIPPING

33.1 Painting:

33.1.1 Painting shall be done as per TS-2001 attached in Construction/Erection, Pre-Commissioning, commissioning & Start-up ITB.

33.1.2 Structural steel which is to be fireproofed, if any, should not be provided with any shop coat.

33.2 Marking

33.2.1 Each supplied item shall be properly identified by Item No., Tag No., or Piece No.

33.2.2 Each bulk material not to be shop-assembled shall be properly marked with material identification.

33.2.3 Marking for erection at the job site shall be provided, and explained in the erection instructions.

33.2.4 Marking on austenitic steels shall be avoided. However, when this is unavoidable, marking material shall be by indelible ink or equivalent.

33.2.5 A nameplate, showing at least Item No., name of furnace, year of furnace erection date, supplier’s name, furnace duty, design pressure, design temperature and hydrostatic test pressure, shall be mounted on each furnace casing on the most accessible point.

33.3 Shipping

(i) All furnace components shall be dry, thoroughly cleaned and free from any dirt or foreign material before shipping.

(ii) All machined surfaces shall be coated with an easily removable rust preventive and suitably protected from damage during shipping.

(iii) End openings of tubing, etc. shall be plugged to prevent entrance of foreign materials.

(iv) When ferritic furnace coils are to be exported, suitable means for rust prevention of coil inside surface, such as enclosure of rust preventive materials or nitrogen into coils, shall be provided.
(v) Bolts, nuts and washers shall be shipped prior to or with first lot of structural steel.

(vi) All bolts, nuts, washers, etc. shall be shipped in kegs or crates and tagged as per size, diameter and length.

(vii) Complete care will be taken while shipping and transportation to avoid damage to fins. Temporary / dummy supports may be provided inside coils, harps to avoid their rattling during shipping/transportation to avoid damage with instruction for their removal before installation.

34.0 SPARES

34.1 Mandatory, Pre-commissioning & Commissioning spares shall be as recommended by LSTK Contractor and 2-Year operation (mandatory) Spares shall be as mentioned at Section-10 in ITB.

35.0 DOCUMENTATION SCHEDULE

35.1 Drawings & Documents shall be submitted as per “Documentation schedule” provided in Section-9 in ITB.
SECTION: VI – 5.3.8

DESIGN PHILOSOPHY – EOT CRANE & HOIST

PLANT: STEAM GENERATION PLANT

PROJECT: INTEGRATED COAL BASED FERTILISER COMPLEX, AT TALCHER, ANGUL DISTRICT, ODISHA (INDIA).

1.0 INTENT

1.1 Design, detailed engineering, manufacturing, shop testing & inspection, painting, supply, transportation to site, unloading and storage at site, load testing at site, final painting and Erection & commissioning, requisite statutory approval of Electric Over head Travelling Crane along with runway rails and supply of spare parts for crane as per the technical specifications, terms and conditions mentioned in this Technical Specification.

LSTK Contractor to provide EOT Cranes of adequate capacity in various Steam Generator Unit, Maintenance Bay, Pump Houses, Compressor & turbine House and other location wherever required for ease in operation and maintenance activities. Cranes to be provided in nearest multiple of 5 Metric Tonnes considering maximum weight to be lifted. Relevant Indian/ ISO Standards to be applicable for EOT Crane. The main hook capacity of each crane shall be minimum 25% over and above the heaviest component/ equipment to be handled. 15 T and above EOT cranes shall have 5T auxiliary hoist. All statutory guidelines to be complied by the contractor/ sub-contractor.

2.0 SCOPE OF SUPPLY & ERECTION

2.1 The scope of supply & erection shall be, but not limited to, the following:

2.2 CODES AND STANDARDS

The Design, manufacture, performance and testing of the EOT crane as specified herein after shall comply with the requirements of the applicable latest standards and
codes of practice. The latest standards with all amendments shall be followed in particulars.

IS:3177 code of practice for overhead traveling Crane and Gantry crane other than steel work crane.

IS:2365 steel wire suspension ropes for lifts elevators and hoists.

IS:807 code of practice for design, manufacture, erection & testing of crane and hoists.

IS:3443 crane rail section.

IS:3815 point hook with shanks for general Engineering purpose.

IS:800 code of practice for use of structural steel in general building structure.

IS:2062 weldable structural steel.

IS:3681 spur and helical gears.

IS:3734 dimensions for worm gearing.

IS:1364 precision and semi-precision, hexagonal bolts, screws, nuts and locknuts.

IS:816 code of practice for use of metal arc welding for general construction in mild steels.

IS:1181 qualifying test for metal arc welders.

IS:1323 code of practice for oxy-acetylene welding for structural work.

IS:3961 recommended current rating of cables.

IS:282 hard drawn copper conductors for overhead power transmission.

IS:2147 degree of protection provided by enclosures for L.V. switchgear and control gear.

IS:2959 contactors for voltage not exceeding 1000V AC or 1200V DC.

IS:2208 HRC cartridge fuse links for voltage above 650V.

IS:4047 heavy duty air break switches not exceeding 1000V.

IS: 5749 forged rams horn hooks.
The material of various components shall be in accordance with relevant IS or equivalent international standard.

3.0 GENERAL DESIGN REQUIREMENTS:

Whole supply & erection shall conform to the following standards and specifications except as modified herein:

The Vendor shall be responsible for complying with any other statutory requirements governing the work.

DESIGN OF MECHANISM

For the hoist mechanism of cranes electric motor shall be connected to the reducer through floating shaft and half geared couplings. Coupling of the output shaft of the reducer to single or double drum shall be by means of geared coupling.

BEARINGS

All running shafts and wheels running on fixed axle shall be fitted with sealed antifriction ball or roller bearings.

COUPLINGS

1. All couplings shall be gear couplings, except that rigid coupling may be used on long transmission shafts.

2. All couplings shall be of steel. Cast Iron shall not be used.

GEARINGS

All gear boxes shall be in totally enclosed construction and gears shall be spur or helical type with machine cut teeth suitably hardened and tempered and shall conform to AGMA standard. The surface hardness of pinion shall be between 255 to 300 BHN and for gear 217 to 255 BHN. Difference in hardness of pinion and gear must not be less than 20 BHN.

For Accurate fixing of unit mechanism (reducer, brakes, motor etc.) and as well as to exclude the possibility of misalignment while working, support surfaces shall be machined level.

TRACK WHEELS

In case where crane and trolley have more than four wheels, balancers shall be used.
The body of the balancer may be fabricated from steel plates or from cast steel.

BRAKES
Hoisting Motion: - The brake shall be automatic electro-mechanical or thrusters release brake applied directly to the hoist motor shaft.

Traversing Motion: - The traversing motion (CT) of every electric overhead travelling crane shall be fitted with an automatic electro-mechanical brake irrespective of traversing speed.

Capacity of hoist brakes shall be determined as follows:

\[ Mt = K \cdot M_{ct} \text{Kg-m} \]

where,

\[ M_{ct} = \text{Static Moment on the braking shaft, due to action of the load, considering the maximum efficiency of the mechanism.} \]

\[ K = \text{Co-efficient of reserve of braking, taking from following figures, corresponding to the class of duty of the mechanism.} \]

For light duty (Class I) \( K = 1.5 \)
Medium duty (Class II) \( K = 1.75 \)
Heavy duty (Class III) \( K = 2.0 \)

Manufacturer to consider Heavy duty co-efficient (K=2.0) of reserve of braking and shall be compliant to IS: 3177.

In case of hoist mechanism with two drives, each drive must have at least one brake. Co-efficient of reserve of braking of each brake is taken not less than 1.25, considering that the full load can be held by one brake.

In case where two brakes are used for each of the two drives co-efficient of reserve of braking must not be less than 1.1 for each brake.

Required capacity of braking in case of traverse and travel motions shall be 0.8 – 1.0 times the static moment on the respective braking shafts due to action of inertial forces, considering maximum efficiency of the mechanism.

Brake drums shall preferably be made of steel castings or steel forging.

HOOKS

Hooks shall conform to the relevant Standards.
The crane hooks shall be provided with spring loaded safety locking arrangement.

No repair work on hook made to shall be allowed without prior approval from purchaser.

MEANS OF ACCESS

Platforms: - An adequately guarded platform minimum 750 mm wide shall be provided on both sides for the full length of the bridge. All platforms and ladders shall have non-skid chequered plate treads and shall be provided with handrails and toe guards. Opening on guard railings for access from outside shall be provided with safety chains.
The access ladder to EOT assembly from G.L. shall be suitably located avoiding any hindrance to EOT travel.
LUBRICATION

All the grease points shall be brought to a safe and easily accessible place which shall be prominently displayed. All gear boxes shall be fully enclosed type prohibiting ingestion of outside dust, oil and moisture. Gear shall be compliant to AGMA/ IS:4460. There will be no centralised lubrication system.

BUFFERS

Bridge of crane and trolley shall be provided with buffers for soft dashing with end Stop. Buffers ends should be made of rubber or iron & wood.

Welding: Welding shall be in accordance with relevant Standards.

ELECTRICAL DESIGN

All electrical including electro-magnetic brakes, limit switches, cables, wirings, lightings etc. shall be in accordance with the Electrical Specifications enclosed.

4.0 SPECIFIC DESIGN REQUIREMENTS:

The Cranes shall be suitable for the duty conditions as given in the specifications sheets.

4.01 Material of construction must be well proven for the required services.

4.02 Cranes shall be suitable for outdoor installation but placed under the roof.

4.03 All gear boxes shall be fully enclosed type.

4.04 The rail and roller support for the flexible cable shall be designed for maximum reliability and minimum maintenance requirements. The roller supports shall be interconnected by flexible steel wire in order to protect the flexible cables against mechanical stress. DSL trolleys shall be provided with four wheels. Rollers should not require greasing.

4.05 Mechanical safety lowering brake shall be supplied by the Vendor which shall be capable of holding the test load in addition to electro hydraulic thrusters brake for all the hoisting motions.

4.06 The Vendor shall provide non-sparking type aluminium guards for couplings.

4.07 The Vendor shall, if required, provide a clearance certificate from a Competent Authority regarding following the safety rules and regulations.

4.08 All the Bearings shall be antifriction type. Bush Bearings are not acceptable.

4.09 1 No. rotary type and 1 No. gravity type limit switches will be provided for each crane/ hoist.
4.10 2 Nos. one way lever type limit switch will be provided for trolley and 1 No. anti-collision device and 1 No. one way type limit switch will be provided for LT.

Anti collision device will consist of 1 No. one way lever type limit switch and striker arm.

4.11 Micro speed arrangement on main hoist, CT and LT will be achieved through separate sq. cage motors, 1 No. thruster brake and planetary gear box arrangement.

4.12 **Installation**

The cranes shall be placed on rails at an suitable elevation of equipment/train building and shall be operated from pendant push-button boxes.

The flexible supply cables shall allow operation of the cranes in the full length of the equipment/train building.

---

5.0 **BATTERY LIMITS**

The following items are excluded from the supply from EOT Crane Manufacturer:

- Building structure including beams supporting crane rails.
- Gangways and ladders along building walls.
- Earth connection to gantry rails.

5.1 It is the obligation of the vendor / OEM to ensure supply of complete package of EOT Crane.

5.2 However, all requisite regarding supply, erection, commissioning covering wide spectrum of project shall be LSTK Contractor’s responsibility.

---

6.0 **EXTENT OF SUPPLY & ERECTION**

6.1 **General**

Supply includes Design, calculations and all materials and services needed for satisfactory and safe operation of the cranes including:

- erection on site
- pre-commissioning and start-up
- load testing which will be performed after erection.

6.2 The supply shall include but not be limited to:-

6.2.1 Design, engineering and fabrication.

6.2.2 The electrical equipment including isolator, flexible feeder cables/internal connection and the control system as per electrical specifications.
6.2.3 The roller supports, fixing material and rails for flexible supply cables.

6.2.4 Crane rails including support plates, cleats, etc. and electrical inter-connections for earthing of rails.

6.2.5 Mechanical stops and buffers for LT & CT motions.

6.2.6 Gangways and steps on the cranes but not on the building.

6.2.7 Workshop tests according to Clause No. 7.0

6.2.8 Painting according to brief specification as described in Article 9.0

6.2.9 The documentation in accordance with NIT/ITB.

6.2.10 The spare parts for 2 years operation as per NIT/ITB.

6.2.11 Inspection programme as per Clause No. 7.0

6.2.12 The name plate in the English Language with indication of max. Permissible load.

6.2.13 Alignment of sole plates, erection and alignment of rails, and down shop leads including supporting arrangement for DSL, wherever required.

7.0 INSPECTION, TESTING & REPAIRS

7.1 Inspection & Testing programme shall be furnished by the Vendor after placement of order for OWNER’S approval.

7.2 Inspection and testing shall conform to relevant standards.

Parts found defective or not conforming to the Standards as to workmanship or materials shall be rejected and replaced by the Vendor free of cost.

Waiving of inspection or acceptance of material or equivalent by the purchaser shall not relieve the manufacturer from the responsibility of furnishing material or workmanship in accordance with the relevant Standards.

All welding shall be carried out by qualified welders. Manufacturer shall furnish evidence acceptable to Third party Inspector of qualification tests of welders as required by relevant Indian Standards. All welding shall be subject to inspection by TPI, who will have the option to call for radiography or other non-destructive examination of welds to check soundness.

The main bridge girder shall be completely radiographed and radiographs produced. However, butt welds of bridge girder will be 100% radiographically tested on tension zone and 25% at random on compression zone.
7.3 **TESTS AT MANUFACTURER’S WORKS**

All electrical and mechanical equipment shall be tested in accordance with the appropriate Standards at either the crane maker’s or the equipment manufacturer’s works and test certifications shall be furnished.

The cranes shall be tested at manufacturer’s works under no-load. Travelling gear may be run light to check shaft and gear alignments.

**TESTS AT SITE**

For testing of electrical installation, refer Electrical Specification.

**Test for Operation:**

After the supply has been connected, and before the complete crane installation is put into commercial service, tests shall be carried out to prove the following:

- Satisfactory operation of all motors under no-load conditions.
- The satisfactory operation of each controller, switches contractor, relay and other control devices and in particular the correct operation of all limit switches under the most unfavourable conditions:
  - The correctness of all circuits and interlocks and sequence of operation.
  - The satisfactory operation of all protective devices:
  - The satisfactory operation of each motion of the cranes.
  - The compliance of the crane with the specified performance requirements: and
  - Tolerance on specified speeds at full load shall be with $\pm 10\%$.

7.4 **DEFLECTION TESTS:**

The deflection test shall be carried out at site with the safe working load at rest and with the crab in a central position. The measurement shall not be taken on the first application of the load. The datum line for measuring the deflection shall be obtained by placing the crab on the extreme end of the crane span with smaller hook approach.

7.5 **OVERLOAD TESTS:**

After tests but before the crane is put into service, it shall, with overload relays approximately set, be tested to lift and sustain a minimum test load of as per codes & standards requirement.

During the overload test each motion in turn shall be manoeuvred in both directions and the crane shall sustain the load under full control. The specified speeds need not be attained but the crane shall show itself capable of dealing with the overload without difficulty.

8.0 **PREPARATION FOR SHIPMENT**

8.1 Each transport unit shall be suitably prepared for shipment, properly braced and loose parts secured to prevent damage during shipment. All material
shipped shall be properly marked with the item number for which it is intended by means of a metal tag.

8.2 The vendor shall give all information concerning the protection needed for preservation of the equipment.

9.0 **PAINTING**
Painting shall be as per manufacturer standard and appropriately chosen for owner’s site condition.

10.0 **SPARES**

10.1 All erection, pre-commissioning & commissioning spares including spares consumed during testing / PGTR till handing over the plant to owner shall be supplied by LSTK Contractor free of cost. Any unused commissioning spares shall be owner’s property.

10.2 Mandatory spares shall be supplied by the LSTK contractor as per NIT.

10.3 LSTK Contractor to also furnish separate recommended list of 2 years operation & maintenance spare part list along with budgetary offers, valid for 2 years from the date of submission of offer for owner’s consideration.

   Recommended spares and their quantities should take into account related factors of equipment reliability, effect of equipment downtime upon production or safety, cost of parts and availability of vendor’s service facilities around the proposed location of equipment.

10.4 Detail List of special tools & tackles shall be furnished by the LSTK bidder along with the bid and shall be in scope of supply of the LSTK contractor.

11.0 **DRAWINGS AND DOCUMENTS:**
The drawings, documents and data to be supplied after placement of the order shall be as per NIT.

12.0 **GUARANTEE:**
The crane shall be guaranteed by the supplier to be of accepted design, free from inherent defects in either workmanship or materials and to safely handle its rated capacity load without any undue deflections on its structure or mechanism. Any part proving defective within the warranty period shall be replaced free of charge by the Vendor.

12.1 **Performance Guarantee:**
The cranes with its drives and other equipment shall be tested at site to verify the electric consumption, various speeds, deflection and other performance figures guaranteed by the Vendor. Noise levels at 1.0 M distance from package machine’s surface shall not exceed 85 d B(A).

</table>
1.0 SCOPE

1.1 The scope includes work/service for the complete design, engineering, manufacture, testing at works, supply of all electrical equipment, dispatch, storage, handling, erection, testing at site and commissioning of complete electrical system required for ‘Steam Generation Plant along with its Associated Utility facilities’.

Although every item of supply and/or installation might not have been described, the LSTK Contractor shall supply anything and everything to complete the project.

1.2 This specification shall be read in conjunction with all drawings and documents attached and other relevant reference as specified therein.

1.3 The scope of work/services of LSTK Contractor shall comprise complete electrics of the Steam Generation Plant along with its Associated Utility facilities. The scope of work/services shall broadly comprise but not limited to the following:

1.2.1 Design & detailed engineering, Coordination, General Services etc

a. Basic as well as detailed engineering.

b. Preparation of drawings/document to suit Project implementation schedule. Preparation of drawings/documents/calculations/formats/test reports/test certificates; Erection, Testing & Commission Manuals/Operations & maintenance Manuals/Reports/QAP etc for approval/Review/reference/record and/or for any other requirement; submission to Owner/Consultant in requisite sets, getting approval from Owner/Consultant, making approved copies available to manufacturers, inspectors, erection & commissioning engineers, supervisors, owner/Consultant etc as required in requisite sets well before those are actually required by them to fulfill their obligations.

c. Design, manufacture, testing of equipment/cables/cable trays/earthing and other erection materials etc at manufacturer’s works, submission of documents with manufacturer's test reports/type test reports to Owner/Consultant prior to inspection call.

d. Quality Assurance at each stage of manufacture including procurement of raw materials/bought out items and arranging inspections by Owner/Consultant/third party.

e. Obtaining dispatch clearance from Owner in writing.

f. Packing, loading, forwarding, delivery at site/store, loading/unloading, storage as per manufacturer's recommendation; shifting from stores and handling in store as well as at site for erection.

h. Arrangement of testing/checking instruments/kits/sets/apparatus with valid calibration certificates issued by duly accredited laboratories/institutions, to carry out tests stipulated in specification and documents referred therein/other applicable standards.

i. Deputing electrical contractors, supervisors' electricians, cable jointers etc. on full time basis for carrying out electrical work.

j. Conducting pre-energisation tests to ensure that installation is fit to be energized.

k. Erection shall not be considered complete unless pre-energisation tests are carried out, results are tabulated & submitted to owner/consultant and results are found satisfactory.

l. Conducting functional/pre-commissioning checks/Cold trial runs; no-load & load tests,

m. Commissioning the installation.

n. Conducting Performance Guarantee tests and taking corrective steps (inclusive of replacement of equipment/materials if required) till results are satisfactory/acceptable.

o. Conducting Pre-Acceptance Tests/checks and tabulating the results/observations
p. Liquidations of defects/ discrepancies/ observations noted during erection, pre-
energisation tests, commissioning, trial runs, performance guarantee tests, Pre-
acceptance tests/ checks etc.

q. Submissions of all final/ ‘As built’ drawings/ documents after incorporation of changes
made in soft as well as hard copies, duly certified by LSTK Contractor to the effect that
those are ‘Final’ and/ or ‘As built’

r. Conducting Final Acceptance Tests/ Checks

s. Co-ordinate with the Owner/ Consultant, other contractors/ agencies working at site as
required for proper, smooth and timely execution of work/ implementation of the project
t. Preparation of drawings/ documents, applications for getting the installation inspected
and approved by Electrical Inspectorate of state and/ or Central Electricity Authority and
all coordination for getting the installation approved for energisation & use. Carrying out
all modifications/ alterations required by statutory authorities. All expenses on these
activities shall be carried out and borne by LSTK Contractor. The obligation of owner
shall be limited to
  − Signing of application as owner of installation and
  − Payment of fee for inspection of installation.

Approved drawings and certificates shall be submitted to the Owner/Consultants well
ahead of schedule so that the actual commissioning of equipment does not get delayed
for want of inspection and approval by the Electrical Inspectorate and other statutory
bodies. The actual inspection work by the Electrical Inspector shall be arranged by the
LSTK Contractor and necessary coordination and liaison work in this regard shall be the
responsibility of the LSTK Contractor.

1.2.2 Manufacture, testing at works, getting inspected by owner and/ or their consultant/ third
party, packing, transportation and delivery to site in well packed condition, insurance during
transit and till commissioning & handing over, storing at site as per recommendation of
manufacturer/ supplier/ direction of supervising engineer of Owner/ Consultant until required
for erection, transportation to work place. Erection, testing & commissioning, handing over of
complete electrical system of ‘Steam Generation Plant’ (hereinafter referred as Plant in
short) comprising, but not limited to :
a. Boiler Control panels and all electrics associated with the boilers and associated
   systems.

b. Emergency DG sets including automatic mains failure (AMF) panels to meet all
   emergency and essential loads of Plant, including providing power to all auxiliaries for
   emergency shutdown.
   All DG Sets shall have provision for Black Start condition.

c. Bus Ducts
d. Transformers viz.
   − 11/3.45 , 11/0.433 kV, 3.3./0.433 V Transformers, as required
   − Lighting Transformers
e. Switchgears:
   − 11 kV / 3.3 kV ICOG Panel, as required
   − 11 kV Switchgears/ switchboards, as required.
   − 3.3 kV Switchgears/ switchboards, as required.
   − DG power Distribution Board.
- 415 Volt Switchgears/ switchboards including PCCs, PMCCs, MCCs, EPMCCs MLDBs, ASPBs, LSDB, PDB, Junction boxes etc. as required.
  - Local control Panels, Local Control stations, Switch Sockets.
  - Variable Frequency Drive Panels, as required.

f. 11kV, 3.3kV, 415V Motors and other special application/ voltage motors as required.

g. All Cables viz
  - Power Cables (11kV, 3.3kV and 1.1kV)
  - Control Cables,
  - Earthing Cable
  - Signal cables,
  - Optical fibre cables
  - Data Cables
  - Communication cables
  - Special application cables

h. Erection/ installation & all sundry materials for installation, testing & commissioning of equipment/ panels/ fittings/ cables (including jointing & termination of cables) comprising (but not limited to) following:
  - Foundations,
  - Brackets, support structures, erection materials & accessories, as required
  - Cable trays, racks, pipes, ducts, cable channels etc as required.
  - Testing checking kits/ instruments

i. Illumination system - Normal, emergency and evacuation lighting

j. Aviation lighting

k. Neutral grounding, NER.

l. Earthing and equi-potential bonding of equipment & structures.

m. Protection against lightning.

n. 110V DC Batteries, battery chargers and DC distribution boards as required.

o. 115V AC UPS System with batteries & UPS Power Distribution Boards for Instrument.

p. 240V AC UPS Panels with batteries & UPS Power Distribution Boards for Electrical

q. Complete Electrics for Boilers/ steam generating units, turbines with auxiliaries.

s. Complete Electrics for Air Conditioning and Ventilation systems.

t. Complete Electrics for Chemical Dosing System

u. Complete Electrics for fire fighting system, 

w. Plant Communication system

x. Cathodic Protection System.

z. Public Address System for Plant and Hook-up of same with Centralised Public Address System.

aa. Fire Detection & Alarm System for Plant and Hookup of same with Centralised Fire Detection & Alarm System.

bb. Cable trench/Cable tray with supporting structure.

cc. Fire fighting systems for Electrical Equipment/ Panels by gas flooding.

dd. The scope shall also include the erection, testing, commissioning of above equipments.

The contractor shall clear the site after commissioning of the equipments / system and obtain the Site Clearance Certificate from owner’s Engineer-in-charge

e. Any and all other Materials, Equipment and Services so as to make a totally integrated and functional system together with all accessories and associated equipment, ensuring safety, maintainability and reliability in compliance with all applicable codes, standards, guidelines, statutory regulations and safety requirements in force.

ff. Any other equipment, not specified, but required for safe, proper, trouble free and efficient operation of the system

gg. LSTK Contractor shall consider any other requirement which is not covered in this NIT, but required for successful operation of the plant.

hh. Spares & consumables for complete electrics as follows:

- Commissioning Spares (as per Clause No. 20.0 of Design Philosophy-Electrical) and Spares for 2 Years operation (Mandatory/Insurance) for all equipments (as per Section 10.0: Spare Parts) shall be supplied by the Contractor as part of LSTK contract.

- LSTK Contractor shall recommend 2 years Operational Spares for all the equipment (item-wise) with recommended quantity & unit price with validity of 2 Years. The same shall not be part of LSTK price.

- Spares and consumables required and first oil fills including short fall during erection, testing, cold trials, commissioning, performance evaluation tests, guarantee tests etc and till handing over of installation.

ii. Tools & Tackles.

jj. Testing Equipments/ instruments

kk. Arranging services of major equipment suppliers during installation and commissioning.

ll. Training of Owner’s Personnel for Operation & maintenance of the Plant.

mm. Any and all other items/ facilities/ services not specifically mentioned but essential/ required for completeness of the systems/ equipments/ facilities

1.4 Normal power supply shall be tapped from two numbers of 11KV feeders at Owner’s Main Receiving substation and further distribution shall be in LSTK Contractor’s scope.

For Emergency power LSTK Contractor shall provide DG System complete in all respect alongwith DG Power Distribution Board. However, Bidder shall indicate the details of Emergency Loads in the bid.

1.5 This design philosophy contains specifications of the major equipments to indicate the basic requirement and serve as a guideline. However, it shall be the responsibility of the contractor to offer a complete quality electrical system of superior quality, even if the specifications of certain items are not given. The items for which technical specifications are not indicated herein shall be of IS/IEC standard and specifications of these shall be subject to owner’s approval in case of order.
1.6 The bidder shall offer the best and proven most suitable type of energy efficient equipments manufactured by well known reputed manufacturers having proven performance track record of minimum 2 years, as per vendor list appended in this bid package. However for the sake of standardization of the electrical equipment and material used for the electrical installation, the LSTK Contractor shall supply all items of a particular type or make for whole plant of the same manufacturing company for ease of maintenance and less spares inventory.

1.7 1 No. 11 kV Feeder (rated for 2 MVA) at Existing Substation near 132 KV Switchyard shall be made available for Construction Power. Tapping of Construction Power (on chargeable basis) from this feeder (including supply & erection of all required materials like structural supports for cable tray, cable trays, power cables, control cables, protection & metering, cable termination etc. as well as underground cabling work) and further distribution shall be in LSTK Contractor's scope.

Bidder shall ensure that the minimum power factor of 0.9 shall be maintained at their end by providing suitable power factor improvement devices.

LSTK contractor shall have to distribute construction power with adequately rated distribution and sub distribution boards/feeder pillars, power supply cables and other associated materials for feeding loads to carry out construction and fabrication activities at his own cost.

Bidder shall indicate details of construction power in the bid with month-wise breakup for the entire duration of project.

However during non availability of construction power, LSTK contractor shall have to arrange emergency power, if required, through DG set at their own cost.

1.8 Contractor shall provide adequate area lighting at site of construction, fabrication yards, storage yard and office etc. by means of suitable lighting fixture, lighting masts, flood lighting poles etc. which are to be supplied and maintained by the contractor as per safety aspect.

1.9 Electrical system studies like Load Flow Study, Short Circuit Study/Electrical Fault Analysis, System Stability Studies under transient and steady state condition, Motor Starting Study, Relay Co-ordination & Relay Settings, Overvoltage study etc. of the entire electrical installation of ‘Steam Generation Plant shall be conducted by the LSTK Contractor using latest software preferably ETAP at appropriate stage of design-engineering. Same shall be done by the reputed and well established Third Party and Electrical equipment of Plant shall be designed and selected accordingly.

All the Electrical equipments shall be designed and selected according to the Short Circuit Study Report.

LSTK Contractor shall submit the study Report in two stages i.e. preliminary and final along with all the necessary calculation for Owner/Consultant’s approval/comments. All equipment Rating to be finalised only after necessary approval and supply / modification in any equipment shall be done accordingly without any cost and time implication.

LSTK Contractor shall provide all editable ETAP working files latest version with complete library/Backup, during design engineering as well as after completion of project. Also, LSTK Contractor shall explain the complete ETAP Study in detail at Owner/Consultant’ office upto their full satisfaction.

In case equipment is ordered before studies are completed and revision of rating or design is required as a result of study then inclusion of such revisions shall be in LSTK Contractor’s scope without any cost and time implication.

Final ETAP editable file along with library and base files and final ETAP study Report shall be provided by the LSTK Contractor.

1.10 For control, monitoring, load management, data logging and printing of status of all important electrical equipment and feeders, a Programmable Logic Controller (PLC) based Load Management System (LMS) shall be provided by Electrical Distribution System (EDS) LSTK Contractor. However, LSTK Contractor has to provide the required multifunctional dual
channel transducers (Only where Current Data is critical and used in process control), Digital Multi-function Meters, latest version numerical/Communicable type protective relays with non-volatile memory, comprehensive unit providing protection, metering, control & communication with communication port & interlinked with Online Energy/Load Management System and required microprocessor based devices if any in panels, communicable door mounted Motor Protection Relays in all motor feeders of PMCC & MCC, proper communication facility in supplied UPS, Battery Chargers, VFD, Soft starter, DG sets, MOV and other critical equipment for proper communication with LMS / DCS system. The interface of electrical equipments with LMS / DCS shall be through IEC 61850 communication protocol for Numerical relays and IEC 61850/Modbus for Multifunction Digital Meters, Motor Protection Relay (MPR) and other equipment, Ethernet communication module shall also be used. 100% redundancy shall be provided for communication i.e. the relay should have minimum 2 Nos. IEC-61850 communication port in addition to Front Port.

LSTK Contractor shall provide separate room for local LMS equipments (Data Concentrator Panels, OWS, EWS, PC console, chairs, furniture etc.) in substations of Steam Generation Plant. Provision of future expansion of Data Concentrator Panels etc. shall also be considered while designing separate room.

1.11 The scope shall also include obtaining all required statutory approvals from all statutory bodies. Contractor shall carry out all modifications/alterations required by statutory bodies. All approvals for permanent installations shall be obtained in the name of Owner. Approval for equipment & installation for Construction Power shall be in LSTK Contractor’s name.

1.12 In case of any discrepancies between Design Philosophy – Electrical and Technical Specification of equipment/item/work in respect of description of equipment/item/work, the details indicated in the Design Philosophy – Electrical shall prevail.

1.13 Final location of equipments as well as route of cable trays shall be rechecked in 3D modelling.

1.14 All electrical equipments installed in the areas classified as hazardous shall be certified for such use by a recognized certifying authority such as CIMFR Dhanbad / PESO, Nagpur etc.

1.15 All electrical works associated with the followings but not limited to, shall be considered

a) Steam generating unit  
b) Fuel oil system  
c) Turbine oil purification systems  
d) Piping valves and specialties  
e) Ventilation system  
f) Coal Handling System, Limestone Handling System  
g) Ash handling system including dry fly ash storage silo area auxiliaries etc. including ESP (Electro Static Precipitator) .  
h) Air conditioning systems  
i) Chemical Dosing System.  
j) Fire fighting system,  
k) Fire protection system  
l) Diesel generator sets  
m) Cranes, Hoist, elevators/Industrial Goods Lifts  
n) Pollution control and monitoring equipment  
o) Stack  
p) All auxiliary building & associated electrical building/rooms.

1.16 Following Integrations are envisaged presently in scope of LSTK Contractor;

- Protection for outgoing feeder of 11 kV Switchboard at Main Receiving Substation to LSTK Contractor Switchboard (Inter tripping, Cable Protection etc.
- Hook-up and Seamless Integration with Centralised Fire Detection & Alarm System.
- Hook-up and Seamless Integration of Centralised PA System.
However, any other interface and Seamless Integration requirement or any other unforeseen which may arise during detailed engineering/execution stage, same shall also be in the LSTK Contractor’s scope without any cost and time implication.

1.17 All the substations shall be provided with following equipment:

- CO₂ fire extinguishers (4.5 litre capacity) as per applicable NFPA.
- Synthetic insulating mats on front and back side of the switchboards. (LV as well as HV) as per latest IS.
- Framed single line diagram in Aluminium frame with glass.
- Do’s & Don’t chart as per Indian Electricity Rules in Aluminium frame with glass.
- Shock treatment chart written in English and Local language duly framed and approved by engineer-in-charge.
- Caution boards / dangers boards written in ENGLISH & HINDI for all the voltage levels.
- CPR (CARDIO PULMONARY RESUSCITATION) Charts.
- High Voltage / Low Voltage danger signage (Skull & bones).
- Exit Route / Emergency Exit Route Signage.
- Earthing rod.- Minimum 1 No. for each Voltage level.
- Sets of Sand buckets with stand (each with at least 3 sand buckets) for substations and transformer yards.
- HT discharge rod.
- HT and LT hand Gloves (3 Sets each for each substation).
- A Type FRP ladder 3 feet & 8 feet – 2 no each type for each substations.
- First Aid Box

Other requirement or any other unforeseen which may arise during detailed engineering shall also be in LSTK Contractor’s scope

2.0 BASIS OF DESIGN

2.1 General

2.1.1 The electrical installation shall be designed to provide:

- Necessary amount of power
- Flexibility
- Service reliability
- Ease of expansion
- Ease of operation and maintenance & inter changeability of equipment
- Safety of personnel

The design of electrical installation shall ensure provision of a safe, efficient and reliable supply of electricity at all times including adverse system conditions. Safe conditions shall be ensured under all operating conditions including those associated with start up and shut down of plant as well as those arising out of failure of electrical equipment. The isolation of part of system of electrical equipment due to either maintenance or shut down shall not compromise safety aspects.

2.1.2 The design of electrical installation shall ensure provision of a safe and reliable supply of electricity at all times. Safe conditions shall be ensured under all operating conditions including those associated with start up and shut down of plant as well as those arising out of failure of electrical equipment, climatic conditions like lightning and earthquake etc. The isolation of part of system of electrical equipment due to either maintenance or shut down shall not compromise safety. All electrical equipments shall be of proven design and technology.

System shall be designed considering following aspects in general:
To facilitate inspection, cleaning and maintenance with the care to safety in operation and personnel protection.

To minimize turnaround time.

To provide safety, reliability and flexibility of service.

Adequate provision for future extension and modification.

Maximum interchangeability of equipment.

Desired level of operator interface to achieve coordinated efficient and fail-safe operation, data logging and maintenance of the equipment.

To decide redundancy, stand by, spares and overload capacities to achieve desired reliability and flexibility requirement.

To get cost effective and techno commercially proven technology. Economic considerations shall cover capital and running costs and an assessment of the reliability of the system.

2.1.3 All the electrical consumers within the battery limit shall be identified and listed to have complete details of rating, efficiency, power factor, operating duty cycle (continuous, intermittent, standby), category of supply required (emergency, normal, critical) etc.

2.1.4 Required redundancy (based on specific process/operating needs) shall be built in substation which feeds power supply to process units/important facilities so that in case of tripping of one feeder, the unit may not be adversely affected and continuity in operation at full capacity is achieved.

2.1.5 While sizing the system necessary consideration shall be given to restrict the system voltage drop within permissible limits during starting of large rated motors. At the same time, the short circuit current shall be kept within limits keeping in view of the market availability of switchgears rating. For this purpose current limiting reactors/unit ratio transformers if required may be used.

2.1.6 LSTK contractor while performing design and engineering activities shall adhere to following guidelines.

a) If any equipment is not covered in this design philosophy but required for successful operation of the project, LSTK contractor shall prepare additional specifications for equipment or bulk material taking reference of Indian/International Codes and good engineering practices prevalent in fertilizer industry and obtain owner’s approval for the same.

b) The standard drawings attached with this package define the basic system design and distribution philosophy for the package. This is for guidance purpose only. LSTK contractor shall develop detailed drawings and submit for owner’s approval.

c) LSTK contractor shall be responsible to verify the rating and consider providing equipment with adequate rating but not less than the specified rating. Compliance should be without any extra cost and time implications.

d) LSTK contractor shall consider any other requirement which is not covered in this bid package, but required for successful operation of the plants without any extra cost and time implications.

e) Contractor shall obtain approval from all statutory authorities such as Central Electricity Authority (CEA)/Electrical Inspectorate, Chief Controller of Explosives (CCoE), CPCB etc. for all electrical facilities including electrical switchboards & panels supplied and installed by LSTK contractor.

f) LSTK contractor shall assist in Liaison and in all interface coordination with contractors of other units of project at construction, erection, testing & commissioning phase for any common facility and for smooth execution.

g) Equipment specification sheet/data sheets for all equipment shall be prepared by the contractor based on relevant codes and Technical specifications/ Data sheets attached.
as reference. Data sheet shall contain all technical data and information which are essential for review and technical acceptability, detailed engineering, installation, testing, repair and maintenance, replacement etc.

h) Contractor shall clearly specify in their purchase specifications the requirement of conducting special tests/type tests, which are envisaged for various electrical equipment which shall have no impact on cost and time.

i) Bidder shall must visit the site and collect all relevant information required for designing of complete system before quoting. Bidder shall make themselves familiar with the work actually involved and actual site conditions. Failure to do so shall not absolve the Bidder of their responsibilities based on adverse site conditions.

j) All the electrical equipments shall be of proven design and technology.

k) Normal & Emergency Load details (rating of all motor, Lighting, Switch socket etc.) load shall be submitted.

l) If VFD is provided in BFW Pump and FD/ID Fans, There shall be provision for by-pass facility. It shall be possible to start the motors in DOL mode through by-pass system in case there is any problem/fault in the VFD. The Electrical system and the process design should have necessary provision to start & operate the Motors in fixed speed (without VFD) without affecting the normal operation of the Boilers.

m) Load Summary shall be prepared by LSTK contractor to determine ratings of electrical equipments (DG set, transformer, switchgears, cables etc.), to evenly distribute plant loads among the various substations and switchgear, and to evaluate the need for power factor correction. All calculation shall be necessarily reviewed/approved by Owner/Consultant.

Motors, heaters etc. shall be designed as per Section 4.0: Design Basis of NIT.

The maximum normal running load and the peak load shall be calculated as follows:
Maximum Normal Running Load = (100% of sum of all continuous load) + (40% of sum of all intermittent loads or largest intermittent load, whichever is higher).

Peak Load = (100% of sum of all continuous load) + (40% of sum of all intermittent loads or largest intermittent load, whichever is higher) + (20% of sum of all standby loads or largest standby load, whichever is higher).

Electrical System shall be designed for continuous Peak Load operation.

Note: If electrical motor is stand-by to non-electrical driven equipment (for e.g. turbine driven equipment), then in such case standby motor shall be considered as continuous load.

All the electrical equipments shall be designed / sized considering motor input power (i.e. BKW divided by motor efficiency).

Margin for future requirement shall be as per clause 2.1.6 n over the above.

Line loss of 2% to be considered for equipment sizing.

Minimum P.F. shall be maintained as 0.95 at every voltage level.

All the electrical equipments like Transformers, DG Set, Switchboards etc. shall be suitable for starting of the largest motor, while other loads are running, considering peak load condition.

n) Electrical equipments i.e. DG Set, Transformers, Switchgears, MCCs, PCCs etc. shall have capacity for future requirements. The Margin shall be as follows:

i) DG Set sizing: 25% is added to the Maximum Emergency Load.

ii) HV Transformer: 25% is added to the Continuous Peak Load.

LV Transformer: 30% is added to the Continuous Peak Load.

iii) Switchgear: Switchgear bus bar current rating as well as breaker shall be equivalent (nearer or higher standard rating size) to full load current of upstream Transformer.
iv) Switchboards and MCCs fed from other switchboards: Shall be rated for 125% of peak load.

o) The actual fault levels shall be arrived at on the basis of incoming power source, transformers, contribution of motors, etc.

p) Prospective touch and step voltages shall not be adverse to the stipulations of relevant publications of Bureau of Indian Standards / IEC/IEEE-80.

q) Sizing calculations for all the electrical equipments shall be submitted for review/approval, in case of award of order. Owner/Consultant’s Comments, if any on the same shall also be considered and modification in any equipment shall be done accordingly, without any price implication.

r) Seismic zone as applicable shall be considered for design of all electrical equipment.

2.2 Load Grouping

Electrical consumers shall be classified as 'normal / non-essential, emergency / essential or vital / critical' loads as per the concepts defined below:

2.2.1 'Emergency' or 'essential' loads shall be identified on the criteria that, when failing in operation or when failing if called upon, will affect the continuity of operation, the quality or the quantity of product. For such loads, reliable source shall be ensured. Such feeders shall be grouped on a separate bus section in the respective Switchboards/ MCCs / PCCs.

2.2.2 Some of the loads which can be identified as emergency / essential load but not essentially limited to following:

- Electrical loads required for continuous operation of process plants utility in case of normal supply failure.
- Electrical loads required for safe shut down of facilities in case of normal supply failure.
- Emergency lighting & communication facilities.
- Fire Detection and Alarm System.
- AC & DC UPS / Battery charging equipment.
- Control room AC equipment -Essential ventilation system for offices / Manned areas of other buildings.
- Motorised valves as per process requirement
- PA & Paging system.
- Barring gear
- AC Emergency Lub Oil Pump
- I.D. Fan Lub Oil Pump
- F.D. Fan Lub Oil Pump
- A.C. Seal Oil Pump
- Compressors
- Flame Scanner Cooling Air Fan
- Any other load (To be indicated by LSTK Contractor )

2.2.3 Critical' or 'vital' loads shall be identified on the criteria that, when failing in operation or when called upon, can cause an unsafe condition of the installation, jeopardize life or cause a major damage to the installation. For critical loads if any, UPS shall be provided to facilitate uninterrupted supply. The loads on UPS are AVR / PLC / DCS / Auxiliary supply for drives etc. Critical drives if any shall be provided with DC motors.

2.2.4 Some of the load which can be identified as critical / vital load but not essentially limited to following:

- Loads providing control and protection to plant equipment.
- Loads serving critical equipment for safety of plant, equipment and / or personnel
2.2.5 Non-essential service is a service, which is neither 'essential' nor 'vital'. Hence the non-essential load does not require any special measure such as standby feeder or standby source to safeguard the continuity of service.

2.3 **Statutory requirement Codes and Standards**

2.3.1 The design, installation, testing & commissioning shall conform to compliance of following statutory requirements:

- Indian Electricity Act
- Indian Electricity Rules
- The Indian Factories Act
- The Indian Explosives Act.
- Indian Boiler Regulation Act
- Statutory requirement of Govt of Odisha and Govt. of India.
- Guidelines, instructions, directions issued by Pollution control Boards of state as well as central government. Guidelines, instructions, directions issued by Chief Controller of Explosives (CCoE), CPCB, CMRI, DGMS, CEA etc.
- Guidelines of Tariff Advisory Committee
- Any other applicable Rules/Acts/Regulations.

The design, installation, testing & commissioning shall be in accordance with established codes, good engineering practices and latest versions of following documents valid/applicable on the date of acceptance of bid. The stipulations in these documents shall be considered as minimum requirements:

- Indian Standard Specification or equivalent IEC Standards
- Publications of IEEE
- API Standards
- National Electrical safety Code(NESC)
- Standards of Underwrites laboratory(UL)
- American Society for Testing Material (ASTM)
- American National Standards Institute (ANSI)
- Other International Standards

LSTK contractor shall be responsible for obtaining necessary statutory approvals from all the statutory bodies/authorities e.g. Electrical Inspectorate, PESO (earlier CCoE) as applicable before commissioning of electrical facilities. The CEA clearance for electrical equipment and components thereof shall be obtained by the contractor.

LSTK Contractor shall carry out all modifications / alterations required by all statutory bodies. However, necessary statutory fee shall be deposited by the Owner.

2.4 Some of the bare minimum relevant Indian Standards are as listed below. However, system/equipment design shall be in line with latest edition of all applicable standards.

IEC 61131 Programmable controllers

IEC 60871-1 /IS 13925 Shunt Capacitors for AC power Systems Specifications

Any other standard may be followed provided it is equivalent or more stringent than the standards specified above.

2.5 In case of any conflict/deviation amongst various documents the order of precedence shall be as follows:

- Statutory rules/regulation
- Design Philosophy
- Data sheets
- Technical specification/Installation Standards, etc.
- Applicable IS/IES standards

In case of contradiction / conflict among documents and statutory requirement, LSTK Contractor shall refer to Owner for clarification. However, most stringent specification shall be followed with Owner’s approval. Owner decision shall be considered as final.

2.6 Site Conditions

The equipment shall be designed for the following site conditions:-

- Minimum ambient Temperature 1 deg.C
- Maximum ambient Temperature 46 deg.C
- Design Reference Temperature 50 deg.C
- Relative Humidity 100%
- Altitude above mean sea level Lower than 1000 Mtrs.
- Atmospheric pollution Dusty due to presence of Coal Dust & Urea Dust and corrosive due to presence vapours of Ammonia.

Equipment/ cables selected shall be derated for (a) higher ambient temperature, (b) restriction in temperature rise (c) variation in voltage, (d) variation in frequency (e) installation conditions viz. proximity to heat sources, bunching, layering, separation from others/ laying in conduits etc. with respect to the conditions for which it was designed & manufactured. Various de-rating factors considered shall be informed with supporting documents.

Equipment to be installed in MCC rooms/ Electrical Rooms/ Control rooms shall be designed for + 50° C so that in case of failure of Air-conditioning/ ventilation facilities, the operation/ functioning of equipment is not be affected.

3.0 AREA CLASSIFICATION.

3.1 The hazardous zones within the project area shall be classified according to the requirement of IS/IEC. The bidder shall furnish area classification drawing with Technical part of the Bid.

PESO approved Hazardous Area Classification Drawing shall be submitted during detailed engineering.

3.2 All electrical equipments installed in the areas classified as hazardous shall be certified for such use by a recognized international certifying authority such as CIMFR earlier CMRI, Dhanbad. The item shall in addition bear the valid certification from PESO (earlier CCoE) and also the manufacturer shall hold a valid Bureau of Indian Standards (BIS) license.
For those items where overseas OEM vendor will supply the electrical equipment certificate from international authority can be accepted but the certification shall be approved by PESO (earlier CCoE), Nagpur India.

3.3 The electrical equipment for hazardous areas shall be selected as per IS-5571 and petroleum rules and Gas group shall be selected based on the approved hazardous area classification drawing. The minimum requirement is summarized below:

<table>

**Notes:**

The electrical equipment for hazardous areas shall generally be suitable for gas group IIB and temp classification T3 as applicable to the selected type of explosion protection. In case of hydrogen or hydrocarbon mixtures having more than 30% hydrogen, the gas group to be considered shall be IIC.

As additional safety features, the following requirements for electrical equipment shall be followed:

1. All electric motors for agitators/mixers and metering pumps handling flammable material shall be flameproof type (Ex-de) irrespective of the area being classified as zone-2 or zone-1.
2. All electric motors for vertical sump pumps handling flammable material shall be flameproof type (Exde).
3. Irrespective of the area classification (whether zone-1 or zone-2), all lighting fixtures within the storage areas shall be flameproof type (Ex-d).
4. Irrespective of the area classification (whether zone-1 or zone-2), all motors and lighting fittings within the pump house near the offsite tank farm and within the loading/unloading gantries shall be of flameproof type (Ex-d).
5. All emergency/critical lighting fixtures and associated junction boxes in hazardous areas (whether zone-1 and zone-2) shall be flameproof type (Ex-d).
6. Even though fired heaters in process units are not considered for area classification, all electrical equipments associated with fired heaters in process units shall as a minimum be suitable for installation in Zone-2 area.
7. Where air conditioning system is designed considering ammonia as refrigerant, the room housing air conditioning equipment shall be adequately ventilated to classify it as safe area. For additional safety the following shall be considered:
   - 100% standby system for ventilation
   - Location of MCC/local panels in adjacent separate room.
   - Instrumentation to be flameproof type or hermetically sealed.
   - AC plant room motors with type‘e’ protection.
   - Lighting in AC plant room suitable for zone-2 area.
8. Building such as Compressor sheds inside the process area shall be designed to allow adequate ventilation to allow area classification as Zone-2. Lighting equipment, EOT
crane etc. in the shed shall be flameproof type (Ex-d). All other electrical equipment shall be suitable for Zone-1 or Zone-2 area depending on extent of hazard.
9. All HV motors for hazardous area Zone-1 shall preferably be flameproof type (Ex-de). Pressurised motors may be provided in exceptional cases.
10. Ex-n motors without pre-start ventilation as permitted by Indian Standard unless any other type is specified by Process Licensor, shall be provided, except for the following cases as listed below:
   - HV motors for Centrifugal compressors (As Ex-n motors are not recommended for use for such applications as per IS/IEC-60079-15 and therefore Ex-de or Ex-p motors shall be provided for these applications)
   - For motors in Zone-2 areas having frequent start/stop requirements e.g. EOT cranes/Elevators, MOV actuators etc., Ex-de motors shall be used.
11. For Zone-2 areas, motors with ratings above 100kW having average starting frequency of more than one per week, Ex-n motors with pre-start ventilation provision or Ex-de or Ex-p motors shall be used.
12. Ex-p motors shall be used for large rating motors where Ex-de or Ex-n motors are not available.

4.0 SYSTEM DETAILS AND UTILIZATION VOLTAGES

4.1 The various voltage levels for in plant power distribution shall be as follows:

<table>
<thead>
<tr>
<th>A. Normal Power</th>
<th>11KV ± 5%, 50Hz ± 3%, 3Ph, 3 W</th>
</tr>
</thead>
<tbody>
<tr>
<td>B. Emergency Power</td>

</table>
4.2 Electrical System Studies

4.2.1 Contractor shall carry out following minimum Electrical System Studies using latest software preferably ETAP and the result of the same shall be furnished.

- Load Flow Studies
- Short Circuit Studies
- Motor Starting Studies
- Relay Co-ordination and Relay settings.

Electrical Equipment shall be designed as per worst operating conditions.

4.2.2 The actual fault levels shall be arrived at on the basis of incoming power source, transformers, contribution of motors, etc. and shall be indicated in the Bid.

All switch boards of the same voltage shall be rated for identical fault level. Minimum fault level to be considered for design and selection of equipment shall be as follows:

- 11 kV Switchgear – 40KA for 3 Seconds.
- 3.3 kV Switchgear – 26.24KA for 3 Seconds.
- The fault level for 415V switchboards shall be 50KA for 1 sec.

Impedance of transformers shall be selected suitably (tap position at principal) without comprising voltage drop at receiving end.

11KV/0.433KV or 3.3KV/0.433KV Transformer rating shall not be more than 2000kVA.

Fault level of DC System shall be decided by the LSTK Contractor after substantiating the same by calculation.

4.3 System Earthing

The neutral of 11 KV and 3.3 KV systems shall be non-effectively earthed through resistance. The earth fault current of 11 KV and 3.3 KV shall be limited to full load current of the transformer or 400 A, whichever is less.

The neutral of 415V supply system shall be solidly earthed.

The DC system shall have positive pole earthed through high impedance. Prospective touch voltage earthing shall comply with the requirements of relevant Indian/IEC standards.

5.0 POWER SUPPLY AND DISTRIBUTION.

5.1 Power supply from 11 KV switch board in Main Receiving Substation to substation of Plant

5.1.1 2 Nos. 11 kV Feeders shall be made available in 11 kV Switchboard at Main Receiving Substation. Tapping of power supply from 11 kV Switchboard at Main Receiving Substation (including supply of all required material), structural supports for cable tray, cable trays,
cables, cable termination etc. shall be in LSTK Contractor’s scope. Further distribution to equipment at 11 KV, 3.3 KV, 415/240 V, 115 V (UPS) AC, 240 V (UPS) AC, 110 V DC etc. through proper type and size of cables, their supply, erection, testing and commissioning etc. shall be in LSTK Contractor’s scope.

LSTK Contractor shall consider 11kV/3.45kV, 11kV/0.433kV or 3.3 kV/0.433kV transformers for downstream distribution. The supply system shall be designed for maximum power requirement of the plant. Double radial system of power supply, each suitable for 125% of full load shall be followed for entire plants.

LSTK Contractor shall indicate details of power requirement and the Rating of 11KV Feeders at Main Receiving Substation in the Bid.

5.1.2 In the event of failure of normal power in the plants, the plants shall be brought to safe shut down condition through Emergency power. Emergency power shall cater to the load of emergency lighting, UPS system, battery charger, motorized valves, Fire alarm system, PA & Paging system in addition to the process loads for safe shutdown of the Plant and wherever required as per detail design.

The emergency power shall be arranged through suitably 125% rated DG Set. Emergency Power shall be tapped from DG Distribution Board through cables (Supply, installation, testing, commissioning shall be in LSTK Contractor’s scope). Further distribution to all emergency equipments etc. including transformers shall be in LSTK Contractor’s scope.

The capacity of DG Sets shall be finalized by the LSTK contractor to meet the emergency power requirement of Plant alongwith its Associated Utilities and internal consumption of the DG Sets keeping a margin of 25% over the actual requirement. DG Sets & Diesel tanks shall be located at centralized place at a minimum safe distance from substations as per relevant IS/IEC of hazardous area classification. Further distribution to all emergency equipments through proper type and size of cables, their supply, erection, testing & commissioning etc. shall also be in LSTK Contractor’s scope.

DG Sets shall be suitable for starting of the largest emergency motor.

DG Sets shall be of continuous duty.

DG Sets shall be suitable for Black start.

In the event of plant black out and/or sustained under voltage on Emergency Switchboard(s), Diesel Generator set shall be started automatically.

After restoration of normal power, provision of automatic stopping of DG Sets after synchronization (Load transfer without Break) with time delay shall be provided as well as bypassing of same shall also be provided. In case of bypass, manual control of DG sets shall be from DG Control Room. Restoration of normal power, stopping of DG shall be done from the DG Control Room. DG room shall have adequate space to house Emergency Power Distribution Switchboard. The DG sets shall have provision of starting and stopping and monitoring of all parameters through LMS.

Further distribution to all emergency equipments of Plant at required voltage shall also be in LSTK Contractor's scope.

Normally DG sets will not run in parallel with Main (Grid) power. But for Load testing and load sharing requirement, DG sets should have the facility and required Control /Protection to Run the DG sets on with parallel to the Grid for continuous basis.

DG Set shall be of continuous duty. The auxiliary load shall be minimised.

DG Set shall be located inside building. The building shall have RCC Roof.

5.1.3 The electrical system layout and interconnections (power as well as control) shall be such that the problem in electrical system of one plant should not affect the electrical system of other plant and vice versa.
5.1.4 The insulation system of cable, 11 KV & 3.3 KV equipments shall be based on unearthed system only.

5.1.5 Each incoming feeder shall be sized for 125% load of the switch board. The outgoing feeders shall be sized for the nominal load. Breaker rating of all the outgoing feeders of 11KV switchboards & & 3.3 KV switchboards shall be same considering provision of interchangeability.

5.1.6 Primary connections of transformers shall be provided with cables of suitable size and secondary connections shall be through cables/bus duct.

5.1.7 The entry of cables in the switchboards shall be from bottom only.

5.1.8 All switchboards shall be provided with minimum two incoming feeders and one bus tie having auto/manual changeover facility.

5.1.9 It shall be possible to have momentary paralleling of power sources at 11 KV, 3.3 KV switchboards and 415V PMCC /PCC/MCC and trip the desired circuit breakers.

5.1.10 The normal operation of the 11 kV, 3.3 kV Switchgears, Power & Motor Control Centre (PMCC) and Motor Control Centre (MCC) shall be as under:

i. Bus-coupler shall be provided between all the sources. Incomer and Bus-coupler breaker rating shall be same for all the switchboards. Each incoming feeder shall independently feed the loads on respective buses with full rated bus tie breaker open and the load on each bus balanced. In order to ensure maximum degree of reliability and continuity, automatic transfer from one incoming feeder to other shall be possible through auto/manual closing of bus tie breaker in case of sustained loss of power on any bus section.

ii. The bus tie breaker shall be provided with auto/manual selection. The bus tie breaker shall be independent in manual mode. In auto selection mode, the bus tie breaker is electrically interlocked with incoming circuit breakers, so that it cannot be closed unless one of the incoming breakers is open.

iii. When one of the incoming feeder trips, the bus tie breaker is closed automatically based on the philosophy described and the total load is transferred to other healthy incoming feeder which is capable of carrying the entire load. Sufficient switchgear capacity is to be provided. Time for changeover is suitably selected based on downstream system requirement of reacceleration of motors etc.

iv. Auto Change Over scheme shall be provided for incomer feeders and bus coupler feeder of 11kV switchboard, 3.3kV Switchboards and 415V Switchboards. Under normal operating conditions, incomer-1 and incomer-2 breakers shall be closed and bus coupler breaker shall remain open with ‘Local-Remote-Off’ switch in ‘Remote’ position. The bus coupler breaker shall close automatically under the following conditions being fulfilled:

- Either of the incoming breaker trips due to under voltage (70% or below).
- Voltage on the healthy bus is more than 80% for the set period.
- Residual voltage on the bus with no power supply comes down to 30% or below.

Required nos. of bus PT, line PT and under voltage relays shall be provided to achieve the desired automatic changeover.

v. Auto transfer shall take place only on sustained loss of power on either of bus sections. Auto transfer shall be blocked in case of fault on either of bus sections or no power on both incomers.

vi. Paralleling of two incoming feeders is not foreseen. However, facility for momentary paralleling shall be provided for intentional changeover without interruption of supply with synchro check relay in Bus Coupler panel. There shall also be provision of selective tripping of one feeder out of three feeders with a Delay (two incoming feeders and one Bus Coupler).

5.1.11 HV emergency board shall also have 2 normal and 1 emergency incomer. EPMCC shall have 2 Nos. Normal Power Incomers & 1 No. Emergency Power Incomer feeding critical
load of plant whereas PMCC & MCC shall have 2 Nos. Normal Power Incomers feeding non-
critical loads. DC Battery Charger, UPS System etc. shall be fed from EPMCC. PMCC shall
fed breaker controlled feeders and various power feeders whereas MCC shall fed contactor
controlled load and various power feeders. PMCC and MCC shall be separate.

5.1.12 Auxiliary Services Power Board (ASPB) having essential bus (to be fed from Emergency Bus
of EPMCC) and nonessential bus (to be fed from Normal Bus of EPMCC) shall be provided
in the plant for supplying power to welding switch sockets, lighting load, EOT crane and
other auxiliary loads.

5.1.13 Separate MCCs be provided for air conditioning and ventilation systems.

5.1.14 For the use of the Owner during plant shut down period, each area shall be provided with
indoor type feeder pillar, which shall be located in a separate room other than substation
building and away from hazardous area. The feeder pillar shall be fed from the 415 V
switchboards (PMCC) of the nearby substation. Each feeder pillar shall comprise of 1 No.
630 A 4 P MCCB incomer, 2 Nos. of 250 A TPN MCCB outgoing feeders, 2 Nos. 125 A TPN
MCCB outgoing feeders and 4 Nos. 63 A TPN MCCB outgoing feeders. Other construction
details shall be as per specification of sheet steel distribution board (PC150-TS-0808).

Location of feeder pillar shall be decided during detailed engineering.

5.2 **Instrumentation Power**

5.2.1 The power supply for instrument shall be 115V, 1Ph from UPS System.

5.2.2 Provision for 240V, 1 Ph power for lighting of instrument panels shall be provided from
LSDB.

5.2.3 All instrument panels shall have two UPS incomer supply (one from different bus of UPS
DBs) to avoid any type of power obstruction in case of failure of one supply.

5.2.4 Separate 240VAC UPS System shall be provided to feed MCC control supply, Control Room
(to meet 250 lux in case of UPS Supply only) & Substation lights (30% of total light) , LMS
Equipment, Fire Detection & Alarm System etc. This UPS System along with associated
Battery (Ni-Cd) and UPS distribution Board shall be located at Substation.

5.3 **Lighting Distribution**

5.3.1 In each substation a Main Lighting Distribution Board (MLDB) shall be in provided. MLDBs
shall have two incomers from PMCC through 415/433 V Lighting Transformers. Two Incomer
of MLDB to be fed from two separate Bus section of PMCC. However, in other areas the
Lighting Distribution Boards shall receive power from MLDB. One third lighting load shall be
connected to the emergency power (DG Source) to provide emergency light during failure of
normal power. Both the MLDB Incomers and Incomers of other LSDB (excluding field
mounted LSDBs) shall have Metering facility with Digital communicable Multi-function
Meters.

Both the lighting transformers feeding MLDB and their respective circuit breakers shall have
same rating. Both the lighting transformers shall be designed for 100% load of MLDB.

33 % of total light of plant excluding Substation & Control Room shall be fed from

10% of light or required Number of lights for safe evacuation at strategic locations, whichever
is higher, shall be used as panic light (110V DC), in case of complete shutdown for the
plant area excluding Substation & Control Room.

5.3.2 The both normal and emergency section of Main Lighting Distribution Board shall have
separate Sections of busbars for indoor and outdoor lighting. Indoor / Outdoor bus Sections
shall be connected by means of suitably rated contactor operated through photo-cells /
digital clock timer.
5.3.3 Manual by-pass circuit for outdoor lighting shall be wired up to a switch located in Electrical control room / shift office, so that outdoor lighting can be switched ON or OFF manually to bypass the automatic switching.

5.3.4 All outdoor lighting fixtures and outside lighting of Sub-Stations, Offices, Control Rooms etc., shall receive power from outdoor lighting bus.

5.3.5 All Lighting fixtures / electrical equipment in Analyzer room shall be flame proof type.

5.3.6 Main Lighting distribution board shall feed Lighting Sub Distribution board having 63A 4 Pole MCB and ELCB as incomer, 16Amp DP MCB and ELCB as outgoing. The outgoing ELCB shall have rating of 300/100 mA. Six, Nine or Twelve way Lighting Sub Distribution board shall be used having 30% as spare outgoing MCB feeder.

5.3.7 Welding outlets shall be fed from ASPB having 3 phase supply for welding connection. All welding outlets shall be provided with CBCT ELCB of 100 mA.

5.4 DC Power

5.4.1 110 V DC system shall be provided for control of circuit breaker feeders and panic lighting. It shall be obtained from Ni-Cd batteries. Separate dedicated Battery, Battery Charger and DC Distribution Board shall be provided in each substation.

5.4.2 The battery shall be provided with SCR controlled automatic rectifier-cum battery chargers and shall consist of Main Float cum Load charger, Standby Float cum Load charger and Boost Charger and 2 Nos. Battery Bank each of 60% capacity (of 5 hours backup at 100% capacity) with isolation facility for ease of operation & maintenance.

5.4.3 Each rectifier-cum-battery charger shall have independent power supply to be fed from the emergency source.

5.4.4 Each Substation requiring 110V DC shall have 2 sources with auto changeover facility in case of failure of 1 source.

5.4.5 DC Battery Charger, AC UPS and HVAC for control room shall be fed from emergency switchboard.

5.4.6 Battery end cell voltage shall 1.1V. Aging factor shall considered 125% and spare capacity shall have 120%.

5.4.7 For Temperature derating factor shall be based upon Minimum Ambient Temperature i.e. 5°C.

5.4.8 Battery Charger shall have at least 20% extra capacity for future load requirement. Battery Charger shall have 110 V DC system.

5.4.9 Separate Rectifier-Cum-Battery Charger with DC Distribution Board and Battery Bank shall be provided for each Substation.

5.4.10 The battery and charger combinations shall be such as to ensure continuity of D.C. supply at load terminals without even momentary interruption.

5.4.11 AC Ammeter and AC Voltmeter on Charger Input; DC Ammeter, DC Voltmeter for charger output/ battery voltage and on demand type Battery Charge / Discharge Ammeter shall be provided.

5.4.12 For all other specifications of Battery Charger, refer PC150-TS-0813.

5.4.13 For all other specifications of Battery Bank, refer PC150-TS-0814.

6.0 SUB-STATION

6.1 Elevated with trays in cable cellar : Yes

6.2 Air-conditioned room for operator : Yes

6.3 Roof slab for
6.12 The Sub-Stations shall be located near the load centres but away from hazardous areas as per IS/IEC. Actual size of substations shall be based on the final dimensions of substation equipments. Each Substation shall include Maintenance room, Engineer Room, Shift Office (Staff Room), Gents toilet (both Indian and western WC), Ladies toilet (both Indian and western WC) etc.

6.13 The sub-station building shall have double storey construction. The ground floor shall have cable gallery and first floor shall have all switchboards, control panels etc. The switch room shall have Kota stone flooring. False ceiling shall be provided in VFD room, staff room & Engineers room.

6.14 The cable gallery shall have a minimum clear height of 2.2 M (i.e. lowest cable tray should run at a height of 2.2 mtr. from finished floor level of cable cellar) and shall be closed on all 4 sides with two entries, preferably on opposite sides. It shall house all cable trays and their supports

6.15 Transformer floor shall be at least 300 mm above the finished floor level of cable cellar room.

6.16 In addition to the entry to substation for operating personnel, a separate entry of minimum 3.5M (H) X 3M(W) with rolling shutter shall be provided for all equipment entry. The rolling shutters should be manually operated with gear box. The Sub-station shall also have an emergency door opening outwards.

6.17 Sub-station wall adjacent to the transformer bays and walls separating transformers shall be 355 mm thick (inclusive of plastering) in case of brick construction or 240 mm thick in case of RCC construction upto roof slab. RCC roof slab shall be provided for Transformer, Series Reactor, capacitor and Cathodic Protection Equipment. The gate of Transformers shall be designed to prohibit bird entry.

6.18 Adequate number of Portable Fire Extinguishers of Dry Chemical Powder and Carbon dioxide shall be provided in suitable location in Substation, Transformer bays, Control room building and DG Building etc. These extinguishers will be used during the early phase of fire to prevent its spread and costly damage.

All extinguishers shall be supplied with initial charge and accessories as required.

Portable type extinguishers shall be provided with suitable clamps for mounting on walls or columns.

All extinguishers shall be painted with durable enamel paint of fire red colour conforming to relevant Indian Standards.

Dry chemical powder type extinguisher shall conform to IS: 2171.

Carbon Dioxide type extinguisher shall conform to IS: 2878.

6.19 Sub-station building shall be without any columns within the switchgear room to ensure optimum space utilization.

6.20 The layout of equipment shall be such that it shall have adequate space for installation, operation, maintenance and future expansion. The clearance of equipment from the
walls/other equipment shall be adequate to ensure safety of working personnel. Generally the following norms shall be maintained for 33/11 KV/3.3 KV/415 V Switchboards:

a) The clear space of 2.5 M at rear side of 33/11kV/3.3 kV Switchboard.

b) A clear space of 1.5M behind the double front switchboards and 1M for single front.

c) A clear space of 3.0M between the two boards facing each other.

d) A clear space of 2.5M on either side at entrance/exit.

e) A clear space of 2.0M between two boards in same line after future panel space of switchboard.

f) A clear space of 1M in switch room from top of equipment.

6.21 The substation Switchgear Room, UPS & Battery Charger room, LMS room, Maintenance room, Engineer Room, and Shift Office shall be fully air conditioned through HVAC with (n+1) system, however all the equipment shall be suitable for operation under specified ambient condition even on failure of air conditioning system. The substation shall have HVAC system so that the temperature inside the substation is maintained at 25 Deg.C in all conditions. Provision for remote alarm on failure of air conditioning system shall be provided. Indication of substation and control room temperature shall be provided. Heat load to be calculated on the basis of heat generation in the substation during peak summer period. Fire damper to be provided in the ventilation duct of the HVAC. There should be a separate room for installation of the HVAC Units located at ground floor.

6.22 Epoxy flooring shall be done to reduce the heat load and improve the aesthetic look.

6.23 The battery room shall form a part of the sub-station. Battery room shall be provided with minimum two flameproof exhaust fans and louvered opening in opposite wall/door. A sink with water tap shall be provided with water connection. Eye wash shower shall also be provided. Floor of the battery room and walls up to 2 M height shall have acid/alkali resistant protective epoxy coating. Light fittings, exhaust fan, on/off switches etc. in this room shall be chemical resistant type and flame proof type.

6.24 Location of battery charger shall be nearer to battery room.

6.25 To the extent possible Bus duct shall be in straight position. Bending of bus duct shall be avoided.

6.26 Staircases (with SS Handrail) and other rooms shall be paved with Kota stone.

6.27 Fixed type glass ventilators on all sides shall be provided near the ceiling height for natural lighting.

6.28 Arrangement shall be provided for lifting heavy equipment to be brought into the sub-station.

6.29 Sufficient nos. of entrances (min. 2) shall be provided for each floor.

a. All doors of sub-station shall be air-tight fire proof steel doors except doors of control rooms/ PLC rooms which may have anodised aluminium frame with toughened glass panel. All doors shall open towards exit.

b. Windows shall have anodised aluminium frame and provided with toughened glass.

c. In case height is more than 10 meters, elevators (of capacity for 10 persons) shall be provided. Elevator shall be suitable for the area of installation.

d. 1000 mm wide insulated rubber mat of appropriate voltage grade shall be provided in front as well as rear of each panel.

6.30 The Sub-stations shall also have an emergency door opening outwards.

6.31 The sub-station shall house all the electrical power, control and monitoring equipment except those required for operation in the field. The equipment shall broadly include the following:

- Transformers located in separate Bay/Room.
- High Voltage Switch Boards
- Power Control Centres
- Power & Motor control centres
- Emergency Power & Motor control centres
- Motor Control Centres
- Auxiliary Service Panel Boards
- Lighting Transformer (Indoor / Outdoor as per requirement)
- Main Light Distribution Board
- Lighting Distribution Boards
- Lighting Sub-Distribution Boards
- Battery Sets
- Rectifier-Cum-Battery Charger
- DC Distribution Boards
- Rectifier-inverter Sets
- UPS System alongwith UPS distribution board.
- Neutral Earthling Resistors (Indoor / Outdoor as per requirement)
- Input / Output Panels
- VFD System
- Any other equipment required

6.32 All static devices such as Rectifier-Cum-Battery Chargers, Variable Speed Drive Panels, Soft Starter etc., shall be housed in a separate room. Heat load for panel to be taken by panel manufacturer.

6.33 Separation walls between transformers in all substations and safe inter transformer distances for switchyard transformers shall be provided.

6.34 Transformers shall be located in bays adjacent to the sub-station building. All bays shall have oil drained floor, surfaced with gravel or other suitable material.

6.35 In order to prevent leaking oil from reaching and polluting the water bearing stratum, transformers shall have the following provisions, depending on the oil capacity of the transformer.

    Oil Capacity up to 2,000 litres:
    Transformers installed adjacent to sub-station shall be provided with oil soak pit with a layer of pebbles of about 40 mm granulation.

    Oil Capacity exceeding 2,000 litres:
    Transformers installed adjacent to sub-station shall be provided with oil collection pit and sump pit as per Drg. No. PC150-PDS:E 114 for draining away of any oil, which may escape or leak from the tanks, to a waste oil tank.

6.36 A clear space of at least 1.5 meters shall be maintained all around the transformers after installation of Nitrogen Fire Protection & Extinguishing System etc. Nitrogen Fire Protection & Extinguishing System complete with piping as required shall be separate for each transformer.

6.37 Separate common oil pits are required for Transformers.

    The volume of common oil pit will be 125% of the volume of oil of the transformer, which contains the largest volume of oil in transformers.

    The oil pit will be closed type of water-proof concrete construction.

    The oil pit will be connected to individual pit under each transformer and drain line of each transformer will be at least 150 mm dia pipe with a minimum slope of 1:96 as per TAC Regulation.

    Transformer fire/drainage of oil will be considered for only one transformer at a time.
Level of pit will be so selected that there would not be accumulation of oil/water/oil-water mixture in the pit under each transformer.

Pit shall be provided with 2 x 100% sump pump for common oil sump. 1 No. Portable sump pump shall also be provided.

Oil Pit under Transformer and its Cooler Bank: Gravel filled open oil pit will be provided under each transformer and its cooler bank. The pit shall be such that it can take oil/water surge of 20% of the volume of the transformer oil. Level of pit shall be such that there will not be accumulation of oil/water in the pit. The gravel size will be 60 mm. Each pit will be connected to the drain line leading to new common oil pit.

6.38 In all substations/MCC rooms, space for future extension of switchboards shall be provided. Two panel extension space on each side (for each bus section) shall be provided for all HV Switchboards, PCCs. One panel extension space on each side (for each bus section) or two panel extension space on one side (in exceptional cases) shall be provided for all PMCCs, MCCs and ASPBs.

In addition, space for future extension of the substation/MCC room building shall be considered. Substations shall have provision for future expansion Minimum 5 Mtrs space for future horizontal expansion.

6.39 Fire protection for substations shall be provided to comply with requirements of relevant BIS (Bureau of Indian Standards) and other Indian/International standards, as applicable. In case Indian standards are not available for any equipment, standards issued by IEC/BS/VDE/IEEE/NEMA/NFPA or equivalent agency shall be applicable.

In case of contradiction/conflict, most stringent specification shall be followed.

Substations shall be provided with smoke detectors and fire alarm system as specified elsewhere in the ITB and as per relevant Indian Standard.

6.40 Fire barriers shall be provided at cable/bus-duct entry/exit point. Cable shall have fire protection paint for 1 m length at building entry points for above ground cables.

7.0 PROTECTION & METERING

7.1 Selection and co-ordination of protection and metering system shall be such as to ensure:

- Selective, sensitive and reliable protection of equipment against damage due to internal or external faults or atmospheric discharge.
- Isolation of fault in the shortest possible time.
- Simplicity of the scheme with maximum protection.
- Uninterrupted operation of healthy system.
- Personnel & plant safety.

7.2 Protective relays shall be of latest version, numerical / communicable type with non-volatile memory, comprehensive unit providing protection, metering, control and communicable with communication port for interlinking with online energy/Load Management System. 100% redundancy shall be provided for communication i.e. the Relay should have minimum 2 Nos. IEC-61850 communication port in addition to Front Port. Numerical Relay shall have communication on IEC-61850 protocol in redundant mode and meters shall have communication on MODBUS protocol.

7.3 Numerical relay shall indicate MWH, MVAR, MVA, V, A, Hz, PF. It shall have future provision for connecting with substation HMI. Separate multifunction meter with communication (for centralized energy monitoring) shall be used and shall not be part of protective device.

7.4 Relays shall support features like remote relay parameterization, disturbance recorder etc. It shall be possible to set/operate the relay from the front facia. Lock out relay shall be conventional type with hand reset facility.

7.5 Contractor shall supply licensed (lifetime) software along with required communication cables for Parameterization and viewing of disturbances, events, etc. through Laptop for all
Make and models of Numerical relays. 1 No. Laptop complete (8GB RAM, 1 TB hard Disk, latest processor) with all required software shall also be provided.

7.6 Special protection if required for any feeder such as differential, restricted earth fault, directional distance power relays etc. shall also be through numerical relay having serial port for monitoring.

7.7 In general all protection shall be through microprocessor based numerical relay. However high speed tripping relay shall be separate.

7.8 All Auto-changeover logic to be built in Numerical Relay. Numerical Relays shall have sufficient I/O to cater the same and there should be minimum 10 % spare I/O for future use. External I/O Card/ Module are not acceptable.

7.9 All Process Stop and other important Parameters shall be routed through Numerical relays for recording and Time-stamping. Hardware Annunciator is not required. Common Audio Visual Alarm for each Bus section of Switchboard shall be provided through Numerical relays.

7.10 Bare minimum protection for power distribution system shall be as indicated below. However, LSTK contractor shall provide any other necessary protection required for complete protection of system:

Protection devices for power distribution system shall be as indicated below (Figure inside bracket refers to note below) (YES – Applicable)

Notes for Relay Protection Philosophy

1. All the numerical relays shall be of communicable type and connected to LMS on IEC 61850 (Ethernet based) communication protocol with time stamping and time synchronization.

2. In case of HV switchboards with continuous parallel operation of incomers, following additional relays shall be provided:
   a. One set of 87B (Bus differential) and 95 B (Bus wire supervision) for each bus section.
   b. 32 (Directional IDMTL over current and earth fault) relays for the incomers.

3. In case of grid power supply EHV incomer following additional relays shall also be provided:
   a. Relay 21 for distance protection, Relay 59 for overvoltage protection with timer, Relay 67 for directional over current protection, Relay 67N for directional earth fault protection, Relay 81 for under frequency / df/dt protection and Relay 98 as dead bus charging relay.
   b. Minimum protection relays for EHV Transformer shall be 50, 50N, 51, 51G, 51N, 63TX, 64R, 86, 87T, 87F & 95.

4. Instantaneous earth fault (50N) shall be provided only for transformer with delta primary.
5. Directional IDMTL earth fault (67N) shall be provided for transformer with star primary.
6. For transformers rated 5 MVA and above.
7. For motors rated 1500 kW and above, excluding VFD fed motors.
8. For critical/long feeders and plant feeders connected to main power generation and distribution bus. A plant feeder implies outgoing feeders from one switchboard to another switchboard of same voltage level.
9. Wherever auto-transfer feature is provided.
10. For switchgears where continuous or momentary paralleling of incomers is envisaged, check synchronizing relay shall be provided.
11. 51G and 64R relays for input transformer of VFD system shall be decided by VFD Manufacturer.
12. The bus tie feeders in HV switchboards shall be provided with 51, 51N, 86 and 95 relays.
13. HV capacitor bank feeders shall be provided with 51, 51N, 59 (over voltage), 60 (Neutral displacement), 86 and 95 relays.
14. The following feeders shall be provided with timers for delayed tripping on bus under voltage while the under voltage relay shall be common for the bus
   a. HV and MV capacitor feeders.
   b. HV and MV breaker controlled motor feeders.
   c. Contactor controlled motor feeders with DC control supply.
   Numerical relays where ever provided for motor and capacitor feeders shall use in built under voltage relay and timer for delayed tripping on bus under voltage.
15. One no. DC supply supervision relay (80) shall be provided for each incoming DC supply to the switchboard.
16. One set of bus differential relays (87B) and bus wire supervision relay (95 B) for each bus section shall be provided for HV switchboards connected directly to generation busses.
17. In case of numerical relays, all relays shall be comprehensive units including all protection, metering and control.
18. Under voltage and over voltage function along with associated timer shall be part of the numerical relays.
19. Auto changeover scheme control & logic between Incomers and bus coupler shall be built in the numerical relay.
20. Tripping relays (86) shall be separate relay. There shall be two nos. high speed tripping relay for motor feeder. One for electrical fault and one for process fault. Electrical fault relay shall be hand reset type and process fault relay shall be self reset.
22. Stand by earth fault relay 51G shall be provided in the incomer of switchboard fed from transformers where transformer & switchboard both are located remotely from HV substation as well as in same HV substation.
23. For transformers located remotely away from HV Substation, a local power isolating device in the form of breaker panel without any protection relay shall be provided before transformer. A local emergency stop push button (Lockable) shall also be provided in transformer bay for tripping remote breaker.
24. Restricted earth fault relay 64R shall be provided for transformer rating >= 1 MVA in the incomer of switchboard fed from transformers having secondary winding star connected. This shall trip the HV side breaker.
25. 3.3kV DG set shall be provided with protection but not limited to 51V,51G,40,46,86,95,80,64R etc. for generator rated above 500KVA and Generator rated less than 500KVA shall have 51V,51G,40,46,86,95,80 unless otherwise agreed with the owner.
26. Relay 87 and 64R shall be separate numerical relay. Hence shall not be part of main comprehensive numerical relay. CT for 87 and 64R can be clubbed, as two core of single CT.
27. Accuracy class of the current transformers shall be
   - Class PS for differential and special requirements.
   - Class 1.0 / 0.2 S for metering purpose.
   - Class 5P20 for protection purpose
   All the CTs shall have rated burden of minimum 15 VA and secondary rated current of 1 A.
28. Accuracy class of the potential / voltage transformers shall be
   - Class 5P for protection purpose.
   - Class 1.0 for metering purpose.
   All the PTs shall have secondary voltage 110 V or 110 V / sqrt.3 and rated burden of minimum 50 VA per phase for both metering and protection core.
29. All the incoming, outgoing and tie breaker feeders of any HV & MV Switchboard shall be provided with numerical relays only with communication facility as protection devices. Releases shall not be acceptable in any case. The relays for outdoor 66 kV EHV switchyard shall also be of numerical type with communication facility.
30. Numerical relays in all HV motor feeders shall be suitable for RTD / BTD inputs.
31. Each bus section shall be provided with separate under voltage relays.
32. Multifunction meter shall be provided to keep a record of power consumption and supervision of all concerned parameters like current, voltage, power, frequency, power factor etc. as specified. All the metering instruments shall be flush mounted.
33. Separate Communicable Digital Multifunctional meters shall be provided in all feeders with Numerical Relays for communication with LMS system.
34. Motors shall also be provided with Unbalanced (-Ve) Sequence Protection Relay (46), as required.
35. Numerical under voltage relays (27) with time delay relay including VT fuse failure relay shall be provided for Bus VTs.
36. All Motor feeders of PMCC & MCC (irrespective of Rating) shall have door mounted communicable (Modbus / Profibus) type Motor Protection relay (MPR) with display.
37. No Meters, transducers or measuring equipments to be installed in the Protection CT circuit.
38. Cable Differential relays for both the end to be supplied by Downstream user contractor i.e. Steam Generation Plant LSTK Contractor. Cable Differential relay will be of Fiber Optic Cable based communication only.
39. All required Alarms and Trips shall be incorporated in the Numerical relays. Sufficient LED shall be available in the Relays.

40. Trip Circuit Supervision relay shall be part of Numerical relay.

7.11 Metering instruments shall be provided to keep record of power consumption and supervision of all concerned parameters like current, voltage, power (Active, Apparent and Reactive), frequency, power factor, Energy (Active & Reactive) etc. All the instruments shall be flush mounted. All meters shall be digital multifunctional meters with communication port for Load management at remote location. Additionally digital type ammeter, voltmeter and Hour Meter shall be provided separately for various feeders as indicated below:

The metering devices in HV and MV switchboards shall be as below:

- Type of metering: Analogue/As part of the Numerical relay

(Figure inside bracket refers to note below) (YES - Applicable)

Notes for Metering:-

1. MVA meter in external power supply incomers shall include maximum demand indication also.

2. Separate analogue type voltmeters with voltmeter selector switch and analogue type ammeters with ammeter selector switch shall be provided for incomers of all switchboards.

3. Ammeter (size 48mm x 48mm) shall be provided in space heater circuit of breaker fed HV & MV motors.

4. Apart from metering which shall be part of the numerical relays, Communicable digital multi-function meters of Accuracy Class 1.0 with suitable Metering CT shall be provided in all the breaker feeders of HV & MV Switchboard i.e. in incomers, bus coupler, outgoing plant feeders, transformer feeders, motor feeders, capacitor bank feeders, etc.

5. Multi function meters with serial communication over RS-485 or fiber optic cable, preferably with IEC protocol shall be provided in all the breaker feeders.
6. Power factor meter shall be provided for synchronous motors in addition to the metering provided for induction motors.

7. For current feedback to DCS and VFD feeders motor current transducers shall be provided and mounted in switchgear panel.

8. CT operated Ammeter for all motor feeders above 5.5 KW, all MOV and LOPs shall be provided at both LCS and feeder end of switchboard.

9. All ammeters for LV motors shall be connected through CT. Only HV motors shall have 3 ammeters or ammeter selector switch or Voltmeter and Voltmeter Selector Switch.

10. Hour run meter shall be provided in all breaker controlled motor feeder.

8.0 CONTROL AND MONITORING

The following provision shall be made for control and monitoring of following electrical equipments.

8.1 Transformers
- TNC switch in primary & secondary side of switchgear.
- Emergency trip from secondary side for tripping primary side of transformer.
- VCB with all required protection to be considered in all the 33kV, 11kV & 3.3kV switchboards.
- Lockable ‘OFF’ push button in transformer room to trip sending end switchgear.
- Ammeter and voltmeter on both primary and secondary side.
- Load break switch with Earthing Switch on transformer primary side (only where primary side circuit breaker is not located in the same sub-station).

8.2 Motors Controlled Through Circuit Breakers
- OFF- ON switch with Ammeter on LCS
- OFF-AUTO/MAN-L/R-ON switch with Ammeter on DCS.
- Ammeter in LCS.
- Current monitoring at DCS/PLC through Dual Channel Current Transducer with Display facility installed at switchgear end, where required from process point of view.
- Emergency trip in switchgear.
- Winding and bearing temperatures of motors shall be available at DCS in control room.
- Process interlock in CCR, where required.
- Indication lamp for ‘ON’, ‘OFF’ and “Ready to Start “ in remote (DCS/PLC etc.)
- Motors controlled through Circuit breakers should also be provided with ammeter, KVAh, KWH and running hour counter. Theses shall be incorporated in Numerical relay Or Multi-function Meter.

8.3 Medium Voltage Motors Controlled Through Contactors
- OFF- ON switch on LCS
- OFF-AUTO/MAN-L/R-ON switch on DCS.
- Current monitoring in DCS, where required from process point of view.
• Emergency Trip in PCC/MCC.
• Process interlock in CCR, where required shall be wired through separate auxiliary relay.
• Indication lamp for ‘ON’, ‘OFF’ and ‘Fault’ in switchgear.
• Indication lamp for ‘ON’, OFF’ and “Ready to Start “ in remote (DCS/PLC etc.)
• Motor space heater & Panel board space heater shall be provided with Ammeter & LED in Switchgear.
• All Motor feeders of PMCC & MCC (irrespective of Rating) shall have door mounted communicable (Modbus / Profibus) type Motor Protection relay (MPR) with Earth fault protection and display.

9.0 EQUIPMENT SPECIFICATION

9.1 General Features

9.1.1 The equipment shall be suitable for tropical climate conditions and corrosive and saline atmosphere.
All electrical equipment accessories and wiring shall have fungus protection involving special treatment of insulation and metal against fungus, insects and corrosion.
Fine mesh screen of corrosion resistant material shall be furnish on all ventilating openings to prevent entry of insects.

9.1.2 The equipment to be installed in indoor plant area shall be enclosed in dust, damp and vermin proof enclosure equivalent to IP 54 as per relevant Indian Standards/IEC.

9.1.3 The equipment excluding motors to be installed in outdoor plant area shall have IP 65 enclosure. Motors of Coal Conveyor, Coal Handling Section, Ash Handling Section shall have IP 65 enclosure. Motors of other sections of plant shall have IP 55 enclosure.

9.1.4 4 mm FRP (fire retardant and UV stabilized) canopies shall be provided for all outdoor equipments like motors, starters, LCS, SDBs, sw. sockets etc. PA stations shall have acoustic hood.

9.1.5 The switch boards, to be installed inside the building shall have enclosure IP 4X for HV switchgear, for LV switchgear degree of protection shall be IP 52 up to 1600A rating and IP-4X above 1600A rating. Equipment requiring ventilation opening such as battery charger/UPS etc. located in air conditioning room may have IP 43 enclosure however, opening for the ventilation shall be covered with fine wire mesh.

9.1.6 Creepage distance shall be 31mm/kV (for highest system voltage) for all equipment.

9.1.7 All the electrical equipment shall be provided with rolled aluminium/stainless steel heavy duty double compression type cable glands and crimping lugs for the cable terminations

9.1.8 The outside surface of all equipment shall be painted after suitable pre-treatment by the application of two coats of anti-rust and corrosion resisting epoxy based paints.

9.1.9 All similar equipment (viz. HV Switchboard, LV Switchboard – PCC, PMCC, MCC, EPMCC, ASB, LDB, DCDB, Transformers, Numerical relays, UPS, Battery Chargers, Motors, etc.) supplied against a package should be of single Make only – for ease of O&M and spare management.

9.2 DG Sets

9.2.1 In order to meet the emergency power requirement for critical loads and also for safe shut down; suitably rated DG sets shall be provided. In the event of the failure of normal power; DG set will supply the total emergency power requirement; keeping one DG set of maximum rating as stand by.
9.2.2 DG Sets, Diesel tanks and associated switchgears shall be located at centralized place away and at a minimum safe distance from substations and hazardous areas as per relevant IS/IEC of hazardous area classification. Emergency power from DG Set shall cater to:-

(a) Loads of emergency shut down
(b) Essential loads of the package
(c) Loads of emergency and aviation lighting
(d) UPS Loads
(e) Battery Charger & DCDB Loads
(f) Any other load recommended by the LSTK Contractor for proper and safe operation & control of the facilities under the package.

9.2.3 The DG Sets control shall have PLC/microprocessor based latest state of art technology. Brushless excitation system shall be used in generator.

9.2.4 The starting of engine of DG Sets shall be electric type. System should be capable of minimum 3 starts.

9.2.5 DG Set shall have all its auxiliaries installed andcontrolled from same place. The control of DG Set shall be based on 110 V DC which shall be supplied from the DC panel. Separate DC battery bank with battery charger shall be provided for control supply. Starting Battery and Battery Charger for DG shall be separate. 110 V DC System Battery and Battery Charger may be separate or may be taped-off from Substation DC System. Both Control supply and Starting Battery Charger shall be (1 + 1) configuration.

9.2.6 The auto starting time (i.e. the time between actuation of loss of power in case of failure of main power to the time of loading of total emergency load) shall be in accordance with the requirement of process. The maximum starting and synchronising time of Sets shall be 30 seconds even after 3rd attempt and shall be able to take full load within lower of two i.e process and 45 seconds. The DG power shall be made available within such a period that none of the plant unit is affected due to failure of normal power. LSTK Contractor shall submit during detailed engineering, the calculation for ‘Time to start’ indicating break up of time for voltage build up 100% loading in steps as required.

9.2.7 The auxiliary power supply board to feed the auxiliaries of DG Sets shall have dual power supply, one from the normal power supply source of plant and other from the DG Set itself with the provision of changeover in the incoming supply in auto mode as well as manual mode. The emergency power distribution board shall be kept in a separate room near to engine room of DG Sets. DG Rooms shall be provided for DG Sets. The incomers and larger rated feeders shall be provided with air circuit breakers and Numerical relays. The feeders of smaller ratings shall be provided using MCCBs. A comprehensive electrical protection system shall be provided to protect the incomer as well as outgoing feeder. The incomer shall have a KWH meter, ammeter, voltmeter etc.

9.2.8 There shall be a separate control panel to control the auxiliaries, and comprehensive alarm and fault indication system shall be provided to indicate the status of auxiliaries as well as Diesel Generator Sets.

9.2.9 DG Set shall be supplied with day oil storage tank of capacity suitable for 24 hour continuous operation at full load, bulk oil storage tank, associated piping, valves, accessories, earthing of all equipment and power and control cables as required.

9.2.10 Emission from DG Set shall meet the requirement of Local Pollution Norms.

9.2.11 DG Set shall be provided with suitable acoustic enclosure to restrict the noise level to 85 dB at 1 metre.

9.2.12 DG Set shall be provided with digital multifunctional meter with communication port for energy management at remote location. Additionally digital type ammeter, voltmeter and Hour Meter shall be provided separately.
9.2.13 Bare minimum protection devices for DG Set have been as indicated below; however LSTK contractor shall provide any other necessary protection relays required for complete protection of system.

Differential, Stator Earth Fault, Rotor Earth Fault, Phase Failure, Over Current (Voltage Restraint), Over Voltage, Winding Temp. Alarm, Bearing Temp. Alarm, Under Frequency, Over Frequency, Reverse Power. A microprocessor based composite generator management relay shall be used for the above mentioned protections. All Numerical Relays and DG set management relays should have dual IEC 61850 communication port for hook-up with LMS.

9.2.14 Complete System shall be separate for each DG Set. Only DG Distribution Board shall be Common.

9.2.15 Following signals for Emergency DG system shall be taken through hard wired/ communication to LMS in addition to various Electrical parameters viz. KW, KVAR, PF, etc.

- DG Set breaker ON/OFF status
- Auto/Manual switch position status
- DC control supply failure
- Tripped on fault
- Generator voltage & current
- DG set run hours
- Number of starts & number of consecutive starts (i.e. DG set auto start blocked due to exhaustion of consecutive starts)
- Day tank diesel level

9.2.16 For all other specification refer PC150-TS-0831.

9.3 Power Transformers

9.3.1 The transformers shall be double wound, copper conductor, and Dyn11 type. Transformers shall rated for 11/3.45 kV, 11/0.433 kV, 3.3./0.433 kV, as required. Transformer with 3.45 kV Secondary winding shall be considered for the substation only, where 3.3 KV switchboard is to be installed for feeding 3.3 KV motors.

9.3.2 The rating of power transformers shall be selected on the basis of load and future load growth. For future load growth the following provision shall be made:

- 25% spare capacity in HV transformers above continuous peak load.
- 30% spare capacity in LV transformers above continuous peak load.

9.3.3 The rating of power transformers shall be selected keeping following into considerations:

(a) Duty : Continuous
(b) Outdoor type : ONAN/ ONAF (ONAN rating shall have 25% spare capacity above continuous peak load. ONAF rating shall be minimum 15% above ONAN rating).
(c) Indoor type : Dry Type
   Epoxy cast resin/ resin encapsulated type
(d) Maximum loading : 80% when one of the transformers is out of service
(e) Peak efficiency at : 35% - 40% of load
(f) Class of Insulation : B or better for oil filled
   : F or better for dry type
(g) Tap changer : OFF load type for less than 10 MVA
   : ON load type for 10 MVA & above

9.3.4 Maximum temperature rise over ambient of 50 Degree Celsius shall be limited to:
(a) Outdoor transformers:
Top oil (measured by thermometer) : 50 °C
Winding (measured by resistance) : 55 °C

(b) Indoor transformers:
Winding (by resistance method) : 90 °C or lower as permissible for class of insulation offered

9.3.5 Special consideration shall be given in specifying the percentage impedance of the transformers to suit the switchgear short-circuit capacity available.

9.3.6 Transformers generally up to 10 MVA shall have ONAN cooling, while ratings above 10 MVA shall be ONAN/ONAF cooled. Bare minimum protection devices for transformer have been as indicated below; however LSTK contractor shall provide any other necessary protection relays required for complete protection of system.

Primary Side.
IDMTL Over Current, IDMTL Earth Fault, High Set Over Current, Instantaneous Earth Fault, Standby Earth Fault, Restricted Earth Fault, Differential (for sizes of 5 MVA and above), *Buchholz Alarm and Trip,*Winding Temperature Alarm,* Trip, *Oil Temperature Alarm, *Oil Level Alarm & Trip, *Trip for Winding Temperature and Oil Temperature. All protection except REF shall be provided on secondary side, if the primary side circuit breaker is located in other sub-station. REF protection shall trip the primary Inter-tripping of primary and secondary circuit breaker of transformer shall be provided for all faults through lockout relays.

CT for Restricted Earth Fault protection shall be provided in the transformer.

9.3.7 Nitrogen Injection Fire Prevention and Extinguishing System (NIFPES) shall be considered for transformers having oil capacity more than 2000 Ltrs.

9.3.8 Following Push buttons shall be provided for transformers:
- Lockable ‘OFF’ push button in transformer room to trip the breakers on primary side.
- Push button shall be provided on breaker on secondary side for permission to close breaker on primary side
- Emergency trip PB on breaker on secondary side for tripping breaker on primary side of transformer.

9.3.9 The instruments such as OTI/WTI, Buchholz relay and MOG shall have Magnetic Reed Switches. The mercury switch contacts are not acceptable.

9.3.10 For all transformers, conservators shall be provided with Magnetic Oil Gauge (MOG) having 1NO contact activated on Low oil level. For transformers where the oil capacity is more than 2000 Ltrs, Air cell shall be provided in the conservator.

9.3.11 Transformer rooms shall have slab and shall be under shed.

9.3.12 Routine test on all transformers and heat run test on one transformer of each rating shall be performed in presence of Owner/Consultant.

9.3.13 All Routine, Heat Run Tests shall be performed in compliance with B.S.171, IEC publication No.60076, IS 2026 (parts I to V), CBIIP and IS: 2026 (Part III) including SFRA Test before dispatch from Manufacturer’s works and at erection site during commissioning or latest editions or any other authoritative standard. Certificates for Type Tests on similar type Transformers shall be submitted.

9.3.14 All Power transformers above 5 MVA shall have facility for Remote display (in LMS) of Oil Temperature, Winding temperature, Conservator Oil Level and moisture ppm of Oil through 4-20 mA signal / Modbus communication.
9.3.15 For all other specification refer PC150-TS-0803.

9.4 **Neutral Earthing Resistor (NER)**

9.4.1 The NER shall be provided to earth the neutral of 11 KV and 3.3 KV systems. Neutral of 415V supply system shall be solidly earthed.

9.4.2 Neutral earthing resistor shall be outdoor type made of AISI 304/406 punched stainless steel grid element. The earth fault current of 11 KV & 3.3 KV shall be limited to full load current of transformer or 400 A, whichever is less.

9.4.3 All NER not requiring operation shall be provided with isolator.

9.4.4 For all other specification refer PC150-TS-0804.

9.5 **Switchboards**

9.5.1 General

9.5.1.1 There shall be three positions for Breaker/Contactor trolley: - Service, Test and Isolate. In service position, the power connections shall be made; but in test and isolate mode, the power connection of bus bars shall be automatically removed.

ACB feeder for PCC, PMCC & MCC shall be single front for ease of operation & maintenance. Non-ACB feeders for motors or power may be double front type.

Breaker duty cycle shall be O-0.3sec-CO-3min-CO.

Separate CT shall be provided for differential/REF protection.

LV circuit breaker shall be 4 Pole type except for outgoing motor feeders which shall be 3 Pole type.

9.5.1.2 Suitable shutter arrangement shall be provided to protect the person from accidental contact with live bus in trolley chamber.

9.5.1.3 The degree of protection shall be IP 4X for HV switchboards and IP 52 for LV Switchboard up to 1600A rating and IP-4X for LV switchboards above 1600A rating.

9.5.1.4 All HV, MV & LV Switchboards shall be LOTO compliance.

9.5.1.5 11 kV & 3.3 kV Switchboard shall conforms to IS/IEC 62271-200, IAC-A FLR-50KA/40KA 1 Sec, PM, LSC 2B which means that the switchgear panels shall be four side internal arc tested, shall have metal partitions and shall confirm to loss of service continuity. LV switchboard shall conform to IEC 60947.

9.5.1.6 LV switchboard (EPMCC/PMCC/MCC) shall be TOTAL TYPE TESTED (TTA) design as per IEC 61439-1/2. Type Test Certificates for short circuit withstand of 50kA for 1 sec along with ACB mounted in the Switchboards shall be provided.

9.5.1.7 LV switchboard (EPMCC/PMCC/MCC) shall comply with Internal Arc Containment test as per IEC 61641.

9.5.1.8 The busbars and connection shall be made of electrolytic grade copper only. Aluminium busbars are not acceptable. All busbars of 11kV & 3.3kV switchgear including bus duct shall have Raychem sleeving.

9.5.1.9 Clearance between gland plate to cable termination point in all switchboards shall be adequate but not less than 300mm to ensure proper cable termination.

9.5.1.10 FRP supports shall be used for bus bars with adequate clearances and creepage distance to prevent flash over due to effect of dust moisture.

9.5.1.11 Protective relays shall be mounted on the front of the switchgear panel.

9.5.1.12 All logic like, Auto/Manual changeover etc. shall be build in the Numerical relay. Adequate number of I/Os shall be provided to meet the requirement. 10% spare I/Os shall also be provided. External I/O Card/ Module is not acceptable.
9.5.1.13 All relays used for protection shall be microprocessor based numerical type only with latest communication protocol IEC-61850 and shall have large graphical display. All relays shall have coating for protection against harsh environment conditions. All numerical relays shall be of one make only. Selected models of numerical relays shall have metering, control, status and protective functions. It shall be possible to save minimum 5 records of each event.

9.5.1.14 LSTK contractor shall supply minimum 1 No. laptops with licensed software for communication & configuration of all make & Type of Numerical Relays.

9.5.1.15 GPS system and associated hardware & software shall be provided for synchronisation of clocks of numerical relay and metering LA & LMS

9.5.1.16 All meters shall be digital multifunctional meters with backlight LCD display and communication port. Additionally digital type ammeter, voltmeter and Hour Meter shall be provided separately for various feeders as indicated above.

9.5.1.17 All the motor / capacitor feeders controlled through vacuum circuit breakers shall be provided with surge arrestors. Lightning Arrestor (LA) shall be provided on each bus of 11KV Switchboard.

9.5.1.18 A continuous ground bus shall be provided at the bottom of the switchgear and in cable connection side for grounding the switchgear, breaker trolley as well as to ground the cable glands.

One no. breaker handling trolley shall be provided for the switchboards as below:
   a) Each HV switchboard.
   b) Each LV switchboard.

9.5.1.19 11KV & 3.3KV Breaker shall be with Integral Earthing switch system with proper interlocks.

9.5.1.20 Control supply bus and space heater supply bus-bars (Copper) of adequate rating shall be provided throughout the length of switchboards with as many sections as sections in power bus-bars.

9.5.1.21 Control supply shall be tapped from control bus in each cubicle/ panel itself through DP MCB of suitable rating.

9.5.1.22 The minimum thickness of sheet steel used in HV and LV switchgear including charger, UPS, ASPB etc. shall be as under:-
   a) Base Channel minimum 3.0 mm
   b) Load Bearing Members minimum 2.0 mm
   c) Doors and covers minimum 1.6 mm

9.5.1.23 A bottom channel of not less than 100 mm shall be provided.

9.5.1.24 The maximum height of the switchboard and other control panels shall be limited to 2200 MM. Maximum height of component requiring operation shall be limited to 1800MM.

9.5.1.25 The switchboards shall have adequate short-circuit ratings and be suitably sized for the load and spare capacity foreseen. The short time rating of bus bar shall be 3 seconds for HV switch boards and 1 second for other boards.

9.5.1.26 The HV switch boards and power control centres shall normally have four spare circuit breaker panel (size shall be as per largest outgoing feeder breaker), two on each side of bus-section.

9.5.1.27 For other boards (PMCCs, MCCs, MLDBs, ASPBs, DCDBs etc.) sufficient number of spare feeders to the extent of min. 20% for each type & rating shall be provided.

9.5.1.28 The 415V switch boards shall have PVC insulated bus bar system suitable for rated voltage. At joints of these bus bars removable shrouds shall be provided.
9.5.1.29 All HV & LV Switchgear, UPS, Battery Charger etc. shall have designated space in each Bus section for Network Switches and other communication equipments.

9.5.1.30 For interfacing with DCS system, separate marshalling panels (with 20% spare terminals) shall be provided on each bus section in all HV & MV switchboards in the same panel line-up. The marshalling panels shall be of full height same as that of switchboards. The horizontal bus bar chamber at the top shall be continuous through this marshalling panel also, for future extension of the MV switchboard. All critical control signals for DCS interface shall be hardwired between substations and DCS. Other non-critical data of Electrical system will be sent to DCS with redundant communication facility between DCS and LMS.

Hardwired signals (with minimum requirement specified below) from various Motor feeders of a bus section for DCS interface shall be wired and terminated in the marshalling cabinet:
- DCS Start permissive
- Process Start command (Auto)
- Remote Start command (Manual)
- Process Stop command
- Process Trip command (for breaker controlled motor feeder)
- Breaker/Contactor ‘ON’ indication
- Breaker/Contactor ‘OFF’ indication
- Ready to Start indication
- Electrical Fault Trip indication

9.5.1.31 Following monitoring signals, as a minimum, shall be taken from substation to DCS interface, through redundant MODBUS SERIAL LINK communication from LMS system.
- Load Data viz. KW, PF, A, etc.
- L/R indication
- Process Trip indication
- Electrical Fault Trip indication
- Trip Details

9.5.1.32 Auto changeover scheme shall be provided for incomers and bus couplers on all 11 KV switch boards, 3.3 KV switch boards and PMCCs/PCCs/ MCCs. Under normal operating conditions, incomer-1 and incomer-2 breakers would be closed and bus coupler breaker would remain open with ‘auto-manual’ switch in ‘auto’ position. The bus coupler switch would close automatically under the following condition being fulfilled:
  i. Either of the incoming breaker trips due to under voltage (70% or below).
  ii. Voltage on the healthy bus is more than 80% for the set period.
  iii. Residual voltage on the bus with no power supply comes down to 30%.
  iv. Auto change over shall be locked on loss of power on both the incomers.

Auto changeover shall also be provided on switchboards catering to emergency loads.

9.5.1.33 Paralleling of two incoming feeders is not foreseen. However, facility for momentary paralleling shall be provided for intentional changeover without interruption of supply.

9.5.1.34 Every enclosure door that provides access to live parts operating at 240 V AC and above shall be mechanically interlocked with a circuit interrupting device on the supply side such that when the door is open, the equipment is de-energised.

9.5.1.35 Separate redundant AC and DC control supply shall be provided for each Switchboard.

9.5.1.36 Control supply for motor feeders having MCCB in PMCC/MCC and VFD panels etc. shall be feed from 240V UPS (Electrical) and motor controlled with breaker shall have 110 V DC control supply irrespective of its being HV or LV.

9.5.1.37 For motors with auto-starting provision, trip of a running motor shall start standby motor automatically.
9.5.1.38 All the HV/LV switchgear shall be fed through two separate transformers, each transformer having capability to take care of 100% load of the associated switchgear and shall have the facility of auto changeover in case of failure of one transformer as well as option of manual changeover for maintenance purpose.

9.5.1.39 Max. 3 runs of 400 sq.mm power HV cable shall be terminated in single panel. For more than 3 runs of cable complete dummy/adaptor panel shall be provided.

9.5.1.40 The CB ON and OFF lamp shall be provided at rear and front side of 11kV/3.3kV switchboards.

9.5.1.41 All breakers service ON/OFF contact multiplier contactors shall be mechanically latched type and independent of control supply. Loss of supply and restoring the supply shall not affect the status of the relay/ contactor.

9.5.1.42 All breakers shall be electrically operable and mechanical operation from the breaker shall be possible locally. Manual breakers are not acceptable.

9.5.1.43 Separate Ammeter shall be provided for panel and motor feeder Space heater circuit for each panel.

9.5.1.44 The terminal strips used shall be of stud and nut type and control wiring shall be done with ring tong lugs only.

9.5.1.45 Dual channel output with display type current transducer for all HV and LV switchboard feeder shall be provided requiring Ammeter at control panel.

9.5.1.46 All motor (HV/LV) power feeders shall have separate earth fault protection through CBCT and earth fault relay. LV motor (above 5.5. KW) and power feeder above 100A shall have CBCT and Digital earth leakage relay with display.

9.5.1.47 All external hardware shall be of stainless steel only.

9.5.1.48 The control compartment and power compartment shall be separate.

9.5.1.49 All HV and LV breakers shall have remote switching facility as well as ON/OFF/TRIP indication at LMS.

9.5.1.50 Following Set of accessories as detailed below shall be provided for each 11kV/3.3 kV Switchboard :
   a) Breaker handling trolley – 2 Nos.

   Following Set of accessories as listed below shall be provided for each 415 V Switchboard :
   a) Breaker lifting and handling trolley : Minimum 2 nos.
   b) Test cabinet with coupling cables for testing the breaker in draw out position : Minimum 1 No.
   c) Racking in/out handle for breakers : Minimum 4 nos.
   d) Racking in/out handle for draw out MCC modules : Minimum 2 for each MCC

9.5.1.51 Alarm relays with reverse flag shall be provided to annunciate failure of main incoming A.C. and D.C. power supplies and annunciation D.C. supply in each panel. Lamp indications shall be provided individually for main D.C. supply-1 fail, main D.C. supply-2 fail, and panel annunciation D.C. supply fail. A common A.C. electric bell shall be provided to give an audible alarm in case of failure of D.C. supply-1/D.C. supply-2/annunciation D.C. supply in any panel. A common push-button shall also be provided for cancellation of lamp indications and audible alarm.

9.5.1.52 Gland plate for single core cables shall be non-magnetic.

9.5.1.53 For all other specifications, refer PC150-TS-0805, PC150-TS-0806, PC150-TS-0808 and PC150-TS-0809.
9.5.1.54 Separate panel shall be considered for incomer Line PT & Bus PT (11 kV & 3.3 kV Switchboards) and PT shall be draw out type. 4 pole MCB shall be provided on LV side of Bus & Line PT.

9.5.1.55 Inspection window shall be provided for HV termination in the switchboard for carrying out thermography, provided internal arc test certificates for this design is available with the bidder.

9.5.1.56 All Incomers and bus couplers shall be provided with synchronising facility. Synchrocheck relay shall be provided in each bus PT & contacts shall be multiplied and wired in each outgoing feeders of each bus section.

9.5.1.57 All 11kV, 3.3 kV and 415 V Switchboards shall preferably be of same make for ease of operation & maintenance.

9.5.1.58 Supervision of installation, testing and commissioning including testing of Relays of all switchboards shall be done through OEM only.

9.5.1.59 All Cable Differential Relays shall be FO Cable type only. Supply & termination of the FO cable & associated HDPE duct, as required, for feeder differential protection shall be included LSTK Contractor’s scope.

9.5.1.60 All Numerical Relays shall be of same Make and Model (series).

9.5.1.61 11kV & 3.3kV Circuit Breaker shall have integrated earth Switch with proper Mechanical & Electrical Interlocks.

9.5.1.62 11kV & 3.3kV Breaker rack in rack out facility should be operable when breaker panel door is closed position.

9.5.1.63 LV Switchgear design shall be such that the feeder doors should not open in locked out tagged out condition.

9.5.2 11 KV Switchboard

9.5.2.1 The 11 KV switchboard shall be indoor, metal enclosed, draw out type, equipped with VCBs, stored energy mechanism working on 110 V DC and shall feed power to the various substations through transformers and other outgoing feeders.

9.5.2.2 Degree of protection shall be IP4X as per IS/IEC 60529,IEC 60298. Switchgear sizes and configuration shall be rationalized to minimum spare holding.

9.5.2.3 A study shall be conducted by LSTK Contractor to determine the rated short circuit capacity for the selection of equipment. However, Rated short circuit breaking capacity shall be as determined by the study or 40 KA for 3 sec, whichever is higher. HV Switchboard shall be suitable for Internal Arc (AFLR) withstand current of “rated short circuit current” for 1 sec.

9.5.2.4 Incoming, bus coupler and outgoing feeders shall be provided with ON, OFF, Trip, Trip Circuit Healthy indications. Process trip lamp/annunciator window to be provided wherever applicable.

9.5.2.5 Control supply shall be 110 V DC.

9.5.2.6 Extra anti-condensing space heater shall be provided in Bus –Bar and Cable chamber of 11KV Switchboard.

9.5.1 3.3 KV Switchboard

9.5.1.1 The 3.3 KV switchboard shall be indoor, metal enclosed, draw out type, equipped with Vacuum Circuit Breakers (VCBs), stored energy mechanism working on 110 V DC. for all feeders.

9.5.1.2 The minimum degree of protection shall be IP4X as per IS/IEC 60529,IEC 60298. Switchgear sizes and configuration shall be rationalized to minimum spare holding.

9.5.1.3 A study shall be conducted by LSTK Contractor to determine the rated short circuit capacity for the selection of equipment. However, rated short circuit breaking capacity shall be as
determined by the study or 26.24kA for 3 sec, whichever is higher. HV Switchboard shall be suitable for Internal Arc (AFLR) withstand current of "rated short circuit current" for 1 sec.

9.5.1.4 Incoming, bus coupler and outgoing feeders shall be provided with ON, OFF, Trip, Trip Circuit Healthy, Spring Charged indications. Process trip lamp/annunciator window to be provided wherever applicable.

9.5.1.5 Control supply shall be 110 V DC.

9.5.1.6 Extra anti-condensing space heater shall be provided in Bus –Bar and Cable chamber of 3.3KV Switchboard.

9.5.2 Low Voltage Switchgears

9.5.2.1 415 V switchboards shall include the following:
   a) Power Control Centres (PCCs)
   b) Power-cum-Motor Control Centres (PMCCs)
   c) Emergency Power-cum-Motor Control Centres (EPMCCs)
   d) Motor Control Centres (MCCs)
   e) Main Lighting Distribution Boards (MLDBs)
   f) Auxiliary Services Power Boards (ASPBs)
   g) Emergency Power Distribution Boards

   EPMCC shall be separate from PMCC.

9.5.2.2 Low voltage switchboards shall be metal clad, arranged with self supporting units and assembled together in a row. The degree of protection shall be IP 52.

9.5.2.3 Internal physical separation / segregation of 415 V Switchboards shall be 3 B for Non-ACB feeders and 4 B for ACB feeders.

9.5.2.4 The switchboards shall be suitable for extension at both the ends.

9.5.2.5 Bus bars shall be of uniform cross section and supported on non-hydroscopic FRP insulators with adequate clearances and creepage distance to prevent flash over due to effect of dust/moisture.

9.5.2.6 The horizontal busbars as well as vertical droppers of LV switchboards shall have heat shrinkable insulated sleeves.

9.5.2.7 Sufficient bus supports shall be given to give adequate mechanical strength during short circuits.

9.5.2.8 A continuous ground bus shall be provided at the bottom in the PCC/PMCC/MCC for grounding the PCC/PMCC/MCC.

9.5.2.9 Rated short circuit breaking capacity shall be 50 KA for 1 sec.

9.5.2.10 The PCC, MCC, Main lighting distribution board and auxiliary services power board shall be provided with withdraw able air circuit breakers for incoming feeders and bus ties.

9.5.2.11 All ACBs shall be electrically operated- EDO type only. Manual breakers are not acceptable. Each electrically operated breaker shall be provided with antipumping (94), Breaker fail (52BF) and trip free feature, trip annunciation (30) and lockout (86) relays. Lockout relay shall be hand reset type.

9.5.2.12 All ACBs shall be without any internal releases. The required protections shall be wired by means of external numerical relays.

9.5.2.13 Motor feeders up to 75 KW rating shall be contactor controlled and above 75 KW, these shall be ACB controlled with combined motor protection relay. All other feeders of 415 V
switchboards shall be provided with MCCB. All outgoing feeders shall be draw-out type in all the switchboards.

9.5.2.14 Switchboards shall be provided with thermostatically controlled anti-condensation heaters.

9.5.2.15 All units in the MCC shall be completely accessible and removable from front. Both power and control connections shall be stab-in type.

9.5.2.16 Bus bar clearances shall conform to relevant Indian Standard/IEC for equipment voltages up to and including 500 V AC.

9.5.2.17 The switchboards shall be compartmentalized and individual feeder modules shall be draw-out type. Fixed type modules shall not be acceptable.

9.5.2.18 The draw out modules shall be standardized and it shall be possible to interchange any module with a module of same size. The components to control the equipment like MCCB, starter, auxiliary relay etc. shall be wired as a unit on the individual module. Safety shutter shall be provided to prevent direct access to live parts when the chassis is removed.

9.5.2.19 The entire draw out construction should be designed for safe operation during placement or removal of chassis. An earthing arrangement shall be provided which will make contact first before the power contacts are made and break last. Each module shall control one motor in general.

The door shall be interlocked so that it cannot be opened unless the isolating switch on that module is OFF. However, it shall be provided with a door defect mechanism for intentional opening when on line for testing and inspection purpose.

9.5.2.20 Control switches for breaker control shall be provided in each breaker cubicle. Circuit breaker shall be interlocked to prevent withdrawal of a closed breaker or insertion of a closed breaker. Each breaker shall be provided with anti pumping device.

9.5.2.21 Provisions shall be made to manually close/trip circuit breakers on loss of control voltage.

9.5.2.22 The LV PMCC/MCC/PCC control supply shall be 240VAC, 50Hz UPS supply fed from UPS Distribution Board of Separate 240 V AC UPS System dedicated for MCC control supply; Control Room & Substation lights, LMS Equipment, Fire Detection & Alarm System etc. Breaker control supply shall be 110V DC.

9.5.2.23 All low voltage switchboards shall be provided with 20% spare outgoing feeders or minimum one of each rating (fully wired) and with all the components.

9.5.2.24 The timers shall be electronic type only. Pneumatic or synchronous type timers are not acceptable.

9.5.2.25 Each outgoing motor feeder shall consist of a number of components mounted in a module duly wired. In general outgoing feeder rated below 75 KW shall consist of:

a) MCCB.
b) Control supply On/Off switch and fuse
c) Power Contactor
d) Electronic Digital Motor Protection Relay with built-in Earth Fault, Overload, Stalling, Single phase protection, etc. Thermal Overload Relay are not acceptable.
e) C.T for metering
f) Overload reset button.
g) Process Trip / ON / OFF indicating lamp with separate indicator fuse.
h) Auxiliary contactors for multiplication / control.
i) Test position limit switch and test PB
j) CT operated Ammeter for all motor feeders above 1.5 KW, all MOV and LOPs at both LCS and Feeder end.

k) Selector switches as per requirement.

9.5.2.26 Provision for indication of minimum following electrical parameters in 415V PCC / PMCC/ MCC shall be made:

a) ON OFF, TRIP, TRIP CIRCUIT HEALTHY, TEST, SERVICE Position, indication in ACB feeders.

b) The KWH meters on incomers shall have provisions for sealing for tariff purpose, as required.

c) MCC shall conform to the following as a minimum:
   - Motor starters rated for utilisation category AC3 and protection equipment with a minimum of type 2 co-ordination.
   - The number of modules per tier shall not exceed 6.
   - MCC incomer sizes and configurations rationalised to minimise spares holdings.

9.5.3 Auxiliary Supply Power Board

The ASPB shall generally be single front, floor mounted draw out type having essential and non-essential bus. Non-essential bus shall be disconnected in case of failure of normal supply through a contactor. Each Substation station shall have separate ASPB.

9.5.4 Lighting Sub Distribution Boards

The Distribution Boards shall be single front, non-draw out wall mounted type.

9.5.5 UPS Distribution Boards

9.5.5.1 The UPS Distribution Boards shall be single front, floor mounted non-drawout type for supply of 115 V AC / 240 V AC.

9.5.6 Direct Current Distribution Boards

9.5.6.1 The Direct Current Distribution Boards (DCDBs) shall be single front, floor mounted non-drawout type for supply of 110 V DC control power to switchgears and panic lighting. Each Substation station shall have separate DCDB.

9.5.6.2 Following potential free contact shall be available for each Motor feeders for indication in LMS in addition to process requirement:

   • Motor ON
   • Motor OFF
   • Motor Process Trip
   • Motor Elect Trip

9.6 Motors

9.6.1 The rating of LV and HV motors shall be selected from the sizes as recommended in relevant Indian Standard/IEC.

9.6.2 The margin between the installed power and absorbed power shall be as recommended by the driven machine supplier but shall not be less than the following:

<table>
<thead>
<tr>
<th>Motor Rating</th>
<th>Margin above Driven M/C Absorbed Power</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 22 KW</td>
<td>25%</td>
</tr>
<tr>
<td>22 KW to 55 KW</td>
<td>15%</td>
</tr>
<tr>
<td>75 KW and above</td>
<td>10%</td>
</tr>
</tbody>
</table>
9.6.3 Voltage Ratings:

Voltage rating for the motors of different ratings shall be as below:

- Upto 150 KW: 415 V, 3-phase, 50 Hz AC
- Above 150 KW - 1000 KW: 3.3 KV, 3-phase, 50 Hz AC
- Above 1000 KW: 11 KV, 3-phase, 50 Hz AC

All motors shall be designed for 3-Phase supply only.

9.6.4 The motors shall have maximum continuous rated duty S1 as per relevant Indian Standard/IEC. Rated duty for special duty motors wherever required e.g. cranes etc. Shall be considered as per driven equipment requirement.

9.6.5 All LV motors shall be TEFC type as per relevant Indian Standards/IEC while HV motors shall be TEFC/CACA type. All motors shall be Class-F insulated with temperature rise limited to that of Class-B.

9.6.6 Normally the motors shall be suitable for DOL starting. However, motors started through VFD shall be suitable to run at 30% to 100% of rated speed and compatible with the VFD.

9.6.7 All motors 30 KW and above shall have space heater provision.

9.6.8 All HV motors shall have winding, hot air and bearing RTDs. All the temperature signals shall be terminated to DCS as well as LMS.

9.6.9 All LV motors shall be of efficiency class 'IE3' as per latest applicable version of IS: 12615. All HV Motors shall be of high efficient and high power factor type.

9.6.10 The starting current i.e. breakaway current of 415 V Motors shall not exceed the values indicated in IS: 12615. Also there shall be no further positive tolerance on the values of breakaway current.

9.6.11 The starting current of 11 KV & 3.3 KV motors shall not exceed 550% of FLC. No positive tolerance is acceptable over 550% FLC.

9.6.12 Type test certificate of similar motor for use in specified hazardous area (if applicable) shall be furnished.

9.6.13 The duty cycle of the motor shall meet the process and driven machine requirement.

9.6.14 In case of 11 KV & 3.3 KV motor, the terminal box shall be suitably designed for proper termination of XLPE insulated Aluminium cables through heat shrink termination kit.

9.6.15 The mechanical parameters such as duty, mounting type, shaft extension, direction of rotation, starting torque requirements etc. shall be adequate for the application. Sleeve or anti friction type bearings shall be used. Vertical motors shall have thrust bearings suitable for the load imposed by the driven machinery. Motors with sleeve bearings may require proximity probes to measure shaft vibration adjacent and relative to the bearings.

9.6.16 Motor rated above 30 KW shall have on line greasing provision and for motor rated above 45 KW, grease outlet feature shall be provided.

9.6.17 All HV motors shall have safety factor not less than 1.1.

9.6.18 Motors rated 1000 kW and above shall have suitable measures to prevent flow of shaft currents and shall have 2 sets (i.e. 6 nos.) of PS class CTs for differential protection.

9.6.19 The motor shall be capable of withstanding the electro dynamic stress and heating imposed if it is started along with the driven equipment at voltage of 110% of the rated value.

9.6.20 During starting of large motor, the voltage may drop to 80% of the rated voltage for a period of 60 seconds. All electrical equipment, while running, shall successfully ride over such period without affecting system performance.
9.6.21 D.C. motor provided for emergency service shall be shunt/compound wound type. Motor shall be sized for operation with fixed resistance starter for maximum reliability.

DC starters shall be complete with MCCB, contactors, resistors, relays, meters, push-buttons, lamps, etc. DC contactor shall be Class I – Category DC3. Switch Duty shall be DC22. The resistor enclosure shall be provided with ventilating louvers and wire mesh guard and shall have a degree of protection IP-23.

9.6.22 The motor may be subjected to sudden application of 150% rated voltage during bus transfer, due to the phase difference between the incoming voltage and motor residual voltage. The motor shall be designed to withstand any torsional and/or high current stresses, which may result, without experiencing any deterioration in the normal life and performance characteristics.

9.6.23 Shaft voltage shall be limited to 200 mV.

9.6.24 For all other specifications, refer PC150-TS-0810.

9.7 **Rectifier-cum-Battery Charger**

9.7.1 The Rectifier-Cum-Battery Charger shall be fully automatic using silicon controlled rectifier and shall consist of units as described below:-

i) Main Float cum Load charger: To supply continuous load and keep the battery in healthy state.

ii) Standby Float cum Load charger: To supply continuous load & keep the battery in healthy state in case any abnormality in Main charger.

iii) Boost charger: To charge the battery set initially and recharge (after meeting emergency or sudden application of heavy loads.)

9.7.2 Battery Charger shall have at least 20% extra capacity for future load requirement. Battery Charger shall have 110 V DC system.

9.7.3 Separate Rectifier-Cum-Battery Charger with DC Distribution Board and Battery Bank shall be provided for each Substation.

9.7.4 Each substation shall be provided with redundant battery charger with 2x100% battery banks and connected to each Charger.

9.7.5 The battery and charger combinations shall be such as to ensure continuity of D.C. supply at load terminals without even momentary interruption.

9.7.6 AC Ammeter and AC Voltmeter on Charger Input; DC Ammeter, DC Voltmeter for charger output/ battery voltage and on demand type Battery Charge / Discharge Ammeter shall be provided.

9.7.7 Following analog signals through suitable transducer shall also be provided for hook-up in LMS:

- Status of charging current (float & boost charging)
- Battery current
- Incoming voltage

9.7.8 Following potential free contacts shall also be provided for hook-up in LMS

- DC under voltage
- DC overvoltage
- DC earth leakage
- AC incoming power supply failure
- AC input fuse blown-off
- Thyristor/ diode failure
- DC output fuse blown-off
- DC battery fuse blown-off
9.7.9 For all other specifications, refer PC150-TS-0813.

9.8 Battery Sets.

9.8.1 These shall be Ni-Cd Battery Sets shall be rated to meet the total DC power requirement for 5 hour after complete power failure.

9.8.2 Spare capacity of 20% for future use shall be considered.

9.8.3 Battery shall be designed with minimum temperature as 5°C.

9.8.4 For all other specifications, refer PC150-TS-0814.

9.9 Uninterruptible Power Supply System (UPS)

9.9.1 115 V AC UPS System with UPS Distribution Board shall be provided to feed 115 V AC, 50 Hz, 1Phase power supply to the instrumentation system, DCS etc. This UPS System along with associated Battery and UPS distribution Board shall be located at Control Room. Separate 240VAC UPS System with UPS Distribution Board shall be provided to feed PMCC & MCC control supply, Control Room & Substation lights, LMS Equipment, Fire Detection & Alarm System etc. This UPS System along with associated Battery and UPS distribution Board shall be located at Substation. Block Diagram of 115 V UPS System shall be followed but with 240 V in place of 115 V.

Both 115 V AC UPS System and 240 V AC UPS System complete with Battery, UPS Distribution Board etc. shall be separate.

9.9.2 The UPS System shall have IGBT type with touch screen LCD display and shall be backed up by nickel cadmium (Ni-Cd) battery rated for 2 hour at rated capacity of the UPS. Battery (100% Capacity) shall be separate for each Inverter.

9.9.3 UPS system construction shall be such that each charger, inverter module can be made fully isolated for maintenance. No common devices/wiring shall be installed. Further there shall be no common device between main & redundant units (e.g. master oscillators etc.) in order to ensure that the failure of the same does not cause shutdown of more than one unit.

9.9.4 UPS system shall have facility for built in Online battery bank monitoring & testing facility for displaying/calculating expected battery bank back-up time (during testing if battery bank does not have sufficient back up time, test shall be terminated & load shall be shifted to charger automatically).

9.9.5 UPS shall be suitable for 100% step load.

9.9.6 Battery Load cycle test shall be carried out by the vendor at site.

9.9.7 The UPS rating shall be such that in any case the load on the individual UPS shall not exceed 40% of the rated capacity.

9.9.8 The over load capacity of UPS shall be 200% for 10 cycles, 150% for 60sec & 125% for 10min.

9.9.9 All four sections, i.e. Rectifier-I, Rectifier-II, Bypass – I and Bypass - II shall be fed through four separate feeders of emergency bus of PMCC.

9.9.10 UPS shall be PWM based using IGBT. Each charger and SCVS shall have isolating transformer at the input.

9.9.11 The salient features of the UPS shall be as under:
   a) High Efficiency
b) Compatible to feed nonlinear, high crest factor loads

c) Microprocessor based monitoring system for UPS status and fault indications

d) High transient performance

e) Low audible noise

9.9.12 Each UPS shall be provided with SNMP software so that all the parameters of UPS and alarms/faults can be viewed into the remote computer. These logs/trends of load can later be printed. Web based parameter and status monitoring shall be used. It shall be hooked to LMS and DCS System.

9.9.13 The transfer time of UPS from inverter to bypass, in case of failure of both inverters, shall be so selected that during this transition period, instrumentation/DCS etc. which leads to tripping of plant shall not fail. Typically, it shall be as below:

- In synchronism: No break transfer i.e. within 6 milliseconds (Maximum)
- In asynchronous mode: Within 16 milliseconds (Maximum).

9.9.14 The technical parameters of UPS shall be as under:

Input

a) Rated Voltage 415 V ± 10%

b) Rated Frequency 50 Hz ± 5%

Output

a) Rated Voltage 115 V AC / 240 V AC

Voltage regulation:

- Static (0-100% load) ±1%
- Dynamic for 100% load change: ±5%

9.9.15 Following potential free contacts shall be made available on the UPS,

- Rectifier ON
- Inverter ON
- Battery CBB ON
- Load on Inverter
- Inverter fail
- Rectifier Fail
- Inverter O/P undervoltage
- Inverter Sync.
- Load on battery
- Bypass Fail
- Load on bypass
- Load transferred, etc

Note: A separate common potential free contact for all the faults/alarms (in UPS / SCVS) shall be made available

9.9.16 Operation Philosophy of UPS:

- 2 sets of rectifiers and inverter shall be provided. Under normal conditions, when AC mains power is available, both the rectifiers shall operate in parallel and supply DC power for float/rapid charging the 2X50% batteries and simultaneously to inverters. In case of failure in one rectifier, the other rectifier shall feed the complete load and the batteries without any interruption.

- In case of Incoming supply failure or failure of both rectifiers the 2X50% batteries shall feed the inverters without any interruption. Each rectifier shall be designed for simultaneously feeding complete inverter load and float/rapid charging of the 2X50% batteries to its rapid capacity. Each rectifier shall be equipped with “On Line” automatic as well as manual charging facility.
• Normally both the inverters will be synchronised with each other and with stabilised bypass supply. Both inverters shall operate in parallel and share the load equally.
• The load sharing controls shall not be subject to common mode failure and any failure of the load sharing controls shall not result in the loss of the vital power.
• When a disturbance/fault occurs in any of the inverters, the faulty unit shall automatically get disconnected and the entire load shall be fed from the other inverter. In case both the inverters develop a fault, the complete load shall be transferred to stabilized bypass supply through the static switches and retransfer of the load from the stabilized bypass supply to the inverter shall be possible in auto as well as in manual mode.

9.9.17 All alarms & status of UPS shall be communicable through Modbus / Ethernet protocol to LMS.

Following minimum shall be considered:
- Load on Inverter
- Load on Bypass
- Load on Battery
- Battery on float/boost charging mode.
- Charger failure.
- Inverter failure
- AC mains failure
- DC under voltage
- DC Over voltage
- Automatic retransfer of load to inverter inhibited.
- Fan failure
- AC Voltage, current & frequency of each inverter
- AC incoming power supply Voltage & voltage.
- DC current at each rectifier output.

9.9.18 For all other specifications, refer PC150-TS-0802.

9.10 Variable Speed Drives (VSD/VFD)

9.10.1 Microprocessor based variable speed drive shall be communicable type and shall be able to communicate with LMS/DCS. It shall be possible to set speed from process DCS for optimum performance through 4-20 mA signal. Speed/current/status feedback to DCS shall be provided. Drive will run at preset speed in the event of loss of signal from DCS.

9.10.2 System shall be highly reliable, efficient and shall provide high power factor, low harmonic distortion, low noise level etc.

9.10.3 System shall be provided with complete by pass circuit to ensure the power supply reliability in case of VSD/VFD failure. It shall be possible to start the motor in DOL mode through bypass system in case there is any problem/fault in the VFD. The Electrical system and the process should be capable to operate the Motor in fixed speed (without VFD).

9.10.4 The system shall be suitable for load characteristics, continuous speed control. Drive shall be able to accelerate the load over the full speed range (0 – 100 %) with incoming line voltage regulation of 10%.

9.10.5 The system shall be designed for 150% over current withstand for 1 minute. The system shall be equipped with an automatic restart facility which will restart the system in case of voltage dip over 20% or power interruptions less than 4 seconds and recovery of voltage to 95% with a facility to block the automatic restart.

9.10.6 The system shall be suitably designed with due care for long length of cables, output filters, chokes, motor insulation, cable voltage grades etc.
9.10.7 The VSD panel shall be located in the clean air conditioned room in the substation. Required local control equipment shall have start, stop speed raise and lower push buttons, ammeter, speed indicator, ON/OFF/READY status selector switches as required and shall be installed near the motor.

9.10.8 The VFD shall be provided with Input and Output transformer. To prevent harmonics in the station supply 12 pulse rectifier shall be deployed at Input of the VFD.

9.10.9 "Auto Restart" facility for drive system within preset time, typically 0-15 seconds, in case of supply system dip or complete loss of power shall be provided.

9.10.10 Preferably screened type cables or cables as recommended by VSD/VFD vendors shall be used for VSD/VFD systems.

9.10.11 The VSD/VFD panels to be supplied shall be of proven model.

9.10.12 Training of VSD/VFD shall be provided to owner personnel.

9.10.13 For all other specifications, refer PC150-TS-0820A and PC150-TS-0820B.

9.11 Soft Starters

9.11.1 Soft Starter may be considered for large sized motors to overcome the problems of voltage drop during starting and also over sizing of transformer and generator. However, VFD shall be preferred over Soft Starter. Soft Starter may be used in exceptional case only after approval of Owner/ Consultant.

9.11.2 The soft starters shall be solid state microprocessor control type with self torque adjustment (during controlled start) feature with bypass contactor. Soft starters shall be communicable type and shall be able to communicate with LMS.

9.11.3 Soft starter shall be designed with starting current limited to 350% to 415% (However Contractor shall ensure that this reduced starting voltage is suitable to develop necessary starting torque requirement of the respective motor). The soft starters shall be designed for the optimum voltage drop during starting such that the drive motor and the load get the required accelerating torque.

9.11.4 Soft starter shall be as per standards IEC 34/BS 4999/IS 325/BS 5000.

9.11.5 The Contractor shall super impose the motor torque vs speed curve at reduced voltage (to motor terminals at starting) on torque vs speed characteristics of the driven equipment to confirm correct operation i.e. acceleration to rated speed. The Contractor shall also calculate acceleration time at reduced voltage (based on these torque vs speed curves) required for accelerating the drive, to full rated speed. This acceleration time shall be sufficiently less than the hot withstand time of the motor.

9.11.6 For all other specifications, refer PC150-TS-0828.

9.12 Local Control Stations

9.12.1 Local Control Stations shall be provided for all motors for testing and maintenance purpose when the selection is made is "LOCAL MODE" Operation. The essential features of the LCS shall be as given below:

9.12.2 LCS shall be pressure die cast aluminium housing (preferably), dust & vermin proof, weatherproof, suitable for wall or pedestal mounting with equipment mounted on a base plate inside and behind a front cover (bolted type).

9.12.3 LCS Enclosure shall be certified for use in hazardous areas.

9.12.4 Provision for pad locking in OFF position shall be provided.

9.12.5 Local control stations for breaker controlled HV and LV motors shall be provided with T-N-C switch, Ready to Start Indication, ON indication, Space Heater ON Indication, Trip Indication, Local-OFF-Remote Control switch and ammeter. Moreover, space heater ON indication lamp, trip indication lamp shall also be provided at the switchgear panel.
9.12.6 Local control stations for contactor controlled LV motors shall be provided with start/stop push buttons, ammeters and Space Heater ON Indication (for motor rated 30KW and above), ON indication, Local-Remote switch (as required) for the motors having rating 5.5 KW and above. If required from process point of view, ammeter shall be provided for motors below 5.5 KW also.

9.12.7 Each element for start and stop shall be provided with 1 NO + 1 NC contact. The push button construction shall be such to avoid mal-operation due to vibrations.

9.12.8 All local control stations shall have weather proof IP-65 enclosure and be suitable for installation in relevant hazardous area, gas group and temperature class. Canopies of suitable size shall be provided with all local control stations.

9.12.9 All components shall be completely wired up to terminal block and also provided with earthing terminals.

9.12.10 Inscriptions on corrosion resistant metal strips giving drive description, mechanism number and functional requirement shall be provided.

9.12.11 Two numbers of LCS shall be provided for the motors, which are installed at elevated platforms, such as cooling tower fan etc. One shall be installed at ground level and the other near the motor.

9.12.12 The ammeter shall be flush mounting, moving iron spring controlled type, of accuracy class 1.5 as per IS: 1248, with square face of minimum size 72 mm × 72 mm having scale range 0-90 degree. The ammeter shall be provided with uniform scale up to CT primary current and compressed end scale up to the 8 times the C.T. primary current. Adjustable red pointer shall be provided to indicate the full load current of the motors. Zero adjusters shall be provided for operation from the front of the meter. All ammeters shall be operated through 1 Amp. CTs only.

9.12.13 Complete Push Button along with its actuator mounted on the cover with wiring done through flexible cables with proper protection.

9.12.14 Preferably Ring Type lug and suitable TB to be used for connection, to avoid loose connection.

9.12.15 All spare hole to be plugged with suitable metal plugs.

9.12.16 For all other specifications, refer PC150-TS-0817.

9.13 Industrial Goods Lifts

9.13.1 Lifts shall have automatic centre opening doors, SS cabin with aluminium chequered plate flooring cabin and steel belts (rope), closed loop VFD. A low – inertia gearless machine with a permanent magnet (PM) synchronous motor, battery-operated rescue system with electronic speed monitoring, machine on the rails to transfer loads down to the pit.

9.13.2 Automatic Rescue Device shall be capable of moving the lift to the nearest landing on main power failure.

9.13.3 Lift Machine room shall be located at ground floor.

9.13.4 Following Control & Indication shall be provided on all landings and ground floor:
- Digital Car position indicator for each lift on top as well as on side wall
- Audio alarm & direction indicator for each lift
- Common up/down call buttons
- Fireman switch
- Braille marking on all buttons

9.13.5 Following Control & Indication shall be provided in car:
- Braille marking on all buttons inside the car
- Voice announcement system with all necessary equipments.
- Appropriate positioning of Car Operating Panel
- Floor selector button
- Emergency stop and alarm button
- Combined digital position and direction indicator.
- Wiring for telephone and telephone instruments (intercom) in lift car, machine room and ground floor, lift lobby
- Lighting, emergency alarm and fan to be provided with emergency supply through inverter having at least half an hour battery backup.
- Car Operating Panel (COP) should be on the front panel as approved by the owner.

9.13.6 Separate minimum 1 No. Lift / Elevator for passenger cum goods of capacity 2.0 Ton shall be provided in each Boiler Area, covering all floors. The location of the Lifts/elevators shall be decided during detailed engineering but the same shall not be located at same place.

9.13.7 No. of level of landing shall be as per operational requirement.

9.13.8 For all other specifications, refer PC150-TS-0827.

9.14 Switch Sockets

9.14.1 Sufficient number of inter-locked type 125A/63A, 415V, 3 Ph and 16A, 240V, 1 Ph switch sockets shall be provided in various plant locations as per hazardous area classification to facilitate the maintenance work. Supply to switch-sockets shall be taken from ASPB through suitably rated RCCB. Minimum 2 Nos. Switch Sockets to be provided in each floor of all Boilers.

9.14.2 Minimum 2 Nos. 24 V 10 A Switch socket shall be provided near all man-hole of vessels for maintenance to which 24 V hand lamps can be connected and carried inside.

9.14.3 Both 3 Phase switch sockets and 1 Phase switch sockets shall be provided at Min. 20 M interval. Maximum 2 Nos. 63A switch sockets and 2 Nos. 16A switch sockets shall be connected in one circuit.

9.14.4 For all Other Specifications, Refer PC150-TS-0811.

9.15 Conduits

9.15.1 Conduits shall be of heavy gauge with minimum wall thickness of 1.4 mm (upto 25 mm dia) and 2 mm (above 25 mm dia) rigid steel, hot-dip galvanized, cut square, reamed, threaded and screwed tight at all joints.

9.15.2 Conduits entrances to pull boxes and switches shall have double lock nuts & insulating bushings. No running thread shall be used.

9.15.3 Flexible metallic conduit shall be used for connection to equipment which are subject to vibration and also for connection to level /limit/pressure switches. Conduit runs shall be supported at an interval of 750 mm for vertical run and 1000 mm for horizontal run.

Conduits shall be sized so that conduit fill (ratio of total cable area to conduit area) shall not exceed the following:

<table>
<thead>
<tr>
<th>Number of Cables</th>
<th>Fill Ratio</th>
</tr>
</thead>
<tbody>
<tr>
<td>One Cable</td>
<td>53%</td>
</tr>
<tr>
<td>Two Cable</td>
<td>31%</td>
</tr>
<tr>
<td>Three Cables &amp; Up</td>
<td>40%</td>
</tr>
</tbody>
</table>

9.16 Bus-Duct

9.16.1 The bus bars and connection shall be made of electrolytic grade copper only. Aluminium busbars are not acceptable. All busbars shall be insulated with Raychem sleeving.

9.16.2 It shall be suitably supported at regular intervals and both bus bars and supports shall be adequately sized and clamped to withstand rated short circuit current without permanent deformation.

9.16.3 The bus bar insulators shall be non-hygroscopic, non-inflammable material. Earth bus shall run along the full length of bus duct without any break.
9.16.4 Outdoor bus-duct shall be weatherproof to IP-65 and shall be provided with canopy, silica gel breather. Construction of outdoor Bus duct shall be such that water gets drain off easily. Extra thickness shall be provided at the corners where water accumulation is likely to happen.

9.16.5 Bus duct shall be supplied with bus bar flexible links for connection at both the ends and expansion joints for every 3M of bus-duct and bus duct support materials.

9.16.6 Openings with cover at suitable locations shall be provided on bus duct for accessing the bus bars for maintenance.

9.16.7 Silica-gel breather shall be provided on both indoor and outdoor portions of the busduct. (shall not be required for pressurized busduct).

9.16.8 For all other specifications refer, PC150-TS-0807.

9.17 Load Management System.

9.17.1 Centralised Load Management System (LMS) shall be provided for Supervision, control, monitoring, data acquisition, data logging & printing of status of all important electrical equipment& feeders and Load Shedding Scheme as per the recommendations of the system study report as per process requirement and in consultation with Owner/Consultant for entire fertilizer complex, by EDS LSTK Contractor.

Data concentrator Panel and other LMS System Equipments including PC console, chairs, furniture etc. for Steam Generation Plant shall be in EDS LSTK Contractor’s scope. However, Steam Generation plant LSTK contractor has to consider space for same in separate room in Substations, as per NIT.

LSTK Contractor shall provide multifunctional dual channel transducers in all the breaker feeders as well as contactor feeders of all important & critical Loads. Also, supply & installation of Network Switches and extend all signals up to Network Switches shall be in the scope of Steam Generation plant LSTK Contractor. Network Switch shall have 20 % spare ports. Specification of Network Switches has to be finalised in co-ordination with EDS LSTK Contractor.

Minimum Inputs and Outputs to be considered for LMS for proper operation/control, effective monitoring and load management shall be inclusive of but not limited to the following:

a. Transformers:
   Oil Temperature, Winding temperature, Conservator Oil Level and moisture ppm of Oil through 4-20 mA signal / Modbus communication and status of Buchholz Relay.

b. Incomer /Bus coupler/ Feeder (Power/Motor)
   KW, KVA, KVAR, KWh, PF, VOLTAGE, CURRENT
   ON, OFF, TEST, SERVICE, TRIP ON FAULT, TRIP CIRCUIT HEALTHY, CONTROL SUPPLY ON, RELAY WATCH DOG, FAULT DETAILS, DISTURBANCES RECORDER.
   Remote ON & OFF Control from LMS.

c. LT motor feeder of breaker controlled motors in EPMC/PMCC/MCC
   KW, KVA, KVAR, KWh, PF, VOLTAGE, CURRENT
   ON, OFF, TEST, SERVICE, TRIP ON FAULT, TRIP CIRCUIT HEALTHY, READY TO START, PROCESS TRIP, EMERGENCY STOP, LOCAL/REMOTE selection on LCS, CONTROL SUPPLY ON, RELAY WATCH DOG, FAULT DETAILS, DISTURBANCES RECORDER.
   Remote ON & OFF Control from LMS.

d. LT motor feeder of Contractor controlled motors in EPMC/PMCC/MCC
ON, OFF, TRIP ON FAULT, READY TO START, PROCESS TRIP.

e. Breaker Controlled Power feeder in PCC/MCC/ASPB
KW, KVA, KVAR, KWh, PF, VOLTAGE, CURRENT
ON, OFF, TEST, SERVICE, TRIP ON FAULT, TRIP CIRCUIT HEALTHY, CONTROL SUPPLY ON, RELAY WATCH DOG, FAULT DETAILS, DISTURBANCES RECORDER.
Remote ON & OFF Control from LMS.

f. UPS
Load on Inverter, Load on Bypass, Load on Battery, Battery on float/boost charging mode, Charger failure, Inverter failure, AC mains failure, DC under voltage, DC Over voltage, Automatic retransfer of load to inverter inhibited,
Fan failure, AC Voltage, current & frequency of each inverter, AC incoming power supply Voltage & voltage, DC current at each rectifier output.

Battery & Battery Charger
Status of charging current (float & boost charging), Battery current, Incoming voltage, Load Voltage DC, Load current DC, DC under voltage, DC overvoltage, DC earth leakage, AC incoming power supply failure, AC input fuse blown-off, Thyristor/diode failure, DC output fuse blown-off, DC battery fuse blown-off, Filter Capacitor fuse blown-off, Load on Battery (using current direction sensing with time delay), Battery under voltage/Disconnected during discharge (using zero current sensing), Cubicle fan failure/cubicle temperature high (for chargers with forced cooling).

g. DG Set
KW, KVA, KVAR, KWh, PF, VOLTAGE, CURRENT
ON, OFF, TEST, SERVICE, TRIP ON FAULT, TRIP CIRCUIT HEALTHY, CONTROL SUPPLY ON, RELAY WATCH DOG, FAULT DETAILS, DISTURBANCES RECORDER, Auto/manual switch position status, DG set run hours, Number of starts & number of consecutive starts (ie DG set auto start blocked due to exhaustion of consecutive starts), Day tank diesel level/.

h. VFD
KW, KVA, KVAR, KWh, PF, VOLTAGE, CURRENT, SPEED, SPEED REFERENCE.
ON, OFF, TRIP ON FAULT, TRIP CIRCUIT HEALTHY, FAULT DETAILS
Remote ON & OFF Control from LMS.
All Multi-function Meters of all HT, LT Switchboard, LDB, etc. to be connected with LMS.

9.17.2 All relays and energy meters shall have communication facility for serial communication (Relays on IEC-61850 protocol and Meters on MODBUS protocol).
10.0 CABLING

10.1 Cables

10.1.1 All HV & LV power and control cables for HV/LV switchgear shall be supplied and laid by the contractor. Terminations at switchgear end and at the equipment end shall be in contractor's scope. Supporting and laying of these cables shall also be in contractor's scope. Termination of HV/LV cables at HV/LV motor end and HV switch gear end including supply of heat shrink type termination kit for HV cables shall be in contractor's scope. Supply and execution of heat shrink type straight through jointing kits for HV cables shall be in the scope of the LSTK Contractor (if required).

10.1.2 Cables shall be sized considering the following factors.
   - Maximum continuous load current
   - Voltage drop
   - System voltage
   - Laying conditions
   - De rating due to ambient air temperature, ground temperature, grouping and proximity of cables with each other, thermal resistivity of soil etc. shall be taken into account
   - Short circuit withstand criteria.

10.1.3 All HV power cables shall be made of stranded aluminium conductor with XLPE insulation, PVC inner sheathed FRLS type, armoured, PVC outer sheathed FRLS type, conductor screen, insulation screen and construction as per IS: 7098 (Part 2). HV cables shall be of unearthed type.

Single core HV Power cable shall be of aluminium conductor. The construction of same shall be as per above.

10.1.4 All LV power cables shall be with stranded aluminium/copper conductor with XLPE insulation, PVC inner sheathed FRLS type, armoured, PVC outer sheathed FRLS type and construction as per IS: 7098 (Part 1). Power cables with conductor size upto and including 16 sq. mm shall be with copper conductor, conductor size 35 sq. mm and above shall be aluminium conductor.

Single core LV Power cable shall be of aluminium conductor. The construction of same shall be as per above.

10.1.5 All control cables shall be with 2.5 sq. mm, stranded copper conductor with XLPE insulation, PVC inner sheathed FRLS type, armoured, PVC outer sheathed FRLS type and construction as per IS: 7098 (Part 1). Control cables shall be twisted pair or shielded wherever electro-magnetic/electrostatic interference is anticipated.

10.1.6 All control cables shall have 20% spare cores. All cores shall be identified with numerical core numbers printed on core in addition to colour coding.

10.1.7 All cables shall be armoured and shall have extruded inner and outer sheath.

10.1.8 Cables connected in parallel shall be of the same type, cross section and terminations.

10.1.9 All power and control cables shall be in continuous lengths (except for very long feeders) without any joints. The cables used for lighting and wires in conduits shall have appropriate junction boxes with adequately sized terminals. Cable joints in hazardous areas shall not be permitted.

10.1.10 The maximum voltage drops in various sections of the electrical system shall be within limits stated in the following table:
### Design Philosophy – Electrical

<table>

#### Note-1

Minimum voltage available across any instrument in the field / control room / satellite rack room shall be as per instrumentation design basis. Distribution system for instrumentation supplies shall be designed accordingly. In case of any conflict between electrical equipment specification sheet and instrumentation design basis report, the latter shall govern regarding instrumentation power supplies.

#### Note-2

In case of difficulty in achieving specified voltage drops in cables up to lighting panel, 5% drop from Auxiliary Switchboard / MLDB up to lighting points may be permitted.

#### Note-3

a) Higher voltage drop may be permitted between PMCC and remote mounted MCC / ASB; if overall voltage drop up to motor (from PMCC) is limited within 5.5%.

b) For large substations 1% drop may be permitted.

The maximum voltage drop at various buses during start-up of large motor and / or motor reacceleration conditions shall be within the limits stated below:

<table>
<thead>
<tr>
<th>Sl. No.</th>
<th>System Element</th>
<th>Operating Condition</th>
<th>Maximum Permissible</th>
</tr>
</thead>
</table>
Voltage Drop

a) At the bus bars of the worst affected Switchboard
Start-up of the large HV motor with other loads on the bus or reacceleration of a group of HV motors (Simultaneous start-up or group reacceleration of HV motors is not envisaged) 10%

b) At the bus bars of the worst affected MV Switchboard (PMCC / MCC)
Start-up of large MV motor with other loads on the bus, or reacceleration of a group of MV motors. 10%

c) Cables between HV Switchboard and motor
Motor start-up or reacceleration 5% (Note-a)

d) Cable between MV Switchboard (PMCC / MCC) and motor
Motor start-up or reacceleration 10% (Note-a)

Notes:

a) Higher voltage drop in motor cables may be permitted, in case the conditions given in Note b), c) and d) are complied.

b) The voltage available at the motor terminals during start-up must be sufficient to ensure positive starting or reacceleration of the motor (even with the motor fully loaded, if required), without causing any damage to the motor.

c) For medium voltage motors, the voltage available at the motor terminals must not be less than 80% of the rated value during start-up or reacceleration.

d) For high voltage motors, the voltage available at the motor terminals must not be less than 85% of the rated value during start-up or reacceleration.

e) Soft Starter / VFD Starter shall be considered for starting large HV motors if essential / unavoidable as per system design requirement / equipment design limitation. For cases other than starting limitation, requirement of soft starter / VFD for any drive shall be confirmed by Process Department.

f) Unless otherwise specified as in clause e), all HV motors and MV motors shall be suitable for Direct on Line (DOL) starting.

10.1.11 MINIMUM CABLE SIZES FOR 415V MOTORS
Direct on line (D.O.L) start motors (2/4 pole motors)

Cables sizes as indicated above are for 2/4 poles motors fed from MCCs located near PCCs and PMCCs.

Cable sizes for motors not confirming to above table (e.g. for 2/4 poles motors rated up to 150kw & motors with high starting pf), extended distance, reduced voltage starting, low speed motors, VFD driven etc. shall be worked out on case to case basis.

However cable sizing calculation shall be submitted for approval.

10.1.12 Design Criteria for Cables/Bus Duct & Short Circuit Withstand Time:

</table>

For breaker control motor circuits the selection of size will be made ensuring that the cable shall withstand a short circuit fault directly for 0.2 sec. Suitable derating factors based on the site ambient conditions, method of laying and the no. of cables laid together shall also be applied.

b) Short circuit withstand time (seconds) shall be as follows for Breaker controlled feeders.

- Bus duct: 1 Sec.
- Feeder to motors and transformer: 0.25 sec
- Feeder from PCC/PMCC to MCC: 0.6 sec
- Main 11 KV primary distribution feeders: 0.7 sec
- 11 KV cable from generator & transformer to switch board: 1 sec
- Incomer from other switchboard: 0.6 sec

10.1.13 The minimum size of power cables shall be 2.5 sq. mm (Cu).
10.1.14 The control cables shall be 2.5 sq. mm (Cu). However, wiring in the panel/switch boards may be by means of 1.5 sq. mm (Cu) cables except for CT wiring which shall be 2.5 sq. mm. All the control and power wiring shall be carried by using FRLS wires only.

10.1.15 For all other specifications, refer PC150-TS-0815.

10.2 Cable Laying

10.2.1 The cables shall generally be laid on overhead racks. Pipe racks where available, shall be used to support the cable racks.

HV power cable shall be laid on cable tray in single layer having 1D spacing between the cables. LV power and control cable shall be laid on cable tray in touching formation in single layer.

HV Power, LV Power and Control shall be on separate trays. Instrument and electrical cable trays shall be separate.

Cables shall be clamped properly on the cable rack in such a way that position and layout of a particular cable shall not change throughout the rack so that it can be easily traced during maintenance jobs.

Walkway to be considered for access to Electrical / Instrument cables on pipe rack.

From substations to various electrical consumers, cable shall be laid overhead. However, wherever overhead cable routing is not feasible LSTK Contractor can go for cable trench / slit (Refer PDS attached with the NIT) as per the site requirement.

Wherever, pipe rack is not available and space for overhead cable laying is possible then dedicated structure for cable shall be made for cable laying.

10.2.2 The cable racks shall be ladder type, pre-fabricated from suitable hot dip galvanised steel/heavy duty FRP material. Cable racks around cooling tower areas shall be of heavy duty FRP (fire retardant and UV stabilized) material. Maximum cable tray size shall be 600mm wide. Maximum supporting span shall be 2 Mtrs. as per PDS Doc. No. PDS: E 530 attached with the NIT. Cable trays shall be designed considering 25% margin for future use.

All cable racks must be provided with GI flat strip of size 75mm X12 mm as running earth all along the tray.

10.2.3 FRP Cable Tray shall be as per NEMA FGI-198X. FRP Cable Tray shall be UV exposed as per ASTM G 154 fro 1000 Hrs and the mechanical properties shall not be deteriorate more than 5%. Glass content shall be greater than 55%. The run spacing shall be 250m.

10.2.4 All cables shall be terminated using suitable cable lugs.

10.2.5 All HV terminations and joints shall be of RAYCHEM make only.

10.2.6 Bimetallic lugs shall be provided, as required.

10.2.7 In Control Room (excluding false ceiling) and Substation, lighting cable shall be laid in concealed conduit.

10.2.8 For all other specification of cable racks, refer PC150-TS-0816 & PDS attached.

11.0 ILLUMINATION SYSTEM

11.1 General

11.1.1 LED type lighting shall be provided. The average illumination levels in the various sections of the plants shall be as indicated in Annexure-I. All the plants and area lighting shall be energy efficient.

11.1.2 LED type lighting shall be provided for all areas. The minimum illumination levels in the various sections of the plants shall be as indicated in Annexure-I.

LED shall conform to the following types and standards:-
Maintenance factor for indoor lighting shall be considered as 0.7 and for Outdoor lighting 0.6.

The colour rendering index shall not be less than 90%.

The LED lights shall work satisfactorily at the design temperature of 50 Degree Celsius.

All the LED fittings shall be selected in accordance with Hazardous Area Classification.

The life assessment of LEDs shall include control gears/driver as well.

11.1.3 The specified illumination level shall be maintained after considering maintenance factor 0.5 for Coal Dust Area, 0.6 for plant & outdoor areas (other than Coal Dust Area) & 0.7 for indoor areas and utilisation factor as per manufacturer catalogues for size of room & type of fixture.

11.1.4 Separate area wise panic lights, fed from 110 V DCDB shall be provided at strategic locations for safe evacuation of operation personnel. These shall be switched ‘ON’ automatically on failure of power supply to main lighting board and shall switch ‘OFF’ automatically on resumption of mains or after 1 hour of power failure to avoid draining of the battery. Location of these lights shall be judiciously decided from safety considerations. The outdoor lighting shall be photocell/timer controlled.

11.1.5 Voltage drop at the fixture from the MLDB bus shall not exceed 3%.

11.1.6 Aviation lights shall be provided on tall structures and all isolated structures. Aviation Lighting shall be in accordance with International Civil Aviation Organization (ICAO) Publication Annexure 14 and to Indian Standards, together with the approval of local aviation authority.

LED type Low Intensity Aviation Obstruction Light suitable for 240V, 50 Hz supply. It shall be covered under Indian patent act (Govt of India) No. 188995. Degree of protection shall be IP-65.

The illumination intensity of aviation lights and mounting height shall be considered based on vicinity of civilian air terminal within 1 km radius. Aviation lights at each location shall be fed from two separate and distinct DBs (one fed from normal bus and another fed from emergency bus of MLDB). Incase aviation lights are not switched ON for any reason, whatsoever, a signal shall be sent to control room which will sound buzzer and also result in flashing of red light. On acknowledgement, buzzer shall stop but flasher will continue unless aviation lights are turned ON.

The fixtures shall have body of corrosion resistant aluminium alloy casting and shall be suitable for outdoor use and mounting on 40 mm NB G.I. pipe. Necessary electrical threading shall be tapped in the fixture for mounting.

</table>
11.1.7 Plant lighting circuits shall be single phase (Phase & Neutral) rated 240 V AC. Each circuit shall be rated to 16A but not loaded more than 8A. A minimum of 25% of MCBs of each board shall be left as spares. The load on one lighting sub-circuit of lighting sub-distribution board and junction box shall be limited to 1000W approx.

11.1.8 The lighting sub-distribution board for control of lighting shall be standardized as 18-way, 15-way, 12-way, 9-way and 6-way type.

11.1.9 In plant office rooms, wall mounting boards shall be installed to control the lighting. These boards shall include switches for lights, fans, 15A/5A plug sockets and fan regulators etc.

11.1.10 15A plug sockets shall be fed through separate circuit of lighting sub-distribution boards/junction box having ELCB of 30mA.

11.1.11 16A plug sockets shall be fed through separate circuit of lighting sub-distribution boards/junction box.

11.1.12 Illuminated exit sign shall be provided in substation / Control Room.

11.1.13 Power factor of complete fitting shall be 0.95 min. at 230 V.

11.1.14 Lights from LED’s shall be soothing to eye and without any bright spots on the floor/objects illuminated by the luminaries.

11.1.15 The driver shall be mounted internally and be replaceable with the aid of commonly available hand tools.

11.1.16 The LED module or array shall be designed in such a way that the failure of one LED shall not affect additional LED’s.

11.1.17 Life expectancy of LED Luminaries shall be minimum of 50000 hrs with greater than 70% of rated lumen output.

11.1.18 Min. efficiency of LED driver: The minimum efficiency of LED driver shall be 85% for driver power output rating <=40W and 87% for driver power output rating> 40W.

11.1.19 Short circuit protection /Open load protection shall be required for LED fixtures.

11.1.20 Surge Protection for minimum 2kV for indoor and minimum 3kV for Outdoor LED systems shall be provided. However, If a site is prone to lightning and surges 10kV surge protection shall be required. In case of outdoor luminaires, the Surge Protection Device (SPD) should be series type with fail safe.

11.1.21 Color temperature of LED Luminaries: 5700K

11.1.22 Cover type for outdoor type fittings shall be Toughened glass or UV stabilized polycarbonate whereas, for indoor and non-weather proof items, UV stabilized Poly Carbonate can be used.

11.1.23 For more details, refer PDS attached.

11.1.24 For lighting fixtures and 16 Amp plug socket circuits, 3 core 2.5 sq. mm (Cu) cable shall be used.

11.2 LED Tube Lighting Fixtures (inside Substations)

a) High quality LED fluorescent tube twin batten type complete with 2 X 20W tube eco friendly, no UV radiation as per the specification tabulated below:

11.3 Street Lighting And Security Lighting

11.3.1 63A TPN outlet from outdoor lighting bus of main lighting board shall be taken direct to the TPN junction box to be mounted on pole through cable and looped from pole to pole.

11.3.2 Hot dip GI octagonal poles of suitable mounting height shall be used for street light. However, for plant lighting (platforms/ structures/ access ways/ walk ways/ pump house/ pump bay etc.), steel tubular poles of suitable mounting height shall be used. The poles shall be subjected to min. following tests:
- Thickness of galvanising
- Drop test as per IS: 2713.
- Deflection test as per IS: 2713

11.3.3 Hot dip galvanized octagonal high mast lighting shall be used for yard and general area lighting. LED type fittings may be used.

11.3.4 LED Street Lighting Fixtures

a) LED Street Light Fitting with cool white light in Pressure Die Cast Aluminium Housing with UV Stabilized Poly Carbonate Cover with in-built power unit of 3500 lumen suitable for 240V, 50 Hz, System shall be used.

b) Lighting fixture shall have 50000 hrs. Life Time, CRI>75, IP-65.

11.3.5 High Mast

In Coal Handling Area and other open area, High Masts shall be provided.

a) Structure

The High mast shall be of continuously tapered, polygonal cross section, at least 16 sided, presenting a good and pleasing appearance and shall be based on proven In-tension design conforming to the standards referred, to give an assured performance, and reliable service.

The mast height shall be 30m, with minimum diameter of 150mm at the top and 610mm at the bottom. Minimum plate thickness of bottom section shall be 5mm and other sections 4mm. The structure shall be suitable for wind loading as per IS 875 Part III, 1987 & for 9 Nos. 2x200W & 3 Nos. 1x200W LED flood light fittings. The PCD of the mast flange shall be minimum 740mm.

b) Construction

The mast shall be capable of safely withstanding the strong winds prevailing at site. The deflection at the top during heavy monsoon periods shall therefore be considered in the design and the mast designed in such way that the above deflection during worst periods is kept to a minimum value.

The High mast shall be fabricated from special steel plates, conforming to BS-EN10025, cut and folded to form a polygonal section and shall be telescopically jointed and fillet welded. The welding shall be in accordance with BS: 5135. The procedural weld geometry and the workmanship shall be exhaustively tested on the completed welds. Mast shall be delivered in multiple sections of length approx.10 metres. Thus a 30 meter mast shall be delivered in three sections.

Each mast section, delivered to site, shall include one no. circumferential welded diaphragm stiffener to reduce the deflection of the mast in heavy winds. At site, the sections shall be joined together by slip-stressed-fit method. No site welding or bolted joint
shall be done on the mast. The minimum overlap distance shall be 1.5 times the diameter at penetration.

The mast shall be provided with full penetrated flange which shall be free from any lamination or incursion. The welded connection of the base flange shall be fully developed to the strength of the entire section. The base flange shall be provided with supplementary gussets between the bolt holes to ensure elimination of helical stress concentration. For the environmental protection of the mast, the entire fabricated system shall be hot dip galvanised, internally and externally, having a uniform thickness of 65 microns for the bottom and top sections.

c) Door Opening
An adequate door opening of size 1000mm x 300mm shall be provided at the base of the mast and the opening shall be such that it permits clear access to equipment like winches, cables, plug and socket, etc. and also facilitate easy removal of the winch. The door opening shall be complete with a close fitting, vandal resistant, weather proof door, provided with a heavy duty double internal lock with special paddle key.

The door opening shall be carefully designed and reinforced with welded steel section, so that mast section at the base shall be unaffected and undue buckling of the cut portion is prevented.

d) Dynamic Loading for the Mast
The mast structure shall be suitable to sustain an assumed reaction arising from a wind speed as per IS: 875 (three second gust), and shall be measured at height of 10m above ground level. The design life of the mast shall be a minimum of 25 years. Wind excited oscillations shall be dampened by the method of construction and adequate allowance shall be made for the related stresses.

e) Earthing Terminals
3 Nos. earthing terminals, one for lightning protection and other two for electrical earthing of the mast, using 12 mm dia. stainless steel bolts shall be provided at convenient location on the base of the mast.

f) Lantern Carriage
i) Fabrication
A fabricated Lantern Carriage shall be provided for fixing and holding the flood light fittings and control gear boxes. The Lantern Carriage shall be of special design and shall be of steel tube construction, the tubes acting as conduits for wires, with holes fully protected by grommets. The Lantern Carriage shall be so designed and fabricated to hold the required number of flood light fittings and the control gear boxes, and also have a perfect self balance.

The Lantern Carriage shall be fabricated in two halves and joined by bolted flanges with stainless steel bolts and plastic lock type stainless steel nuts to enable easy installation or removal from the erected mast. The inner lining of the carriage shall be provided with protective PVC arrangement, so that no damage is caused to the surface of the mast during raising and lowering operation of the carriage. The entire Lantern Carriage shall be hot dip galvanised after fabrication.

ii) Junction Box
Weather proof junction box with IP65 enclosure, made of cast Aluminium shall be provided on the Carriage assembly as required, from which the inter-connections to the designed number of the flood light luminaries and associated control gears fixed on the carriage, shall be made.

g) Raising and lowering mechanism
For the installation and maintenance of the luminaries and lamps, it will be necessary to lower and raise the Lantern Carriage assembly. To enable this, a suitable winch arrangement shall be provided, with the winch fixed at the base of the mast and the specially designed head frame assembly at the top.

i) Winch

The winch shall be of completely self sustaining type, without the need for brake shoe, springs or clutches. Each driving spindle of the winch shall be positively locked when not in use, gravity activated PAWLS. Individual drum also should be operated for fine adjustment of lantern carriage. The capacity, operating speed, safe working load of the winch and the recommended lubrication and serial number of the winch shall be clearly marked on each winch.

The gear ratio may be according to manufacturer’s standard. However, the minimum working load shall not be less than 750Kg. The winch shall be self lubricating type by means of an oil bath and the oil shall be readily available grades of reputed producers.

The winch drums shall be grooved to ensure perfect seat for stable and tidy rope lay, with no chances of rope slippage. The rope termination in the winch shall be such that distortion or twisting is eliminated and at least 5 to 6 turns of rope remains on the drum even when the lantern is fully lowered and rested on the rest pads.

It should be possible to operate the winch manually by a suitable handle and / or by an external power tool. It shall be possible to remove the double drum after dismantling, through the door opening provided at the base of the mast.

Also, a winch gear box for simultaneous and reversible operation of the double drum winch shall be provided as part of the contract. A test certificate shall be furnished by the Bidder from the original equipment manufacturer, for each winch in support of the maximum load operated by the winch.

ii) Head Frame

The head frame, which is to be designed as a capping unit of the mast, shall be of welded steel construction, galvanised both internally and externally after assembly.

The top pulley shall be of appropriate diameter, large enough to accommodate the stainless steel wire ropes and the multicore electric cable. The pulley block shall be made of non-corrodible material, and shall be of die cast Aluminium alloy (LM-6). Pulley made of synthetic materials such as plastic or PVC is not acceptable. Self lubricating bearings and stainless steel shaft shall be provided to facilitate smooth and maintenance free operation for a long period. The pulley assembly shall be fully protected by a canopy galvanised internally and externally.

Close fitting guides and sleeves shall be provided to ensure that the ropes and cables do not get dislodged from their respective positions in the grooves. The head frame shall be provided with guides and stops with PVC buffer for docking the lantern carriage.

iii) Stainless Steel Wire Ropes

The suspension system shall essentially be without any intermediate joint and shall consist of only non-corrodible stainless steel of AISI 316 or better grade. The stainless steel wire ropes shall be of 7/19 construction, the central core being of the same material. The overall diameter of the rope shall not be less than 6mm. The breaking load of each rope shall not be less than 2350Kg individually, giving a factor of safety of over 5 for the system at full load as per the TR-7 referred to in the beginning of this specification. The end constructions of ropes to the winch drum shall be fitted with telluric.

The thimbles shall be secured on ropes by compression splices. Two continuous lengths of stainless steel wire ropes shall be used in the system and no intermediate joints are acceptable in view of the required safety. No intermediate joint either bolted or else is provided on the wire ropes between winch and lantern carriage.
h) Electrical System, cable and Cable Connections

The electrical connection from bottom to top shall be made with at least 5 core 2.5 sq. mm flexible round sheath power cables using copper conductors of appropriate rating. A suitable flameproof socket arrangement shall be provided at the bottom of the mast. The trailing cable shall also have an FLP plug connected at the bottom end. Also, suitable provision shall be made at the base compartment of the mast to facilitate the operation of externally mounted, electrically operated FLP power tool for raising and lowering of the lantern carriage assembly. The trailing cables at the top shall be terminated in the weather proof junction box.

i) Power Tool for the Winch

A suitable, high powered, electrically driven, flameproof, integral mounted power tool, with manual handle together with an operating stand shall be supplied for the raising and lowering of the lantern carriage for maintenance purposes. The speed of the power tool may, preferably, be slow of 1.5 to 1.8 metre/minute, so that vibrations associated with high speed operation are avoided. The power tool shall be single speed, provided with a flameproof motor of required rating, suitable for trolley mounting. The power tool shall be supplied with suitable reversible starter in flameproof enclosure. The capacity and speed of the electric motor used in the power tool shall be suitable for the lifting of the design load installed on the lantern carriage. The power tool trolley shall be so designed that it will not only be self supporting but also aligns the power tool perfectly with respect to the winch spindle during the operations. Also, a handle for the manual operation of the winch in case of problems with electrically operated tool, shall be provided and shall incorporate a torque limiter.

j) Lightning Finial

One number heavy duty, hot dip galvanised, lightning finial shall be provided for each mast. The lightning finial shall be minimum 1.2m in length and shall be provided at the centre of the head frame. It shall be bolted solidly to the head frame to get a direct conducting path to the earth through the mast body. The lightning finial shall not be provided on the lantern carriage under any circumstances in view of safety of the system.

k) Luminaries

i) Each mast shall be fitted with required numbers of specially designed non integral type high mast luminaries (IP-65) complete with separate control gear box (IP-65) suitable for 200W LED lamps. Two types of fittings shall be used, viz. 2X200 W LED (asymmetrical) and 1X200W LED (symmetrical).

ii) Twin dome LED type (2x40W) Aviation Obstruction Lights of reliable design and reputed manufacturer shall be provided on top of each mast. It shall have cast aluminium housing finished in aviation yellow colour, suitable rated step-up transformer, thick glass dome mounted on cast aluminium ring and spring loaded high tension porcelain socket fitted with neon cold cathode helix light source. The light source shall be designed to give Omni-directional red colour light distribution to have maximum light output in the zone between 10°C to 90°C above horizontal plane.

11.3.6 24 V Portable Module

The 24V A.C. supply modules (with air-cooled two winding, 500VA, 1-phase, 50HZ, 240/24V transformer with HRC fuses on both primary & secondary side and necessary 240V and 24V terminals for incoming and outgoing connections ) shall be sheet steel enclosed with louvers and shall be suitable for outdoor use. The 240V terminals of 24V AC supply module shall be fed from respective lighting panels / 5/15A Switch socket.

240 V AC Terminal shall be 20 Mtr PVC insulated PVC sheathed cables and 5/15 A Plug Top.

24 V Output shall be complete with 50 Mtr PVC insulated PVC sheathed cables, 24 V 20 W LED hand lamps with suitable hook.
12.0 EARTHING AND LIGHTNING PROTECTION

12.1 Earthing

12.1.1 Complete earthing installation shall be done as per IS: 3043, IEEE-80, IE Rules and IEC recommendations. The earthing system shall be designed to:

(a) Provide a permanent & continuous path from equipment and conductor enclosures to earth from circuits for flow of fault current.

(b) Provide sufficient current carrying capacity to conduct safely any current liable to be imposed on it.

(c) Provide sufficient low resistance to earth to limit the potential between metalwork and earth within safe limits.

(d) Provide equal distribution of potential and minimum potential difference for safety of personnel.

(e) Ensure sufficient current in case of fault to facilitate the operation of relays, over current devices, fuses etc. provided in the circuit.

12.1.2 Common underground earthing grid shall be provided covering sub-stations and plants which is further connected to overall Earthing Grid. The overall earth resistance (dry) shall be limited to 1 ohm.

12.1.3 Earthing rings shall be provided around sub-stations and plants which in turn shall be connected to the common earthing grid. Minimum size of main grid shall be 75mm×12mm. Anti-corrosive bituminous paint shall be provided at each joint of earth flat after necessary finishing and priming treatment .

12.1.4 Earthing grid/ring shall comprise of buried GI earth strips and GI pipes/electrodes.

12.1.5 Separate earth electrodes shall be provided for system neutral earthing. For equipment earthing, minimum two numbers of electrodes shall be provided around each plant/section. However, all these earth electrodes shall be interconnected.

12.1.6 Inter-connecting pits having an earth bus in an enclosed brick chamber without earth electrode shall be provided in the common underground earthing grid for convenience of taking earth conductors inside the plants.

12.1.7 As far as possible, the reinforcement rods inside concrete column shall be connected to the earthing grid/ring to reduce the overall earth resistance.

12.1.8 Individual electrical equipment shall be earthed by GI strip/GI wire/Cu/Al cable. Earth buses shall be provided in plants for earthing groups of electrical/non-electrical equipment to earthing grid/rings.

12.1.9 Size of earthing grid/ring and earth conductors of equipment for generating station and sub-stations shall be as per relevant standards. The fault current magnitude shall be decided based on system fault level. The time duration shall be taken as 1 second for voltage level above 66 kV and 3 seconds for voltage upto 66 kV as per IS -3043.

12.1.10 All equipment rated above 250 V shall have two external earth connections and those rated up to 250 V shall have one external earth connection. However, for lighting fixtures, earthing shall be done through 3rd core of the cable in safe as well as in hazardous area.

12.1.11 Flameproof equipment, in addition, shall have one internal earth connection. This means that 4 core cables to be used for all the flameproof equipments and 3.5 core cables to be used for all flameproof motors located at hazardous area.

12.1.12 All steel structures, tanks, vessels, pipes, pipe joints, valves etc. shall be earthed against static charge accumulation by 50x6 mm GI strip. The no. of earth connections shall be as follows:

<table>
<thead>
<tr>
<th>Equipment having diameter</th>
<th>Hazardous area</th>
<th>Non hazardous area</th>
</tr>
</thead>
</table>
12.1.13 Wherever process equipments are mounted on steel structures, the structures shall be earthed instead of earthing the individual equipment.

12.1.14 The pipe structures shall be earthed at not more than 25M apart.

12.1.15 For all equipment in hazardous area, in addition to external earthing one internal earthing shall be provided.

12.1.16 Minimum sizes of earth conductors to be used shall be as given below.

<table>

</tbody>
</table>

Vendor to calculate the actual size. However, higher size of calculated one or above-mentioned size shall be provided.

All GI conductors shall meet the galvanizing requirement as per IS.

12.1.17 The main ground grid shall be buried in earth at a minimum depth of 1000 mm below finished grade level unless stated otherwise

12.2 Lightning Protection

12.2.1 All structure shall be protected against lightning strokes by suitable lightning protection system to be designed and installed as per IS/IEC-62305.

12.2.2 The number of down conductors shall be minimum two.

12.2.3 Bare metallic structures shall not have any air termination rods at the top. The earth connections shall be welded to the bottom of structure at 300 mm above floor level. However, tall metallic columns with insulation at top shall be provided with air termination rods. Separate earth electrodes shall be provided for each down conductor of lightning protection. However, these shall be inter-connected with the other electrodes in main grid.

12.2.4 Air Terminal

The vertical air terminal rods shall be installed at the roof of buildings (including power house main building), at the top of chimney and cooling towers to protect these objects from lightning strokes.

The vertical air terminal except for chimney shall be made of 20 mm dia galvanized steel rod. The projected length of the rod shall be as required to protect the object (on which the rod is fixed) from lightning stroke.

The air terminal rods provided at the top of chimney/stack for lightning protection shall be 20 mm dia lead coated solid copper rod.

The air terminal rod shall be properly fixed on the top of the building/structure to withstand very high wind pressure. In case the air terminal rod is embedded at the top of roof of
building: the portion embedded inside the concrete shall not touch the reinforcement bars and shall be duly insulated from them.

All the vertical air terminal rods shall be electrically connected together by means of horizontal conductors of size 50 x 6 mm galvanized steel flats.

The shielding angle for one vertical air termination shall be 45 degrees. For more than one rod, shielding angle between the rods shall be taken as 60 degrees.

Horizontal air termination (i.e. G.S. Flat conductor) shall be so laid that no part of the roof will be more than nine (9) metres from the nearest roof conductor.

12.2.5 Shielding Masts

The shielding mast for lightning protection shall be installed at the top of steel columns cap plates of power house main building.

The shielding mast shall be made of galvanized steel pipe and the height of the same shall be decided considering the zones to be protected.

Each shielding mast shall be connected to grounding grid by a down conductor 50 x 6 mm. Galvanized steel flat run along the building column. In addition all power house building columns joints shall be electrically bonded.

12.2.6 Down Conductors

The down conductors shall be 50 x 6 mm galvanized steel flats. The connection between each down conductor and earth electrode shall be made via test link located at approximately 1500 mm above ground level.

13.0 CATHODIC PROTECTION SYSTEM

13.1 Entire underground pipe work including those laid in concrete trench and filled with sand, the steel structures (within battery limit), tank bottom etc. shall be provided with cathodic protection in their battery limit. The scope shall include, site surveying to collect required information, design, supply, installation, commissioning, maintenance, monitoring and performance guarantee of impressed current cathodic protection system as per relevant Indian/IEC/BS/NACE Standards and codes of practices. Contractor shall have to design and engineering of complete CP system for their battery limit. The design life of CP System shall be 30 years.

Following shall be excluded from Cathodic Protection system.

- Underground Pipes with SS material / GRP Material,
- Above Ground reinforcements bars of reinforced concrete,
- Reinforcements bars of reinforced concrete foundations.
- Reinforcement bars in concrete piles.

13.2 LSTK Contractor shall carryout the detail site survey to confirm the desired limits of polarized potential as per standard, functionality check, vetting / confirmation of the system by NACE -4 Level certified person having more than 3 years’ experience in the plant structure CP WORKS.

13.3 The SCOPE shall include but not limited to the CP system consisting of TR Units, Various types of anode beds, associated system and for monitoring the parameters SCADA System is provided.

13.4 There shall be centralised SCADA system to control and monitor the CP system of the complete plant. CP system of individual unit shall have the provision for hook-up with centralised CP SCADA system.

13.5 Shed shall be provided for all Cathodic Protection equipment installed in the field.

13.6 Solid State Polarization Cell shall have short time fault current withstand capacity:- 5 kA/ 5000 A @ 30 Cycles and Lightening Surge Current rating : 50000 A Crest for 8 to 20 μ seconds with DC Blocking voltage range of - 3.0 V to + 1.0 V.
13.7 Surge over voltage diverter shall be provided across each monolithic isolation joint.

13.8 For all other specifications, refer PC150-TS-0823, PC150-TS-0824, PC150-TS-0825.

14.0 CAPACITOR BANKS

14.1 The LSTK Contractor shall ensure that the power factor remains minimum 0.95 lag (inductive) in all the Bus of HV, MV& LV Switchboards.

Suitable capacitor bank shall be designed and installed at 415 V voltage level in the substation.

Capacitor bank at 3.3 kV or 11 kV may also be considered, if required.

The capacitor bank shall utilize the Automatic Power Factor Controllers to maintain the power factor of individual plant. Under no circumstances power factor shall become leading (capacitive) and all necessary protections to avoid this shall be used.

14.2 For all other specifications, refer PC150-TS-0822.

15.0 COMMUNICATION SYSTEM (PA & Paging System)

15.1 Public Address system suitable to provide reliable and quick source of communication among operating personnel shall be provided. The system shall be microprocessor based with modular construction for ease of expansion capabilities and capacity. The system shall have speakers, calling points etc. suitable to area of classification for that location.

Substation shall be connected with the PA System.

PA system shall be located in respective control room.

Minimum no. of field call stations of PA System shall be 15 Nos.

Minimum No. of PA Speakers shall be 15 Nos.

1 Nos. Master Call Station shall be considered and to be install at control room. Additionally Call Station shall also be provided in Substation.

All required furniture, PC console with chairs for complete PA System shall be in scope of LSTK Contractor.

15.2 Close talk mode shall be provided for conversation between two or more stations through close talk channel. Speeches from any hand set shall be heard over all the speakers. The system shall have the following facility:-

i) Alert tone facility

ii) Paging facility

iii) Private conversation facility

iv) Loud speaker mute facility

i) Emergency tone facility.

15.3 The system may be centrally located at a particular plant but the location shall in no way affect the performance of system. If required separate but interconnected system shall be provided. The microphone system shall be capable to suppress the environmental noise which will be present in the plant due to machineries.

15.4 It shall be possible to have automatic testing, monitoring, fault diagnosis etc. through interface PC. The system programming shall be user friendly through interface PC.

15.5 Separate dedicated UPS with battery back-up of 8 hours shall be considered for PA System. VRLA type maintenance free Ni-Cd Battery shall be provided.

15.6 Paging speakers provided in areas having ambient noise levels shall produce a paging sound level at least 10 dB above the anticipated ambient noise level. Where it is not possible to achieve the sound level of above 10 dB above the ambient, rotating beacons shall be
15.7 The design of the system shall be such as to provide two channel communication i.e. Page & Party in each zone. Page & Party system shall comprise of one channel for paging & one channel for party talk.

15.8 It shall be possible to communicate between two field stations without the interference of the MCS / operator. Also it shall be possible to have direct communication with the MCS.

15.9 The equipment shall be sturdy, impact resistant, dust & damp proof generally conforming to minimum IP 66 degree of protection. For classified hazardous areas flameproof equipment shall be provided duly certified by recognised certifying authority for the area of installation.

15.10 Acoustic hood for PA stations in Steam Generation Plant in addition with acoustic hood in noisy area shall be considered.

15.11 Paging system shall be interfaced with EPABX and Fire Alarm System.

15.12 Each PA System shall have 20% spare capacity.

15.13 10 nos. flameproof walkie-talkie alongwith Base Station & License and 10 nos. flameproof hand lamps shall be provided for convenience of installation, operation and maintenance of equipment.

15.14 Separate Centralised PA System of entire fertiliser complex shall be provided by EDS LSTK Contractor. However hook-up of PA System of Steam Generation Plant with Centralised PA System shall be in LSTK Contractor’s scope. All interfacing equipment as well as cabling required for hook-up shall be in LSTK Contractor’s scope.

15.15 All cables (including communication cable) shall be armoured type only.

15.16 For all other specifications refer PC150-TS-0801.

16.0 FIRE DETECTION AND ALARM SYSTEM

16.1 LSTK Contractor shall provide the Fire Detection and Alarm System which shall be an independent system comprising of individual break glass type manual call points, automatic sensors e.g. smoke and heat detectors, main panel, repeater panel, hooter, battery, battery charger and any other hardware.

16.2 The system shall be designed to provide audio-visual indication at the main panel to be located in Control Room and repeater panels shall be provided in fire station.

16.3 The manual call points shall be provided at strategic locations with access along all exit routes and roads.

16.4 Electrical sirens shall be provided to cover entire Steam Generation Plant. Hooters and exit lights shall be provided at required locations in the buildings.

16.5 Panel design and component selection shall be done for future extension upto 10% of specified zones or one zone, whichever is maximum in each panel. The design of common facility and hardware shall be provided for required future extension of zones.

16.6 The fire detection system shall be interfaced with fire suppression system.

16.7 Supply, installation, testing and commissioning of above mentioned components/equipment for plant area, substation & control room shall be by the Contractor along with necessary supply and laying of required signals cables.

16.8 The required nos. of MCPs and detectors in substation & control room shall be calculated as per IS norms and contractor shall get approval from client during detailed engineering stage.

16.9 Separate Centralised Fire Alarm & Detection System of entire fertiliser complex shall be provided by EDS LSTK Contractor. Fire Alarm & Detection System of Steam Generation Plant shall be hooked-up with the Centralized Fire Alarm System and shall be in LSTK
Contractor’s scope. All interfacing equipment as well as cabling required for hook-up shall be in LSTK Contractor’s scope.

16.10 All cables (including communication cables) shall be armoured type only.

16.11 For all other specifications refer PC150-TS-0826.

**17.0 COAL HANDLING AND ASH DISPOSAL HANDLING SYSTEM**

17.1 The Electrical system shall be suitable for the full capacity of coal conveying and ash disposal system.

17.2 Suitable switchgears, motors, cabling etc, for these systems shall be as described in the Electrical design philosophy under these headings.

17.3 Conveyor Control Panel (PLC based).

The conveyor control panel (CCP) is required to perform the various control operation to obtain the material flow in the desired patterns. Vendor to develop control schematic diagram, trip/interlock logics and furnish the same for the safe & proper operation of all conveyor motors.

The important parameters and data of CCP to be communicated to main control room DCS with suitable communication protocol.

**Emergency Safety Devices**

17.3.1 Following emergency safety device shall be provided at the provided at the specified intervals to trip the conveyor under abnormal operating conditions:-

   i. Pull cord switch
   ii. Belt sway switch
   iii. Zero speed switch
   iv. Emergency stop push button
   v. Gravity take up switch
   vi. Chute choking device
   vii. Bunker level indicating device

In addition status of all safety switches on CCP also to be also provided.

17.3.2 Pull Cord Switch

   a) The pull card switch shall be installed only on the normal walk way side of each conveyor at an interval of 30 meters with a minimum of one for each conveyor for tripping the conveyor under emergency.

   b) The switch shall be heavy duty type pedestal mounted, enclosed in a dust proof cast aluminium IP-65 enclosure/stainless steel IP-65 enclosure with removable cover, complete with rope clamping arrangement and a set of normally open/normally close contacts rated or open on the operation of deriving shaft through the lever which shall be actuated by pulling the flexible steel wire rope of about 5 mm dia.

   c) The operating position of the switch shall have latches for safety purpose and resetting of the latch shall only possible by local manual operation. The lever shall operate on either side of its normal vertical axis.

   d) The switch shall be provided with sturdy terminal spring to take the tension of 100 meters long steel wire rope. An arrangement for the adjusting the angle of lever on the shaft shall be provided. The switch shall be complete with a set of normally open/normally close contacts rated for 10 Amps, 240V A.C for alarm and trip. 1 no. of earthing terminal, compression type brass nickel coated cable glands, terminal blocks and cable lugs etc. for termination of 3X2.5 sq.mm PVC insulated armoured and PVC
sheathed copper conductor cable. The complete details, of limit switch and assembly sketches shall be furnished.

17.3.3 Belt Sway Switch

17.3.3.1 The belt sway switches shall be provided along with timer (range 2 min. to 15 min.) to stop the conveyor in case of excessive sway in the belt on either side. These shall be mounted on the both side of the conveyor at an interval of 50 meters or minimum one pair for shorter length of conveyor. The switch shall be heavy duty type, enclosed in dust and weather proof cast aluminium IP-65 enclosure/stainless steel IP-65 enclosure.

17.3.3.2 The switch shall comprise of horizontally mounted spring return type vertical lever which shall be suitable for operation on its neutral vertical axis, a roller fitted on the lever which is suitable to rotate around its vertical axis. The resetting of the switch shall be possible by local manual operation. The switch shall be complete with a set of normally open/normally close contacts rated for 10 Amps, 240V A.C for alarm and trip. 1 no. earthing terminal, compression type cable glands suitable for 3x2.5 sq. mm (Cu) control cable, cable lugs, terminal block etc. The complete details of switch and assembly sketch shall be furnished.

17.3.4 Zero Speed Switch

a) The zero speed switch with timer of suitable range shall be required to provide adequate protection to conveyor against the following:-
   - Excessive belt slip and belt under speed.
   - Belt breakage or snapping

b) The switches shall be provided one per conveyor. The switches shall be heavy duty type enclosed in dust and weather proof cast aluminium IP-65 / stainless steel IP65 enclosure. The switch shall be turn on mounted type having centrifugal switch chamber on one side and extended rotating spindle with pulley at other end.

c) The pulley mounted on the spindle shall be so designed that it shall be able to rotate with the friction against the belt surface with as minimum slip as possible. The arrangement shall be provided to adjust the belt speed within the desired limits. This shall be mounted on the tail end side of the conveyor.

d) The switch shall be complete with a set of normally open/normally close contacts rated for 10 Amps, 240V AC, and 1 no. earthing terminal, cable glands, suitable for 3X2.5 sq.mm copper conductor control cable, cable lugs, terminal block etc. The complete details of the switch and assembly sketches shall be furnished.

17.3.5 Emergency Stop Push Button

a) The stop push button shall be provided in staggered manner at an interval of 20 meters with a minimum of one on each side of conveyor for tripping the conveyor under emergency.

b) The push button shall be heavy duty type enclosed in dust and whether proof cast aluminium enclosure / SS enclosure and shall be suitable for wall/structure mounting.

c) The push button shall be red colored, un-shrouded type having a set of normally open/normally closed contact rated for 10 Amps, 240V AC and shall have padlocking facility. The push button shall be complete with 1 no. earthing terminal cable glands suitable for 3X2.5 sq.mm copper conductor control cable, cable lugs and terminal block etc.

17.3.6 Steel Wire Rope & ‘U’ Clamps

a) Galvanized steel wire rope shall be 6/19 construction, ordinary right hand lay, 5 mm dia. conforming to IS-3459 and provided with PVC sleeve of suitable thickness.

b) The steel wire shall be provided all along with conveyor with one end tied to ‘U’ clamp and other end to lever of pull cord switch Steel ‘U’ clamp fabricated out of 50X7 flats, complete with all nuts & bolts for fixing 5 mm dia. galvanized steel wire rope. The ‘U’
clamp shall be duly painted to withstand the corrosive chemical atmosphere prevailing inside the conveyor gantries due to coal/urea dust.

17.3.7 KLAXON

a) Electric Klaxon, heavy duty type, enclosed in a dust and weather proof cast aluminium epoxy painted enclosure, suitable for still air range of 250 meters and rated for half hour at 240V single phase 50Hz AC supply.

b) The Klaxon shall be provided all along with conveyor at an interval of 100 meters apart with a minimum of 1 per conveyor and 1 per transfer tower and at any convenient location to sound the alarm before the start up of plant.

17.3.8 Other Electrical Items

All other electrical items shall be suitable for the duty involved and service Conditions.

18.0 Electric Heat Tracing System

18.1 Electrical trace heating of pipelines, instruments and equipment for process temperature maintenance shall be considered if required from process point of view.

18.2 Electrical trace heating system shall be designed according to IEC 60079-30 and shall be based on the use of self-regulating cables, suitable for installation in accordance to hazardous area classification.

18.3 Mineral insulated cables shall be used only where process temperature maintenance high values would not allow the use of self-regulating cables.

18.4 All self-limiting parallel resistance type heater cables shall be covered with a metal braid and a polymer over jacket for mechanical protection and corrosion resistance.

18.5 Cable sheaths, conductor and termination materials, and cable support clamps shall withstand the maximum operating temperature, temperature cycling and thermal expansion of the piping or equipment to which is applied.

18.6 The design of the heating system shall be such that the heater element temperature does not exceed the temperature classification of the hazardous area.

18.7 Heat tracing system shall be fed through a separate control station approachable to operator and suitable ammeter shall be provided to ascertain that heat tracing cables are working.

18.8 System shall be designed for tripping in case of leakage to earth or pipe for human safety.

19.0 MOUNTING STRUCTURES

Switch sockets, cable trays, DBs etc shall be mounted / supported on suitable structure fabricated out of standard sections of mild steel, i.e. channels, angels, flats etc conforming to IS: 2066.

20.0 SPARES

20.1 Commissioning Spares

LSTK Contractor shall recommend list of commissioning spares for all the equipments, as required. The commissioning spares shall form an integral part of the scope of supply. LSTK Contractor shall be responsible for the quantification of the commissioning spares for the smooth start up of the plant/package system. Item wise list of commissioning spares with recommended quantity shall be furnished for information. The same shall be Part of LSTK Price.

20.2 Mandatory/Insurance spares

Contractor shall supply Mandatory / Insurance spares for all equipments as per Section 10.0: Spare Parts of this bid package. The same shall be Part of LSTK Price.

20.3 2 Years Bidder’s Recommended Operational Spares (Other than Spares for 2 Years Operation & Maintenance)
Bidder shall recommend 2 years Operational Spares for all the equipment (item-wise) with recommended quantity and unit price. The item-wise price shall be with validity of 2 Years. The same shall not be part of LSTK price.

20.4 All spare parts shall be identical to the parts used in the equipments.

20.5 Any other spare parts or special tools not specified, but required, shall also be quoted along with the offer.

21.0 VENDORS’ SERVICES

21.1 The LSTK Contractor shall consider the services of major equipment suppliers during installation, testing and commissioning in their scope as required.

21.2 The services of engineers of following equipments’ (OEM) manufacturers are envisaged and required during installation, Testing and commissioning. LSTK contractor shall arrange for the same without any additional cost implication:

- AC UPS
- DC Panels
- Variable Speed Drives / Soft Starter
- Numerical relay
- MOV
- DG sets
- Power Transformer
- HV & LV Switchboard
- Cathodic Protection System
- Public Address System
- Fire Detection & Alarm System
- Lift

21.3 Site Testing, parameterization and commissioning of the Numerical relays shall be done by OEM expert only.

22.0 TESTING & INSPECTION

22.1 Testing of all electrical equipments shall be done in accordance with relevant IEC/BIS codes in presence of owner’s representative at manufacturer’s works before despatch / at site before installation. All such tests shall be arranged by the contractor and testing charges, if any, shall be borne by the contractor.

22.2 The LSTK Contractor shall submit the certificates of type tests performed on identical equipment as evidence of the compliance of the equipment with the type tests.

22.3 The LSTK Contractor shall submit the certificates of routine and acceptance tests conducted on the purchased equipments.

22.4 All the routine/acceptance tests shall be performed at the manufacturer’s works in the presence of owner’s representative.

22.5 Stage Inspection of Electrical Equipment shall be considered. The owner or their representative shall be allowed to visit the manufacturing works for stage inspection during manufacturing stage.

22.6 The equipment shall be dispatched from works only after receipt of Owner written approval of the test reports.

22.7 The LSTK Contractor shall intimate the owner 4 weeks in advance of the tests and submit the detailed schedule of tests.

22.8 In addition, the equipment shall be inspected at site for final acceptance.

22.9 Certified reports of all the tests carried out at the works shall be furnished in six (6) copies for approval of the Owner.
22.10 Electrical installation work shall be subjected to inspection by owner / his authorized representative, statutory bodies like Electrical Inspector, Factory Inspector and where applicable by equipment supplier’s engineer. The contractor shall carry out without extra cost to owner rectifications / modifications desired by the above authorities to make the installation conforming to I.E. Rules etc.

22.11 The owner may reject any portion of the work considered defective or of poor workmanship and the contractor shall make good these defects without extra cost to owner.

23.0 DOCUMENTATION

23.1 The LSTK Contractor shall submit the documents for electrical equipments (MS-word, MS-excel and AutoCAD) as per the drawing and documentation schedule as given in this bid package.

23.2 Sizing of Electrical system and Equipments shall be submitted during detailed engineering stage.

23.3 A dedicated PC with licensed copy of documentation software shall be included in the scope of LSTK Contractor for documentation of Electrical Engineering.

23.4 The software shall be used for preparing and updating the various documents such as general arrangement drawings, cable schedules, single line diagrams, control system drawings and equipment specifications etc.

23.5 The documentation software shall be same which is used by the LSTK Contractor for electrical documentation.

23.6 The details of the documentation software shall be furnished in the technical offer.

23.7 LSTK Contractor shall ensure that following shall be mentioned in each sheet of drawings/documents in the order mentioned below:

(a) Logo and Name of the client
(b) Logo and Name of the consultant
(c) Logo and Name of the contractor (LSTK Contractor)
(d) Logo and Name of the Manufacturer on the drawings prepared by manufacturer, if applicable
(e) Name of the Project for which drawings are applicable
(f) Title of the drawing (Title shall indicate the details shown in the drawing)
(g) Drawing/ document number with sheet number and number of total sheets in the drawing (Drawings having different title shall be assigned different drawing number)
(h) All sheets of each drawing shall bear same title, same document number and same revision number

23.8 At the time of handing over of the installation, LSTK Contractor shall supply as built drawings taking into consideration the actual execution carried out at site.

23.9 Erection, testing/ checking (inclusive of calibration check) prior to energisation/ after energisation and commissioning Manuals shall be in bound book format and shall give step by step procedure for:

(a) Storage, Handling and Erection
(b) Checking/ testing after erection and before energisation.
(c) Pre-commissioning tests/ checks and cold trials
(d) Commissioning
(e) Drawings relevant for erection, operation, maintenance and repair of the equipment.
(f) List of instruments/ testing kits/ sets, measuring instruments etc. required for testing/ checking with specification, ratings, ranges etc.

23.10 Operation & Maintenance Manuals for each of the equipment/ system being shall be in bound book format and shall be supplied alongwith dispatch of equipment and inclusive of following:

(a) Log sheets indicating daily/ hourly recordings of parameters to be noted down by customer's operating personnel.
(b) Procedure for shut down and energisation.
(c) Preventive maintenance schedule.
(d) Safety procedures for safe operation of equipment and complete system.
(e) Specification of equipment installed. Manufacturer’s catalogues operation and maintenance manuals for all types of relays/components used.
(f) Test procedures for site tests/ checks.
(g) Spares list for each equipment/ system for 2 years operation and maintenance.
(h) Relevant calculations and protection relay setting table for the equipment/ system being supplied by him
(i) Instructions for Diagnostic trouble shooting / fault location charts
(j) Tests for checking of proper functioning/ Operation.
(k) Storage and re-conservation Manual
(l) Safety Manual
(m) Drawings relevant for operation, maintenance and repair of the equipment
(n) Instructions for Maintenance and Repair
(o) List of spare parts with ordering specifications and manufacturer's catalogues.
(p) List of consumables with specifications, brand names and annual consumption figures.
(q) Manufacturer’s catalogues with ordering specification for all items
(r) List of special tools and tackles
(s) QAP, Internal Test Certificates and Inspection Certificates
(t) Procedure for ordering spares.
(u) All as built drawings.

23.11 Drawings/ documents to be submitted with inspection call of equipment:

(a) Type test certificate for identical equipment
(b) Sub-supplier’s/ vendor’s catalogue/technical literature
(c) Test reports for internal inspection
(d) Test certificates of components
(e) Technical specification & data sheets of equipment
(f) All drawings as applicable of category ‘Approved’, ‘Approved with comments’ and drawings ‘For information/ Reference’ including comments thereon

23.12 The details of equipment layout and cable routing will be designed by the LSTK Contractor during detail engineering stage and these shall be subject to approval by Owner/Consultant. Changes as required to achieve a neat layout with adequate working space all around, for
better aesthetics as well as to meet statutory regulation and codes shall be done without any
time and cost implication.

24.0  **TOOLS & TACKLES**

The LSTK Contractor shall supply at least one set of all special tools for each substation
required for maintenance of the equipment supplied by them and price shall be included in
the offer. List of tools & tackles with quantities shall be mentioned in the offer.

25.0  **REVIEW OF DRAWINGS & DOCUMENTS BY OWNER/ CONSULTANT**

25.1 The successful Bidder (herein after referred as contractor), shall submit within one month of
placement of LOI; list of drawings/ documents/ Manuals that would be submitted by them. The
list shall mention Serial Number, Title of the drawing/ document/ manual, Category (For
Approval, For review, For Reference, etc) and tentative date of submission. The list shall be
prepared taking in to account into consideration stipulations in respect of submission of
drawings/ documents and scheduled date for completion.

25.2 Template for name plate of drawings, documents and drawing/ document numbering system
shall also be submitted by contractor and approval obtained.

25.3 The LSTK Contractor shall ensure that all sheets of the drawings/ documents and top sheet
of manual prepared by manufacturer/ vendor/ supplier & submitted by him or by his
consortium member or by manufacturer or his consultant, are checked by him/ leader of
consortium and vetted by LSTK Contractor / Leader of consortium before submission with
stamp ensuring correctness, completeness, suitability of document for subject work and
compliance with stipulations of order

25.4 The responsibility for delay in approval/ review of drawings/ documents due to

a. Submission of incomplete drawings/ documents not meeting the requirement of
project/ stipulations of order

b. Non-compliance of comments made earlier

c. Drawings are not submitted in requisite copies;

and consequent delay in project shall be that of contractor.

25.5 The contractor shall ensure that in case any model number is mentioned in the drawing,
detailed technical catalogue, literature, explanatory notes to describe the model and its
technical details in full are also submitted along with the drawing. Such drawings/ documents
should be assigned Drawing/ Document Number, Number of sheets in the drawing, Rev
number etc (Unique Identification). Reference of such drawing/ document number should be
mentioned in the drawing.

25.6 The drawings/ documents shall be prepared in such sizes that those can be read easily.
Size of font in print submitted shall not less than size10 Arial or equivalent.

25.7 The drawings/ documents shall be submitted in sizes in which those are prepared.
Photocopies in reduced sizes shall not be accepted.

25.8 The contractor shall leave space on each sheet for stamping the drawing by Owner/
consultant to avoid stamping on contents of drawing making them unreadable. Submission
of drawings in A4 size shall be avoided.

25.9 All sheets of a drawing shall be assigned same title and drawing number. Drawings having
different title shall be assigned different drawing numbers.

25.10 GA drawings, schematic diagrams, single line diagrams, bill of material, data sheets,
characteristics curves, cable schedules and cable termination diagrams shall be assigned
separate drawing numbers.

25.11 Revision shall be clearly marked on all subsequent issue of drawings and documents.
25.12 Inability to incorporate some of the comments shall be clearly stated by contractor with reasons and without delay. However, to accept or reject the non-compliance based on the reasons indicated by contractor shall be discretion of Owner/their consultant.

25.13 In case alterations are considered necessary by the contractor in the drawings already approved, such drawings shall be resubmitted for approval again stating the considerations necessitating changes/alterations. In case, alterations/changes proposed by contractor are approved by the consultant/Owner; all other drawings and data affected by such alterations/changes shall be duly revised and re-submitted for the approval as stated above.

25.14 Contractor shall depute their concerned engineers (with the engineers of suppliers, if required) shall visit consultant after submissions of drawings for discussion, modification of drawings and approval so that project is not delayed for want of approval of drawings.

25.15 It will be the responsibility of contractor to submit the drawings and obtain approval to meet the project schedule. Delay in approval of drawings due to following shall be the responsibility of contractor:
   a. non-submission of drawings/documents well before those are actually required and/or
   b. delay in incorporation of comments and/or
   c. non-incorporation of comments by contractor and/or
   d. submission of drawings without checking and ensuring requirement stipulated in contract/order

25.16 Contractor shall note that any approval and/or clearance accorded by Owner or consultant for manufacture and/or to proceed further given during discussions or recorded in the minutes of the meetings shall be valid only after the drawings showing relevant details are submitted by contractor and clearance/approval is accorded by Owner/Consultant by stamping and signing on the relevant drawings.

25.17 Approval of drawings by Owner/his consultant shall not relieve the contractor of his contractual obligations and responsibility for engineering, design, workmanship, materials and performance of the equipment.

25.18 Contractor shall furnish, if requested, additional drawings, calculations, information to the Owner/Consultant to enable him to examine/study the drawings submitted.

25.19 Contractor shall note that work shall be carried out exactly as indicated in the approved drawings and no alterations shall be made without the written approval of the Owner/Consultant.

26.0 TRAINING

26.1 Training shall be imparted to owner's personnel at manufacturer’s works as under:
   a) AC UPS: Two engineers for one week.
   b) Variable Speed Drive / Soft Starter (if required): Four persons for one week.
   c) DC System: Two engineers for one week.
   d) Numerical relay: Two engineers for one week

27.0 VENDOR LIST

27.1 Make of all electrical equipment shall be as per Section 15.0: Vendor List attached with this bid package.

27.2 Any other vendor shall be subject to Owner/Consultant’s approval.

27.3 Bidder shall indicate the make of all the equipments in their offer.
27.4 Any other item for which vendors are not mentioned in NIT, LSTK Contractor shall furnish list of proven suppliers with PTR subject to Owner’s/ Consultant’s approval during detailed engineering. Document(PTR) shall be in English language only.

28.0 INSTALLATION, TESTING AND COMMISSIONING

28.1 The LSTK Contractor shall undertake installation of all electrical equipment in accordance with latest code of practices, in conformity with recommendation of the respective equipment manufacturers, drawings approved by the owner or owner's representative, direction of engineer-in-charge, statutory regulations and to the entire satisfaction of the owner.

28.2 The LSTK Contractor shall arrange all the necessary erection tools and tackles, testing and measuring instruments and shall supply the required erection materials including structural steel.

28.3 LSTK Contractor shall furnish field inspection and test data sheets for all equipments for owner's approval.

28.4 The LSTK Contractor shall obtain the necessary certificate of compliance/completion certificate with test results from statutory authorities as required. All necessary drawings and test certificates as required by them shall be furnished by the vendor.

28.5 The erection work shall be supervised by competent supervisors holding relevant supervisory license from the Government.

28.6 Installation of Equipment

a. The equipment shall be installed in switchgear rooms, MCC rooms, control rooms and at shop floors.

b. The scope of work of LSTK Contractor under installation shall be inclusive of but not limited to the following:

c. Physical inspection and handling
d. Assembly and interconnection of shipping sections, if any, as per manufacturer's instructions. Supply of materials, fabrication and installation of supporting frames/ brackets for proper support of equipment/ panels/ devices/ cable trays etc..

e. Installation on foundation/ supports/ brackets.

f. Alignment, leveling and clamping/ welding/ fixing/ grouting with supports/ foundation bolts as required.

g. Mounting loose supplies and connection of wiring.

h. Conducting pre-energisation tests/ checks to ensure that installation is carried out as per manufacturer’s instructions/ direction of supervising engineer and is healthy/ fit for energisation.

28.7 Cable Installation

28.7.1 General

(a) All Cables to be laid in overhead cable tray only. Cable Tray for HV, LV and Control cable should be separate. Underground cable to be avoided, Cables to be laid on racks in underground concrete cable trenches inside the plant only where overhead structure is not possible. Cables may be laid in ground (slit with HDPE conduit) where number of cables to be laid are less and do not justify use of concrete cable trenches.

(b) All the cable tray structures shall be painted with two coats of primer and two coats of final paint after necessary surface preparation.
(c) Cable OD 40 MM and above shall be clamped individually.

(d) Cables shall be clamped only after the cables are neatly arranged, dressed tailored and kept in position. Support of cables on edges of cable trays/ structural steelwork shall be avoided.

(e) Power cables shall be laid in one layer only. Control and other cables may, however, be laid in two layers. More than two layers shall not be permitted.

(f) All the cable tray network shall be earthed by a continuous earth strip.

28.7.2 Cable laying in Trench/ on Racks/ Trays/ Cleated on Wall/ Structure. For proper support, access and neatness of appearance of installation; cables shall be laid on racks or cable trays or cleated on wall and/or structure taking following into consideration:

(a) Cable racks/ trays shall be 250 mm apart.

(b) Ladder type GI cable trays shall be used for laying power cables.

(c) Perforated type GI cable trays shall be used for laying control, signal, and communication etc. cables.

(d) Cable racks around cooling tower areas shall be of heavy duty FRP (fire retardant and UV stabilized) material.

(e) Coaxial cables for data transfer from/to microprocessor based equipments shall be laid in HDPE conduits with pull boxes fixed to cable supporting racks.

(f) Top tray shall be used/ left vacant for communication, signaling and fire alarm cables.

(g) Cables shall be laid in separate trays according to voltage and noise classification. Fire proof partition shall be provided between HV and LV cables.

(h) Power, control and lighting cables shall be laid in separate cable trays.

(i) Large size cables shall be clamped individually. Small size cables may be bunched together provided that in any bunch all cables have sheath of same material.

(j) Cables in trays shall be clamped at not more than every 1500 mm for horizontal run and 800 mm for vertical run and near bends.

(k) Cable racks/ trays shall be planned in such a way so that at least 20 % or one rack/tray (whichever is more) can be added in future and at least 20 % free space shall be left in each cable tray for cable laying in future.

(l) Support to cable trays shall be provided at intervals as required for proper support but at interval not more than 1000 mm.

(m) Support to trays shall also be provided at each joint of tray irrespective of it's distance from adjacent support.

(n) GI trays shall be fixed using nuts and bolts as welding will not be permitted.

28.7.3 Cable laying in conduits

(a) Cables shall be laid in GI conduits while laying on or crossing floors/ wall/ railway lines/ roads.

(b) While laying on floor or wall or crossing roads conduits shall be embedded in concrete/wall.

(c) When laid on floor the top cover shall be minimum 10 mm.

(d) At rail/ road crossings, the conduits shall be laid not less than 1 meter below top surface of the road.

(e) Mechanical protection by G.I. Pipe shall be provided to all cables up to 1200 mm from ground/ floor level.
(f) Minimum diameter of G.I. pipes used for laying/ protection of cables shall be 1.6 times the cable diameter.

(g) Only one cable shall be laid in one conduit.

(h) Conduit shall be sealed after cable laying.

(i) Standard bends or fabricated bends shall not be used. Wherever required, conduits shall be bent using bending machine. Bending radius shall not be less than 10 times the diameter of conduit.

(j) Jointing of the conduits shall be done using sockets which may be welded from top to avoid ingress of water.

(k) Ends of conduits shall be made smooth to avoid damage to cables.

28.7.4 Cable Jointing

(a) Joints in cable length less than standard drum length shall not be allowed.

(b) Joints, if unavoidable, shall be made at most suitable places.

(c) Joints shall not be made at passageways or under rail/ road crossings and in hazardous area.

(d) Joints shall be segregated by not less than 2 meters so as to reduce the possibility of one joint failure affecting the other.

(e) Individual cores in cables shall always be joined number to number or colour to colour of the insulation over the conductors.

(f) Continuity and current carrying capacity for earth conductor and/or armour shall be provided.

(g) Cable jointing shall be done by joiners who possess certificate of competency for carrying out particular joint.

(h) Minimum 2 meters cable loops shall be kept near each joint.

28.7.5 Cable Termination

(a) Double compression heavy type glands/ heat shrinkable termination kits and bi-metallic/ copper lugs shall be used for termination of cables.

(b) Paint of the gland plate at the contact point of gland shall be removed for proper contact.

(c) Cable glands/ termination kits shall be earthed.

(d) Cables to individual cubicles shall be neatly laid out and supported.

(e) Cables shall be clamped at a distance of 400 mm from gland/ termination.

(f) Conductors of control cables shall be neatly arranged in compact group. The entire group shall be placed and tied with nylon straps.

(g) Spare cores shall be terminated with sufficient length to permit future connection to the terminal block associated with control cables.

28.7.6 Identification

(a) Cable tags shall be made of non-corrodible material, preferably SS.

(b) Voltage, cable number etc shall be engraved on each tag.

(c) Cable tags shall be tied to each cable at

(i) All termination (outside as well inside panel/ box.)

(ii) All bends.
(iii) All points before and after which their route cannot be easily identified.
(iv) Entry and exit from conduits.
(v) All joints.
(vi) Every 15 meter for straight run.

29.0 TESTING OF INSTALLATION AFTER ERECTION

29.1 The LSTK Contractor shall carry out tests/ checks after erection of equipment/ cables to check, ensure and demonstrate the conformity of equipment supplied and installation done with the specification and statutory requirement.

29.2 Prior to starting the test, the LSTK Contractor shall satisfy himself and ensure that

   a. The installation is strictly in accordance with the specification, drawings and statutory requirement.
   b. Any automatic controls that might vitiate the tests have been relaxed.
   c. All instruments to be used for testing are suitable for the purpose and have been calibrated by a recognised laboratory within the last 12 months and copy of the calibration certificates have been submitted to the Owner/ Consultant.
   d. The testing, commissioning, operation and maintenance manuals are available to the testing engineer and Owner/ Consultant.
   e. Formats for recording test results have been finalised with the Owner/ Consultant and copies have been distributed to all concerned.

29.3 The skilled manpower to test all the equipment, cables, earthing etc deputed by LSTK Contractor is well aware of and prepared to perform checks/ tests.

29.4 The tests shall be witnessed by the representatives of Owner/ Consultant.

29.5 The LSTK Contractor shall compile and tabulate all the test results in agreed formats and submit to Owner/ Consultant for approval prior to acceptance of installation.

29.6 Testing and checking shall be carried out to demonstrate and record prior to completion, that supply and installation meets the requirement/ performances specified. The installation shall be tested in presence of Owner/ Consultant.

29.7 The LSTK Contractor shall give at least 24 hours notice to Owner/ Consultant to enable them to witness the test.

29.8 The LSTK Contractor shall submit to Owner/ Consultant test record sheets on daily basis.

29.9 Equipment or any part of the installation shall be energised only after all pre-energisation tests are completed and test results are approved by Owner/ Consultant.

29.10 Failure to submit test results as tests are completed may render the LSTK Contractor for carrying repeat tests.

29.11 The LSTK Contractor shall supply six (6) bound and indexed copies of all tests in agreed formats prior to preliminary acceptance and handing over of the equipment/ installation, duly signed by representatives of the Owner/ Consultant who have witnessed the tests.

29.12 It will be the responsibility of the LSTK Contractor to supply/ arrange at his own cost all necessary testing equipment and measuring equipment required for conducting the tests as per applicable standards.

29.13 Should any of the tests reveal any discrepancy or non-conformity, the same shall be attended to and retested before proceeding with any other tests.

29.14 All tests shall be conducted in accordance with this specification, standard specifications of Bureau of Indian Standards, recommendations of IEC and IE Rules.

29.15 Tests checks to done at site shall be inclusive of but not limited to the following:
a. Physical Check & Verification : All Equipment/Cables etc
b. Tightness of connections : All Equipment/Cables etc
c. Checking for cleanliness : All Equipment/Cables etc
d. Size & No. of Earth connection : All Equipment/Cables etc
e. Erection, alignment, mounting height and clearances : All Equipment/Cables etc

f. Insulation Resistance test : All Equipment/Cables etc
g. Earth continuity test : All Equipment/Cables etc
h. Earth Resistance test : All Equipment/Cables etc
i. Earth loop impedance test : All Equipment/Cables etc
j. No load & rated load current : All Motors/Loads
k. No load & rated load P.F. : All Motors/Loads
l. No load & rated load Power : All Motors/Loads
m. Functional checks : All Equipment & Controls
n. Primary injection test : All switchgear
o. Secondary injection test : All protective relays/devices
p. Ratio and polarity test : CTs
q. Power frequency HV test : Power & Control circuit
r. Phase sequence checks : /C & bus couplers
s. Winding resistance test : Motors & Transformers
t. Direction of rotation : All motors
u. Free running for 2 Hrs : All motors
v. Under voltage tests : All U/V Devices
w. Calibration Checks : All instruments
x. Load and Performance tests : UPS, PLC, & Variable Frequency equipment, Battery Bank
y. Checking of Voltage, current : UPS, PLC, & Variable Frequency equipment
z. Checking of specific gravity and acid level : Battery
aa. Illumination levels : All areas

29.16 It is anticipated that following equipment will be necessary to perform testing of the installation. The LSTK Contractor shall, therefore, arrange these as well as any other equipment for testing of the installation.

a. HV Testing Set
b. Primary Injection Set
c. Secondary Injection Set
d. IR Testers
e. Earth Continuity testers  
    f. Soil resistivity Testers  
    g. Earth resistance Testers  
    h. Phase to earth loop impedance testers  
    i. Mili volt drop testers  
    j. Micro-ohm meter  
    k. Phase sequence testers  
    l. Clip-on ammeters  
    m. Voltmeters  
    n. Power factor meter  
    o. Frequency meter  
    p. 3 Ph 4 wire unbalance load kWh meter  
    q. Cable fault location equipment  
    r. Digital multi-meter suitable for testing IC voltage and current levels  
    s. Analogue Multi-meters  
    t. Portable multi-range precision ammeters, voltmeters complete with CTs, PTs for AC/DC circuits.  
    u. Protection relay test plugs  
    v. Portable earthing equipment  
    w. Dual beam oscilloscope with storage facility.  
    x. UV recorder  
    y. Illumination level meter  
    z. Thermometers  
    aa. Power Analyser / Portable Power Meter  
    bb. Rpm meter  
    cc. Noise meter  

29.17 At least following tests shall be specifically conducted before commissioning in presence of owner’s representative. All the test results shall be recorded and submitted to the owner.  

a) Insulation Test  
   b) Continuity Test  
   c) High Voltage Test  
   d) Simulation Test  
   e) Earth Resistance Test  

29.18 The major testing equipment that are required to be provided by the contractor (permanent basis) are listed below :  

a) Power operated Megger-1 KV and 5 KV Grade (Make – Fluke)  
   b) Earth Resistance Megger, range 0-1/3/30 Ohms (Make – Fluke).  
   c) Tong testers of suitable ranges (Make – Fluke).  
   d) Torque wrench of various sizes.
30.0 QUALITY ASSURANCE

30.1 All equipment, components, materials proposed to be supplied by LSTK Contractor shall be procured, manufactured, erected, commissioned and tested as per a comprehensive Quality Assurance Programme (QAP) to be approved by the Owner/ Consultant.

30.2 The Successful Bidder shall submit within 1 Month of from order; Quality Assurance Plan (QAP) for all the equipment/ panels/ cables/ motors/ devices etc. under their scope of supply.

30.3 All routine and acceptance tests shall be carried out as per relevant IS / IEC/ Other Standards during inspection at manufacturer’s works in presence of Owner or his representative.

30.4 The LSTK Contractor shall submit type test certificates for similar equipment supplied by him elsewhere. In case type test certificates (not more than 5 years old and conducted at duly accredited laboratory) for similar equipment is not available, the type test shall be conducted in presence of Owner or his representative without any financial implications to Owner.

30.5 The inspection procedure shall be finalized and approved by Owner and/ or their consultant/ authorized representative.

30.6 Inspection will be carried out as per drawings and quality assurance plan approved by the Owner/ Consultant. Inspection shall be carried out either at manufacturer’s shop/ works or any other place where facilities for conducting tests/ checks are available.

30.7 Owner reserves the right to witness any of the tests and verify the documents of the LSTK Contractor, his supplier/ vendor/ manufacturer.

30.8 Manufacture test certificate for bought out components shall be submitted during inspection.

30.9 No equipment or part items shall be dispatched without final acceptance certificate and dispatch instructions in writing issued by Owner and/or their authorized representatives.

30.10 The LSTK Contractor shall carry out an inspection and testing programme during manufacture in his works and/ or that of his vendor’s works to ensure accuracy/ correctness/ completeness of components, compliance with drawings, conformance to functional and / or performance requirements, identify and acceptability of all materials, parts and equipment. The LSTK Contractor shall also carry out all tests/ inspections required to establish that the items/ equipment conform to requirements of the specification and the relevant codes/ standards specified in the specification in addition to carrying out tests as per the approved Quality Plan.

30.11 Quality audit/ surveillance/ approval of the results of the tests and inspection, approval of drawings will not, however, prejudice the right of the Owner to reject the equipment at any subsequent stage if it does not comply with the specification or does not give complete satisfaction in service and shall in no way limit the liabilities and responsibilities of the LSTK Contractor of ensuring complete conformance of the materials/ equipment supplied to relevant specification, standard, data sheets, drawings etc.

30.12 The owner or their representative shall be allowed to visit the manufacturing works for stage inspection during manufacturing stage.

30.13 The LSTK Contractor shall intimate the owner 4 weeks in advance of the tests and submit the detailed schedule of tests.

30.14 LSTK Contractor shall supply reports of type tests, acceptance tests, all requisite factory tests and site tests in bound volumes.

30.15 All the equipment shall be tested at site to know their condition and to prove suitability for energisation and required performance.

31.0 COORDINATION WITH OTHER CONTRACTORS
31.1 LSTK Contractor shall coordinate with Owner’s other Contractors and shall freely exchange all technical information required for this purpose.

31.2 All civil works connected with electrical installation shall be under the LSTK Contractor’s scope.

32.0 DEVIATIONS

32.1 Deviations, if any from this standard (clause wise) shall be clearly indicated in the offer with reasons thereof. In the absence of any such deviation the compliance to the clauses shall be deemed automatically.

32.2 Successful Bidder shall also note that all those deviations mentioned in bid but not accepted by Owner/Consultant in writing shall be considered as withdrawn by bidder.

32.3 Any and all deviations mentioned anywhere else in the bid but not specifically and unambiguously mentioned under specific section ‘List of deviations’ shall not be considered.
## ANNEXURE-I
### ILLUMINATION LEVELS

Average illumination levels (Mean Lux) for various areas shall be as follows:

<table>

</tbody>
</table>
1.0 SCOPE

1.1 This standard covers the technical requirements of design, manufacture, testing, delivery installation at site and commissioning of Public Address System along with all accessories.

1.2 This standard shall be read in conjunction with relevant part of Design Philosophy - Electrical.

2.0 STANDARDS TO BE FOLLOWED

2.1 The design, manufacture and testing of public address system and their accessories covered by this standard shall comply with the latest issue of the following and other relevant Indian Standards Equipment complying with equivalent IEC standards shall also be acceptable.

IS: 1881 - Code of practice for installation of indoor amplifying and sound distribution systems.
IS: 1882 - Outdoor installation of public address system-code of practice.
IS: 1301 - Code of safety requirements for electric mains-operated audio amplifiers.
IS: 8061 - Code of practice for design, installation and maintenance of service lines up to and including 650 V.
IS: 1490 - Recommendation for minimum performance requirements of mains-operated public address amplifiers.
IS: 1819 - Recommendation for general requirements of public address amplifiers.
IS: 1031 - Methods of measurements of loudspeakers and loudspeaker systems.
IS:1554 (Part1) - PVC insulated (heavy duty) electric cables for working voltages up to and including 1100 V.
IS: 694 - PVC insulated cables for working voltage up to and including 1100 volts.
BS: 2004 - Electric cables for working voltage up to and including 1100 volts.

2.2 The design and operational features of all the equipments offered shall comply with the provisions of the latest issue of the Indian Electricity Rules and other Statutory Acts and Regulations. The supplier shall, wherever necessary, make suitable modifications in the equipment to comply with the above.

2.3 Wherever any requirement, laid down in this standard, differs from that in Indian Standard specifications, the requirement specified herein shall prevail.

3.0 SERVICE CONDITIONS

3.1 Ambient Conditions

These shall be as indicated in Design Philosophy - Electrical.
3.2 System Details

These shall be as indicated in Design Philosophy - Electrical.

4.0 OPERATIONAL REQUIREMENTS

The public address system and their associated accessories shall be suitable for operating continuously under the ambient conditions and with the voltage and frequency variation without exceeding temperature rise limits as per relevant standards and without detrimental effect on any part.

5.0 TECHNICAL REQUIREMENTS

5.1 The public address system shall be microprocessor based, non-EPABX distributed amplifier type. It should be designed for communication between various process units and office areas of an industrial plant and various control room(s).

5.1.1 The band width of the communication system shall not be less than 9 KHz for intelligible speech reproduction required for industrial environment.

5.1.2 The system shall comprise of:
   i) Microprocessor based central exchange
   ii) Master control station(s)
   iii) Field stations and junction boxes, if any
   iv) Power supply unit
   v) Cables
   vi) Loudspeaker

5.1.3 All other items not specifically mentioned, but required for the completeness of the system shall be supplied.

5.2 Microprocessor based central exchange

5.2.1 The exchange shall be rack mounted microprocessor controlled. It should be designed such that future extensions or modification can be easily carried out.

5.2.2 The actual control of communication shall be from the exchange. From the exchange, various system information and data shall be acquired, processed and communication links between stations shall be established as per user requirement through master control station.

5.2.3 The exchange shall be 100% redundant in hot standby mode. The exchange shall have facility for hooking up with the existing EPABX system. It shall have two independent lines of communication viz. page & party.

5.3 Master control stations (MCS)

5.3.1 The MCS shall be desk mounted type and shall comprise of a keyboard with LEDs, a built-in loudspeaker and a built-in dynamic noise cancelling goose neck microphone. It should have facility for duplex mode of communication.

5.3.2 The MCS shall have a key to initiate an EPABX call and should have facility to receive EPABX call.

5.3.3 The MCS shall have features to initiate the following type of call:
   i) All call
   ii) Alarm call
iii) Conferencing
iv) Inter MCS call
v) Call from MCS to field station & vice-versa
vi) Global call
vii) Call from field station of one MCS to field station another MCS

5.3.4 The MCS shall have drop out facility i.e. after connecting two field stations, the MCS, if required, may drop out of the ongoing conversation. Priorities shall be assigned to the various calls (Alarm & Global) shall have higher priority than other calls.

5.4 Field Station

5.4.1 It shall be of cast aluminium (LM-6) enclosure and shall consist of adequate capacity amplifiers for page channel, telephone type handset (but made of unbreakable material and of different size to make it pilfer proof), cradle switch and all other necessary control switches & push buttons required for satisfactory operation of the system.

5.4.2 Handsets shall be completely factory wired up to terminal blocks and shall be provided with cable termination accessories for connecting external cables.

5.4.3 The field stations shall be suitable for hazardous area classification defined as zone I/II, gas group IIA/IIB/IIC & temperature class T3. All master control station shall be suitable for outdoor installation with IP-65 protection.

5.5 Loudspeaker (LS)

5.5.1 Loudspeaker shall be highly efficient, high power driver unit designed for non-ringing to deliver clear reproduction. The driver unit shall be lockable type to avoid pilferage.

5.5.2 Loudspeaker shall be provided with impedance matching transformer. Transformer shall have the minimum “frequency characteristic” required for public address system.

5.5.3 Loudspeaker for indoor mounting shall be direct radiator, permanent magnet moving coil type rated for 15W. However, loudspeaker for outdoor mounting and in areas with high ambient noise level shall be pressure unit operated, projector or horn type, weatherproof, rugged die-cast aluminium construction rated for 15W.

6.0 POWER SUPPLY

6.1 Power supply single phase, 240 V, 50 Hz and further distribution shall be arranged by the vendor.

6.1.1 DC supply, if required, shall be arranged by the vendor from the dedicated power supply unit working on single phase 240 V, 50 Hz supply.

6.1.2 The system shall be provided with a transistorised type UPS of one hour back-up and the battery used shall be Nickel-Cadmium type.

7.0 CABLES

7.1 Signal and loudspeaker cables shall have annealed tinned copper, twin twisted & colour coded, PVC sheathed, GI round wire armoured and PVC overall sheathed. Loudspeaker cables shall be of 24 / 0.2 mm copper and signal cable shall be of 16 / 0.2 mm copper.

7.1.1 For power cables, 3 core 2.5 sq. mm annealed tinned copper, PVC insulated armoured cables are required.

7.1.2 The bidder shall indicate the details & quantity of cables required in tabular form.
8.0 CABELING

The contractor shall supply, lay & connect at both ends all the cables with accessories. The cables shall be accommodated in the existing overhead cable racks / structures as far as possible; where racks are not available, the cables shall be laid underground by using GI protection pipes.

9.0 JUNCTION BOXES

The junction boxes shall be of die cast aluminium powder coated. These shall be complete with inspection cover, conduit glands and terminal stripes. The cover shall be gasketted to make it dust & vermin proof and IP-55 protection. Holes for screwing the covers shall have stainless steel inserts.

10.0 EARTHING

All the equipment and their associated accessories of public address system shall be provided with earthing terminals and shall be connected to the ground mat by vendor as per relevant Indian Standard.

11.0 ERECTION & COMMISSIONING

The bidder shall include complete, testing & commissioning along with fittings & accessories in their scope. Good engineering practice in conformity with latest Indian Standard & code of practice shall be followed for erection & commissioning of all the accessories of public address system.

12.0 DRAWINGS AND DOCUMENTS

12.1 Drawings and documents as per Annexure-I shall be supplied unless otherwise specified.

12.2 All drawings and documents shall have the following description written boldly.
   i) Name of client
   ii) Name of consultant
   iii) Enquiry / order number with plant / project name
   iv) Equipment Code no. and Description

13.0 SPARES

13.1 Spares for operation and maintenance
   Item wise unit prices of spare parts with recommended quantity shall be quoted.

13.2 Commissioning Spares
   Commissioning spares, as required, shall be supplied with the main equipment. Item wise list of recommended commissioning spares shall be furnished for approval.

13.3 Any other spare parts not specified, but required, shall also be quoted along with the offer.

13.4 All spare parts shall be identical to the parts used in the equipments.
14.0 PACKING

The public address system shall be properly packed to safeguard against weather conditions and handling. It shall be wrapped in polythene bag with an additional wrapping of bitumen paper to make it completely waterproof before the equipment is packed in wooden crates.

15.0 DEVIATIONS

15.1 Deviations, if any, from this standard shall be clearly indicated in the offer with reasoning.

1.0 SCOPE

1.1 The specification covers the design, manufacture, testing at works and despatch in well packed condition of Uninterrupted Power Supply System required to supply AC power for non linear loads (i.e. instrumentation loads).

1.2 This standard shall be read in conjunction with block diagram & UPS distribution diagram.

1.3 The scope shall include the following:
   i) Full wave controlled rectifier
   ii) Inverter
   iii) Static switches
   iv) Storage battery
   v) Static voltage stabilizer for bypass supply
   vi) Manual bypass switches
   vii) Isolation / output transformer to achieve desired output voltage
   viii) UPS Distribution Boards
   ix) Interconnecting cabling between various units of UPS
   x) All other items required, but not specified for safe and reliable operation of UPS system.

2.0 STANDARDS TO BE FOLLOWED

2.1 The equipment shall conform to the latest issue of the following and relevant Indian Standard specifications Equipment complying with equivalent IEC standards shall also be acceptable.

   IS-13314 - Solid state inverters run from storage batteries
   IS-11260 - Stabilized power supplies AC output
   IEC-146 - Solid state inverters

2.2 The equipment shall also conform to the provision of Indian Electricity Rules, Indian Supply Act and any other statutory regulations in force from time to time.

3.0 AMBIENT CONDITIONS & ELECTRICAL SYSTEM CHARACTERISTICS

These shall be as specified in the enclosed Design Philosophy - Electrical.

4.0 DESIGN AND OPERATIONAL REQUIREMENTS

4.1 The UPS unit and its associated equipments shall be suitable for operating at the specified rating continuously with the specified voltage and frequency variations under the ambient conditions without exceeding the temperature rise limits specified in relevant standards and without any detrimental effect on any part.

4.2 The UPS system shall be based on latest generation of IGBT based, pulse width modulated (PWM) design with proven performance. The basic scheme required for UPS system shall be as indicated in Block diagram in this specification.

4.3 The UPS shall have Redundant Scheme with Bypass. Under normal operating conditions, both inverter units should run in parallel sharing 50% load in synchronism with by-pass power and supply uninterrupted A.C. power to load. On failure of one of these inverters, the faulty inverter should get automatically disconnected from the load and healthy inverter should supply 100% load in synchronism with by pass supply. In
the event of second inverter also developing a fault, a no-break load transfer to standby power supply should take place through static switch.

4.4 Output frequency of the inverters must remain synchronised to one another which in turn shall be synchronised to the standby power supply frequency provided the latter does not vary by more than +3% to -5%. It should be possible to change the setting of frequency range of synchronism between above limits by frequency selector switch. Outside these limits inverter should desynchronise with the bypass and run at its own frequency. When running at its own frequency, frequency variation shall be maintained less than ±1.0%. Resynchronisation with bypass power supply must take place automatically with some time delay when frequency comes back to +3% to -5% range. Change-over from inverter to bypass or bypass to inverter shall also be possible in desynchronised mode of operation. Change-over time in both synchronised and desynchronised mode operation shall be indicated.

4.5 The UPS unit shall be suitable for 0.7 lagging to unity power factor. The overall power factor may be taken as 0.8 lagging.

4.6 The maximum waveform distortion of the output voltage shall not exceed 5% r.m.s. for linear loads and 10% r.m.s for non-linear loads. The UPS unit shall be suitable for operation for non-linear loads having crest factor of 3.

4.7 The inverter steady state output voltage and frequency (free running) variation shall not exceed ±1% for specified input power supply condition and no-load to full load condition.

4.8 Voltage dip / rise on sudden application / throw of 100% load or on changeover from inverter to bypass or vice versa shall not exceed 15% and shall be recovered within 100 m. sec. to rated voltage.

4.9 UPS shall be designed for overload of 125% for 10 min. and 150% for 10 sec. after which drooping characteristic shall come into operation.

4.10 On failure of the main supply, inverter unit shall continue to supply rated load from the battery bank for two hours duration.

4.11 Charger shall simultaneously supply entire power necessary for inverter and to keep the battery of required capacity in fully charged condition. Provision for automatic charging in both float and boost shall be made.

4.12 Battery shall be Nickel-Cadmium or Lead Acid Plate tubular positive plate or VRLA type. The battery capacity shall be decided considering load power factor as 0.8, derating factor for ageing 0.8 and derating for minimum ambient temperature as applicable.

4.13 The ventilation fans, if provided shall be fully redundant and connected to the output from the inverter and an audio-visual alarm shall be provided on its failure. It shall be possible to operate inverter for about half an hour even after the failure of the fan without temperature rise inside the inverter cubicle exceeding the safe operating temperature limits.

4.14 In case of inverter failure due to any reason or overload, affected unit shall be isolated and changeover to other inverter or to bypass shall take place automatically.

4.15 Noise level at a distance or 1m from UPS panels shall not exceed 60 dB.

4.16 UPS system shall be provided with necessary control, protection, metering, indication, alarm & annunciation for reliable and safe operation of the system. The suggestive list is indicated in Annexure-II.

4.17 All semi-conducting devices shall be protected by fast acting semi-conducting fuses. These fuses shall be co-ordinated with load side HRC fuses.
4.18 The battery may be taken out of service for maintenance during which period it shall be possible for the inverter to continue operation taking power from the rectifier. The input filter of the inverter shall be suitably designed to take care of this operational requirement.

4.19 It shall be possible to vary the output voltage steplessly within ±5% of the specified output voltage. This adjustment shall be possible to be made when UPS is in operation.

4.20 UPS system shall be suitable for both floating output and earthing of one leg in case of single phase system / star-point in case of three phase system.

4.21 The UPS system shall have very high system of reliability having minimum MTBF of 50,000 hrs. Vendor shall furnish the value of MTBF, MTTR & availability factor.

5.0 CONSTRUCTIONAL DETAILS

5.1 The equipment shall preferably be supplied in enclosed, dust & vermin proof, floor mounted, sheet steel enclosure. In case, it is necessary to provide opening for ventilation, this should be closed by fine mesh. Minimum degree of protection for enclosure shall be IP-43 as per IS/IEC-60947.

5.2 Enclosure shall be fabricated with cold rolled sheet annealed steel of minimum thickness 2.0 mm.

5.3 The door hinges shall be concealed type. The doors and the removable covers shall be provided with non-deteriorating neoprene gaskets without any discontinuities. Gaskets shall be held in position in groove in shaped sheet steel work or these shall be of U type.

5.4 All external hardware shall be cadmium plated steel. Hardware for fixing the removable parts shall be provided with retaining devices.

5.5 Panels shall be liberally designed. All components shall be so mounted that they are easily accessible for inspection and maintenance.

5.6 UPS unit shall preferably have separate panels for each rectifier inverter units, bypass supply, distribution boards etc. Various panels of UPS except distribution boards shall be mounted side-by-side & bolted together to form compact assembly.

5.7 Distribution boards shall be of fixed type single front execution in fully compartmentalised design and divided into distinct panels each comprising of bus-bar chambers, individual feeder modules and vertical cable alley.

5.8 Mounting height of components requiring operation and observations shall not be lower than 300 mm and higher than 1800 mm.

5.9 All the live parts which are accessible after opening the front cover / back cover shall be properly insulated or provided with insulating barrier to prevent accidental contact. Bus bars of distribution boards shall be PVC sleeved.

5.10 Nameplate consisting of black Perspex with white engraving shall be provided for each panel and for each equipment mounted on the front of the panel. Suitable label identification for each component mounted inside the panel shall also be provided.

5.11 All the wirings shall be properly laid and ferruled at both ends. PVC channels may be used for wiring. For control wiring, minimum 1.5 sq. mm copper conductor shall be used.

5.12 The power connections shall be made by PVC insulated flexible copper cables or taped copper / aluminium strip.

5.13 All power & control cables shall enter from the bottom.
5.14 Removable bolted aluminium gland plate, heavy duty compression type rolled aluminium cable glands, crimping type aluminium cable lugs for Al. cables and copper cable lugs for Cu. cables, pressure clamp / bolted type terminals etc. shall be provided for each incoming and outgoing cable.

5.15 Terminal blocks shall be grouped according to circuit functions and suitably numbered. 20% extra terminals shall be provided in the terminal block.

5.16 A suitably sized earth bus shall be provided at the bottom of panel with provision for earth connection at both ends to purchaser’s earth grid.

5.17 All panels shall be of same height so as to form a bank which shall give good aesthetic appearance.

6.0 COMPONENT DETAILS

6.1 All components shall conform to relevant IS / IEC standards and shall be of reputed make. Makes of all components shall be subject to owner’s / consultant’s approval.

6.2 Thyristors, diodes and transistors
The thyristors, diodes and transistors shall have adequate safety margins to withstand specified operating conditions. A factor of safety of minimum 4 shall be taken against voltage surges.

6.3 PCBs
All electronic control & monitoring printed circuit cards shall preferably be modular plug in type. Monitoring points shall be provided in each of the PCB, PCBs shall be firmly clamped in position so that vibration or long usage does not result in loose contacts. Failure of each PCB shall be indicated by visual alarm and indication. The visual fault diagnostic shall preferably indicate fault into various sections of the card.

6.4 Transformers and Chokes
All transformers and chokes shall be of dry type and air cooled. This shall be class ‘H’ insulated, vacuum impregnated. Class B insulated cast resin transformers and chokes shall be also acceptable.

6.5 Electrolytic Capacitors
These shall be polarised aluminium type I, suitable for long life and category I, as per IS-4317 or equivalent IEC. The capacitor shall preferably be self healing type. These shall be so located in inverter panels that the operating temperature does not exceed 65ºC maximum.

6.6 Instruments
Ammeters & voltmeters shall be moving coil type of class 1.5 accuracy as per IS-1248. These shall be flush mounting type of minimum size of 96 mm x 96 mm and shall have taut band scale of 240º. Frequency meter shall be of reed type having range of 45 Hz to 55 Hz.

6.7 Static Switches
Static switches shall be naturally commutated type with parallel inverse connected thyristors. These shall be rated for continuous duty for 100% load. Short time rated static switches are not acceptable.

6.8 Voltage Stabilizer
Voltage stabilizer shall be static type and shall satisfy the following requirements:

i) Maximum output voltage variation under steady state condition shall be ±3%.

ii) Maximum harmonic distortion shall be less than 5%.

iii) The output voltage shall be restored within ±2% of nominal value in less than 2 secs.
6.9 **Battery**
Battery along with accessories shall conform to Engineering Standard ES-0814.

6.10 **Indication Lamps**
All indication lamps shall be of LED type suitable for the specified control voltage, having minimum illumination of 40 milli candela. The colour of the LEDs shall be as follows:

- **ON**: Red
- **OFF**: Green
- **FAULT**: Yellow

6.11 **Moulded Case Circuit Breakers**
For isolating devices of various equipment, moulded case circuit breakers shall be used. These shall be provided with overload and short circuit protective devices and shall conform to IS 2516.

7.0 **OTHER ITEMS**

7.1.1 **Monitoring System**
Microprocessor based monitoring system for UPS to supervise the UPS operation and to print out the following data at a preset time automatically by using its own printer shall be provided.

i) Output voltage of UPS (Common)
ii) Output current of UPS (Common)
iii) Input DC voltage of each inverter
iv) Input voltage of each rectifier (Ph to Ph)
v) Input current of each rectifier
vi) Output current of each inverter
vii) Output voltage of each inverter
viii) Room temperature
ix) Input frequency of each inverter
x) Output frequency of each inverter

7.1.2 In addition to print out once in a preset time, above data shall also be automatically printed for the following conditions:

i) Power source change over from mains to battery and vice-versa.
ii) Change over of load from UPS to bypass supply and vice versa.
iii) On failure of UPS
iv) On failure of either inverter
v) Also facility for on demand print out of above data shall be provided.

7.1.3 On failure of UPS, the printer shall print out the waveform of the following:

i) Output voltage of UPS
ii) Output current of UPS
iii) Output voltage of each UPS
iv) Output current of each UPS
7.2 **Insulation monitoring & automatic earth fault finding system**

Insulation monitoring and automatic earth fault finding system shall be provided to detect earth fault in unearthed system. The system shall preferably be of the type which injects a low frequency alternating voltage between the earth and the network which is used for determining the insulation resistance and to detect and locate earth faults. There shall be fixed detectors located in incoming feeders of main distribution boards and portable detector for location of fault within a feeder. The fixed detector shall be connected to a central unit which can display a faulty feeder.

7.3 Potential free contact shall be brought to outgoing terminal for remote monitoring system for the following:
   i) UPS-1 fault
   ii) UPS-2 fault
   iii) Load on inverter
   iv) Load on bypass

8.0 **PAINTING**

8.1 The enclosure after suitable pre-treatment shall be painted with two coats of anti-rust paint followed by two coats of anticorrosive paint.

8.2 All paints shall be carefully selected to withstand tropical heat and extremes of weather. The paint shall not scale off, crinkle or be removed by abrasion due to normal handling.

8.3 Unless otherwise specified, the finishing shade shall be light grey shade no.631 as per IS: 5.

8.4 Electrostatic powder paint shall be preferred.

9.0 **TESTS AND INSPECTION**

9.1 The UPS units shall be subjected to tests as per relevant standards. The tests shall include, but not limited to the following:-
   i) Rectifier & inverter soft starting
   ii) Regulation test
   iii) Heat run test for 8 hours
   iv) Overload test
   v) Test for changeover time in synchronised and desynchronised mode.
   vi) Test for dynamic response and transient performance
   vii) Sequence & transfer test
   viii) Noise level measurement
   ix) Test to check the selectivity of protective devices
   x) Alarm test (simulation of various fault conditions)
   xi) Measurement of harmonic distortion
   xii) Ventilation test (operation without fan)
   xiii) Insulation test
   xiv) Current division in parallel UPS
9.2 All the above tests shall be carried out in presence of purchaser’s representative. In addition, the equipment shall be subjected to stage inspection during process of manufacture at works and site inspection.

9.3 These inspections, shall, however, not absolve the vendor from his responsibility for making good any defects which may be noticed subsequently.

10.0 DRAWINGS AND DOCUMENTS

10.1 Drawings and documents as per Annexure-I shall be supplied, unless otherwise specified.

10.2 All drawings and documents shall have the following description written boldly.
   - Name of client
   - Name of consultant
   - Enquiry / order number with plant / project name
   - Equipment Code no. & Description

11.0 SPARES

11.1 Spares for operation and maintenance
   Item wise unit prices of spare parts shall be quoted.

11.2 Commissioning Spares
   Commissioning spares, as required, shall be supplied with the main equipment. Item wise list of recommended commissioning spares shall be furnished for approval.

11.3 Any other spare parts not specified, but required, shall also be quoted along with the offer.

11.4 All spare parts shall be identical to the parts used in the equipments.

12.0 PACKING

12.1 The board shall be properly packed before despatch to avoid damage during transport, storage and handling.

12.2 The packing box shall contain a copy of the installation, operation and maintenance manual.

12.3 A sign to indicate the upright position of the panels to be placed during transport and storage shall be clearly marked. Also proper arrangement shall be provided to handle the equipment.

13.0 DEVIATIONS

13.1 Deviations, if any, from this standard shall be clearly indicated in the offer with reasoning.

ANNEXURE – II

METERING INDICATIONS AND ALARM SCHEDULE

A. METERING

1. Incoming Voltmeter with selector switches for each incomer
2. Ammeter with selector switches for each incomer
3. Ammeter & Voltmeter at each inverter output and bypass output.
4. Frequency meter & power factor meter at one common point of output
5. Ammeter & Voltmeter at incoming of each UPS distribution boards
6. Ammeter at each rectifier output
7. Battery charge / discharge meter

B. LED INDICATION

1. A.C. Mains ‘ON’
2. Rectifier output ‘ON’
3. Load on inverter
4. Load on bypass
5. Inverter synchronised to mains
6. Battery on float
7. Battery on boost
8. Fault (one lamp for all types of fault)

C. AUDIO-VISUAL ALARM (with Accept, Reset & Test facilities)

1. Mains failure
2. Rectifier failure
3. Inverter output over voltage
4. Inverter output under voltage
5. Inverter fuse failure
6. Rectifier fuse failure
7. Fan failure
8. Inverter temperature high
9. Static switch failure
10. Bypass input failure
11. Inverter desynchronised

</table>
1.0 **SCOPE**

1.1 This standard covers the technical requirements of design, manufacture, testing at works and despatch in well-packed condition of Power Transformers.

1.2 This standard shall be applicable for 3 phase, core type, separate winding power transformers of rating 315 KVA and above.

1.3 This standard shall be read in conjunction with the relevant part of Design Philosophy – Electrical.

2.0 **STANDARDS TO BE FOLLOWED**

2.1 The design, manufacture and testing of the equipment covered by this standard shall comply with the latest issue of IS 2026, unless otherwise specified. Equipment complying with equivalent IEC standards shall also be acceptable.

2.2 The design and operational features of the equipment offered shall comply with the provisions of the latest issue of the Indian Electricity Rules and other relevant Statutory Acts and Regulations. The supplier shall, wherever necessary, make suitable modifications in the equipment to comply with the above.

2.3 Wherever any requirement, laid down in this standard, differs from that in Indian Standard Specifications, the requirement specified herein shall prevail.

3.0 **SERVICE CONDITIONS**

3.1 **Ambient Conditions**

These shall be as indicated in Design Philosophy – Electrical.

3.2 **System Details**

These shall be as indicated in Design Philosophy – Electrical.

4.0 **OPERATING REQUIREMENTS**

4.1 The transformer shall be suitable for operating at the rated capacity continuously at any of the taps, under the ambient conditions and with the voltage and frequency variations without exceeding the permissible temperature rise and without any detrimental effect on any part.

4.2 The transformer shall also be capable of delivering rated current at a voltage equal to 105% of the rated voltage.

4.3 The transformer shall be capable of allowing at least three consecutive starts of the largest Squirrel Cage Induction Motor, while delivering 85% of its rated power without any harmful effect on its insulation. It shall be possible to repeat the starting cycle once in eight hours.

4.4 The transformer shall be designed to be loaded as per IS 6600.

4.5 The transformer shall be so designed as to operate in parallel satisfactorily with similar transformers.

5.0 **GENERAL DESIGN FEATURES**
5.1 The design of the transformers shall be in accordance with the latest practice.

5.2 **Rated Voltage, Frequency and Phase Connection**

These shall be as indicated in Design Philosophy – Electrical.

5.3 The transformer shall be so designed that it is capable of operation at 125% rated voltage for a period of one minute and 140% rated voltage for a period of five seconds due to sudden load throw off.

5.4 **Tap Changing Gear**

5.4.1 Each transformer shall be provided with on-load/ off-circuit tap changing equipment on the high voltage winding with taps. It shall be mounted on one side, in an easily accessible position.

5.4.2 The range of tap changer shall be as indicated and arranged in steps of 2.5%.

5.4.3 The off-circuit tap changing shall be affected by an externally operated handle capable of being padlocked in any position and provided with tap position indicator and mechanical stops at the extreme positions.

5.4.4 For transformer specified with on-load tap changer, tap changing gear shall be complete with tap position indicator, limit switch, lock and key and necessary control panel. Provision shall be made for auto-manual operation. The manual operation shall be possible both from the panel as well as from field. In case the tap changer is located in a separate housing, the housing shall be connected with the conservator for oil connection. A separate buchholz relay shall be provided in such a case. Emergency mechanical manual device shall also be provided. A minimum of 2 lakh trouble-free operations shall be guaranteed.

5.4.5 **ON-LOAD TAP-CHANGING MECHANISM (O.L.T.C.)**

5.4.5.1 For transformer specified with on-load tap changer, high speed tap changing gear shall be complete with tap position indicator, limit switch, lock and key and necessary control panel. Provision shall be made for auto-manual operation. In case the tap changer is located in a separate housing, the housing shall be connected with the conservator for oil connection. A separate buchholz relay shall be provided in such a case. Emergency mechanical manual device shall also be provided. A minimum of 2 lakh trouble-free operations shall be guaranteed. The OLTC gear shall have diverter resistance and the current diverting contacts shall be housed in a separate oil chamber segregated from the main tank of the transformer.

5.4.5.2 Transformer shall be provided with an on-load tap changing mechanism, as required. This shall be designed suitable for remote control operation from switch boards in the control room in addition to being capable of local manual as well as local electrical operation.

5.4.5.3 It shall not be possible to use the electric drive when manual gear is in use and it shall be possible to use only one electrical control at a time. Operation of the local or remote control switches shall cause one tap movement only until the control switch is returned to the off position for the next operation.

5.4.5.4 The local electrical control switches shall be mounted in the out door cubicle.

5.4.5.5 The equipment shall be so arranged as to ensure that when a tap change operation has been commenced it shall be completed independently of the operation of the control relays and switches. If a failure of the auxiliary supply during a tap change or
any other contingency result in that movement not being completed, adequate means shall be provided to safeguard the transformer and its auxiliary equipment from damage. Supervisory indication shall be provided to indicate “The change incomplete” foul.

5.4.5.6 Limit switches may be connected in the control circuit of the operation motor provided that a mechanical de-clutching mechanism is incorporated. Otherwise it shall be directly connected to the operating motor circuit and mechanical stop provided.

5.4.5.7 Thermal devices or other means shall be provided to protect the motor and control circuits. All relays switches, fuses etc. shall be mounted in the marshalling box and shall be clearly marked to indicate their purpose.

5.4.5.8 The whole of the apparatus shall be of robust design and capable of giving satisfactory service without undue maintenance under the conditions to be met in service, including frequent operation.

5.4.5.9 A five-digit counter shall be fitted to the tap changing mechanism to indicate the number of operations completed by the equipment.

5.4.5.10 A permanently legible lubrication chart shall be fitted within the driving mechanism chamber.

5.4.5.11 The ON-LOAD Tap Changer shall include the following :-

a) An oil immersed tap selector and arcing switch or arc-suppressing tap selector, provided with resistor for reduction of make and break arcing voltage, overload and short circuits.

b) Motor driven mechanism.

c) Control and Protection devices.

d) Local and remote tap-changer position indicator.

e) Manual operating device.

5.4.5.12 The on-load tap changer shall be designed so that the contacts shall not interrupt arc within the main tank of the transformer. The tap selector and arcing switch or arc suppressing tap selector switch shall be located in one oil filled compartment. The compartment shall be provided with a means of releasing the gas produced by the arcing. It shall be designed so as to prevent the oil in the tap selector compartment from mixing with the oil in the transformer tank.

5.4.5.13 The oil in those compartments of the main tap-changing apparatus which do not contain contacts used for making or breaking current shall be maintained under conservator head by means of an adequate diameter pipe corresponding dia of OLTC oil surge relays connection from the highest point of the chamber connection corresponding to the dia. of OLTC oil surge relay from the highest point of the chamber to the conservator. This connection shall be controlled by a suitable valve and shall be arranged so that any gas leaving the chamber will pass into the gas and oil actuated relay.

5.4.5.14 The tap changer shall be capable of permitting parallel operation with other transformers for which necessary wiring and accessories, if any, shall be provided.

5.4.5.15 The centre of manual operating device shall be located at a height of 1500 mm from rail top so that it can be operated by a person standing at the ground level. The arrangement shall be strong and robust in construction. The transformer shall give full load output on all tap positions.
The mechanism shall be complete with normal accessories including at least the following:

- A mechanical tap position indicator (Rated tap voltages shall be marked on the diagram plate).
- A mechanical operation counter.
- Mechanical stops to prevent over cranking of the mechanism beyond extreme tap positions.

5.4.5.16 The control scheme for the tap changer shall be provided for independent control of the tap changers when the transformers are in independent service. In addition, provision shall be made to enable parallel operation control also at time so that the tap changer will be operated simultaneously when one unit is in parallel with another will not become out of step and this will eliminate circulating current.

Additional features like Master / Follower and visual indication during the operation of motor shall also be incorporated.

Control circuit shall incorporate the following:

a) Local/remote manual electrical operation.

b) Device to ensure a positive and full completion of tap change once it is initiated even if there is loss of power.

c) An interlock to cut-off electrical control automatically upon recourse being taken to manual mechanical control in emergency.

d) Electrical interlock to cut-off a counter impulse for a reverse tap change, being initiated during a progressive tap change and until the mechanism comes to rest and resets circuits for a fresh operation.

e) All auxiliaries and devices for electrical control of OLTC gear should be housed in a weather-proof cabinet mounted on the transformer and shall include:
   - Local tap position indicator
   - 5 digit operation counter
   - Cubicle lighting
   - Thermostatically controlled space heater.
   - Miniature circuit breaker with magnetic and thermal overload devices for controlling the incoming supply to the OLTC motor.
   - Padlocking arrangement for the hinged cabinet door.
   - Removable plate with cable glands.
   - Inside tag with control scheme indelibly marked.

5.4.5.17 Necessary interlock, blocking independent control when the units are in parallel, shall be provided.

5.4.5.18 Under abnormal conditions such as may occur if the contactor controlling one tap changer sticks, the arrangement must be such as to switch off supply to the motor so that an out of step condition is limited to one tap difference between the units. Details of out of step protection provided for the taps should be furnished in the bid.

5.4.5.19 The contactor and associated gear for the tap change driving motors shall be housed in a local kiosk mounted adjacent to the transformer. The motors shall be suitable for operation on 230 V single phase or 3-phase 440 V, 50 cycle external power supply. The kiosk having space heater, shall be dust and vermin proof and suitable protected against corrosion or deterioration due to condensation, fungi etc.

5.4.5.20 Indoor cubicle (RTCC panel) shall be provided in the control room which shall contain:
a) Indication of the transformer ratio in use on each transformer and the number designsating the tap in use by means of digital type indicators.
b) Raise and lower push Button switch and AVR Relay.
c) Independent/Master/Follower selector switch.
d) Remote tap position indicator with indicating lamp.
e) Repeater dial of winding temperature indicator for remote indication with a device for indicating hottest spot winding temperature in addition to a pointer to register the highest temperature reached.
f) An indication lamp showing tap change in progress.
g) Necessary audible and visual alarms.
h) Pressure relief device operation alarm.
i) Out of step relay with two spare contacts (2 NC and 2 NO).
j) The remote indoor cubicle in addition to the above indications shall also have the following trip and non-trip alarm windows facias with 5 spare windows suitable for 110V DC supply.
   i) Oil Temperature alarm
   ii) Winding Temperature alarm
   iii) Winding temperature trip
   iv) Buchholz alarm
   v) Buchholz trip
   vi) Sudden Pressure trip (Main tank)
vii) Surge Relay trip (OLTC Gear)
viii) Tap changer out of step alarm
   ix) Low oil level alarm
   x) Cooling fans working indication
   xi) Oil pumps on and off indication
   xii) Failure of group of fans alarm
   xiii) Failure of group of oil pumps alarm
   xiv) Failure of supply
   xv) Oil flow alarm

Each relay for tripping function shall have two normally open and two normally closed contacts for connection.

5.4.5.21 The OLTC shall be provided on the conservator side of the Power Transformer and not in front of H.V. Bushings.

5.4.5.22 OLTC shall be suitable for bi-directional power flow.

5.5 Impedance Voltage

The impedance voltage of the transformer at 75°C shall be as per relevant IS / IEC. This shall be guaranteed within limits specified in relevant IS / IEC at principal tap position.

5.6 Losses

The losses under the full load condition, at the rated voltage and frequency shall be indicated by the vendor at 75°C. These shall be guaranteed within the tolerable limits specified in IS: 2026 at principal tap position. The purchaser has the right to impose penalty charges or reject the transformer in case of any difference in the test and guaranteed values.

5.7 Temperature Rise

The temperature rise of the winding, oil and core shall not exceed the values specified in IS: 2026 when the transformer is delivering its rated output continuously under the service conditions.
5.8 **Insulation Level**

All windings up to maximum system voltage of 72 KV shall have uniform insulation to earth. For windings having higher maximum system voltage, graded insulation is acceptable.

5.9 **Terminal Arrangements**

The HV and LV side terminal arrangement shall be provided as required. Disconnecting link chambers shall be provided on the transformer primary side in all cases as well as on secondary side, except where the termination is through bus duct. The disconnecting chambers shall be oil filled, preferably connected with the main tank through an isolating valve and also provided with a drain valve. However for system not exceeding 11 KV, air filled disconnecting chamber may be accepted. Suitable cable end box complete with cable glands and lugs shall be provided for termination of cables. Gland plate for single core cables shall be non-magnetic.

5.10 The transformer shall be able to withstand the electro-dynamic and thermal stresses due to terminal short circuit of the secondary, assuming the primary side fed from an infinite bus. All leads and windings in cores shall be properly supported, clamped and tightened after vacuum drying to ensure the short circuit withstand capacity. The short circuit withstand duration shall be 3 Secs.

5.11 The short circuit test results for similar transformers shall be furnished.

5.12 The transformer shall be so designed as to minimise any undue noise and vibration.

The noise level shall be limited to the value specified by latest NEMA Standard / CBIP.

5.13 Due attention shall be given in the design for the suppression of harmonics.

5.14 **Cooling System**

5.14.1 The cooling system shall be provided as required. In case the transformer is designed for two types of cooling, the output rating for each type shall be indicated in the offer. The minimum acceptable output shall be 70% of rated output when forced type of cooling system is not in operation.

5.14.2 Wherever ONAF Cooling is specified, the cooling fans shall be adequately rated and shall be suitable for auto/manual and local/remote operation. Auto operation shall be through winding temperature indicator contact.

5.14.3 Transformer shall have multiple cooling units with standby cooling units.

5.14.4 Cooling fans for each radiator bank shall be housed in fan box to prevent ingress of rain water. Each fan shall be suitably protected by galvanized wire mesh guard. It shall be possible to remove the cooling fan with motors without disturbing and dismantling the cooler structural frame work.

5.14.5 Where OFAF cooling is applicable, two numbers of centrifugal oil pumps shall be used. Measures shall be taken to prevent mal-operation of Buchholz relay or sudden pressure relay when all oil pumps are simultaneously put into service. The pumps shall be so designed that on failure of power supply to the pump motor, the pump impeller will not limit the natural circulation of oil.

5.14.6 Cooling fans and oil pump motors shall be of squirrel cage, totally enclosed whether proof type suitable for operation on 400 volts, three phase, 50 Hz power supply. All motors having ball and roller bearings and grease lubricators shall be fitted with hexagonal nipples conforming to relevant Indian Standard.
5.14.7 An oil flow indicator with alarm contacts shall be provided for the confirmation of the oil pump operating in a normal state. An indication shall be provided on the control panel to indicate that the pump is running.

5.14.8 The coolers and theirs accessories shall be hot dip galvanized or corrosive resistant painted.

5.14.9 The supporting arrangement for the cooler units or for radiator banks shall be in such a manner that the stresses if developed, shall not be transferred to the flanges of the butterfly valves.

5.14.10 The shut off valves shall be provided on the tank at each point of connection of cooler units radiators to the transformer tank. Removable blanking plates shall be provided to permit blanking off the oil connection to cooler radiators.

5.14.11 All valves shall be of gun metal or cast steel or may have cast iron bodies with gun metal fittings. They shall be of full way type with internal screw and shall be opened by turning counter clock-wise when facing the hand wheel.

5.14.12 Means shall be provided for pad locking of valves in the open and closed position.

5.14.13 Every valve shall be provided with indicator to show clearly the position of the valve whether open or closed.

5.14.14 All valves shall be provided with flanges having machined faces.

5.14.15 The drilling of valve flanges shall comply with the requirements of IS:3639.

5.14.16 CONTROL OF COOLER OPERATION

5.3.15.1 Each motor or group of motors shall be provided with an electrically operated contactor and with control gear of suitable design both for starting and stopping the motor manually and also automatically from the contacts on the winding temperature indicating device as specified. Additional terminal for remote manual electrical control of motors shall be provided. Overload and single phasing protection shall be provided. HRC fuses shall be provided for short circuit protection. This equipment shall be accommodated in the marshalling box. The power supply shall be adequately and properly fused.

5.3.15.2 Where small motors are connected in groups, the group protection shall be arranged so that it operates satisfactorily in the event of a fault occurring on a single motor.

5.3.15.3 Where fans and oil pumps are provided, the connection shall be arranged as to allow the motors or groups of motors to be started up and shutdown either collectively or individually.

5.3.15.4 All motor contactors and their associated apparatus shall be capable of holding in and operating satisfactorily and without over heating for a period of ten minutes if the supply voltage falls for that period, to 75% of normal value and at normal frequency. The motor contactors and associated apparatus shall be capable of normal operation with a supply voltage of 85 % of the normal value and at normal frequency.

5.3.15.5 All contacts and other parts which may require renewal, adjustment or inspection shall be readily accessible.
5.3.15.6 The control arrangements are to be so designed as to prevent the simultaneous starting of motors of total rating of more than 20 HP where such an eventually may arise, two step operation shall be preferred.

5.3.15.7 Alarm indication for failure of group of fans and oil pump shall be provided.

5.3.15.8 Alarm indication shall be provided to indicate failure of power supply.

5.3.15.9 Provision in the cooler control circuit may be made such that tripping of transformer breaker on Differential or Sudden Pressure should lead to supply disconnection to motor of the cooler pump.

6.0 CONSTRUCTIONAL FEATURES

6.1 Core

6.1.1 The transformer core shall be of high grade, non-ageing, electrical silicon cold rolled magnetic sheet steel of low hysteresis loss and high permeability. The maximum flux density in any part of the core and yoke at rated voltage and frequency shall not exceed 1.7 Tesla. The core structure shall be securely grounded to prevent electrostatic potential. Lifting eyes and lugs shall be provided on the limbs and coils assembly. Preferably no bolt shall be used in the cores. Clamping shall be done external to the limb. Bolts passing through the yoke, if any, shall be insulated for 2 KV for transformers rated up to 33 KV and 5 KV for higher voltage ratings.

6.1.2 The temperature of the core shall not exceed that permitted in IS.

6.2 Tank

6.2.1 The tank shall be made of good commercial grade low carbon steel plate of adequate thickness capable of withstanding stress not less than 0.40 kg/cm², properly welded and gusseted to ensure a rigid construction. It shall also be able to withstand normal transportation shocks without any deformation and shall be capable of withstanding following vacuum.

6.2.2 For outdoor transformer, the top of the tank, the marshalling box and the headers of radiators, shall be of such a construction so as to prevent accumulation of water.

6.2.3 Guides shall be provided to facilitate tanking and untanking of the core with the coil assembly. The details of anchoring of core and coil assembly of the tank shall be furnished.

6.2.4 Radiators, where necessary, shall be provided on the tank to facilitate cooling. These shall be detachable type and shall be provided with isolating valves at ends, drain plug and air release plug. The radiators shall be fabricated out of minimum 1.25 mm thick seamless steel tubing or pressed sheet steel. For sizes up to 500 KVA, cooling tubes shall be acceptable.

6.2.5 Means for lifting and jacking of the transformer shall be provided.

6.3 Windings
6.3.1 Each coil shall be made out of paper insulated electrolytic grade copper conductor. Similar coils shall be interchangeable. Successive coils of a winding shall be connected by accessible joints and shall be brazed and finished smooth to prevent abrasive damage to insulation. There shall be no sharp bends in the connecting leads to prevent corona discharge. Aluminium foil wound transformer will also be acceptable.

6.3.2 The winding assembly shall be dried and impregnated in the vacuum with tested insulating oil. The insulation resistance and polarization index of the winding measured after impregnation shall be furnished in the test certificate.

6.3.3 For transformers rated 20 MVA and above vapour phase drying shall be adopted.

6.3.4 The magnitude of impulse surges transferred from HV to the LV winding by inductive and capacitive coupling shall be limited to a value below the rated impulse strength of the LV winding. The impulse voltage test results and surge distribution on windings for similar transformer shall be furnished.

6.4 Insulation Materials

6.4.1 Class ‘A’ insulating materials specified in IS 1271 shall be used. Paper insulation shall be new and free from punctures. Wood insulation, where used, shall be well seasoned and treated.

6.4.2 The mineral oil shall comply with IS: 335. 10% extra oil shall be supplied along with the transformer in non-returnable drums.

6.4.3 For the transformers required to be filled up with inert gas for transport purpose, the required amount of oil including 10% extra shall be supplied in non-returnable drums.

6.5 Bushing

The bushing insulator shall be rated for the maximum system voltage and shall comply with the requirements laid down in IS. The minimum current rating shall be 400 Amps. in case of overhead line connected transformers, the bushings shall be outdoor type having creepage distances of 31mm/kV and complete with arcing horns. In case of transformers connected with bus duct or cable, the bushings shall be enclosed in the terminal box. In either case, they shall be detachable from outside of the tank. The hardware shall be of tinned copper or nickel plated brass suitable to receive the conductors. Separate neutral bushings shall be provided for earthing the neutral, as required. All bushings shall be marked with the symbols corresponding to the connection diagram indicated in the diagram plate and in accordance with IS.

Bushing rated 52 KV class and above shall be oil impregnated paper condenser bushings. Bushing rated below 52KV voltage class shall be solid porcelain or oil communicating type.

7.0 FITTINGS

7.1 Fittings as listed in Annexure - I shall be provided. Any other fittings which may be necessary for the satisfactory operation of the transformer shall also be provided on each transformer.

7.2 All fittings shall conform to relevant Indian Standard Specifications.

7.3 Fittings such as conservator and associated pipes, explosion vent pipe etc. shall be designed to withstand vacuum as specified in Clause 6.2.1 against atmospheric pressure.

7.4 Fittings such as rating plate, dehydrating breather, off-circuit tapping switch, dial type thermometer etc. which need to be observed/ operated, shall be mounted at
7.5 All opening shall be provided with gasketted metallic covers for protection during transportation.

7.6 All valves shall be of globe/butterfly type provided with blanking plates. The valve body shall be made of either Carbon Steel with trim of 13 Cr. steel or gun metal.

7.7 The rating plate, the terminal diagram and terminal marking plates shall be made of Aluminium and shall contain relevant details as per IS 2026. The Code No. of equipment shall be marked on a separate plate.

7.8 All terminals shall be anti loosening type and complete with connectors of required size. The earthing terminals shall have identification marks.

7.9 **Winding Temperature Indicator**

Winding temperature indicator for measuring hot spot temperature of the winding shall comprise of current transformer image coil, temperature sensing element, capillary tube jacketed with PVC sleeve, 150 mm dia. local indicating instrument with two pairs of contacts one for alarm and other for trip and maximum point indicator capable of being reset by hand without tools.

7.10 **Oil Temperature Indicator**

Oil temperature indicator for measuring top oil temperature shall comprise of 150 mm dial type thermometer, thermometer pocket and capillary tube jacketed with PVC sleeve. Thermometer shall have two pairs of contacts, one for alarm and other for trip and maximum point indicator capable of being reset by hand without tools.

7.11 **Buchholz Relay**

The Buchholz relay as per IS 3637 shall be of double float type, provided with, two pairs of contacts, one for alarm and other for trip, facility for testing by injection of air by hand pump and with a cock for draining and venting of air. The relay shall be provided with shutoff valves on the conservator side as well as on the tank side.

7.12 The alarm and trip contacts of all protective devices shall be potential free and rated for 1 Amp at 110 V / 220 V D.C.

7.13 **Marshalling Box**

7.13.1 A marshalling box shall be provided to accommodate all auxiliary devices except those which are to be located directly on transformer or housed in a separate panel.

7.13.2 The marshalling box shall be dust, weather and vermin proof type made of sheet steel of not less than 2 mm thick. The box shall be rectangular in shape having sufficient space for easy termination of cables. The terminal block shall be pressure clamp type. 10% spare terminals shall be provided.

7.13.3 Suitable heavy duty double compression type rolled Aluminium cable glands for all incoming and outgoing cables shall be provided.

7.14 **Current Transformers**

The current transformers shall be provided and shall comply with IS 2705. The C.T. terminals shall be accessible through a weatherproof removable cover for the purpose
of testing etc. CT polarity shall be clearly marked. The C.T. for standby earth fault protection shall be 15 VA, 5P10. The C.T.'s for differential and restricted earth fault protection shall be of Class PS accuracy. The values of $V_k$ and Imag for these CTs shall be furnished at the order stage.

7.15 **Wiring**

All controls, indication and protective devices provided on the transformer shall be wired up to the terminal block inside the marshalling box, by means of stranded copper heat resistant PVC insulated armoured cable of 1.1 KV grade and size not less than 2.5 sq. mm. Wiring shall be properly fixed on cable tray with at least 100 mm clearance from the transformer body. Suitable identification mark shall be provided on all wires.

7.16 **All** bought out items shall be of reputed make to be approved by Consultant/Purchaser.

8.0 **NITROGEN INJECTION FIRE PREVENTION AND EXTINGUISHING SYSTEM**

8.1 Nitrogen Injection Fire Prevention and Extinguishing System shall be provided for fire protection of Transformer against fire due to an arc, during internal faults and external fires is for preventing tank explosion. The system design shall also conform to TAC/NFPA norms.

8.2 The system should comprise the following:

i. Fire Extinguishing Cubicle with base frame and containing, oil drain assembly, nitrogen cylinder, electric mechanical control unit for oil drain and nitrogen release detections necessary for monitoring system flanges on top panel for connecting pipe connections from transformer, panel lighting etc.

ii. Control Box for monitoring system operation, automatic control and remote operation, with alarms, indication light switches, push buttons, audio signal, suitable for tripping and signaling on 110V DC supply.

iii. Pre-stressed non-return valve (PNRV) working on transformer oil flow rate, with proximity switch for remote alarm indication and with visual position indicator.

iv. Required number of fire detectors rated for 1410C for heat sensing, each fitted with two number cable glands.

v. Signal box for terminating cable connections from PNRV and fire detectors.

vi. Pressure relief valve with limit switch.

8.3 The following arrangements are required to be made on the transformer Tank at the time of fabrication of the tank:

i. Oil drain opening with pipe, flange and manual gate valve at about 120mm below the top cover. Pipe size DN125 for 100 MVA and higher ratings.

ii. Nitrogen Injection openings with pipe size DN 25 with flange and manual gate valve on tank sides at about 100-200 mm from the bottom plate.

iii. Flanges having 4 Nos. 18 dia. holes with pcd as 155mm and dummy pipe on the conservator pipe between buchholz relay and conservator tank manual gate valve, for fixing PNRV.

iv. Fire detector brackets on top cover.

v. brackets for fixing signal box at a suitable location on top cover or tank size wall.

8.4 **ACTIVATION OF NIFPES:**
Mal-functioning of fire prevention / extinguishing systems is their major shortcoming which leads to interruption in power supply. The Contractor shall ensure that the chances of malfunctioning of NIFPES are practically nil. To achieve this objective, the Contractor shall work out their scheme of activating signals which, while preventing mal-operation, should not be to rigorous to make the operation of NIFPES impracticable in case of actual need. Transformer isolation shall be the mandatory pre-requisite for activation of the system in Automatic mode or Remote mode in the control room.

In addition, at least following electrical-signals shall be provided in series for activating NIFPES.

8.4.1 Auto Mode
a) For Prevention of Fire:
   i) Differential Relay Operation
   ii) Buchholz Relay parallel with Pressure Relief Valve or RPRR. (Rapid Pressure Release Relay)
   iii) Tripping of all concerned breakers is a prerequisite for initiation of system activation.

b) For Extinguishing Fire:
   i) Fire Detector
   ii) Buchholz Relay paralleled with Pressure Relief Valve or RPRR.
   iii) Tripping of all connected breakers is a prerequisite for initiation of system activation.

8.4.2 Manual Mode (Local/Remote): Tripping of all connected breakers is a pre-requisite for initiation of system activation.

8.4.3 Manual Mode (Mechanical): Tripping of all connected breakers is a pre-requisite for initiation of system activation.

8.5 General Description of NIFPES

8.5.1 Schematic of the System
NIFPES should be a stand alone dedicated system for oil filled. It should have a fire extinguishing FE) cubicle placed on a plinth at a distance of 6-10 mtrs. from the transformer. The F.E. cubicle may be connected to the transformer oil tank (near its top) and to the oil pit from its bottom through oil pipes with gate valves. The F.E. cubicle should house a pressurized nitrogen cylinder connected to the transformer oil tank (near its bottom). Cable connections are to be provided from signal box placed on the transformer to the control box in the control room and from control box to F.E. cubicle. Fire detectors placed at the top of transformer are to be connected in parallel to the signal box. The signal box may be connected to a pre-stressed non-return valve fitted between the conservator tank and Buchholz relay. Control box is also to be connected to relay panel is control room for system activation signals.

8.5.2 Operation
On receipt of all activating signals, drain of pre-determined quantity of oil commences thus removing high temp. top oil layer. Simultaneously nitrogen is injected under high pressure at a pre-fixed rate, string the oil thus bringing the temperature of top oil layer down. Nitrogen occupies the space created by oil drained out and acts as an insulating
layer between the tank oil & fire on top cover. Pre-stressed non return valve blocks oil flow form conservator tank, thus isolating it & preventing aggravation of fire.

8.5.3 System Components

Broadly, NIFPES shall consist of the following components. It is emphasized that all components, necessary for fast reliable & effective working of NIFPES shall be considered within the scope.

8.5.4 Fire Extinguishing Cubicle

It shall be made of 3mm thick steel sheet, painted dark red from inside & outside with hinged split doors fitted with high quality tamper proof lock. It shall be complete with the base frame and the following :-

- Nitrogen gas cylinder with regulator and falling pressure electrical contact manometer
- Oil drain pipe with mechanical quick drain valve.
- Electro mechanical control equipment for oil drain and pre-determined regulated nitrogen release.
- Pressure monitoring switch for back-up protection for nitrogen release.
- Limit switches for monitoring of the system.
- Flanges on top panel for connecting oil drain and nitrogen injection pipes for transformer.
- Panel lighting (CFL Type)
- Oil drain pipe extension of suitable sizes for connecting pipes to oil pit.

8.6 Control Box

Control Box for monitoring system operation, automatic control and remote operation, with following alarms indication, light switches, push buttons, audio signal, line fault detection suitable for tripping and signaling on 110V DC supply:

- System on
- PNRV open
- Oil drain valve closed
- Gas inlet valve closed
- PNRV closed
- Fire Detector Trip
- Buchholz Relay Trip
- Oil drain valve open
- Extinction in pressure
- Cylinder pressure low
- Differential relay trip
- PRV/RPRR trip
- Transformer trip
- System out of service
- Line fault free detector
- Line fault differential relay
- Line fault buchholz relay
- Line fault PRV
- Line fault transformer trip
- Line fault PNRV
- Auto/Manual/Off
- Extinction release on
- Extinction release off
- Lamp test
- Visual / Audio Alarm
- Visual / Audio alarm for DC supply fail

The signals marked (*) shall be in the topmost row of control box panel. The signals marked (^) shall follow next.

### 8.7 Pre-stressed Non Return Valve (PNRV)

PNRV is to be fitted in the conservator pipe line between conservator & Buchholz relay. It shall have the proximity switch for remote alarm, indication and with visual position indicator. The PNRV should be of the best quality because malfunction of PNRV shall be of serious consequence as its closing leads to stoppage of breathing of transformer.

### 8.8 Fire Detectors

The system shall be complete with adequate number of fire detectors fitted on the top of oil tank, OLTC/Off ckt. Tap changer rated for 1410C for heat sensing each fitted with two no. cable glands (water proof/weather proof).

### 8.9 Signal Box

It shall be fitted on the transformer for terminating cable connections from PNRV & fire detectors and for further connection to the control box.

### 8.10 Cables

Fire survival cables, able to withstand 7500C, 4 core x 1.5mm sq. for connection of fire detectors in parallel shall be used. Fire retardant low smoke (FRLS) cable 12 core x 1.5mm sq. for connection between transformer signal box/marshalling box to control box and control box to fire extinguishing cubicle shall be used.

Fire retardant low smoke (FRLS) cable 4 core x 1.5mm sq. for connection between control box to DC supply source and fire extinguishing cubicle to AC supply source, signal box marshalling box to prestressed non return valve connection on transformer shall be used.

### 8.11 Pipes

Pipes, complete with connections, flanges, bends, tees etc. shall be supplied alongwith the system.

### 8.12 Other items

a) Oil drain and nitrogen injection openings with gate valves on transformer tank at suitable locations

b) Flanges with dummy piece in conservator pipe between Buchholz relay and conservator tank for fixing PNRV.

c) Fire detector brackets on transformer top cover.
d) Spare potential free contacts for system activating signals i.e. differential relay, buchholz relay, pressure relief valve, transformer isolation (master trip relay).

e) Pipe connections between transformer to fire extinguishing cubicle and fire extinguishing cubicle to oil pit.

f) Cabling on transformer top cover for fire detectors to be connected in parallel and inter cabling between signal box to control box and control box to fire extinguishing cubicle

g) Mild steel oil tank with moisture proof coating with capacity as minimum 10% of total oil quantity of transformer, with water tight cover, to be place in the oil pit. This tank shall be provided with the manhole, air vent pipe through silica gel breather, drain valve and a spare gate valve at the top.

h) Gate valves on oil drain pipe & nitrogen injection pipe should be able to withstand full vacuum. A non-return valve shall also be fitted on nitrogen injection pipe between transformers & gate valve.

i) Pressure relief valve, wherever not fitted on the transformer.

j) The F.E. cubicle shall be painted with post office red colour (Shade 538 of IS-5). All the exposed parts i.e. pipes, supports, signal box etc. shall be painted with enameled paint.

8.13 Modification on the transformer

No modification on the transformer shall be allowed which affects its performance (i.e. efficiency, losses, heat dissipation ability etc.), safety, life etc. or its any other useful parameter. This requirement shall be of paramount importance and shall be followed.

However, in any case, performance of transformer should not be affected in any manner by having NIFPES system and the Contractor shall give an undertaking to this effect. All pipes should be washed/rinsed with transformer oil. If any damage is done to the transformer and/or any connected equipment during installation & commissioning full recovery therefore shall be effected from the Contractor.

It shall be solely the responsibility of Contractor/Sub-Contractor to install, carry out pre-commissioning tests & commission NIFPES at Ridge Valley indicated in this Specification, to the entire satisfaction of the Owner/Consultant..

8.14 Interlocks

It shall be ensured that once the NIFPES gets activated manually or in auto mode, all the connected breakers shall not close until the system is actually put in OFF mode. Also PNRV shall get closed only if all the connected breakers are open.

8.15 In general, following Fire Extinction period and other data shall be followed:

On commencement of Nitrogen Injection: Maximum 30 seconds

From the moment of system activation to complete cooling: Maximum 3 minutes

Fire detectors heat sensing temperature: 141°C

Heat sensing area: 800mm radius

Pre-stressed non return valve setting for Operation: minimum 60 ltr. Per minute

Capacity of Nitrogen cylinder: Minimum 68 litre water capacity And shall hold minimum 10 cubic Meter gas to 150
8.16 The following information in detail shall be provided:
   a) The maintenance and testing schedule for NIFPES.
   b) All the steps required to be undertaken for restarting the transformer and connected equipment after operation and mal-operation (if any) of the NIFPES.
   c) The process of venting nitrogen in case nitrogen pressure in the cylinder exceeds the stipulated maximum value.

9.0 PAINTING

9.1 The surface to be painted shall be shot or sand blasted to remove all dust, scale and foreign adhering matter. All traces of oil and greases should be removed by suitable treatment.

9.2 All steel surfaces in contact with insulating oil shall be painted with heat resistant oil insoluble insulating varnish.

9.3 All steel surfaces exposed to outside shall be painted with suitable anti-rust and anticorrosive paints. Epoxy paints shall be used.

9.4 All paints shall be carefully selected to withstand tropical heat and extremes of weather. The paint shall not scale off, crinkle or be removed by abrasion due to normal handling.

9.5 Unless otherwise specified, the finishing shade shall be light grey Shade No. 631 as per IS 5.

9.6 1 litre of paint per transformer shall be supplied for touch up at Site.

10.0 TESTS AND INSPECTION

10.1 All transformers shall be routine tested as per IS 2026. Transformer oil shall be tested as per IS 335.

10.2 Additional tests, wherever specified, shall be carried out on one transformer of each rating.

10.3 All the above mentioned tests shall be carried out in the presence of Purchaser’s representative. In addition, the transformers shall be subject to stage inspection at works and inspection at site for final acceptance.

10.4 These inspections shall, however, not absolve the Vendor from their responsibility for making good any defect which may be noticed subsequently.

11.0 DRAWINGS AND DOCUMENTS

11.1 The drawings and documents as per Annexure-III shall be furnished, unless otherwise specified.
11.2 All drawings and documents shall have the following descriptions written boldly:
-- Name of Client
-- Name of Consultant
-- Enquiry / order number with plant / project name
-- Equipment Code No. and Description

11.3 The transformer shall be suitably packed to avoid damage in transit and shall be properly sealed so as to completely exclude oxygen and moisture from coming in contact with oil. Bushing shall be wrapped in straw ropes or similar material and complete transformer shall be packed in wooden crates.

11.4 The packing box shall contain a copy of the installation, operation and maintenance manual.

11.5 All loose pieces shall be separately wrapped in moisture resistant paper and marked with identification mark of the corresponding transformer.

12.0 SPARES

12.1 Spares for operation and maintenance

Item wise unit prices of spare parts shall be quoted.

12.2 Commissioning Spares

Commissioning spares, as required, shall be supplied with the main equipment. Item wise list of recommended commissioning spares shall be furnished for approval.

12.3 Any other spare parts not specified, but required, shall also be quoted along with the offer.

12.4 All spare parts shall be identical to the parts used in the equipment.

13.0 PACKING

13.1 The transformer shall be suitably packed to avoid damage in transit and shall be properly sealed so as to completely exclude oxygen and moisture from coming in contact with oil. Bushing shall be wrapped in straw ropes or similar material and complete transformer shall be packed in wooden crates.

13.2 The packing box shall contain a copy of the installation, operation and maintenance manual.

13.3 All loose pieces shall be separately wrapped in moisture resistant paper and marked with identification mark of the corresponding transformer.

14.0 DEVIATIONS

14.1 Deviations, if any, from this standard shall be clearly indicated in the offer with reasoning.
ANNEXURE - I

LIST OF FITTINGS

I. The fittings as given below shall be provided for all the ratings of transformers.

1. Oil Sampling Valve.
2. Filter valves with plug.
3. Radiator shutoff valves on top and bottom for each unit.
5. Winding temperature indicator for 1000 KVA and above.
6. Oil temperature indicator.
7. Oil level indicator with minimum marking.
8. Oil conservator complete with drain plug and oil filling hole with cover.
9. Buchholz relay with air release device and alarm and trip contacts.
10. Silica gel breather with oil seal and connecting pipe.
11. Explosion vent.
12. Bi-directional rollers.
13. Inspection holes with cover.
14. Marshalling Box.
15. Rating Plate.
17. Lifting lugs.
18. Jacking pad.
20. Air release device.
22. Ladder with safety device for access to the top of transformer tank.

II. The additional fittings as given below shall also be provided, as per requirement:

1. Magnetic oil level gauge with low oil level alarm contact.
2. Hauling lugs for extra high voltage transformers.
3. Protective CTs for
   a) Stand-by earth fault.
   b) Restricted earth fault.
   c) Differential protection.
4. Bi-directional wheels if already bi-directional rollers not considered.
5. Skids.
6. Cooler units complete with valves, fans, pumps, oil flow indicators, supporting structure with fixing and foundation bolts etc as required and Cooler Control panel.
7. Tap-changing gear complete with tap position indicator, operation counter etc. For OLTC gear(where specified), oil surge relay(OSL) with shut-off valve, Local control cabinet.
8. Nitrogen Injection Fire Prevention and Extinguishing System

1.0 SCOPE

1.1 This standard covers the technical requirements of design, manufacture, testing at works and despatch in well packed condition of Neutral Earthing Resistor for earthing the neutral of power transformers / generators for limiting the line to ground fault current.

1.2 This standard shall be read in conjunction with the relevant part of Design Philosophy – Electrical.

2.0 STANDARDS TO BE FOLLOWED

2.1 The design, manufacture and testing of the equipment covered by this standard shall comply with the latest issue of IS 3043, unless otherwise specified. Equipment complying with equivalent IEC standards shall also be acceptable.

2.2 The design and operational features of the equipment shall also comply with the provisions of latest issue of the Indian Electricity Rules and other relevant Statutory Acts and Regulations. The supplier shall, wherever necessary, make suitable modifications in the equipment to comply with the above.

2.3 Wherever any requirement, laid down in this standard, differs from that in Indian Standard Specifications, the requirement specified herein shall prevail.

3.0 SERVICE CONDITIONS

3.1 Ambient Conditions

These shall be as indicated in Design Philosophy – Electrical.

3.2 System Details

These shall be as indicated in Design Philosophy – Electrical.

4.0 OPERATING REQUIREMENTS

4.1 The neutral earthing resistor shall be suitable for carrying the rated current for duration of 30 seconds under the specified ambient conditions and voltage and frequency variations without the temperature exceeding 350ºC.

4.2 The resistor shall be designed to carry continuously 20% of the rated short time current without any harmful effect.

4.3 The housing shall be sized such that temperature rise of the metal parts through which current is not required to pass, when rated current is passed for the specified period, shall not exceed 40ºC.

5.0 GENERAL DESIGN AND CONTRUCTIONAL FEATURES

5.1 Resistors

5.1.1 The resistance bank shall be of heavy duty non-inductive type having high specific resistance and low temperature co-efficient.

5.1.2 The resistor elements shall be made of joint-less, non-corroding, sturdy and oxidation resistant AISI 304 / AISI 406 stainless steel of punched / formed construction.
5.1.3 The contact between elements shall be made by individually bolting the terminals of two adjacent elements and connecting them in series, parallel or combination of both to achieve the specified resistance. The interconnecting link shall be zinc plated copper of uniform cross section throughout.

5.1.4 The resistance grid shall be properly supported so that damage due to vibration and thermal or mechanical stresses is avoided.

5.1.5 Porcelain / Epoxy insulators rated for the highest system voltage shall be used to insulate the resistor elements from the body of the housing.

5.1.6 Insulation level for resistor bank shall be as follows:

<table>
<thead>
<tr>
<th>Highest system voltage</th>
<th>Power frequency withstand voltage</th>
<th>Impulse withstand Voltage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Up to 3.6 KV peak</td>
<td>10 KV RMS</td>
<td>40 KV</td>
</tr>
<tr>
<td>7.2 KV peak</td>
<td>20 KV RMS</td>
<td>60 KV</td>
</tr>
</tbody>
</table>

5.2 Metal clad housing

5.2.1 The housing shall be fabricated out of 3 mm thick sheet steel fitted on a 6 mm thick mild steel frame work. This shall be floor mounting type and rectangular in shape.

5.2.2 It shall be suitable for outdoor installation and shall have minimum degree of protection IP: 43 as per IS 2147. Ventilating louvers, if provided, shall be covered by fine wire mesh from inside and shall be such that the above degree of protection for the enclosure is not altered. Top cover of the housing shall be slopping construction to prevent accumulation of water.

5.2.3 All external hardware below 8 mm size shall be of stainless steel and those of higher size of mild steel cadmium plated or zinc passivated.

5.3 Isolation Arrangement

5.3.1 An isolator shall be provided on the incoming side to isolate the resistors from the main equipment.

5.3.2 The isolating switch shall be single pole knife type having a rating of 1.5 times the rated current of the resistor. The switch shall have four sets of potential free auxiliary contacts, 2 NO and 2 NC for remote indication, wired to a terminal block. An external handle, suitably insulated and lockable both in the ON and OFF positions, shall be provided for the switch. The handle shall preferably be mounted at a height of 1.5 meters from the base of the housing.

5.4 Current Transformers

Epoxy moulded current transformer of accuracy 5P for stand by earth fault protection and PS for restricted earth fault protection shall be provided, as per requirement. The CT connections shall be brought to separate terminal box with shorting arrangement.

5.5 Terminal Arrangement

5.5.1 For incoming connection, either bushing or cable box arrangement shall be provided. In case of bushing connection, the bushing shall be provided on top of the housing. In case of cable box connection, the same shall be mounted on the side of the housing.

5.5.2 For the outgoing connection, cable box arrangement is to be considered in all cases. The cable box shall be mounted on the side of the housing.
5.5.3 Heavy duty double compression type rolled aluminium cable glands shall be provided for all the incoming and outgoing cables.

5.5.4 The equipment terminals shall be anti loosening type and complete with tinned copper cable lugs suitable for cables of specified size. For bushing connections, suitable tinned copper conductor shall be provided as per conductor size specified.

6.0 ACCESSORIES

6.1 The equipment shall be complete with cable glands, cable lugs, drain plug, lifting hook, name plate, foundation bolts and all other accessories required to make the equipment complete in all respects.

6.2 Name Plate

6.2.1 Name plate shall be of stainless steel with letters embossed on them.

6.2.2 The name plate shall contain all the required details and shall include at least the following:
   i) Make
   ii) Description of code no. of equipment
   iii) Short time rating
      a) Current
      b) Duration
   iv) Rated voltage
   v) Maximum temperature rise over ambient
   vi) Total resistance at ambient temp.
   vii) Materials of resistors
   viii) Degree of protection of enclosure

7.0 PAINTING

7.1 The enclosure, after suitable pre-treatment shall be painted with two coats of antirust paint followed by two coats of anti-corrosive paints.

7.2 Epoxy based paints shall be used.

7.3 All paints shall be carefully selected to withstand tropical heat and extremes of weather. The paint shall not scale off, crinkle or be removed by abrasion due to normal handling.

7.4 The finishing paint shall be light grey shade no. 631 as per IS 5.

8.0 TESTS AND INSPECTION

8.1 Following tests shall be carried out on the neutral earthing resistors:

8.1.1 Routine Tests
   i) Resistance value measurement at room temperature.
   ii) Power frequency high voltage test for one minute.
   iii) Insulation resistance test.

8.1.2 Type test
   i) Heat run test.
8.2 The above mentioned tests shall be carried out in the presence of purchaser’s representative. In addition, the equipment shall be subjected to stage inspection during process of manufacture at works and inspection at site for final acceptance.

8.3 The purchaser’s inspection shall, however, not absolve the vendor from his responsibility for making good any defects which may be noticed subsequently.

9.0 DRAWINGS AND DOCUMENTS

9.1 The drawings and documents as per Annexure-I shall be furnished unless otherwise specified.

9.2 All drawings and documents shall have following descriptions written boldly.
- Name of the client
- Name of consultant
- Enquiry / order number with plant / project name
- Equipment code no. and Description.

10.0 SPARES

10.1 Spares for operation and maintenance
Item wise unit prices of spare parts shall be quoted.

10.2 Commissioning Spares
Commissioning spares, as required, shall be supplied with the main equipment. Item wise list of recommended commissioning spares shall be furnished for approval.

10.3 Any other spare parts not specified, but required, shall also be quoted along with the offer.

10.4 All spare parts shall be identical to the parts used in the equipment.

11.0 PACKING

11.1 The neutral earthing resistor shall be properly packed to safeguard against weather conditions and handling. It shall be wrapped in polythene bag with an additional wrapping of bitumen paper to make it completely waterproof before the equipment is packed in wooden crates.

11.2 A sign to indicate the upright position of the panel for placing during transport and storage shall be clearly marked.

11.3 Packing box shall include one copy of the installation operation and maintenance manual

12.0 DEVIATIONS

12.1 Deviations, if any, from this standard shall be clearly indicated in the offer with reasoning.
# ANNEXURE - I

1.0 **SCOPE**

1.1 This standard covers the technical requirements of design, manufacture, testing at works and delivery in well-packed condition of Medium Voltage Switchboards.

1.2 This standard shall be applicable for the Power Control Centres, Power cum Motor Control Centres and Motor Control Centres.

1.3 This standard shall be read in conjunction with relevant part of Design Philosophy – Electrical, Schematic diagrams etc.

2.0 **STANDARDS TO BE FOLLOWED**

2.1 The design, manufacture and testing of the equipment shall comply with the latest issue of the following Indian Standards, unless otherwise Specified. Equipment complying with equivalent IEC standards shall also be acceptable.

   - IS 8623 - Specification for low voltage switchgear and control gear assemblies
   - IS/IEC 60947 - Low-voltage switchgear and control gear (General Rules)
   - IS 5578 - Guide for marking of insulated conductors
   - IS 10118 - Code of practice for selection, installation and maintenance of switchgear and control gear
   - IS 11353 - Guide for uniform system of marking and identification of conductors and apparatus terminals

   Various components housed in the switchboards shall conform to the Indian Standard specifications as mentioned against the component details or IEC specifications.

2.2 The design and operational features of all the equipment offered shall also comply with the provisions of the latest issue of the Indian Electricity Rules and other Statutory Acts and Regulations, as applicable. The supplier shall, wherever necessary, make suitable modifications in the equipment to comply with the above.

2.3 Wherever any requirement, laid down in this standard, differs from that in Indian Standard Specification / IEC Specification, the requirement specified herein shall prevail.

3.0 **SERVICE CONDITIONS**

3.1 **Ambient Conditions**

These shall be as indicated in Design Philosophy – Electrical.

3.2 **System Details**

These shall be as indicated in Design Philosophy – Electrical.

4.0 **OPERATING REQUIREMENTS**

The Medium Voltage Switchboards shall be suitable for operating at the specified rating continuously, with the specified voltage and frequency variations under the ambient
conditions, without exceeding the permissible temperature rise and without any detrimental effect on any part.

5.0 DESIGN AND CONSTRUCTIONAL FEATURES

5.1 General

5.1.1 The switchboards shall consist of an assembly of a series of floor mounting, identical, metal clad, dead front type sheet steel panels of unitized design. The panels shall be placed side by side to form a compact assembly and shall be extensible on either side.

5.1.2 The complete assembly shall be dust, damp and vermin proof having minimum degree of protection equivalent to IP-52 as per IS/IEC:60947.

5.1.3 The frame work of the cubicles shall be of bolted/welded construction. The minimum thickness of sheet steel shall be 2 mm for load bearing members, 1.6 mm for non-load bearing members and 3 mm for base channel. The doors and covers shall be fabricated from cold rolled sheets. Suitable reinforcement, wherever necessary, shall be provided.

5.1.4 The door hinges shall be concealed type.

5.1.5 All external hardwares shall be cadmium plated. The hardwares for fixing the removable parts shall be provided with retaining devices.

5.1.6 The doors and the removable covers shall be provided with non-deteriorating neoprene gaskets. Gaskets without any discontinuity shall be preferred. Gaskets shall be held in position in groove, in shaped sheet steel work or these shall be of U type. Adhesive cement, if used, shall be of good quality so that the gaskets do not come off during service.

5.1.7 All the components shall be accessible for inspection and maintenance without the necessity for removal of the adjacent ones.

5.1.8 The layout of the component inside the module shall be liberal to facilitate maintenance and interconnecting wiring between the components shall not be subjected to any undue stresses at the bends.

5.1.9 Mounting height of components requiring operations and observation shall not be lower than 300 mm and higher than 1800 mm.

5.1.10 Inter panel barriers shall be provided.

5.1.11 All the live parts which are accessible after opening of front cover/cable alley cover/back cover shall be properly insulated or provided with insulating barrier to prevent accidental contact. Removal facility shall be provided for all such parts.

5.1.12 Adequate arrangement for earthing shall be provided to safeguard the operator or other personnel from electric hazards under all conditions of operation.

5.2 Panel Arrangement

The Switchboards shall be in fixed/draw out, single front execution, fully compartmentalised type and divided into distinct panels, each comprising of:

i) A completely metal enclosed bus-bars compartment running horizontally the top.
ii) Individual feeder modules.
iii) Enclosed vertical bus-bars serving all modules, in case of multi-tier panels.
iv) A vertical cable alley.
v) Separate horizontal enclosure for all auxiliary power and control buses.

5.3 Circuit Breaker Controlled Feeders
5.3.1 The panels housing circuit breaker feeders shall be in single front draw out execution. The incoming and bus coupler circuit breaker feeders shall be in single tier formation while the outgoing circuit breaker feeders may be in double tier formation.

5.3.2 A suitable barrier shall be provided between the circuit breaker and the associated control, protective and indication devices including instrument transformers.

5.3.3 All the protective relays and meters shall be flush mounted type. The relays and meters pertaining to a particular circuit breaker shall be mounted on the same panel. Where it is not possible to accommodate all the relays and meters in the same panel, one metering panel shall be provided adjacent to the circuit breaker panel exclusively for that feeder. Location of these in the adjacent panel of other feeders shall not be acceptable.

5.3.4 A spacious cable chamber suitable for accommodation, support and termination of required number of power cables shall be provided at the back. No bare bus-bars or live connection shall intrude into the cabling space.

5.3.5 The switchboard shall be provided with following inter locks and safety features:
   i) It shall not be possible to open the compartment door unless the breaker is drawn to isolated position.
   ii) The withdrawn and engagement of a circuit breaker shall not be possible unless it is in open position.
   iii) The operation of a circuit breaker shall not be possible unless it is in fully service, test or isolated position.
   iv) It shall not be possible to close the circuit breaker in service position unless all auxiliary and control circuits are connected.
   v) A breaker of the lower rating shall be prevented from engaging with the stationary element of higher rating.
   vi) Insertion of the manual mechanism shall render the motorised mechanism in operation.
   vii) Circuit breaker ‘ON’, ‘OFF’ indication shall be provided at the back of each panel. Alternatively, alarm shall be provided in case panel back door is opened with breaker “ON”.
   viii) Caution nameplate shall be provided at the back of incomer’s panels where terminals are likely to remain live and isolation is possible only from remote end.
   ix) Automatic safety shutter, with Padlocking facility for locking in closed position, to completely cover the spouts for the bus-bars and cable connection when the breaker is withdrawn.

5.4 Switch/MCCB Controlled Feeders

5.4.1 The panels housing motor starter or other feeders shall be either fixed or draw out type in single front execution.

5.4.2 All components of one feeder shall be mounted on a rigid sheet steel chassis.

5.4.3 Each panel shall be divided into a number of modules in tier formation placed one above the other. These modules shall be closed on all sides.

5.4.4 The modules shall be so placed that largest one is placed at the bottom of the panel. Type modules shall be at least 300 mm from the base channel.

5.4.5 The number of modules shall be so decided that the cables in the cable alley are not over crowded. However the number of module in any panel shall not exceed six.

5.4.6 The minimum size of module shall be 300 mm and 200 mm for starter and switch fuse feeders respectively.

5.4.7 The minimum clear width of cable alley shall be 250 mm.
5.4.8 For MCC rated above 630 Amp. The incomer and bus coupler modules shall be located in individual single panel. For MCC rated for 630 Amp. and below the incomer and bus coupler modules shall be half the panel size.

5.4.9 The module door shall be so interlocked that it shall not be possible to open the door with switch in closed position and close the door unless the module is fully plugged in. Defeat interlock facility shall be provided.

5.5 Special Features of Draw out Modules

5.5.1 The module shall be fully draw out type with sheet steel chassis moving freely on the guides. Chassis of the same size shall be fully interchangeable.

5.5.2 The module shall have the following distinct mechanical positions:
   i) Service -- In which both power and control contacts shall be made.
   ii) Test -- In which power contacts shall be isolated but control contacts shall be made.
   iii) Isolated -- In which both power and control contacts shall be Isolated.

   Maintenance position shall be preferred.

5.5.3 Each position shall be clearly marked. Padlocking facility shall be provided to padlock the chassis in any of the position.

5.5.4 The movement of the chassis from one position to the other shall be controlled by using an appropriate racking mechanism. Stopper shall be provided to prevent over travel of the chassis beyond the isolated position.

5.5.5 The guiding system shall permit smooth movement of the module and the power and control contacts shall be self-aligning type so that accurate alignment of the contacts is ensured.

5.5.6 No wiring shall be taken to the door. Only the actuators of the push buttons and switches, lenses for the indicating lamps and Perspex cover for meters shall be mounted on the door.

5.5.7 The power contacts shall be of plug-in/stab-in type made of silver plated copper, spring loaded and of adequate current carrying capacity. The contacts shall be so designed that contact pressure is maintained both under normal and short circuit conditions.

5.5.8 The parting contacts, both on bus-bar side and outgoing cable side, shall always be copper to copper and both sides silver plated. A bimetallic strip shall be used where two dissimilar materials are in contact.

5.6 Bus-Bars and Connections

5.6.1 The bus-bars shall be for three phase and neutral. The main bus-bars and connections shall be made of electrolytic grade copper of rectangular cross-section. Auxiliary bus-bars for control supply, space heater supply etc. shall be made of electrolytic copper.

5.6.2 The horizontal bus-bars shall be insulated with heat shrinkable PVC sleeves of reputed make to protect against approach to live parts. The vertical bus-bars shall be sleeved or shrouded by barriers. Removable type insulating shrouds shall be provided for all joints of horizontal bus-bars.

5.6.3 The bus-bars shall be amply sized to carry the rated continuous current under the specified ambient temperature without exceeding temperature limits specified in IS: 8084. The thermal rating of the bus-bars shall be designed to withstand the system fault current for 1 second without exceeding the limiting temperature of 200ºC for bare Aluminium/Copper. Calculation for bus-bars sizing shall be furnished along with the offer.
5.6.4 Horizontal bus-bars shall be of the same cross-section throughout. Stepped bus-bars shall not be acceptable.

5.6.5 The bus-bars shall be arranged and colour coded according to IS: 5578 / IS: 11353.

5.6.6 The bus-bar chamber shall be sufficiently spacious and shall have separate screwed covers for maintenance purpose.

5.6.7 The bus-bars shall be rigidly supported at equal intervals to withstand maximum short circuit stresses. The supports shall be of moulded construction with built-in anti-tracking barriers. The support materials shall be of DMC or fibreglass reinforced thermosetting plastic.

5.6.8 Bus-bar joints shall be between the two transporting sections only.

5.6.9 A minimum of two bolts shall be used in bus-bar joints. Only high tensile electric galvanized bolts, nuts and washers shall be used.

5.6.10 In case of Aluminium bus-bars, all joints shall be suitably treated to avoid oxidation of contact surfaces and bimetallic corrosion.

5.7 Earth Bus

A continuous earth bus of electrolytic grade copper, running along the entire length of the lower part of the switchboard shall be provided with lugs at two ends for external connections. The minimum size of earth bus shall be suitable for carrying three phase fault current for 1 sec.

5.8 Bus Duct

5.8.1 Suitable extension of bus-bars in proper phase sequence on the top, with the connecting bolts shall be provided where connection of transformer to switchboard is specified to be through bus duct.

5.8.2 Bus duct between two halves of a switchboard, if required, shall be supplied by the switchboard manufacturer. The bus-bars of interconnecting bust duct shall be similar to the main bus-bars of the switchboard and as specified above.

5.8.3 Bust duct between transformer and incoming breaker panel, if included in Vendor’s scope, shall conform to ES-8062.

5.9 Clearances and Creepage Distances

5.9.1 The clearances and creepage distances shall not be lower than the values specified below:

i) Minimum clearance between two live conductors -- 20 mm

ii) Minimum clearance between live parts and accidentally dangerous part -- 20 mm

iii) Minimum creepage distance -- 28 mm

5.9.2 The clearances and creepage, as specified above, shall definitely be maintained in the bus-bar system. Provision of bus-bar insulation, separators or barriers shall not be considered to reduce the clearance from the values specified above.

5.9.3 At the termination points in the equipment e.g. switches, contactors, thermal relays etc. It is realized that above clearances may not always be possible to be maintained. All such points, where above clearances and creepage distances are not possible to be maintained, shall be insulated or taped.

5.10 Insulation
5.10.1 The insulation used shall be non-hygroscopic and may be of porcelain, epoxy resins or fibreglass moulded with plastic. It shall be of adequate electrical, mechanical and thermal strength to give trouble free service during normal operation and short circuit conditions.

5.10.2 The insulation shall be treated suitably to withstand the tropical conditions and atmospheric pollution.

5.11 **Power Wiring**

5.11.1 The connections from bus-bar to individual functional unit on the modules shall be of PVC insulated flexible copper cables or taped Copper/Aluminium strip.

5.11.2 The power wiring size shall be decided based on rating of the switch/breaker after using a rating factor of not more than 50% over the current rating in free air.

5.11.3 Power wiring size selected for breaker controlled module shall also be able to withstand full short circuit current for duration of 0.25 sec.

5.11.4 In any case minimum size of power wiring shall not be less than 4 sq. mm copper.

5.11.5 The size of connection from incomer to horizontal bus-bar and from horizontal bus-bar to bus-coupler shall not be less than the size adopted for horizontal bus-bar.

5.12 **Control Wiring**

5.12.1 The switchboard shall be completely factory wired and ready for external connections.

5.12.2 The wiring shall be carried out with flexible stranded PVC insulated copper conductor cables of 1100 Volt grade. The size of wires shall be as follows:

- C.T. Circuit -- 2.5 sq. mm
- V.T. and Control Circuits -- 1.5 sq. mm

5.12.3 All wiring shall be provided with dependent both ends marking as per IS: 5578. Numbered ferrules, reading from the terminals outwards, shall be provided at both ends of all wiring for easy identification. These shall be interlocking type plastic ferrules.

5.12.4 Control wiring circuits, fed from a supply common to a number of panels, shall be so protected that failure of a circuit in one panel does not effect the operation of the other panels.

5.12.5 The wiring to the equipment mounted on the doors shall be carried out with flexible multi strand copper conductor cable and so supported that on opening of the door there is no undue strain on wire leads.

5.12.6 The control cables shall be neatly arranged and properly supported.

5.13 **External Cable Termination**

5.13.1 All power and control cables shall enter the switchboard from the bottom. Sufficient space shall be provided for ease of connection and termination of cables.

5.13.2 The type, number and sizes of cables shall be as indicated in Feeder details.

5.13.3 Compression type cable glands along with the cable lugs as required shall be provided for termination of cables.

5.13.4 The cable glands shall be of rolled Aluminium heavy duty double compression type and shall be mounted on a removable gland plate, provided at a minimum height of 75 mm from the bottom of the switchboard. Two number spare knockouts of size 20 mm shall also be provided on the gland plates for future use. Gland for termination of single core cables shall be nonmagnetic type.
5.13.5 For all power cables, crimped type Aluminium lugs for Aluminium cables and tinned Copper lugs for Copper cables shall be provided.

5.13.6 The terminal blocks shall be pressure clamp type up to 35 sq. mm cable sizes and bolted lug type for higher sizes of cables. These shall be protected type and rated for 1100 Volts service. The minimum current rating of terminal block shall be 16 Amp. The construction shall be such that after the connection of cables by means of lugs, necessary clearance and creepage distance are available.

5.13.7 Where more than two cables in parallel are required to be terminated, a system of bus links shall be provided with adequate clearance and spacing.

5.13.8 Suitable clamps to support the vertical run of cables shall be provided.

5.13.9 The terminal block shall be grouped according to circuit functions and suitably numbered. 20% extra terminals shall be provided in the terminal block.

5.13.10 For power connections, suitable marking on the terminals shall be provided to identify the phases.

5.14 Feeder Details

5.14.1 The requirements of incomer, bus coupler and outgoing feeders shall be as indicated in the single line diagram, feeder details and corresponding schematic diagrams.

5.14.2 Interlocks shall be provided between incomers and bus section panels. The interlocks shall be either electrical or mechanical type. In addition, arrangement for defeating the interlock shall also be provided to facilitate manual changeover.

5.14.3 Auto changeover scheme, wherever specified, shall be provided.

5.15 Dummy Panels

Dummy panels complete with bus-bar system in 400 mm width may be required for which unit price shall be indicated.

5.16 Control Power Supply

5.16.1 D.C. Power required for closing, tripping and indication of circuit breaker feeders shall be supplied at the bus coupler panel through two completely separate circuits by owner, one for tripping and other for closing and indication.

5.16.2 For receiving each external control supply, a double pole miniature circuit breaker shall be provided. This power shall be distributed inside the switchboard for each circuit breaker feeder having its MCB unit.

5.17 Space Heater Power Supply

5.17.1 Panel space heater shall be fed from a separate bus common for the whole board. This bus shall be fed from owner's supply for which a double pole MCB shall be provided in bus section panel.

5.17.2 Power supply for space heaters of motors shall be tapped from this bus by means of a MCB located in the motor feeder compartment. These MCBs shall be of triple pole and rated for 15 Amp.

6.0 COMPONENT DETAILS

Components of the switchgear shall ensure type of coordination ‘C’ as per IS:60947 (Part 4/ Section 1). Makes of all components shall be subject to owner’s / consultant’s approval

6.1 Circuit Breaker
6.1.1 The circuit breakers shall comply with the requirement of IS/IEC 60947.

6.1.2 All circuit breakers shall be of P2 (0-3 min - CO - 3 min - CO) category, capable of carrying the specified current at the site conditions and making/breaking of the system fault current.

6.1.3 Type test certificates from an independent testing authority shall be furnished along with the offer for each circuit breaker rating and type.

6.1.4 The circuit breakers controlling motors shall be suitable for DOL starting and stopping of induction motor a number of times.

6.1.5 The circuit breakers controlling capacitors shall be suitable for energizing and de-energizing the rated capacitor bank.

6.1.6 The circuit breakers shall be of the 3 phase, 4 pole horizontal draw out, horizontal isolation, air break type.

6.1.7 The circuit breaker shall be suitable for electrical or manual closing as specified. Manual operated breakers shall have independent manual spring closing mechanism. In case of electrically operated breaker, it shall have motor wound spring mechanism. In all cases tripping shall be by means of shunt trip coil.

6.1.8 All circuit breaker units of the same rating shall be physically and electrically interchangeable.

6.1.9 The circuit breakers shall be electrically and mechanically trip free and provided with anti-pumping feature.

6.1.10 Provision shall be made for slow closing for maintenance purposes. A suitable handle shall be provided one for each board for this purpose.

6.1.11 The circuit breakers shall have three positions i.e. service, test and isolated with the cubicle door closed. Necessary stoppers shall be provided to prevent the excessive movement of the breaker cradle than desired for the position. Service and test positions of the breaker shall have monitoring switch having 1NO+1NC contacts.

6.1.12 The circuit breaker shall be provided with emergency manual trip device, mechanical ‘ON’, ‘OFF’ and ‘ISOLATED’ position indicators and operation counter.

6.1.13 A maintenance truck/device for raising, lowering and withdrawal of the circuit breaker shall be supplied for each switch board.

6.1.14 The arc interrupting devices shall be capable of interrupting satisfactorily current from zero to the rated interrupting current when used on predominantly capacitive or inductive circuits, without requiring excessive maintenance of the contacts. The arc shall be restricted within the interrupting chamber and no emission of flame shall be allowed which may cause electrical breakdown or damage to insulation on the apparatus.

6.1.15 The main contacts shall be self aligning, adjustable and replaceable type.

6.1.16 The arcing contacts shall be easily accessible for maintenance and inspection and shall be easily replaceable type. They shall be provided with, contact face of special arc-resisting and non-pitting metal.

6.1.17 Mechanical safety interlock shall be provided for safe operation and movement of the breaker.

6.1.18 The circuit breakers shall be provided with minimum of four normally open and four normally closed auxiliary switch contacts, over and above those required for its own control scheme, for Owner’s use. The contacts shall be wired separately to the terminal board.

6.2 **Moulded Case Circuit Breakers**
6.2.1 The circuit breaker shall conform to IS/IEC 60947 and shall be of P2 category having
rupturing capacity as per system requirement and mounted on a draw out chassis.
6.2.2 The circuit breaker shall be provided with spring assisted quick make quick break type
manually operated trip free mechanism, mechanical ‘ON’, ‘OFF’ position indicators,
thermal tripping devices of inverse characteristics, instantaneous short circuit tripping
devices and necessary auxiliary and alarm switches. The MCCB Chassis shall be
provided with service, test and isolated position and automatic safety shutter.
6.2.3 The thermal and short circuit tripping devices shall be adjustable type.
6.2.4 When used for motor circuits, shunt trip device shall be provided and the let through
power of controlling MCCB shall be lower than the respective contactor.
6.2.5 In addition, under voltage trip shall be provided.

6.3 Switches

6.3.1 The switches shall be motor duty type AC 23 Category and shall comply with the
requirements laid down in IS/IEC 60947. Switches up to 63 Amps shall be rotary type
and those of 100 Amps & above, link type.
6.3.2 ‘ON’ and ‘OFF’ position of the switches shall be indicated on the module. Provision shall
be made to lock the switch in the ‘OFF’ position.
6.3.3 The fixed contacts shall be shrouded type. All contacts shall be silver plated.

6.4 Fuses

6.4.1 The fuses shall be of non-deteriorating HRC cartridge link type and shall conform to IS:
13703. They shall be suitable for the load and service required in the circuit.
6.4.2 One fuse puller shall be supplied along with each board.

6.5 Air Break Contactors

6.5.1 The Air Break Contactors shall be of Category AC3/AC4, unless otherwise specified,
conforming to IS: 60947 and flapper type.
6.5.2 The dropout voltage shall not exceed 65% of rated voltage.
6.5.3 Each contactor shall be provided with auxiliary contacts as required. The rating of the
auxiliary contacts shall be 5 Amps. AC or 1 Amp DC at the specified control voltages.
The spare auxiliary contacts shall also be wired up to the terminal blocks.

6.6 Bimetal Thermal Overload Relays

6.6.1 The contactor shall be provided with three pole bimetal thermal overload relays, unless
other-wise specified. The bimetal relays shall be of suitable range, ambient temperature
compensated and shall be separate mounting type. They shall be adjustable through
graduated scale and shall be provided with changeover contact. Thermal relays having
long time/current characteristics, operated through saturated C.T.s shall be supplied,
wherever required.
6.6.2 Bimetal thermal relays shall conform to IS: 3231 and IS/IEC 60947 and shall have built-
in single phasing preventor.
6.6.3 The bimetal relays shall be provided with a manual resetting device resetable after
opening module door. Auto reset thermal relays are not acceptable.

6.7 Current Transformers
6.7.1 The current transformers shall conform to IS: 2705.

6.7.2 C.T.s shall be Class F insulated and vacuum impregnated or resin cast. The C.T.s shall be rigidly mounted and shall be easily accessible for maintenance and testing.

6.7.3 The short time thermal withstand ratings of C.T.s shall be same as the thermal withstand rating of the breakers.

6.7.4 The C.T.s output shall be minimum 15VA for breaker feeders and 7.5 VA for the other feeders per phase and in any case, the output shall be adequate for the protection and metering duties involved with sufficient margin. The C.T.s shall have the following accuracies for the various applications:

<table>
<thead>
<tr>
<th>Application</th>
<th>Class of accuracy as per IS: 2705</th>
</tr>
</thead>
<tbody>
<tr>
<td>i) For metering service</td>
<td>- 1</td>
</tr>
<tr>
<td>ii) For use with protective relays</td>
<td>- 5P</td>
</tr>
<tr>
<td>iii) For use with restricted earth fault</td>
<td>- PS</td>
</tr>
</tbody>
</table>

6.7.5 The C.T. cores for metering and protection shall be separate.

6.7.6 The ratio of C.T.s shall be as specified in Feeder details.

6.7.7 All the C.T.s shall be provided with terminals and shorting links. One of the terminals of the C.T. shall be earthed. The polarity of the C.T.s shall be clearly marked.

6.7.8 Provision of Interposing C.T.s is not acceptable.

6.7.9 The C.T.s shall be capable of withstanding momentary open circuit on the secondary side without injurious effects.

6.8 Voltage Transformers

6.8.1 The V.T.s shall be Class F insulated and vacuum impregnated or resin cast conforming to IS: 3156.

6.8.2 The primary nominal voltage shall be equal to the system nominal voltage. The secondary terminal voltage shall be 110 V.

6.8.3 The primary and secondary winding shall be protected by HRC fuses in each phase except in the ground phase of the secondary side.

6.8.4 The V.T.s shall be mounted on separate withdrawable carriage. The accuracy Class of V.T.s shall be 1.

6.8.5 The rated output of each V.T. shall be adequate for the relays, meters and associated wiring connected to it and shall not be less than 50 VA per phase.

6.9 Control Transformers

These shall be air cooled Class F insulated and vacuum impregnated. The rating of control transformer shall be twice the hold on VA of all contactor/relays or 2.5 KVA whichever is high. It shall be free from hum and rigidly mounted. Epoxy cast transformers shall be preferred.

6.10 Transformers for Kondorffer Starting

These shall be three phase core type, Class F insulated and vacuum impregnated. Tapping at 90%, 80%, 70% & 60% shall be provided and terminals shall be brought out
for easy change of tapping at site. The operating temperature shall not exceed 80°C. The transformers shall be suitable for taking 7.5 times the specified full load current of the motor continuously for 120 secs.

6.11 Relays

6.11.1 All protective relays shall be of latest version, microprocessor based numerical type with communication port and interlinked with online energy management system. 100% redundancy shall be provided for communication.

6.12 Timers

The timers shall be electronic pneumatic or synchronous type with manual/auto reset features as per the functional requirements. The time delay shall be 'ON' delay or 'OFF' delay type as specified. The repeat accuracy shall be 0.5% or better.

6.13 Single Phasing Preventor

6.13.1 Single phasing preventor relay shall be of the current operated type, suitable for the system voltage. The relay shall not operate for normal system voltage but operate positively in the event of unbalanced voltage more than the normal. The relay shall not operate in case of total interruption of power.

6.13.2 The relay shall be fail safe, self reset type and provided with flag indication. The relay operation shall be independent of the motor rating, loading and speed.

6.14 Instruments and Meters

6.14.1 All instruments shall be flush mounting type with square face of 96 mm x 96 mm. They shall be tropicalized and dust tight.

6.14.2 Meters shall be digital multifunctional meters with communication port for energy management at remote location.

6.14.3 All ammeters and voltmeters, to be provided separately, shall have 0-90º scale and shall be moving iron spring controlled type of class 1.5 accuracy as per IS: 1248. The scale range of the ammeters and voltmeters shall be as indicated in the Feeder details.

6.14.4 In case of motor feeders, the ammeters shall be graduated uniformly upto C.T. primary current and with compressed end scale upto 6 times C.T. primary current. Red pointer shall be provided, which shall be adjusted at site for indicating full load current of the motor.

6.15 Push Buttons and Control Switches

6.15.1 The switches and push buttons shall conform to utilization category AC11/DC11 as per IS: 60947. The contact shall be rated to make, break and carry inductive current of 5 Amp at 415 V AC and 1 Amp at 220 V DC.

6.15.2 The control switches shall be spring return rotary type, unless otherwise specified and provided with pistol grip type handle. The control switches for circuit breakers shall be additionally fitted with lost motion devices and sequencing devices.

6.15.3 The selector switches shall be stay put rotary type and provided with oval shape handles.

6.15.4 The push buttons shall be of momentary contact spring loaded type with a set of normally close and open contacts. The push button for ‘Start’ shall be shrouded type and coloured green, stop push button shall be un-shrouded type and coloured red and other push buttons shall be un-shrouded type coloured black. The fixing ring shall be metallic white.
6.15.5 Emergency stop push buttons, if specified, shall be lockable in pushed position.

6.16 **Miniature Circuit Breakers**

6.16.1 The miniature circuit breakers shall conform to IS: 8828 and shall be of duty category M-9.

6.16.2 It shall be provided with overload and short circuit protective devices in a heat resistant housing.

6.16.3 A certificate for short circuit rating and Current-Time tripping curve shall be furnished along with the offer.

6.17 **Signal Lamps**

6.17.1 Signal lamps shall be provided to indicate the various circuit conditions as shown in scheme drawings. The colour of the lamps for various functions shall be as follows:

- Red -- Circuit breaker/switch/contactor closed.
- Green -- Circuit breaker/switch/contactor open.
- White -- Trip circuit healthy.
- Amber -- Alarm and auto trip.
- Blue -- Non-Trip

6.17.2 All lamps shall be of LED type with lumen output of 200 mili candela in axial direction.

7.0 **ACCESSORIES**

7.1 The supply shall include the following accessories:

- Maintenance truck/device for raising, lowering and withdrawal of circuit breaker, if required.
- Fuse puller.
- Test plug for relays.
- Test plug for kWh meters.

7.2 **Space Heater**

Each vertical section shall be provided with a thermostatically controlled space heater, rated for 240 V, 50 Hz and controlled through double pole miniature circuit breaker.

7.3 **Name Plates**

7.3.1 The switchboard shall have large name plate on the top indicating its Name, Designation and Code No.

7.3.2 Each feeder shall be provided with name plate. Each single front panel shall have name plate indicating panel number both in front and back.

7.3.3 All control switches, push buttons, lamps etc. shall have functional identification labels.

7.3.4 Name plate shall be of black Perspex with white engraving and of minimum 3mm thick.

7.4 Any other accessories required, but not specified, shall also be supplied to make the switchboard complete in all respects and ensure safe and proper operation.

8.0 **PAINTING**
8.1 The enclosure, after degreasing, pickling in acid, cold rinsing, phosphatising, passingivating etc. shall be painted with two coats of anti-rust paint followed by two coats of anticorrosive paint.

8.2 Epoxy based paint shall be used.

8.3 All paints shall be carefully selected to withstand tropical heat and extremes of weather. The paint shall not scale off, crinkle or be removed by abrasion due to normal handling.

8.4 Unless otherwise specified, the finishing shade shall be light grey having Shade No.631 as per IS: 5.

8.5 One litre of paint shall be supplied along with each board for touch up at site.

9.0 TESTS AND INSPECTION

9.1 All the switchboards shall be subjected to routine test as per IS: 8623 and their components as per relevant standards.

9.2 Additional tests, wherever specified, shall be carried out.

9.3 All the above tests shall be carried out in presence of Purchaser’s representative. In addition, the equipment shall be subjected to stage inspection during process of manufacture at works and site inspection.

9.4 These inspections shall however, not absolve the vendor from their responsibility for making good any defect which may be noticed subsequently.

10.0 DRAWINGS AND DOCUMENTS

10.1 Drawings and documents as per Annexure-I shall be supplied, unless otherwise specified.

10.2 All drawings and documents shall have the following description written boldly:

-- Name of Client
-- Name of Consultant
-- Enquiry / Order Number with Project / Plant Name
-- Code No. & Description

11.0 SPARES

11.1 Spares for operation and maintenance

Item wise unit prices of spare parts shall be quoted.

11.2 Commissioning Spares

Commissioning spares, as required, shall be supplied with the main equipment. Item wise list of recommended commissioning spares shall be furnished for approval.

11.3 Any other spare parts not specified, but required, shall also be quoted along with the offer.

11.4 All spare parts shall be identical to the parts used in the switch boards.

12.0 PACKING
12.1 The board shall be properly packed before despatch to avoid damage during transport, storage and handling.

12.2 The packing box shall contain a copy of the installation, operation and maintenance manual.

12.3 A sign to indicate the upright position of the panels to be placed during transport and storage shall be clearly marked. Also proper arrangement shall be provided to handle the equipment.

13.0 DEVIATIONS

13.1 Deviations, if any, from this standard shall be clearly indicated in the offer with reasoning.

ANNEXURE - I DOCUMENTATION FOR HIGH VOLTAGE SWITCHBOARDS
1.0 SCOPE

1.1 This standard covers the technical requirements of design, manufacture, testing at works and delivery in well-packed condition of High Voltage Switch Boards.

1.2 This standard shall be read in conjunction with relevant part of Design Philosophy – Electrical, Schematic diagrams etc.

2.0 STANDARDS TO BE FOLLOWED

2.1 The design, manufacture and testing of the equipment shall comply with the latest issues of the following standard, unless otherwise specified. Equipment complying with equivalent IEC standards shall also be acceptable.

IS: 3427 A.C. Metal enclosed switchgear and control gear for rated voltages above 1 kV up to and including 52 kV.

IS: 13118 Specification for high voltage alternating current circuit breakers.

IS: 11353 Guide for uniform system of marking and identification of conductors and apparatus terminals.

IS: 10118 Code of Practice for selection, installation and maintenance of switchgear and control gear.

Various components housed in the switchboards shall conform to the Indian Standards Specification as mentioned against the component details or IEC Specifications.

2.2 The design and operational features of all the equipment offered shall also comply with the provisions of the latest issue of the Indian Electricity Rules and other Statutory Acts and Regulations. The supplier shall, wherever necessary, make suitable modifications in the equipment to comply with the above.

2.3 Wherever any requirement, laid down in this standard, differs from that in Indian Standard Specifications / IEC Specification, the requirement specified herein shall prevail.

3.0 SERVICE CONDITIONS

3.1 Ambient Conditions

These shall be as indicated in Design Philosophy – Electrical.

3.2 System Details

These shall be as indicated in Design Philosophy – Electrical.

4.0 OPERATING REQUIREMENTS

The switchboards shall be suitable for operating at the specified rating continuously, with the specified voltage and frequency variations under the ambient conditions, without exceeding the permissible temperature rise and without any detrimental effect on any part.

5.0 DESIGN AND CONSTRUCTIONAL FEATURES

5.1 General

5.1.1 The switchboards shall consist of an assembly of a series of floor mounting, identical,
metal clad, cubicle type panels placed side by side to form a compact assembly and shall be extensible on either side.

5.1.2 The complete assembly shall be dust, damp and vermin proof having minimum degree of protection equivalent to IP4X as per IS/IEC:60529. However, in case some ventilation openings are to be provided, these may be permitted for equipment located indoors and such openings shall be covered by fine wire mesh ensuring minimum IP3X protection.

5.1.3 The framework of the cubicles shall be bolted / welded construction. The minimum thickness of sheet steel shall be 3 mm for base channel and 2 mm for other members. The doors and covers shall be fabricated from cold rolled sheet steel. Suitable reinforcement, wherever necessary, shall be provided.

5.1.4 The switchboard shall be mounted on the channel which shall be included in the vendor's scope.

5.1.5 Each cubicle shall be provided with front access door with handle lock and key for breaker compartment and a removable back cover. The door hinges shall be concealed type. Front doors of the panels shall mechanically stop in full open position to facilitate removal of breakers and for ease of maintenance.

5.1.6 All external hardwares shall be cadmium plated. The hardwares for fixing removable parts shall be provided with retaining devices.

5.1.7 The doors and the removable covers shall be provided with non-deteriorating neoprene gaskets. Gaskets without any discontinuity shall be preferred. Gaskets shall be held in position in groove, in shaped sheet steel work or these shall be U-type.

5.1.8 Each cubicle shall have separate compartment within the cubicle for circuit breaker, bus-bars, instrument transformers, metering and relaying devices and cable termination.

5.1.9 Inter-panel and inter-compartment fire resistant barrier shall be provided. Cast resin seal off bushing shall be provided in the bus compartment, through which connections to breaker compartment/cable compartment/bus compartment of adjacent panel shall be taken. Failure of one of the equipment shall not effect the equipment in the adjacent compartment.

5.1.10 All the components shall be accessible for inspection and maintenance without the necessity of removing the adjacent ones. Their mounting shall be accessible and ensure the necessary degree of safety.

5.1.11 The layout of the components inside the cubicle shall be liberal to facilitate maintenance and the interconnecting wiring between components shall not be subjected to undue stresses at the bends.

5.1.12 Mounting height of components requiring operation and maintenance shall not be lower than 300 mm and higher than 1800 mm.

5.1.13 All live parts which are accessible after opening of front and back door/cover shall be properly insulated or provided with insulating barrier to prevent accidental contact. Phase insulating barriers shall be provided between the breaker poles. Removal facility shall be provided for all such barriers.

5.1.14 Adequate arrangement for earthing shall be provided to safeguard the operator or other personnel from electric hazards under all conditions of operation.

5.1.15 The switchboard shall be provided with following interlocks and safety features:

i) The withdrawal and engagement of a circuit breaker shall not be possible unless it is in open position.

ii) The operation of a circuit breaker shall not be possible unless it is in fully service, test or isolated position.

iii) It shall not be possible to close the circuit breaker in service position unless all
auxiliary and control circuits are connected.

iv) A breaker of the lower rating shall be prevented from engaging with the stationary element of higher rating.

v) Insertion of the manual mechanism shall render the motorized mechanism inoperable.

vi) Circuit breaker “ON”, “OFF” indication shall be provided at the back of each panel.

vii) Caution name plate shall be provided at the back of incomer panels where terminals are likely to remain live and isolation is possible only from remote end.

viii) Automatic safety shutter, with padlocking facility for locking in closed position, to completely cover the spouts for bus-bars and cable connection when the breaker is withdrawn.

5.2 Bus-Bars and Connections

5.2.1 The bus-bars shall be for three phases. The bus-bars and connection shall be made of electrolytic grade copper of rectangular cross-section.

5.2.2 Bus-bars and connections shall be sleeved to protect against approach to live parts and to eliminate potential arcing points. Sleeving material shall have adequate electrical, thermal and mechanical properties to withstand impulse level, temperature rise during normal and short circuit condition and allow easy bending of bus bars.

5.2.3 The bus-bars shall be amply sized to carry the rated continuous current under the specified ambient temperature without exceeding the limits specified in IS: 8084. The thermal rating of the bus-bars shall be designed to withstand the system fault current for 3 seconds without exceeding the limiting temperature of 250°C for bare copper. Calculation for bus-bar sizing shall be furnished along with the offer.

5.2.4 Horizontal bus-bars shall run in a separate compartment through the entire length of the board and shall be of same cross-section throughout. Stepped bus-bars shall not be acceptable.

5.2.5 The bus-bars shall be arranged and colour coded according to IS: 5578 & IS: 11353.

5.2.6 The bus-bars chamber shall be sufficiently spacious and shall have separate screwed covers for maintenance purpose. It shall be adequately ventilated and shall allow the escape of the hot gases.

5.2.7 The bus-bars shall be rigidly supported at equal intervals to withstand the stresses due to full short circuit and also to take care of thermal expansion.

5.2.8 A minimum of two bolts shall be used per bus-bar joint. Only high tensile electro galvanized cadmium plated bolts, nuts and washers shall be used. The washers shall be spring and plain type. The bus-bar supports shall be of molded construction with built-in anti-tracking barriers. The support materials shall be of DMC or fiber glass reinforced thermosetting plastic.

5.2.9 The bus-bars, both horizontal and vertical, shall be PVC sleeved. Insulating shrouds shall be provided for all joints of insulated bus-bars.

5.3 Earth Bus

A continuous earth bus of Aluminium running along the lower part of the switchboard shall be provided with two end terminals with lugs for external connection. The earth bus shall be rated to carry three phase fault current for a period of 3 sec.

5.4 Bus Duct

5.4.1 Suitable extension of bus-bars in proper phase sequence on the top, with connecting
bolts shall be provided where connections between transformer and switchboard or between two halves of the switchboard is specified to be through bus duct.

5.4.2 Bus duct between two halves of the switchboard, if required, shall be supplied by the switchboard manufacturer. The bus-bars of interconnecting bus duct shall be similar to the main bus-bars of switchboard as specified above and shall conform to IS: 8084.

5.4.3 Bus duct between transformer and switchboard, if included in vendor’s scope shall conform to IS: 8084.

5.5 **Clearances and Creepage Distance**
The clearance and creepage distance shall be adequate to meet the BIL of the equipment.

5.6 **Insulation**

5.6.1 The insulation used shall be non-hygroscopic and shall be of porcelain, epoxy resins or fiber glass molded with plastic. It shall be of adequate electrical, mechanical and thermal strength to give trouble free service during normal operation and short circuit conditions.

5.6.2 The insulation shall be treated suitably to withstand the tropical conditions and atmospheric pollution.

5.7 **Control Wiring**

5.7.1 The switchboard shall be completely factory wired and ready for external connections.

5.7.2 The wiring shall be complete in all respect so as to ensure proper functioning of control, interlocking, protection, metering, indications and annunciations.

5.7.3 The wiring shall be carried out with flexible stranded PVC insulated copper conductor cables of 1100 Volt grade. The minimum size of wires shall be as follows:

- C.T. Circuit: 2.5 Sq. mm
- V.T. and Control Circuits: 1.5 Sq. mm

5.7.4 All wiring shall be provided with dependent both ends marking as per IS: 5578. Numbered ferrules, reading from the terminal outwards, shall be provided at both ends of all wiring for easy identification. These shall be interlocking type plastic ferrules.

5.7.5 Control wiring circuits, fed from a supply common to a number of panels, shall be so protected that failure of a circuit in one panel does not affect the operation of other panels.

5.7.6 The wiring to the equipment mounted on the doors shall be carried out with flexible multi-strand copper conductor cable and so supported that on opening of the door, there is no undue strain on wire leads.

5.7.7 The control cables shall be neatly arranged and properly supported.

5.8 **External Cable Termination**

5.8.1 All power and control cables shall enter the switchboard from the bottom on the back of the panel. Sufficient space shall be provided for ease of connection and termination of cables.

5.8.2 All power cables and control cables shall be of type, number and size as indicated in Feeder Details.

5.8.3 The termination arrangement for single core cables shall be such that so as to minimize flow of eddy current and heating due to eddy currents.

5.8.4 Heavy duty double compression type rolled Aluminium cable glands along with the cable lugs, as required shall be provided for termination of control cables and auxiliary
power supply cables.

5.8.5 The cable glands shall be mounted on a removable gland plate, provided at a minimum height of 75 mm from the bottom of the switchboard. Two number spare knockouts of size 20 mm shall also be provided on the gland plate for future use.

5.8.6 Terminal blocks shall be provided at suitable locations inside the panels for termination of control and auxiliary power supply wiring. These terminal blocks shall be pressure clamp type up to 35 sq. mm cables and bolted lug type for higher sizes of cables. These shall be protected type and rated for 1100 Volt service. The minimum current rating of the terminal block shall be 16 Amp.

5.8.7 Where more than two cables in parallel are required to be terminated, a system of bus links shall be provided with adequate clearance and spacing.

5.8.8 The terminal block shall be grouped according to circuit functions and numbered suitably. 20% extra terminals shall be provided in the terminal block.

5.8.9 Suitable clamps to support the vertical run of cables shall be provided.

5.8.10 For power connections, suitable marking on the terminals shall be provided to identify the phases.

5.9 **Feeder Details**

5.9.1 The requirements of incomer, bus coupler and outgoing feeders shall be as indicated in the single line diagram, feeder details and corresponding schematic diagrams.

5.9.2 Non-paralleling interlocks shall be provided between incomers and bus section panels. The interlocks shall be either electrical or mechanical type. Arrangement for defeating the interlock shall also be provided.

5.9.3 Auto changeover scheme, wherever specified, shall be provided.

5.10 **Dummy Panels**

Dummy panels complete with bus-bar system in 400 mm width shall be required for which unit price shall be indicated.

5.11 **Control Power Supply**

5.11.1 D.C. power required for closing, tripping and indication shall be supplied at the bus coupler panel through two completely separate circuits by the owner, one for tripping and another for closing and indication for the whole board.

5.11.2 For receiving each external control power supply, a double pole miniature circuit breaker shall be provided. This power shall be distributed inside the switchboard for each feeder having its MCB unit.

5.12 **Space Heater Power Supply**

5.12.1 Panel space heaters shall be fed from a separate bus, common for the whole board. This bus shall be fed from owner's supply for which a double pole MCB shall be provided in bus section panel.

5.12.2 Power supply for space heaters of motors shall be tapped from this bus by means of miniature circuit breakers located in the motor feeder panels. These MCB’s shall be of triple pole and rated for 15 Amp.

6.0 **COMPONENT DETAILS**

6.1 **Circuit Breakers**

6.1.1 The circuit breakers shall comply with the requirements of IS: 13118.
6.1.2 All circuit breakers shall be of 0-3 min-CO-3 min-CO rated operating sequence capable of carrying the specified current at the site conditions and making/breaking of the system fault current.

6.1.3 Type test certificates from an independent testing authority shall be furnished along with the offer for each circuit breaker rating and type.

6.1.4 The circuit breakers controlling motors shall be suitable for DOL starting and stopping induction motor a number of times and shall have provision to limit over voltage to the value safe for motor insulation. Unless otherwise specified this value shall be taken as 2.5 times the rated voltage. The magnitude of the voltage surge produced by the breaker when switching off the smallest motor shall be indicated.

6.1.5 The circuit breakers controlling capacitors shall be suitable for energizing and de-energizing the rated capacitor bank.

6.1.6 The circuit breakers shall be of the 3 phase, single/double break, horizontal draw-out, vertical/horizontal isolation type. The medium of arc quenching shall be minimum Oil/Bulk oil/vacuum/SF6 as specified elsewhere.

6.1.7 The circuit breakers shall be suitable for electrical/manual closing as specified in Feeder details. Electrically operated circuit breakers shall preferably have motor wound spring closing mechanism with provision for manual closing arrangement. Manually operated circuit breakers shall have independent manual spring closing mechanism. In all cases tripping shall be by means of shunt trip coil.

6.1.8 All circuit breaker units of the same rating shall be physically and electrically interchangeable.

6.1.9 The circuit breakers shall be electrically and mechanically trip free and provided with anti-pumping feature.

6.1.10 The circuit breakers shall have three positions, i.e. service, test and isolated with the cubicle door closed. Necessary stoppers shall be provided to prevent the excessive movement of the breaker cradle than desired for the position. Service and test positions of the breaker shall have monitoring switch having 1NO+1NC contacts.

6.1.11 The circuit breakers shall be provided with emergency manual trip device, mechanical ‘ON’, ‘OFF’, ‘ISOLATED’ position and spring ‘CHARGED’, ‘DISCHARGED’ indicators and operation counter.

6.1.12 A maintenance truck/device, if required, for raising, lowering and withdrawals of the circuit breaker shall be supplied for each switchboard.

6.1.13 The arc interrupting devices shall be capable of interrupting satisfactorily current from zero to the rated interrupting current when used on predominantly capacitive or inductive circuits, without requiring excessive maintenance of the contacts. The arc shall be restricted within the interrupting chamber and no emission of flame shall be allowed which may cause electrical breakdown or damage to insulation on the apparatus.

6.1.14 Mechanical safety interlock shall be provided for safe operating and movement of the breaker.

6.1.15 The circuit breakers shall be provided with minimum of four normally open and four normally closed auxiliary switch contacts, over and above those required for its own control scheme, for owner’s use. These contacts shall be wired separately to the terminal board.

6.1.16 The closing coil and other associated auxiliary relays shall operate satisfactorily at all voltages between 85% and 110% of the rated control voltage. The tripping coil and other associated relays shall operate satisfactorily at all voltages between 70% and 110% of the rated control voltage.
6.1.17 Cable earthing facility shall be provided in the circuit breaker for discharging of power cable through the circuit breaker contact with circuit breaker in drawn-out position. An integral earthing arrangement shall be preferred. In case the integral earthing arrangement is not feasible due to circuit breaker design, a separate earthing truck, which shall be inserted in place of circuit breaker, shall be provided per board.

6.1.18 Positive earthing of circuit breaker frame shall be maintained at every position of circuit breaker. The earthing contact shall be line/scraping type and not of point type.

6.2 Current Transformers

6.2.1 The current transformers shall conform to IS: 2705.

6.2.2 C.T.s shall be class F insulated and vacuum impregnated or resin cast type. The C.T.s shall be rigidly mounted and shall be easily accessible for maintenance and testing.

6.2.3 The short time thermal withstand ratings of the C.T.s shall be same as the thermal withstand ratings of the breakers.

6.2.4 The C.T.s output shall be minimum 15 VA per phase and in any case, the output shall be adequate for the protection and metering duties involved with sufficient margin. The C.T.s shall have the following accuracies for the various applications:

<table>
<thead>
<tr>
<th>Application</th>
<th>Class of Accuracy as per IS: 2705</th>
</tr>
</thead>
<tbody>
<tr>
<td>i) For metering service</td>
<td>1</td>
</tr>
<tr>
<td>ii) For use with protective relays</td>
<td>5 P</td>
</tr>
<tr>
<td>iii) For use with restricted earth fault and differential relays</td>
<td>PS</td>
</tr>
</tbody>
</table>

6.2.5 The C.T. cores for metering and protection shall be separate.

6.2.6 The ratios of the current transformers shall be as indicated in Feeder details.

6.2.7 All the C.T.s shall be provided with terminals and shorting links. One of the terminals of the C.T. shall be earthed. The polarity of the C.T. shall be clearly marked.

6.2.8 Provision of interposing C.T. is not acceptable.

6.2.9 The C.T.s shall be capable of withstanding momentary open-circuit on the secondary side without injurious effects.

6.3 Voltage Transformers

6.3.1 The V.T.s shall be class F insulated and vacuum impregnated or resin cast type conforming to IS: 3156.

6.3.2 The primary nominal voltage shall be equal to the system nominal voltage. The secondary terminal voltage shall be $110 / \sqrt{3}$ V.

6.3.3 The rated output of each VT shall be adequate for the relays, meters and associated wiring connected to it with sufficient margin and shall not be less than 200 VA per phase.

6.3.4 The accuracy class of V.T.s shall be 1 as per IS: 3156.

6.3.5 The primary and secondary winding shall be protected by HRC fuses in each phase except in the grounded phase of the secondary side.

6.3.6 The V.T. shall be mounted on a with-drawable carriage. Shutters with padlocking facility, provided on high voltage sides, shall be so arranged that the live orifices are automatically closed when the V.T. is withdrawn.

6.3.7 Mechanical interlocking arrangement shall be provided so that the access to the high voltage fuse is possible only when the V.T. is fully withdrawn.
6.4 Relays
6.4.1 All protective relays shall be of latest version, microprocessor based numerical type with communication port and interlinked with online energy management system. 100% redundancy shall be provided for communication.

6.5 Timers
6.5.1 The timers shall be electronic, pneumatic or synchronous type with manual/auto reset features as per the functional requirements. The timers shall be ‘ON’ delay or ‘OFF’ delay type as specified. The repeat accuracy shall be 0.5% or better.

6.6 Instruments and Meters
6.6.1 All instruments shall be flush mounting type with square face of 96 mm x 96 mm. They shall be tropicalized and dust tight.
6.6.2 Meters shall be digital multifunctional meters with communication port for energy management at remote location.
6.6.3 All ammeters and voltmeters, to be provided separately, shall have 0-90° scale and shall be moving iron spring controlled type of class 1.5 accuracy as per IS: 1248. The scale range of the ammeters and voltmeters shall be as indicated in the Feeder details.
6.6.4 In case of motor feeders, the ammeters shall be graduated uniformly upto C.T. primary current and with compressed end scale upto 6 times C.T. primary current. Red pointer shall be provided, which shall be adjusted at site for indicating full load current of the motor.

6.7 Push Buttons and Control Switches
6.7.1 The switches and push buttons shall conform to utilization category AC11/DC11 as per IS/IEC:60947. The contact shall be rated to make, break and carry inductive current of 5 Amps. at 415 V AC and 1 Amp. at 220 V DC.
6.7.2 The control switches shall be spring return rotary type, unless otherwise specified and provided with Pistol grip type handle. The control switches for circuit breakers shall be additionally fitted with lost motion devices and sequencing devices, if required.
6.7.3 The selector switches shall be stay put rotary type and provided with oval shape handles.
6.7.4 The push buttons shall be of momentary contact spring loaded type with a set of normally close and open contacts. The start push button shall be shrouded type and coloured green. The stop push button shall be un-shrouded type and coloured red and other push buttons shall be un-shrouded type and coloured black. The fixing ring shall be metallic white.
6.7.5 Emergency stop push buttons, if specified, shall be lockable in pushed position.

6.8 Control Fuses
6.8.1 The fuses shall be non-deteriorating HRC cartridge link type and shall conform to IS: 13703. They shall be suitable for load and service required in the circuit.
6.8.2 One fuse puller shall be supplied along with each board.

6.9 Miniature Circuit Breakers
6.9.1 The miniature circuit breakers shall conform to IS: 8828 and shall be of duty category M-9.
6.9.2 It shall be provided with overload and short circuit protective devices in a heat resistant housing.
6.9.3 Type test certificate for short circuit rating and current time tripping curve shall be
furnished along with the offer.

6.10 **Signal Lamps**

6.10.1 Signal lamps shall be provided to indicate the various circuit conditions as shown in scheme drawings. The colour of the lamps for various functions shall be as follow:

- **Red** - Circuit breaker ‘ON’
- **Green** - Circuit breaker ‘OFF’
- **White** - Trip circuit healthy
- **Amber** - Alarm and auto trip
- **Blue** - Non-Trip

6.10.2 The lamps shall LED type with lumen output of 200 millicandella in axial direction.

7.0 **ACCESSORIES**

7.1 The supply shall include the following accessories.

- Maintenance truck/device for raising, lowering and withdrawal of circuit breaker, if required.
- Earthing truck, in case the integral earthing arrangement is not feasible in the circuit breaker.
- Fuse puller.
- Test plug for relays.
- Test plug for kWh meters.
- Special tools and tackles, as required.

7.2 **Space Heater**

7.2.1 Each panel shall be provided with a thermostatically controlled space heater, rated for 240 V, 50 Hz and controlled through double pole miniature circuit breaker.

7.3 **Name Plates**

7.3.1 The switchboard shall have large name plate on the top to indicate its name and designation.

7.3.2 Each panel shall be provided with name plate both in front and back.

7.3.3 All control switches, push buttons, lamps etc. shall have functional identification labels.

7.3.4 Name plate shall be of black Perspex with white engraving and of minimum 3 mm thick.

7.4 Any other accessories required, but not specified, shall also be supplied to make the switchboard complete in all respects and ensure safe and proper operation.

8.0 **PAINTING**

8.1 The enclosure, after degreasing, pickling in acid, cold rinsing, phosphatising, passivating etc. shall be painted with two coats of anti-rust paint followed by two coats of anti-corrosive paint.

8.2 Epoxy based paint shall be used.

8.3 All paints shall be carefully selected to withstand tropical heat and extremes of weather. The paint shall not scale off, crinkle or be removed by abrasion due to normal handling.

8.4 Unless otherwise specified, the finishing shade shall be light grey having shade No.631 as per IS: 5.

8.5 One litre of paint shall be supplied along with each board for touch up at site.
9.0 TESTS AND INSPECTION

9.1 All the switchboards shall be subjected to routine test as per IS: 3427 and their components as per relevant standards.

9.2 Additional tests, wherever specified, shall be carried out.

9.3 All the above tests shall be carried out in presence of purchaser's representative. In addition, the equipment shall be subjected to stage inspection during process of manufacture at works and site inspection.

9.4 These inspection shall, however, not absolve the vendor from his responsibility for making good any defect which shall be noticed subsequently.

10.0 DRAWINGS AND DOCUMENTS

10.1 Drawings and documents as per Annexure-I shall be supplied, unless otherwise specified.

10.2 All drawings and documents shall have the following description written boldly.
   - Name of client
   - Name of consultant
   - Enquiry / Order Number with plant / project name
   - Code No. and Description

11.0 SPARES

11.1 Spares for operation and maintenance
   Item wise unit prices of spare parts shall be quoted.

11.2 Commissioning Spares
   Commissioning Spares, as required, shall be supplied with the main equipment. Item wise list of recommended commissioning spares shall be furnished for approval.

11.3 Any other spare parts not specified, but required, shall also be quoted along with the offer.

11.4 All spare parts shall be identical to the parts used in the equipments.

12.0 PACKING

12.1 The switchboard shall be properly packed before dispatch to avoid damage during transport, storage and handling.

12.2 The packing box shall contain a copy of the installation, operation and maintenance manual.

12.3 A sign to indicate the upright position of the panels to be placed during transport and storage shall be clearly marked. Also proper arrangement shall be provided to handle the equipment.

13.0 DEVIATIONS

13.1 Deviations, if any, from this standard shall be clearly indicated in the offer with reasoning.
## ANNEXURE - I

</tbody>
</table>
1.0 SCOPE

1.1 This standard covers the technical requirements of design, manufacture testing at works and despatch in well packed condition of bus duct.

1.2 This standard shall be read in conjunction with relevant part of Design Philosophy - Electrical.

2.0 STANDARDS TO BE FOLLOWED

2.1 The design, manufacture and testing of the equipment covered by this standard shall comply with the latest issue of following Indian Standards unless otherwise specified. Equipment complying with equivalent IEC standards shall also be acceptable.

- IS: 8084 - Interconnecting bus-bars for A.C. Voltage above 1 KV up to and including 36 KV.
- IS: 8623 - Specification for low voltage switchgear and control gear assemblies.

2.2 The design and operational features of all the equipment offered shall also comply with the provisions of the latest issue of the Indian Electricity Rules and other relevant Statutory Acts and Regulations. The supplier shall wherever necessary, make suitable modifications in the equipment to comply with the above.

2.3 Wherever any requirement, laid down in this standard differs from those in Indian Standard Specifications, the requirement specified herein shall prevail.

3.0 SERVICE CONDITIONS

3.1 Ambient conditions

These shall be as indicated in Design Philosophy - Electrical.

3.2 System Details

These shall be as indicated in Design Philosophy - Electrical.

4.0 OPERATING REQUIREMENTS

The bus duct shall be suitable for operating at the rated capacity continuously under the ambient conditions and with the voltage and frequency variations without exceeding the permissible temperature rise and without any detrimental effect on any part.

5.0 GENERAL DESIGN AND CONSTRUCTIONAL FEATURES

5.1 Enclosures

5.1.1 The sheet steel enclosure for enclosing and supporting the bus-bars shall be made out of 14 SWG sheet steel, bolted on the angle iron framework.

5.1.2 The enclosure shall completely enclose the bus bars from all sides. It shall have degree of protection IP: 52 for indoor installation and IP: 55 with rain protection canopy for outdoor installation as per IS/IEC:60947. Where part of the bus duct is required for indoor installation and part for outdoor installation, the complete section shall be suitable for outdoor installation. Ventilation louvers, if necessary, shall be provided with fine wire mesh from inside, in that case the degree of protection shall be IP: 42. Neoprene gasket shall be provided on covers at joints.
5.1.3 Whether bus duct (with louvers) is installed outdoor or indoor, suitably rated space heater with thermostat control shall be provided at different locations inside the bus duct to avoid moisture condensation.

5.1.4 All external hardwares of diameter less than 8 mm shall be stainless steel and those of diameter 8 mm and above shall be mild steel cadmium plated or zinc passivated.

5.2 **Bus Bars and Connections**

5.2.1 The bus-bars in LV Bus duct shall be of three phase and neutral, non-segregated and air insulated type.

The bus-bars in HV Bus duct shall be of three phase, phase-segregated with insulating material.

5.2.2 The bus bars shall be amply sized to carry the rated continuous current under the specified ambient temperature without exceeding the temperature limits specified in IS: 8084. The bus bars shall be designed to withstand the system fault current for one second without exceeding the total temperature of 200°C. Type test certificate of similar bus duct shall be furnished.

5.2.3 The bus-bars material shall be high conductivity Aluminium alloy conforming to grade E91E of IS: 5082/electrolytic grade copper.

5.2.4 The bus-bars shall be rectangular in shape and cross-sectional area of neutral bus-bars shall be half of phase bus-bars.

5.2.5 The sizes of bus-bars selected shall be subjected to approval by PDIL. The vendor shall furnish supporting calculations for bus-bars and enclosure sizes both under normal load and short circuit conditions as well as that of temperature rise along with the offer.

5.2.6 All the bus-bars shall be bare and without any painting. The bus-bars shall be arranged and provided with proper phase identification as per IS: 5578/11353.

5.3 **Joints and Bends**

5.3.1 Only lap joints shall be used for jointing the bus bars. The over lap shall be equal to the width of the bus bars.

5.3.2 The contact surfaces of the overlapping bus-bars shall be thoroughly cleaned followed by application of good quality electrical grease and bolted immediately. In case of Aluminium to copper joints, copper bus-bars in addition shall be preferably tinned.

5.3.3 The bolting schedule adopted shall ensure proper contact pressure. A minimum of two bolts shall be used per joint.

5.3.4 The contact pressure shall be 100-140 kg/cm². Only high tensile, zinc passivated or galvanized steel bolts shall be used along with large diameter flat washers of adequate thickness.

5.3.5 At the bends, the bus-bars shall bend at a radius of 2t where the ‘t’ is the thickness of the bus-bars and the radius is measured to the inside of bus-bars.

5.4 **Flexible Joints**

Flexible joints and connections shall consist of tinned laminated copper strips or Aluminium strips of required cross sectional area. Precautions as mentioned under 5.3.2 shall also be observed while marking joints with laminated copper plates. Filler plates of Aluminium as required shall be used.

5.5 **Expansion Joints**

Expansion joints, where necessary, to allow for longitudinal expansion and contraction of bus-bars and bus enclosures caused by temperature variation shall be provided.

5.6 **Bus Bar Supports**
5.6.1 The bus-bars shall be rigidly supported at equal intervals. The bus-bars supports shall be such that they withstand stresses to which they may be subjected under normal and short circuit conditions.

5.6.2 The supports shall be of moulded construction of fibre glass reinforced with thermosetting plastics or superior materials. The supports, where necessary, shall either have built-in anti-tracking barriers or painted with anti-tracking varnishes.

5.7 Clearances and Creepage Distance

5.7.1 The clearances and creepage distance shall not be lower than the values specified below for any part of the bus duct.

i) Minimum clearance between two live parts - 25 mm

ii) Minimum clearance between a live part and accidentally dangerous part - 25 mm

iii) Creepage distance - 30 mm

5.7.2 The clearances and creepage distance, as specified above, shall definitely be maintained throughout the bus bars system. Provision of bus-bar separators or barriers shall not be considered to reduce the clearances from the values specified above.

5.8 Terminal Chambers at Switchgear and Transformer End

5.8.1 The bus duct shall be suitable for bolting to the flanges provided at the transformer and switchgear end. The exact dimensions and details of these terminal chambers shall be made available at the time of execution.

5.8.2 Phase changeover arrangement wherever required shall be provided in one of the terminal chambers to connect the bus-bars between same phase terminals at switchgear and transformer ends.

6.0 ACCESSORIES

6.1 Earthing
Two continuous earth strips of Aluminium having minimum 300 sq. mm size shall be provided throughout the length of bus duct or shall be suitable for full short circuit fault current for 1 sec. whichever is more.

6.2 Drain Plug
Bus duct shall be provided with drain plug to remove condensed moisture when required.

6.3 Fire Barriers
Two sets of epoxy moulded fire barriers shall be provided on switchgear end as well as transformer end.

6.4 Name Plates
6.4.1 Each bus duct shall be provided with a name plate of stainless steel with letter embossed on them and located at convenient location.

6.4.2 The name plate shall contain all details as per IS: 8084.

6.5 Hardware
Required number of hardwares like bolts, nuts, plain washers, spring washers etc. shall be provided for jointing the bus duct with transformer as well as switchgears.

7.0 LAYOUT

7.1 The proposed bus duct routing between transformer and associated switchgear shall be as shown in the drawing enclosed with NIT. Where no layout drawing is enclosed, the schedule of quantities shall be followed for bidding. However, the exact routing and
details of switchgear and transformer end chambers shall be supplied at the time of order or drawing approval.

7.2 The successful vendor shall prepare final layout drawing for each bus duct with bill of materials and submit the same for PDIL/Purchaser’s approval.

8.0 PAINTING

8.1 The enclosure after degreasing, pickling in acid, rinsing, phosphatising, passivating etc. shall be painted with two coats of anti-rust paint followed by two coats of anticorrosive paint.

8.2 Epoxy based paint shall be used.

8.3 All paints shall be carefully selected to withstand tropical heat and extremes of weather. The paint shall not scale off, crinkle or be removed by abrasion due to normal handling.

8.4 Unless otherwise specified, the finishing shade shall be light grey having shade no. 631 as per IS: 5.

9.0 TESTS AND INSPECTION

9.1 The bus duct shall be subjected to routine tests as per relevant standard.

9.2 Wherever specified, temperature rise tests shall be carried out on a minimum 5 metre length bus duct of each rating.

9.3 The test shall be carried out in manufacturer’s works in presence of purchaser’s representative. In addition, the bus ducts shall be subjected to stage inspection at works and inspection at site for final acceptance.

9.4 These inspections shall, however, not absolve the vendor from his responsibility of making good any defect which may be noticed subsequently.

10.0 DRAWINGS AND DOCUMENTS

10.1 Drawings and documents as per Annexure - I shall be supplied, unless otherwise specified.

10.2 All drawings and documents shall have the following descriptions written boldly
- Name of client
- Name of consultant
- Enquiry / Order Number with plant / project name
- Code No. and Description

11.0 SPARES

11.1 Spares for operation and maintenance
Item wise unit prices of spare parts shall be quoted.

11.2 Commissioning Spares
Commissioning spares, as required, shall be supplied with the main equipment. Item wise list of recommended commissioning spares shall be furnished for approval.

11.3 Any other spare parts not specified, but required, shall also be quoted along with the offer.

11.4 All spare parts shall be identical to the parts used in the equipment.
12.0 PACKING

12.1 The bus duct shall be properly packed before despatch to avoid damage during transport, storage and handling. It shall be wrapped in polythene bags to make it waterproof. An additional wrapping with bitumen paper shall also be provided to make it completely waterproof before the equipment is packed in wooden crates.

12.2 The packing box shall contain a copy of the installation, operation and maintenance manual.

13.0 DEVIATIONS

13.1 Deviations, if any, from this standard shall be clearly indicated in the offer with reasoning.

</table>
1.0 SCOPE

1.1 This standard covers the technical requirements of design, manufacture, testing at works and delivery in well-packed condition of Sheet Steel Distribution Boards.

1.2 This standard shall be read in conjunction with relevant part of Design Philosophy – Electrical.

2.0 STANDARDS TO BE FOLLOWED

2.1 The design, manufacture and testing of the equipment shall comply with the latest issue of the following Indian Standards, unless otherwise specified. Equipment complying with equivalent IEC standards shall also be acceptable.

- IS: 8623 - Specification for low voltage switchgear and control gear assemblies.
- IS/IEC:60947 - Specification for Low-voltage Switchgear and Control gear
- IS: 10118 - Code of practice for selection, installation and maintenance of switchgear and control gear.

Various components housed in the distribution board shall conform to the Indian Standard Specification as mentioned against the component details.

2.2 The design and operational features of the equipment offered shall also comply with the provisions of the latest issue of the Indian Electricity Rules and other Statutory Acts and Regulations. The supplier shall, wherever necessary, make suitable modifications in the equipment to comply with the above.

2.3 Wherever any requirement, laid down in this standard, differs from that in Indian Standard Specification the requirement specified herein shall prevail.

3.0 SERVICE CONDITIONS

3.1 Ambient Conditions
These shall be as indicated in Design Philosophy – Electrical.

3.2 System Details
These shall be as indicated in Design Philosophy – Electrical.

4.0 OPERATING REQUIREMENTS

The distribution board shall be suitable for operating at the specified rating continuously with the specified voltage and frequency variations under the ambient conditions, without exceeding the permissible temperature rise and without any detrimental effect on any part.

5.0 DESIGN AND CONSTRUCTIONAL FEATURES

5.1 General

5.1.1 The distribution board shall consist of an assembly of a series of floor mounting, identical, metal clad, dead front type panels of unitized design. The panels shall be placed side by side to form a compact assembly and shall be extensible on either side.

5.1.2 The complete assembly shall be dust, damp and vermin proof having minimum degree of protection equivalent to IP-52 as per IS/IEC:60947.

5.1.3 The frame work of the cubicles shall be of bolted/welded construction. The minimum thickness of steel shall be 2 mm for load bearing members, 1.6 mm for non-load bearing
members and 3 mm for base channel. The doors and covers shall be fabricated from cold rolled sheet steel. Suitable reinforcement, wherever necessary, shall be provided.

5.1.4 The door hinges shall be concealed type.

5.1.5 All external hardware shall be cadmium plated/zinc passivated. The hardware for fixing the removable parts shall be provided with retaining devices.

5.1.6 The doors and the removable covers shall be provided with non-deteriorating neoprene gaskets. Gaskets without any discontinuity shall be preferred. Gaskets shall be held in position in groove of shaped sheet steel work or these shall be of U type. Adhesive cement, if used, shall be of good quality so that the gaskets do not come off during service.

5.1.7 All the components shall be accessible for inspection and maintenance without the necessity for removal of the adjacent ones. In case of single front design all components shall be accessible from the front for maintenance and back opening doors/openable covers for maintenance shall not be acceptable.

5.1.8 The layout of the components inside a module shall be liberal to facilitate maintenance and the interconnection of wiring between the components shall not be subjected to any undue stress at the bends.

5.1.9 Mounting height of components requiring operation and observation shall not be lower than 300 mm and higher than 1800 mm.

5.1.10 Inter panel barriers shall be provided.

5.1.11 Adequate arrangement for earthing shall be provided to safeguard the operator or other personnel from electric hazards under all conditions of operation.

5.2 Panel Arrangement

5.2.1 The distribution board shall be non-drawout type in single front configuration.

5.2.2 Each Panel shall have its horizontal bus-bar chamber running on the top with multi-tier module units in the centre and having vertical bus-bar chamber and cable alley on either side.

5.2.3 The modules shall be enclosed on all sides and shall be so arranged that larger ones are placed at the bottom portion of the panel. Fixed type modules shall be at least 300 mm from the base channel.

5.2.4 The number of modules in the panel shall not exceed six for motor starter feeders and eight for switch fuse/MCB/MCCB feeders. The minimum size of module shall be 300 mm and 200 mm for starter and switch fuse feeders. The incomer and bus coupler module sizes for ratings up to 400 A shall be half the panel size. For higher ratings they shall be housed in single panel.

5.2.5 The module door shall be so interlocked that it shall not be possible to open the door with switch in closed position. Defeat interlock facility shall be provided.

5.2.6 The relay, meters, switches and lamps shall be flush mounted. All components of one module shall be mounted on the same module on a rigid sheet steel chassis. A 20 mm dia. rotating knob on the door shall be provided for closing and opening.

5.3 Bus Bars and Connections
5.3.1 The bus-bar shall be suitable for the supply system. The bus-bar and connections shall be made of electrolytic copper or high conductivity aluminium alloy conforming to Grade E91E of IS: 5082.

5.3.2 The bus-bar shall be amply sized to carry the rated continuous current under the specified ambient temperature without exceeding the temperature of 90ºC. The bus-bars shall also be designed to withstand the system fault current for 1 second without exceeding the temperature of 200ºC for bare aluminium and 250ºC for bare copper. The minimum acceptable size of bus-bars shall be 250 sq. mm (Al). Calculation for the bus-bar sizing shall be furnished along with the offer.

5.3.3 In case of double front arrangement of distribution boards, different sets of vertical bus-bars shall be provided. The vertical bus-bars shall be PVC sleeved or shrouded by insulating barriers which shall have cut-outs to permit entry of power wires. It shall be possible to remove the shroud for inspection and maintenance. Neutral-bars shall be provided in this chamber.

5.3.4 Horizontal bus-bars shall be of same cross-section throughout. Stepped bus-bars shall not be acceptable.

5.3.5 All bus-bars shall be arranged and colours coded according to IS: 5578/11353.

5.3.6 The horizontal bus-bar shall run in a separate bus chamber located at the top shall have separate screwed cover for inspection purpose.

5.3.7 The bus-bars shall be rigidly supported at equal intervals to withstand maximum short circuit stresses. The supports shall be of moulded construction with built in anti tracking barriers. The support material shall be of fibre glass reinforced thermosetting plastic.

5.3.8 All joints shall be suitably treated to avoid oxidation of contact surfaces and bimetallic corrosion. A minimum of two bolts with spring washers shall be used for horizontal bus-bar joints.

5.3.9 Horizontal bus bars shall be insulated with heat shrinkable PVC sleeves of reputed makes. Insulating shrouds shall be provided for all joints of insulated bus-bars.

5.4 Clearance and Creepage Distances

5.4.1 The clearance and creepage distances shall not be lower than the values specified below:

i) Minimum clearance between two live conductors -- 20 mm

ii) Minimum clearance between live part and accidentally dangerous part -- 20 mm

iii) Minimum creepage distance -- 28 mm

5.4.2 The clearances and the creepage, as specified above, shall definitely be maintained in the bus-bar system. Provision of bus-bar insulations, separator or barriers shall not be considered to reduce the clearance from the values specified above.

5.4.3 At the termination points in the equipment, e.g. switches, contactors, thermal relays, etc. it is realized that above clearance shall not always be possible to be maintained. All such points where above clearance are not possible to be maintained shall, therefore, be insulated or taped.

5.5 Insulation

5.5.1 The insulation used shall be non-hygroscopic and shall be of porcelain, Epoxy- resins or fibre glass moulded with plastic. It shall be of adequate electrical and mechanical strength to give trouble free service during normal operation and short circuit conditions.

5.5.2 The insulation shall be treated suitably to withstand the tropical conditions and atmospheric pollution.
5.6 **Power Wiring**

5.6.1 The connections from bus-bar including neutral to individual units on the modules shall consist of PVC insulated flexible copper cable or tapped copper strip.

5.6.2 The power wiring size shall be decided based on the rating of the switch, after using a rating factor of not more than 50% over the current rating in free air. In any case the minimum size of power wiring shall not be less than 4 sq. mm copper.

5.6.3 The size of connection from incomer to horizontal bus-bar and from horizontal bus-bar to bus coupler shall not be less than the size adopted for horizontal bus-bar.

5.7 **Control Wiring**

5.7.1 The switch board shall be completely factory wired and ready for external connections.

5.7.2 The wiring shall be carried out with flexible stranded PVC insulated copper conductor cables of 1100 Volt grade. The size of wires shall be as follows:

- C.T. Circuit -- 2.5 sq. mm
- V.T. and Control Circuits -- 1.5 sq. mm

5.7.3 All wiring shall be provided with dependent both end marking as per IS: 5578. Numbered ferrules, reading from the terminals outwards, shall be provided at both ends of all wiring for easy identification. These shall be interlocking type plastic ferrules.

5.7.4 Control wiring circuits, fed from a supply common to a number of feeders, shall be so protected that failure of a circuit in one feeder does not affect the operation of the other feeders.

5.7.5 The wiring to the equipment mounted on the doors shall be carried out with flexible multi strand copper conductor cable and supported so that opening of the door, there is no undue strain on wire leads.

5.7.6 The control cables shall be neatly arranged and properly supported.

5.8 **External Cable Termination**

5.8.1 All power and control cables shall enter the distribution board from the bottom. Sufficient space shall be provided for ease of connection and termination of cables.

5.8.2 All cables shall be of 1.1 KV grade PVC insulated armoured and PVC sheathed except for single core cable which shall be unarmoured. The number and sizes of cable shall be as indicated in Feeder details.

5.8.3 Compression type cable glands along with the cable lugs as required shall be provided for termination of cables.

5.8.4 The cable glands shall be of rolled Aluminium heavy duty double compression type and shall be mounted on a removable gland plate, provided at a minimum height of 75 mm from the bottom of the distribution board. Two numbers spare knockouts of size 20 mm shall also be provided on the gland plates for future use.

5.8.5 For all power cables crimped type aluminium lugs for aluminium cables and tinned copper lugs for copper cables shall be provided.

5.8.6 The terminal blocks shall be pressure clamp type up to 35 sq. mm cable and bolted lug type for higher sizes of cables. These shall be protected type and rated for 1100 Volts service. The minimum current rating of terminal block shall be 16 Amp. The construction shall be such that after the connection of cables by means of lugs, necessary clearance and creepage distance are available.

5.8.7 Where more than two cables in parallel are required to be terminated, a system of bus links shall be provided with adequate clearance and spacing.
5.8.8 Suitable clamps to support the vertical run of cables shall be provided.

5.8.9 The terminal block shall be grouped according to circuit functions and suitably numbered. 20% extra terminals shall be provided in the terminal block.

5.8.10 For power connections, suitable marking on the terminals shall be provided to identify the phases.

5.9 **Feeder Details**

5.9.1 The requirements of incomer, bus coupler and outgoing feeders shall be as indicated in the single line diagram, feeder details and corresponding schematic diagram.

5.9.2 The bus coupler shall be so located that it is possible to maintain half of the bus-bars while the other half is still alive. Complete segregation of bus-bar connections to bus coupler shall be provided.

5.9.3 Castle key type mechanical interlocks shall be provided between incomers and bus section modules to avoid paralleling of incomers. In addition padlocking facilities shall be provided in OFF position.

5.9.4 Single phase loads shall be distributed as far as possible on all the three phases.

6.0 **COMPONENT DETAILS**

The components shall conform to type of co-ordination C as per IS/IEC:60947. Makes of all components shall be subject to owner’s / consultant’s approval

6.1 **Moulded Case Circuit Breakers**

6.1.1 The circuit breaker shall conform to IS/IEC:60947 and shall be of P2 category having rupturing capacity as per system requirement.

6.1.2 The circuit breaker shall be provided with spring assisted quick make quick break type manually operated trip free mechanism, mechanical ON/OFF position indicators, thermal tripping devices of inverse characteristics, instantaneous short circuit tripping devices and necessary auxiliary and alarm switches. The MCCB cubicle shall be provided with service, test and isolated position and automatic safety shutter.

6.1.3 The thermal and short circuit tripping device shall be adjustable type.

6.1.4 When used for motor circuit shunt trip devices shall be provided and the let through power of controlling MCCB shall be lower than the respective contactor.

6.1.5 In addition, under voltage trip shall be provided, if specified.

6.2 **Switches**

6.2.1 The switches shall be Motor duty type AC23 category and shall comply with the requirements laid down in IS/IEC:60947. Switches up to 63 Amps shall be rotary type and those of 100 Amp and above shall be link type.

6.2.2 ‘ON’ and ‘OFF’ positions of the switches shall be indicated on the panel. Provision shall be made to lock the switch in the ‘OFF’ position.

6.2.3 The fixed contacts shall be shrouded and the contacts shall be silver plated.

6.2.4 Two Pole switches shall also isolate the neutral circuit along with phase circuit.

6.3 **Fuses**

The fuses shall be of non-deteriorating HRC cartridge link type and conform to IS: 13703. They shall be suitable for the load and the service required in the circuit.

6.4 **Air Break Contactors**
6.4.1 The Air Break Contactor shall be of AC3 category unless otherwise specified, conforming to IS/IEC:60947 and flapper type. Gravity operated contactors are not acceptable.

6.4.2 The dropout voltage shall not exceed 65% of rated voltage.

6.4.3 Each contactor shall be provided with auxiliary contacts as required. The rating of the auxiliary contacts shall be 5 Amps. AC or 1 Amp DC at the specified control voltages. The spare auxiliary contacts shall also be wired terminal block.

6.5 **Bimetal Thermal Overload Relays**

6.5.1 The contactor shall be provided with three pole bimetal thermal overload relays unless otherwise specified. The bimetal relays shall be of suitable range, ambient temperature compensated and shall be separate mounting type. They shall be adjustable through graduated scale and shall be provided with changeover contact.

6.5.2 Bimetal relays shall conform to IS: 3231 and shall have built in single phasing preventor.

6.5.3 The bimetal relays shall be provided with a manual reset device resetable after opening the cubicle door. Auto reset thermal relays are not acceptable.

6.6 **Current Transformers**

6.6.1 The current transformers shall conform to IS: 2705.

6.6.2 Current Transformers shall be Class-F insulated and vacuum impregnated. The Current Transformers shall be rigidly mounted and shall be easily accessible for maintenance and testing.

6.6.3 The Current Transformers shall be of 7.5 VA output. The output shall be adequate for the instrument and metering duties involved with sufficient margin. The Current Transformers shall have the accuracy Class-1 for the metering duty.

6.6.4 All the Current Transformers shall be provided with terminals and shorting links. One of the terminals of C.T. shall be earthed. The polarity of the C.T. shall be clearly marked.

6.6.5 The C.T.s shall be capable of withstanding momentary open-circuit on the secondary side without injurious effects.

6.7 **Instruments and Meters**

6.7.1 All instruments shall be flush mounting type with square face and shall be tropicalized and dust tight.

6.7.2 The size of the instruments shall be 96 mm x 96 mm for full and half size modules and 72 mm x 72 mm for lower size modules.

6.7.3 Dials shall be parallax free with scale marked in black on white background and shall be suitable for direct reading.

6.7.4 Zero adjusters shall be provided for operation from the front of the cases.

6.7.5 All ammeters and voltmeters shall have 0 - 240º scale moving iron spring controlled type and of Class 1.5 accuracy as per IS: 1248. The scale range of the ammeter and voltmeter shall be as indicated in the feeder details.

6.7.6 In case of motor feeders, the ammeter shall be graduated uniformly upto C.T. primary current and with a compressed end scale upto 6 times the C.T. primary current. Red pointer shall be provided, which can be adjusted at site for indicating full load current.

6.7.7 KWH meter shall be 3 phase 4 wire type. These shall conform to the requirements of relevant IS and shall be C.T. operated. The current coil shall be rated for 5 Amp.

6.7.8 All kWh meters shall be provided with test blocks for current and voltage coils for testing them at site without interrupting their recording while in service.
6.8 Push Button and Control Switches

6.8.1 The switches and push buttons shall conform to utilization category AC 11/DC 11 as per IS/IEC:60947. The contact shall be rated to make, break and carry inductive current of 5 Amp. at 415 V AC and 1 Amp at 220 V DC.

6.8.2 The control switches shall be spring return rotary type unless otherwise specified and provided with pistol grip type handle. The control switches for circuit breakers shall be additionally fitted with lost motion devices and sequencing devices.

6.8.3 The selector switches shall be stay-put rotary type and provided with oval shape handles.

6.8.4 The push buttons shall be of momentary contact spring loaded type with a set of normally close and open contacts. The push button for ‘Start’ shall be shrouded type and coloured green, stop push button shall be un-shrouded type and coloured red and other push buttons shall be un-shrouded type coloured black. The fixing ring shall be metallic white.

6.8.5 Emergency stop push buttons, if specified, shall be lockable in pushed position.

6.9 Miniature Circuit Breakers

6.9.1 The miniature circuit breakers shall conform to IS: 13032 and shall be of duty category M-9.

6.9.2 It shall be provided with overload and short circuit protective devices in a heat resistant housing.

6.9.3 A certificate of short circuit rating and current time tripping curve shall be furnished alongwith the offer.

6.10 Signal Lamps

6.10.1 Signal lamps shall be provided to indicate the various circuit conditions as shown in scheme drawings. The colour of the lamps for various functions shall be as follows:

<table>
<thead>
<tr>
<th>Colour</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red</td>
<td>Switch/Contactor closed.</td>
</tr>
<tr>
<td>Green</td>
<td>Switch/Contactor open.</td>
</tr>
</tbody>
</table>

6.10.2 The lamps shall be LED type having lumen output 200 milli candela in axial direction.

6.10.3 It shall be possible to remove the globe from outside for replacement of lamps.

7.0 ACCESSORIES

7.1 The supplier shall include the following accessories.

-- Fuse Puller.

-- Test plug for kWh meters.

7.2 Space Heater

Each vertical section shall be provided with a thermostatically controlled space heater, rated for 240 V, 50 Hz and controlled through double pole miniature circuit breaker.

7.3 Name Plates

7.3.1 The distribution board shall have large name plate on the top to indicate its name and designation.

7.3.2 Each feeder shall be provided with name plate. Each single front panel shall have name plate both in front and back.

7.3.3 All control switches, push buttons, lamps etc. shall have functional identification labels.

7.3.4 Name plate shall be of black perspex with white engraving and of minimum 3 mm thick.
7.3.5 Any other accessories required, but not specified shall also be supplied to make the distribution board complete in all respects to ensure safe and proper operation.

8.0 PAINTING

8.1 The enclosure after degreasing, pickling in acid, cold rinsing phosphatising, passivating etc. shall be painted with two coats of anti-rust paint followed by two coats of anticorrosive paint.

8.2 Epoxy based paint shall be used.

8.3 All paints shall be carefully selected to withstand tropical heat and extremes of weather. The paint shall not scale off, crinkle or be removed by abrasion due to normal handling.

8.4 Unless otherwise specified, the finishing shade shall be light grey Shade No.631 as per IS: 5.

8.5 One litre of paint shall be supplied along with each board for touch up at site.

9.0 TESTS AND INSPECTION

9.1 The distribution boards shall be subjected to routine test as per IS: 8623.

9.2 Additional tests, wherever specified, shall be carried out.

9.3 All the above tests shall be carried out in presence of purchaser’s representative. In addition, the equipment shall be subjected to stage inspection during process of manufacture at works and site inspection.

9.4 These inspections shall however, not absolve the vendor from his responsibility for making good any defect which shall be noticed subsequently.

10.0 DRAWINGS AND DOCUMENTS

10.1 Drawings and documents as per Annexure-I shall be supplied unless otherwise specified.

10.2 All drawings and documents shall have the following description written boldly:
   - Name of client
   - Name of consultant
   - Enquiry / Order Number with plant / project name
   - Code No. and Description

11.0 SPARES

11.1 Spares for operation and maintenance

Item wise unit prices of spare parts shall be quoted.

11.2 Commissioning Spares

Commissioning spares, as required, shall be supplied with the main equipment. Item wise list of recommended commissioning spares shall be furnished for approval.

11.3 Any other spare parts not specified, but required, shall also be quoted along with the offer.

11.4 All spare parts shall be identical to the parts used in the equipments.

12.0 PACKING

12.1 The distribution board shall be properly packed before despatch to avoid damage during transport, storage and handling.

12.2 The packing box shall contain a copy of the installation, operation and maintenance manual.
12.3 A sign to indicate the upright position of the panels to be placed during transport and storage shall be clearly marked. Also proper arrangement shall be provided to handle the equipment.

13.0 DEVIATIONS

13.1 Deviations, if any, from this standard shall be clearly indicated in the offer with reasoning.

1.0 SCOPE

1.1 This standard covers the technical requirements of design, manufacture, testing at works and delivery in well packed condition of lighting sub distribution boards.

1.2 This standard shall be read in conjunction with relevant part of Design Philosophy - Electrical.

2.0 STANDARDS TO BE FOLLOWED

2.1 The design, manufacture and testing of the equipment covered by this standard shall comply with the latest issue of the following Indian Standards. Equipment complying with equivalent IEC standards shall also be acceptable.

- IS/IEC:60947 - Low voltage switchgear and control gear
- IS: 8623 - Specification for low voltage switchgear and control gear assemblies

2.2 The design and operational features of the equipment offered shall also comply with the provisions of latest issue of the Indian Electricity Rules and other relevant statutory acts and regulations. The supplier shall, wherever necessary, make suitable modification in the equipment to comply with the above.

2.3 Wherever any requirement, laid down in this standard, differs from that in Indian Standard Specifications, the requirement specified herein shall prevail.

3.0 SERVICE CONDITIONS

3.1 Ambient Conditions

These shall be as indicated in Design Philosophy - Electrical.

3.2 System Details

These shall be as indicated in Design Philosophy - Electrical.

4.0 OPERATING REQUIREMENTS

The lighting sub-distribution boards shall be suitable for operating continuously under the ambient conditions and with the voltage and frequency variations, without exceeding the specified temperature rise and without any detrimental effect on any part.

5.0 GENERAL DESIGN AND CONSTRUCTIONAL FEATURES

5.1 The lighting sub distribution boards shall be fabricated out of 2.5 mm thick cold rolled sheet steel and shall be suitable for mounting on wall/structure. These shall have dust and vermin proof construction conforming to IP-54 as per IS/IEC:60947. For outdoor installation, the enclosure shall conform to IPW-55. Suitable canopy made out of 2 mm thick Aluminium sheet shall be supplied along with the board.

5.2 The miniature circuit breakers shall be so mounted inside the enclosure that their operating knobs project outside for easy operation. The cut-out for the knobs on the enclosure shall be lined with gasket for dust proofness. For further protection against ingress of dust, the portion where the knobs have protruded out, shall be provided with another external front cover, internally hinged at the top, gravity operated and with a knurled knob at the bottom. The external cover shall be flushed with the main cover. Continuous neoprene gasket shall be provided to make the board completely dust and weather proof.

5.3 All external hard ware of diameter less than 8 mm shall be of stainless steel and those of diameter 8 mm and above shall be of mild steel cadmium plated or zinc passivated.
5.4 The sub-distribution boards to be located indoors shall have top entry arrangement for outgoing cables and bottom entry for incoming cable. However for outdoor locations, all cable entries shall be from the bottom only.

5.5 Three phase and neutral bus bar system of adequate size shall be provided to which all outgoing and incoming MCB’s shall be connected.

5.6 The internal wiring shall be carried out by means of single core PVC insulated 2.5 sq. mm stranded copper conductor cables.

5.7 Two earthing terminals outside the board shall be provided.

5.8 Suitable label inscription consisting of black perspex with engraving for the board and circuit nos. of all outgoing feeders shall be provided. The label inscription of the board shall contain description and code no. The circuit nos. of outgoing feeders shall be serially indicated as 1L, 2L.........17L, 18L.

5.9 The board shall be complete with terminal block, cable glands, cable lugs and other accessories as specified.

6.0 SPECIAL FEATURES FOR FLAME PROOF LIGHTING SUB DISTRIBUTION BOARDS

6.1 The enclosure shall be in addition of flame proof execution as per IS: 2148.

6.2 The enclosure group and temperature class shall be as indicated in Design Philosophy – Electrical.

6.3 The enclosure shall be of cast iron/cast Aluminium alloy (4600 as per IS: 617).

6.4 Cables shall enter the terminal chamber through flame proof compression type cable glands. From terminal chamber to the main enclosure connection shall be made through bushings. Direct entry of external cables into the main enclosure shall not be accepted.

6.5 The sub-distribution board shall be of 6 way type.

6.6 Individual earth terminals shall be provided for the earth conductor of the outgoing cables beside the phase and neutral terminals.

6.7 The sub-distribution board must be certified by Central Mining Research Institute, Dhanbad or other statutory authority for use in specified hazardous area.

7.0 COMPONENT DETAILS

7.1 The lighting sub-distribution board shall be wired and have components as per SD-8083 (copy attached).

7.2 Miniature Circuit Breaker (MCB)

The MCB shall be of duty category M-9 and shall conform to IS/IEC:60898-1:2002. It shall be provided with overload and short circuit protective devices. MCB shall be of C Curve Type.

7.2.1 The incoming MCB’s or switches shall be of triple pole and switched neutral type and outgoing MCB’s of single pole and switched neutral type, single phase earth leakage protection in each phase of the incomer shall be provided.

7.3 Terminal Block

Pressure clamp type terminal blocks shall be provided both for incoming and outgoing cables. The rating of the terminal block shall be at least 1.5 times the rating of the MCB.

7.4 Cable Glands

Heavy duty double compression type Aluminium cable glands suitable for PVC insulated, armoured and PVC sheathed 1.1 KV grade incoming and outgoing cables shall be provided.
8.0 **PAINTING**

8.1 The enclosure after suitable pre-treatment shall be painted with two coats of anti rust paint followed by two coats or anticorrosive paint.

8.2 Epoxy based paint shall be used.

8.3 All paints shall be carefully selected to withstand tropical heat and extremes of weather. The paint shall not scale off, crinkle or be removed by abrasion due to normal handling.

8.4 The finishing shade shall be light grey shade no.631 as per IS: 5.

9.0 **TESTS AND INSPECTION**

9.1 All the lighting sub-distribution boards shall be subjected to routine tests as per IS: 8623.

9.2 Additional tests, wherever specified, shall be carried out on one lighting sub-distribution board of each type.

9.3 The above mentioned tests shall be carried out in the manufacturer’s works in the presence of purchaser’s representative. In addition, the equipment shall be subjected to stage inspection at works and inspection at site for final acceptance.

9.4 The purchaser’s inspection shall, however, not absolve the vendor from his responsibility for making good any defects which may be noticed subsequently.

10.0 **DRAWINGS AND DOCUMENTS**

10.1 Drawings and documents as per Annexure-I shall be supplied, unless otherwise specified.

10.2 All drawings and documents shall have the following description written boldly.
   - Name of client
   - Name of consultant
   - Enquiry / Order Number with plant / project name
   - Code No. and Description

11.0 **SPARES**

11.1 Spares for operation and maintenance

   Item wise unit prices of spare parts shall be quoted.

11.2 Commissioning Spares

   Commissioning spares, as required, shall be supplied with the main equipment. Item wise list of recommended commissioning spares shall be furnished for approval.

11.3 Any other spare parts not specified, but required, shall also be quoted along with the offer.

11.4 All spare parts shall be identical to the parts used in the equipment.

12.0 **PACKING**

12.1 The equipment shall be properly packed to safeguard against weather conditions and handling during transit. It shall be wrapped in polythene bags and an additional wrapping of bitumen paper shall also be provided to make it completely water proof before the equipment is packed in wooden crates.

12.2 The packing box shall contain a copy of the installation, operation and maintenance manual.

13.0 **DEVIATIONS**

13.1 Deviations, if any, from this standard shall be clearly indicated in the offer with reasoning.

1.0 SCOPE

1.1 This standard covers the technical requirements of design, manufacture, testing at works and delivery in well-packed condition of medium voltage and high voltage induction motors.

1.2 This standard shall be read in conjunction with relevant part of Design Philosophy - Electrical.

2.0 STANDARDS TO BE FOLLOWED

2.1 The design, manufacture and testing of the equipment covered by this standard shall comply with the latest issue of IS-325 and other relevant Indian Standards, unless otherwise specified. Equipment complying with equivalent IEC standards shall also be acceptable.

2.2 The design and operational features of the equipment offered shall also comply with the provisions of latest issue of the Indian Electricity Rules and other relevant Statutory Rules & Regulations. The supplier shall, whenever necessary, make suitable modification in the equipment to comply with the above mentioned rules.

2.3 Flame proof motors shall, in addition, comply with the requirements laid down in IS: 2148.

2.4 Increased safety motors shall, in addition, comply with the requirements laid down in IS: 6381.

2.5 Motors with type of protection “n” shall, in addition, comply with the requirements laid down in IS: 9628.

2.6 Wherever any requirement laid down in this standard differs from that in Indian Standard Specifications, the requirement specified herein shall prevail.

3.0 SERVICE CONDITIONS

3.1 Ambient Conditions

The ambient conditions shall be as indicated in the Design Philosophy - Electrical.

3.2 System Details

3.2.1 The details of power system to which the motors will be connected shall be as indicated in the Design Philosophy - Electrical.

3.2.2 The motors shall be suitable for connection to a power system where transient disturbances are very likely to occur. During the transient disturbances, voltage of the system may completely disappear and return in a short time with the motors still running and connected. Under this condition, the return of voltage may occur at such an instant that the induced e.m.f. in the motor is in phase with the applied voltage giving rise to current surges which may reach a value equal to 1.6 times the starting current and also cause transient torques of large magnitudes.

4.0 GENERAL DESIGN FEATURES

4.1 Enclosure

4.1.1 The enclosure of motors for indoor and outdoor services shall be IP-54 and IPW-55 respectively as per IS/IEC:60529, unless otherwise specified.

4.1.2 Motors for outdoor service shall be provided with special seals for the enclosure, joints, bearing housing, terminal boxes etc. so that no extra protective covering for ingress of water shall be required.

4.1.3 Vertical motors for outdoor installation shall be provided with a rain protective hood.
4.1.4 All external hardware shall be zinc passivated or cadmium plated.

4.1.5 The enclosure shall be provided with threaded metallic plug to permit drainage of condensed water from the inside.

4.2 Cooling

4.2.1 All motors shall be totally enclosed fan cooled conforming to IC-0141 as per IS: 6362 unless otherwise specified.

4.2.2 In case of CACA construction, the same shall conform to IC-0161 as per IS: 6362.

4.2.3 In case of CACW construction, the same shall conform to ICW 37A 91 as per IS: 6362.

4.2.4 Wherever service conditions are such that corrosive agents are present in the surroundings, the following materials of construction for cooling tubes shall be adopted, unless otherwise specified.

For CACA motor - Aluminium tubes having minimum thickness of 1.6 mm

For CACW motor - Low carbon alloy steel

4.2.5 In case of CACW motors, the cooling tubes and flanges shall also be suitable for the cooling water analysis. Trays shall be provided for collection of leaking water with arrangement for its drainage.

4.2.6 The cooling fans shall be suitable for bidirectional rotation of motors. These shall be fastened to the motor shaft by means of compensating rings or will be balanced independent of the motor. Guide key or reference points shall be supplied to prevent wrong assembly. The cooling air shall be sucked from the non-driving end.

4.2.7 The cooling fans shall be made of non-sparking materials such as cast Aluminium (LM-6 alloy) / cast iron.

4.3 Direction of Rotation

4.3.1 Motors shall be suitable for both directions of rotation. In case of any design limitation, the same shall be indicated in the offer.

4.3.2 In either case, a plate showing the direction of rotation corresponding to the phase terminal markings shall be fitted at the driving end shield of the motors.

4.4 Stator

4.4.1 The stator laminations shall be made from suitable magnetic sheet iron varnished on both sides. Where ventilation is required, these shall be arranged in suitable packs, each pack being separated by spacers to form ventilating ducts for circulation of air.

4.4.2 The slot shall be open type with coils so arranged that the coils can be easily removed for inspection and repair.

4.5 Rotor

4.5.1 The rotor shall be of squirrel cage construction, unless otherwise specified.

4.5.2 For small motors, the squirrel cage shall preferably be of pressure die-cast construction. For large motors, the rotor bars and the end rings shall be of copper or copper alloy. The bars shall be firmly placed in slots to prevent vibration during start up / locked rotor condition. Conductor ends shall be securely fixed to the end rings using the latest brazing techniques. Retaining rings shall be provided for high speed machines for the end rings. The rotor cage shall be designed for the required starting and duty cycles.

4.5.3 Wherever wound rotor is specified, the windings shall have the same features as detailed for the stator windings. The rotor voltage shall not exceed the stator voltage.
4.5.4 The rotor shall be dynamically balanced and shall rotate perfectly with no preferential stop points. The rotor shall be constructed such as to allow the removal or addition of material for balancing.

4.5.5 The rotor shaft shall be electrically and magnetically so balanced that the induced shaft voltage does not exceed 200 millivolt. Otherwise the bearing housing at non-driving end shall be insulated for 2 KV.

4.6 Windings and Insulation

4.6.1 The motor coils shall be made out of insulated electrolytic grade copper conductor. Successive coils shall be connected by accessible joints, well brazed and finished smooth to prevent damage to insulation.

4.6.2 The motors shall be insulated assuming the power system neutral as isolated.

4.6.3 All motors shall be insulated with F insulation with tropical and fungicidal treatments.

4.6.4 Wherever class F insulation is specified, the windings shall be easily replaceable type and the temperature rise shall not exceed that of class B insulation.

4.6.5 The winding coils shall be dried, properly impregnated with suitable varnishes to withstand the site conditions and properly baked. At least two additional impregnations and baking shall be applied to the assembled stator coil, making a total of three impregnations and baking. Finally the windings shall be painted with special anti-acid and anti-alkali paints to withstand the site conditions.

4.6.6 The windings shall be well brazed and capable of withstanding thermally and mechanically the transient disturbances specified under clause 3.2.2.

4.6.7 Lead-in wire between the windings and the outside terminals shall be made through bushings in H.V. motors. For M.V. motors, heat resistant insulated conductors shall be used as lead-in wire.

4.6.8 The windings shall be star connected for high voltage motors and delta connected for medium voltage motors.

4.7 Slip Rings and Brushes

4.7.1 Slip rings shall be located in the non-driving side. The material of construction shall be copper alloy. The slip rings and the brush gear shall be cooled by the motor cooling fan.

4.7.2 For explosion proof motors, the slip rings and brush gear shall be housed in a flameproof housing. In case this is not possible, the housing shall be pressurised type with flameproof pressure switch for interlocking with the motor. In either case, glass covers shall be provided for inspection.

4.7.3 The starting rheostats shall be designed for intermittent duty and rated for 10 minutes. Where speed regulation is required, the rheostats and the controllers shall be suitable for such duty and be continuously rated. Auxiliary contacts shall be provided on the controllers for connections to the motor supply controls to prevent wrong operations during starting.

4.8 Bearings

4.8.1 All motors shall be provided with bearings suitable for the application. The bearings must be guaranteed to ensure a smooth operation and a life not shorter than 30,000 hrs.

4.8.2 Where external thrusts are specified, the motors shall be fitted with special roller thrust bearings capable of withstanding the specified thrust. In such cases, the guaranteed life of the bearings shall not be less than 20,000 hours.

4.8.3 The bearing housing shall be effectively sealed against ingress of dust and water and creep age of lubricants along the shaft.
4.8.4 The bearing shall be suitable for both directions of rotation of the motor.

4.8.5 All motors shall be provided with on-line grease lubrication arrangement for both DE and NDE side bearings except for motors of frame size 112 and less and flange mounted M.V. motors. The arrangement shall be complete with grease nipple and drain plug located at convenient locations.

4.8.6 All oil lubricated bearings shall be fitted with oil level indicator and resistance temperature detector/dial type thermometer with alarm and trip contacts.

4.8.7 Self cooled bearing system shall be preferred.

4.8.8 The manufacturer shall specify the type of lubricant and the time interval of lubrication for the bearings of each motor.

4.8.9 The bearing temperature shall not exceed 90ºC for grease lubricated bearings and 70ºC for oil lubricated bearings.

4.8.10 Wherever shaft end-play has been specified, the bearings shall be capable of providing the specified end-play.

4.9 Terminal Box

4.9.1 All the terminal boxes shall have identical degree of protection as that of the motor.

4.9.2 The power terminal box shall be mounted on the right hand side of the motor as viewed from the coupling end. For M.V. Motors, design of terminal boxes shall be such that it may be possible to arrange top/bottom/side entry of cables at site.

4.9.3 The power terminal boxes shall be as follows:
   a) For H.V. motors - Phase segregated type capable of with standing the system fault level for 0.2 Sec. or more.
   b) For M.V. motors - Manufacturer’s standard box with epoxy or SRBF moulded terminal board.

4.9.4 The mounting arrangement of power and neutral side terminal boxes for HV motors shall be identical so that it shall be possible to interchange the boxes at site.

4.9.5 In case of H.V. motors, all the six leads of the motors shall be taken out, three on one side and three on the other side to separate terminal boxes. However, neutral shorting link shall be provided on the neutral box for star connection.

4.9.6 In case of M.V. motors, all the six leads of the motors shall be taken out to a common terminal box. Shorting links for delta connections shall be provided in the terminal box for motors 112 frame and above.

4.9.7 For increased safety motors and for motors with type of protection “n”, the terminals shall be provided with positive locking device so that they do not become loose during normal operation.

4.9.8 The power terminal boxes shall have adequate clearances in between the terminals and also between the terminals and cable gland for proper termination of cables. Where more than one cable is required to be terminated in parallel, the spacing in the box shall be adequate for easy termination.

4.9.9 Separate terminal boxes shall be provided for connection of power, control and space heater cables.

4.9.10 All terminal boxes shall be complete with heavy duty double compression type cable glands and lugs/connectors to receive the external cables.

4.9.11 Where cross linked polyethylene cables are specified, the terminal box shall be suitably designed for proper termination of such cables.
4.9.12 The cable lugs shall be of tinned copper and suitable for crimping.

4.10 **Geared Motors**

Where geared motors are specified, the gears shall be oil lubricated, heavy duty as per AGMA class III and capable of transmitting the rated motor power continuously. They shall be capable of withstanding moderate shock loads having a service factor of 2 and the starting duties. They shall be silent and smooth in operation. Inspection glass shall be provided to indicate the oil level in the gear box.

**5.0 PERFORMANCE**

5.1 **Starting**

5.1.1 The motors shall be capable of being started direct-on-line, unless otherwise specified.

5.1.2 The starting torque of each motor shall be higher than the initial resisting torque of the driven load throughout the starting period even at a feeding voltage of 85% of the rated voltage for normal purpose motor and 80% of the rated voltage for special purpose motor.

5.1.3 The starting current of 415 V Motors shall not exceed the values indicated in IS: 12615. Also there shall be no further positive tolerance on the values of starting current.

The starting current of 11 KV & 3.3 KV motors shall not exceed 500% of FLC.

5.1.4 The motors shall be suitable for the following starting cycle:

a) With the motor at ambient temperature - 2 successive starts and 3rd start after 5 minutes.

b) With the motor at steady state load temperature - 1 immediate start and 2nd start after 5 minutes. This sequence shall be repeated in the next hour.

5.1.5 Speed switch shall be provided, wherever required, to fulfil the starting conditions.

5.2 **Locked Rotor Condition**

5.2.1 The locked rotor withstand time (t_E), under hot condition at 110% of rated voltage shall be more than the starting time of the motor coupled to the load even at the lowest stipulated starting voltage by 2 secs. for motors, having starting time up to 10 secs. and by 5 secs. for motors, having starting time more than 10 secs.

5.2.2 For increased safety motors, t_E under hot condition shall not be less than 10 secs. The value of t_E shall be determined in the presence of purchaser’s representative unless test certificate from an independent testing authority is submitted for similar motors. The time t_E and the locked rotor current shall be stamped on the name plate as well as indicated in the test certificates.

5.2.3 For deciding the time t_E in all cases, the temperature of the insulated stator and rotor shall not exceed the value stipulated under clause no. 5.4.3.

5.3 **Running**

5.3.1 All motors shall be continuous maximum rated (S1 duty as per IS: 325), unless otherwise specified.

5.3.2 The motors shall be capable of delivering the rated output without exceeding the specified temperature rise under the system voltage and frequency variation conditions.

5.3.3 The motors shall be suitable for running at the rated load for 5 minutes duration at 80% voltage and for 1 Sec. duration at 70% voltage, without exceeding the specified temperature rise.

5.4 **Temperature Rise**
5.4.1 The total temperature of the stator winding under full load running condition shall not exceed the values permissible for the specified insulation class. For increased safety motors, the total temperature shall be 10°C less than for normal motors.

5.4.2 For explosion proof motors, the maximum surface temperature shall not exceed the values applicable for temperature class of the hazardous gases / vapours present in the surrounding area. However for type 'n' motors, the maximum allowable temperature shall not exceed 200°C.

5.4.3 In case of starting and locked rotor conditions stipulated under clause nos. 5.1.4 and 5.2.1 respectively, the maximum temperature in the rotor shall not exceed the following values:

- For squirrel cage rotor: 300°C
- For wound rotor: As applicable to the insulation class
- For explosion proof motor: As per temperature class of the hazardous gases / vapours, without exceeding the above temperature as applicable

6.0 COUPLING DETAILS

6.1 Unless otherwise specified, all motors shall be coupled to the driven equipment through flexible coupling.

6.2 Normally the coupling half for the motor shaft shall be supplied by the driven equipment supplier. The coupling half shall be keyed on the shaft with a tapered joint or shrunk with a straight joint. For this purpose, the motor manufacturer shall coordinate all details of the coupling system with the driven equipment manufacturer, wherever required.

6.3 Where rigid coupling is specified, the motor shaft shall have the desired class of accuracy.

6.4 For all vertical flange mounted motors, the limitations on shaft extension, run out, perpendicularity and eccentricity, as required by the driven machine supplier shall be complied with by the motor supplier.

6.5 i) If the motor is to be coupled to a reciprocating pump or compressor requiring fluctuating torque, the motor supplier shall ensure that the inertia of the driving and driven machine assembly shall be such that the variation in the armature current shall not exceed ±66% of the rated current while delivering full load.

ii) The measurement of armature current shall be done with the oscillograph.

iii) The additional fly wheel, if any, shall be assembled at such a distance from the motor so as to allow easy inspection of the windings.

iv) All necessary coordination with driven equipment manufacturer shall be carried out by the motor manufacturer.

6.6 i) Wherever belt drive is specified, the motor supplier shall ensure that the shaft extension and the bearings are suitable for the duty specified.

ii) Unless otherwise specified, the slide rails for all belt driven motors shall be supplied by the motor manufacturer.

7.0 ACCESSORIES

The motors shall be complete with all the accessories.

7.1 Space Heaters
7.1.1 Space heaters rated for 240 V A.C. shall be provided to keep the winding dry for all high and medium voltage motors, except for motors rated below 30 KW which shall be suitable for space heating by connecting 24 V A.C to any of the two motor winding terminals.

7.1.2 The location of the space heaters shall be such as to allow easy access for inspection, maintenance and replacement.

7.2 **Name Plates**

7.2.1 The name plates shall be of stainless steel with letters embossed on them.

7.2.2 The name plate shall contain all the relevant details as per IS: 325 and in addition shall indicate the following:
   i) The description and code no. of motor
   ii) Degree of protection of enclosure
   iii) Temperature rise of windings under running condition
   iv) Designation of bearings
   v) Recommended type of lubricant and interval of lubrication
   vi) Direction of rotation
   vii) Mounting Arrangement

7.2.3 Flameproof motors shall have additional name plate containing relevant particulars as per IS: 2148.

7.2.4 Increased safety motors shall have additional name plate containing relevant particulars as per IS: 6381.

7.2.5 Motors with type of protection “n” shall have additional name plate containing relevant particulars as per IS: 9628.

7.3 **Embedded Temperature Detectors**

7.3.1 All high voltage motors shall be provided with 6 nos. of evenly distributed embedded resistance temperature detectors for measurement of winding temperature. These shall be located in positions at which the highest temperatures are likely to occur.

7.3.2 In addition, the high voltage motors shall be provided with
   i) 1 no. RTD for hot air temperature measurement
   ii) 2 nos. RTDs (1 on each side) for bearing temperature measurement of oil lubricated bearings. For grease lubricated bearings, RTD shall be provided only where specified

7.3.3 These RTDs shall be of platinum having 100 ohm resistance at 0ºC and temperature coefficient as 3.850 x 10⁻³.

7.3.4 The RTDs shall be 3 lead type having power frequency insulation level of 2KV.

7.3.5 The RTDs shall comply with the requirements laid down in IS: 2848.

7.4 **Dial Type Thermometers**

7.4.1 In high voltage motors, the measurement of hot air and bearing temperature (of oil lubricated bearings) by dial type thermometers shall be provided wherever specified.

7.4.2 The arrangement shall consist of a dial type of mercury-in-steel thermometer so mounted that its stem shall be located in the maximum temperature region.
7.4.3 The thermometer shall have two potential free contacts for alarm and trip.

7.4.4 All contacts shall be rated for 2 Amps. at 110 V D.C.

7.4.5 For bearing temperature measurement, separate thermometers shall be provided for each bearing.

7.4.6 For grease lubricated bearings, temperature measurement arrangement shall be provided only where specified.

7.5 **Oil Supply System**

7.5.1 For large sized motors, where forced oil lubrication system is considered, a common oil supply system for the motor and the driven equipment shall be provided by the driven equipment manufacturer.

7.5.2 However, the motor supplier shall quote separate price for the complete oil system of the motor.

7.5.3 The system shall be suitable for location near the motor.

7.5.4 The oil supply system for each motor shall include:
   i) 2 Nos. 100% rated motor driven pumps with motors
   ii) 1 No. oil tank complete with oil level gauge and thermometer
   iii) 1 No. oil cooler
   iv) 1 No. oil filter
   v) 1 No. differential pressure switch for filter
   vi) 2 Nos. pressure switches
   vii) Necessary piping
   viii) Necessary control and interlocks

8.0 **VIBRATIONS**

The motor vibrations measured at the bearings must not exceed the limits specified in IS: 12075.

9.0 **NOISE LEVEL**

The motor noise level shall not exceed 85 dB measured at a distance of 1 metre from the motor.

10.0 **PAINTING**

10.1 Enclosures of the motor and its accessories shall be painted with two coats of anti-rust paint and two coats of anti-corrosive paint after suitable pre-treatment.

10.2 Epoxy paint shall be used.

10.3 Unless otherwise specified, the finishing shade shall be light grey having shade No. 631 as per IS: 5.

11.0 **TESTS AND INSPECTION**

11.1 All motors shall be routine tested as per relevant standards.

11.2 Additional tests, wherever specified, shall be carried out on one motor of each rating.

11.3 For high voltage motors of each rating, polarization index test shall also be carried out.
11.4 All the above mentioned tests shall be carried out in the presence of purchaser’s representative. In addition, the motor shall be subject to stage inspection at works and inspection at site for final acceptance.

11.5 These inspections shall, however, not absolve the vendor from their responsibility for making good any defects which may be noticed subsequently.

12.0 PACKING
12.1 The motors shall be properly packed to safeguard against weather conditions and handling during transit.
12.2 The shaft shall be properly clamped / supported.
12.3 Rust inhibiting agents shall be applied to fittings and sliding surfaces.
12.4 All flanges shall be closed with blanking plates to avoid entry of foreign materials.
12.5 The loose pieces of the motor / spare parts / Instruments shall be separately wrapped in moisture resistant paper and marked with identification marks and name plate of the corresponding motors.
12.6 The packing box / crate shall include a copy of installation, operation and maintenance manual.

13.0 DRAWINGS AND DOCUMENTS
13.1 Drawings and documents as per Annexure-I shall be supplied, unless otherwise specified.
13.2 All drawings and documents shall have the following descriptions written boldly:
   - Name of client
   - Name of consultant
   - Enquiry / order number with plant / project name
   - Motor Code No. and Description

14.0 SPARES
14.1 Spares for operation and maintenance
   Item wise unit prices of spare parts shall be quoted.
14.2 Commissioning Spares
   Commissioning spares, as required, shall be supplied with the main equipment. Item wise list of recommended commissioning spares shall be furnished for approval.
14.3 Any other spare parts not specified, but required, shall also be quoted along with the offer.
14.4 All spare parts shall be identical to the parts used in the motors.

15.0 DEVIATIONS
15.1 Deviations, if any, from this standard shall be clearly indicated in the offer with reasoning.

</table>
1.0 SCOPE

1.1 The standard covers the technical requirements of design, manufacture, testing at works and delivery in well packed condition of interlocking switch socket and plug.

1.2 The standard shall be read in conjunction with relevant part of Design Philosophy - Electrical.

2.0 STANDARDS TO BE FOLLOWED

2.1 The design, manufacture and testing of the equipment covered by this standard shall comply with the latest issue of IS-4160/ IEC-309 and other relevant Indian Standards, unless otherwise specified. Equipment complying with equivalent IEC standards shall also be acceptable.

2.2 The design and operational features of the equipment offered shall also comply with the provisions of latest issue of Indian Electricity Rules and other statutory acts and regulations. The supplier shall, wherever necessary, make suitable modifications in the equipment to comply with the above.

2.3 Wherever any requirement, laid down in this standard differs from that in Indian Standard Specifications, the requirement specified herein shall prevail.

3.0 SERVICE CONDITIONS

3.1 Ambient conditions

These shall be as indicated in Design Philosophy - Electrical.

3.2 System details

These shall be as indicated in Design Philosophy - Electrical.

4.0 OPERATING REQUIREMENTS

The equipment shall be suitable for operating at the rated capacity continuously without exceeding the specified temperature rise and without any detrimental effect on any part.

5.0 GENERAL DESIGN AND CONSTRUCTIONAL FEATURES

5.1 The switch socket shall be heavy duty industrial type. The interlocking arrangement shall be such that it is not possible to insert or withdraw the plug with the switch in ‘ON’ position.

5.2 The switch sockets shall have dust, hose and weather proof construction conforming to IPW55 as per IS/IEC:60947 and shall be suitable for outdoor use without any extra protection. All jointing surfaces shall be smoothly machined and of sufficient width to prevent ingress of dust. Further the covers shall be provided with continuous gaskets made of neoprene to prevent ingress of dust and moisture.

5.3 The enclosure of switch sockets and plugs shall be of cast aluminium alloy 4600 and suitable for fixing on wall / structure.

5.4 The enclosure shall be largely dimensioned in order to avoid temperature rise inside it which may damage the insulating materials and gaskets employed therein.
5.5 The insulating materials used shall be non-hygroscopic, mould proof and treated with suitable varnish to withstand the ambient conditions.

5.6 All external hardware of diameter less than 8 mm shall be of stainless steel and those of diameter 8 mm or above shall be of mild steel cadmium plated or zinc passivated.

5.7 Suitable arrangement for looping of cables from one switch socket to the other shall be provided. For switch sockets rated above 63A, looping shall be done from busbars and for switch sockets rated 63A and below, looping may be done from terminal block. Necessary terminals, cable glands and lugs for looping shall be provided. Also one no. The readed plug for each switch socket shall be supplied loose.

5.8 All the relevant information shall be provided on engraved name plate made of aluminium.

5.9 The enclosure shall be provided with two earthing terminals outside the body.

6.0 SPECIAL FEATURES FOR FLAME PROOF SWITCH SOCKET AND PLUGS

6.1 The enclosure shall be in addition of flame proof execution as per IS: 2148.

6.2 The enclosure group and temperature class shall be as indicated in Design Philosophy - Electrical.

6.3 Cable shall enter the terminal chamber through flame proof compression type cable glands. From the terminal to the main enclosure, the connection shall be made through proper bushings. Direct entry of external cables into the main enclosure shall not be accepted.

6.4 An additional earthing terminal inside the terminal chamber shall be provided.

6.5 Switch socket, plug and cable glands must be certified by the Central Mining Research Institute, Dhanbad or any other statutory authority for use in the specified hazardous area.

6.6 Further interlocking shall be provided so that the contacts cannot be energised when the plug and socket are separated.

7.0 COMPONENT DETAILS

Makes of all components shall be subject to owner’s / consultant’s approval

7.1 Air Break Switches

7.1.1 The switches shall be quick make, quick break rotary type and of utilisation category AC-23 as per IS/IEC:60947.

7.1.2 Switches shall be hand operated from outside the cover. The switch handle shall remain fixed to the front cover while removing the front cover.

7.2 H.R.C. Fuses

7.2.1 The sockets shall be provided with link type HRC fuses.

7.2.2 The fuses shall be capable of withstanding a short circuit current of 50 KA and shall be delayed action type conforming to IS: 13703. These shall be mounted on a shrouded base.

7.3 Socket Outlets
7.3.1 The socket outlet shall be located in the lower part of the enclosure and shall be provided with a threaded aluminium cover attached to the body with G.I. chain, to protect the socket after extraction of the plug. Spring loaded automatic shutter shall not be acceptable.

7.3.2 The socket contacts shall maintain satisfactory spring pressure and contact with the corresponding plug under normal service conditions.

7.3.3 The socket contacts shall be sunk well below the surface of the socket- outlets so as to make it impossible to be touched unintentionally.

7.3.4 An earthing contact shall be provided in the socket outlet which shall ensure making and breaking respectively of its contact with the earthing pin of the plug before and after making and breaking of the corresponding current carrying contacts.

7.4 Plugs

7.4.1 The plugs shall be so constructed so that these can be easily fitted in to the socket outlets.

7.4.2 These shall be provided with knurled knob arrangement for screwing on the body of the socket so that it can be securely fixed on the top.

7.4.3 The plug base and cover shall be firmly secured to each other and shall be sufficiently robust in construction to withstand normal usage.

7.4.4 The plug pins shall preferably be of single part. The earthing pin shall be slotted with a single slot and shall be larger in dimension than other pins.

7.4.5 The plug and socket contacts shall be self aligning type with best electrical continuity.

7.4.6 The plug shall be provided with dust proof cable entry suitable for receiving TRS flexible heavy duty copper conductor cable of specified size. The arrangement shall be such that the conductors are relieved from strain including twisting where they are connected to the terminals and that the outer surface of the cable at the place of entry is not damaged.

7.4.7 Insulating barriers forming an integral part of the plug shall ensure separation of metals and bare flexible conductors at different potentials.

7.5 Cable Termination

7.5.1 Switch socket shall have cable termination arrangement on the upper part of the housing and shall be provided with side entries, one on either side, through heavy duty double compression type rolled aluminium cable glands suitable for 1.1 KV grade PVC insulated armoured and PVC sheathed cables of size.

7.5.2 The terminal blocks shall be pressure clamp type for switch socket rated up to 63A and bolted lug type for higher ratings. The terminals shall be rated for at least 1.5 times the switch rating.

8.0 PAINTING

8.1 The enclosure after suitable pre-treatment shall be painted with two coats of anti-rust paint followed by two coats of anti-corrosive paint.

8.2 Epoxy based paint shall be used.

8.3 All paints shall be carefully selected to withstand tropical heat and extremes of weather. The paint shall not scale off, crinkle or be removed by abrasion due to normal handling.
8.4 The finishing shade shall be light grey shade no.631 as per IS: 5, unless specified otherwise.

9.0 TESTS AND INSPECTION

9.1 The switch sockets and plugs shall be subjected to routine tests as per IS-4160 and other relevant standards.

9.2 Wherever specified, additional tests shall be carried out on one switch socket and plug of each rating.

9.3 The tests shall be carried out in the manufacturer’s works in the presence of purchaser’s representative. In addition to the above tests, the equipment shall be subject to stage inspection at works and inspection at site for final acceptance.

9.4 These inspections shall, however, not absolve the vendor from their responsibility for making good any defect which may be noticed subsequently.

10.0 DRAWINGS AND DOCUMENTS

10.1 Drawings and documents as per Annexure-I shall be supplied, unless otherwise specified.

10.2 All drawings and documents shall have the following descriptions written boldly.
- Name of client
- Name of consultant
- Enquiry / Order Number with plant / project name
- Code No. and Description

11.0 PACKING

11.1 The switch socket and plug shall be properly packed to safeguard against weather conditions and handling during transit. It shall be wrapped in polythene bags and an additional wrapping of bitumen paper shall also be provided to make it completely water proof before the equipment is packed in wooden crates.

11.2 The packing box shall contain a copy of the installation, operation and maintenance manual.

12.0 SPARES

12.1 Spares for operation and maintenance
Item wise unit prices of spare parts shall be quoted.

12.2 Commissioning Spares
Commissioning spares, as required, shall be supplied with the main equipment. Item wise list of recommended commissioning spares shall be furnished for approval.

12.3 Any other spare parts not specified, but required, shall also be quoted along with the offer.

12.4 All spare parts shall be identical to the parts used in the equipment.
13.0 DEVIATIONS

13.1 Deviations, if any, from this standard shall be clearly indicated in the offer with reasoning.

1.0 SCOPE

1.1 This standard covers the technical requirements of design, manufacture, testing at works and delivery in well packed condition of Battery Charger Units.

1.2 The standard shall be read in conjunction with relevant part of Design Philosophy - Electrical.

2.0 STANDARDS TO BE FOLLOWED

2.1 The design, manufacture and testing of the equipment covered by this specification shall comply with the latest issue of IS: 8623 Specification for low voltage switchgear and control gear assemblies and other relevant Indian Standards, unless otherwise specified. Equipment complying with equivalent IEC standards shall also be acceptable.

2.2 The design and operational features of the equipment shall also comply with provisions of the latest issue of the Indian electricity Rules and other relevant Statutory Acts and Regulations. The supplier shall, wherever necessary, make suitable modifications to comply with the above.

2.3 Wherever any requirement, laid down in this standard, differs from that in Indian Standard Specifications, the requirement specified herein shall prevail.

3.0 SERVICE CONDITIONS

3.1 Ambient Conditions

These shall be as indicated in Design Philosophy - Electrical.

3.2 System Details

These shall be as indicated in Design Philosophy - Electrical.

4.0 DESIGN AND OPERATIONAL REQUIREMENTS

4.1 The Battery Charger Unit and its components shall be suitable for operating at the specified rating continuously with the specified voltage and frequency variations under the ambient conditions without exceeding the temperature rise limits specified in relevant standards and without any detrimental effect on any part.

4.2 The battery charger board shall consist of two units as follows:

(a) Float cum load cum Boost Charger

To supply continuous load and keep the battery in state in float mode. In Boost mode, for Initial charging of Battery and after power restoration subsequent to failure, to recharge the battery while simultaneously supplying load current.

(b) A stand by unit for (a) above.

4.3 The rated voltage of the float charger for lead acid battery shall be 2.2 Volt/ Cell and final charging voltage of the boost charger shall be 2.75 Volt/ Cell. The rated voltage of the float charger for Ni-Cd shall be minimum 1.4 Volt/ Cell and final charging voltage of the boost charger shall be minimum 1.7 Volt/ Cell. The rated output voltage of the charger under 4.2 (a) above shall be adjustable by ± 5% of the rated value manually.
4.4 Charging unit stated under 4.2 (a) above shall be fully automatic using silicon controlled rectifiers (SCR) common for Float and Boost service. Charger D.C. output voltage shall be maintained within ± 2% irrespective of the input supply variations and load variation of 0 to 100% by closed loop voltage feed back control system. The charger shall be provided with current limit feature.

4.5 The output voltage of the float charger shall be monitored and in case voltage falls below 90% of the rated voltage the stand by charger shall be automatically switched ‘ON’ with audio-visual alarm and annunciation. Time delay features shall be incorporated to avoid spurious changeover.

4.6 Boost charging shall be achieved through the same silicon controlled rectifier (SCR) which shall regulate the charger output automatically by current control closed loop system. Provision for manual adjustment of charger output shall also be made. Charger shall maintain its output current constant at starting rate/ finishing rate of battery charging current irrespective of variation in input supply and battery condition.

4.7 Transfer from float charging to boost charging and vice versa shall be automatic as per the battery charge condition.

4.8 During boost charging operation, arrangement shall be made so that DC power to load is not interrupted even if AC power fails during this operation. During Boost charge period, battery backup to load shall be arranged by a tapping from suitable point of the battery.

4.9 Suitable dropper diodes shall be provided to reduce the voltage across the load to 105% of the rated voltage at rated load current. When power supply to the charger fails, the dropper diodes shall be by-passed automatically through contactor so that full battery output voltage is available to the load.

4.10 Provision of suitable filters shall be made so that the ripple in output voltage shall not exceed 3% and 10% for float and boost charger respectively.

4.11 It shall be ensured that during boost charging, no over/under charging of cells takes place.

4.12 All the automatic features specified above shall also have provision of manual arrangement for control of charging rates and transfer from one charger to others.

4.13 Charger unit shall be provided with all required indication, metering, protection, control and alarm annunciation devices for safe and reliable operation and shall include at least as indicated in Annexure-I.

5.0 CONSTRUCTIONAL FEATURES

5.1 Each of the charger units shall be housed in separate metal clad cubicles of identical size suitable for floor mounting and arranged to form a compact switchboard.

5.2 The complete assembly shall be dust, damp and vermin proof type equivalent to IP-43 as per IS/IEC:60947. In case it is necessary to provide openings for ventilation, these shall be closed from inside by fine wire mesh. Forced ventilated panel shall not be acceptable.

5.3 The frame work of cubicles shall be of bolted/welded construction, fabricated out of cold rolled sheet steel of not less than 2 mm thickness. The thickness of base channel shall not be less than 3 mm, suitable reinforcement, wherever necessary, shall be provided.
5.4 Hinged doors shall be provided on both the front and back side for easy access. The door hinges shall be concealed type.

5.5 The doors and the removable covers shall be provided with non-deteriorating neoprene gaskets. Gaskets without any discontinuity shall be preferred. Gaskets shall be held in position in groove in shaped steel work or these shall be 'U' type. Only one joint per gasket shall be permitted. Adhesive cement, if used, shall be of good quality so that the gaskets do not come off during service.

5.6 The mounting of the components shall be such that these are accessible for checking and replacement without the necessity of removing the adjacent ones, at the same time ensuring necessary degree of safety.

5.7 It shall be possible to carry out maintenance of one charger when the other is in operation.

5.8 The meters, switches and lamps shall be flush mounted type. All components of one unit shall be mounted on the same unit.

5.9 All the live parts shall be insulated. Parts which can not be insulated shall be provided with insulating barriers. These barriers shall provide shielding of all live parts to prevent accidental contact when the door is open. However, for the parts requiring handling normally, such as fuses/lamps etc., separate barriers shall be provided. The barriers in all cases shall cover the cable lug portions and shall be firmly secured, stable and durable. It shall, however, be possible to remove such barriers, if required.

5.10 At the equipment termination points, insulated phase barriers, PVC bolt caps, PVC hoses or insulating ribs shall be provided.

5.11 The outgoing terminal blocks shall be shrouded type or provided with insulating barriers.

5.12 Adequate arrangement for earthing shall be provided to safeguard the Operator or other personnel from electric hazards under all conditions of operation.

5.13 **Clearances and Creepage**

The clearances and creepage distances shall not be lower than the values specified below:

- i) Minimum clearance between two live parts : 20 mm
- ii) Minimum clearance between a live part & earth : 20 mm
- iii) Minimum creepage distance : 28 mm

5.14 **Insulation**

5.14.1 The insulation used shall be non-hygroscopic and may be of porcelain, epoxy resin or glass fibre moulded with plastic. It shall be of adequate electrical and mechanical strength to give trouble free service during normal operation and short circuit conditions.

5.14.2 The insulation shall be treated suitably to withstand the tropical conditions and atmospheric pollution as specified.

5.15 **Wiring**

5.15.1 The switch board shall be completely factory wired and ready for external connections.
5.15.2 The wiring shall be complete in all respect so as to ensure proper functioning of control, protection, interlocking and measurement.

5.15.3 The wiring shall be carried out with flexible stranded PVC insulated copper conductor cables of 1100 V grade of minimum 1.5 Sq.mm size.

5.15.4 All wiring shall be marked with dependent both ends marking as per IS: 5578. Numbered ferrules, reading from the terminals outwards, shall be provided at both ends for easy identification. These shall be interlocking type plastic ferrules.

5.15.5 The control cables shall be neatly arranged and properly supported on PVC wiring channel.

5.16 **Cable Termination**

5.16.1 The boards shall be designed for bottom entry of the power and control cables. Sufficient space shall be provided for ease of connection and termination of cable.

5.16.2 Provision for receiving one 415 V, 3 phase 4 wire incoming supply lines, one for each charger shall be made. However, DC output for battery and load shall be looped inside the panel and only one outgoing supply each for battery and load shall be provided.

5.16.3 The termination of cables shall be done through cable glands which shall be suitable for the cables.

5.16.4 Heavy duty double compression type rolled Aluminium cable glands shall be provided. The cable glands shall be mounted on a removable gland plate, provided at a minimum height of 75 mm from the bottom of the switchboard. Two spare knockouts of size 20 mm shall also be provided on the gland plate for future addition of control cables.

5.16.5 For all power cables, crimped type cable lugs of same material as of conductor shall be provided.

5.16.6 The internal power wiring shall be terminated in the terminal blocks for connection to the outgoing cables. These terminal blocks shall be pressure clamp type up to 35 Sq.mm, cable and bolted lug type for higher sizes of cables. These shall be protected type and rated for 1100 V service. The minimum current rating of terminal block shall be 16 Amp. The construction shall be such that after the connection of cables by means of lugs, necessary clearances and creepage distances are available.

5.16.7 Not more than two wires shall be connected to any terminal. If necessary a number of terminals shall be jumpered together to provide wiring points.

5.16.8 Wherever necessary, suitable clamps to support the vertical run of cables shall be provided.

5.16.9 The terminal blocks shall be grouped according to circuit functions and suitably numbered. 20% extra terminals shall be provided in the terminal block.

5.16.10 For power connection, suitable marking on the terminals shall be provided to identify the phases.

5.17 **Earth Bus**

5.17.1 A continuous earth bus of Aluminium of suitable size minimum 32 x 6 mm shall be run all over the length in the lower part of the board with two ends connected to the external earth terminals of the board.

6.0 **COMPONENT DETAILS**

6.1 **Rectifier Transformer**
This shall be double wound, air cooled, 3 phase type. Class ‘F’ insulating materials shall be used, with temperature rise limited to Class ‘B’. The windings shall be vacuum impregnated.

6.2 Thyristors and Diodes

The thyristors and diodes shall be properly selected to have adequate safety margin. A factor of safety of minimum 4 shall be taken for voltage surges and 2 for current ratings. The thyristors and diodes shall be mounted on their respective heat sinks which shall preferably be made of extruded Aluminium properly machined and providing intimate contact with the stud for heat dissipation. Each thyristor/diode shall be protected with properly designed snubber circuit.

6.3 Air Break Switches

The switches shall be heavy duty quick make, quick break type conforming to IS/IEC 60947. Switches shall be snap action rotary type. ‘ON’-‘OFF’ position of the switch shall be boldly indicated. The handle of switches shall remain fastened to the door even when the door is opened after turning the switch ‘OFF’. The AC input switch shall not be directly mounted on the door.

6.4 Fuses

For protection of thyristors/diodes, semi-conductor fuses shall be provided. All other fuses shall be HRC cartridge link type. They shall be suitable for the load and service required.

6.5 Contactors

The contactor shall be air break type of category AC-3/ DC-1 as per IS/IEC 60947. DC contactor shall be provided with arc chutes and magnetic blow out coil. The contactors shall not drop out even when the coil voltage drops to 65% of rated voltage.

6.6 Thermal Overload Relays

Adjustable bimetal thermal overload relays shall be provided. The bimetal relays shall be ambient temperature compensated. The thermal relays shall be provided with a manual resetting device on the door.

6.7 All ammeters and voltmeters shall be class 1.5 as per IS 1248 and shall be flush mounted type of minimum size 96 x 96 mm. Ammeters and Voltmeters for A.C. service shall be of moving iron type and that for D.C. service shall be moving iron or moving coil type. Zero adjuster shall be provided for operation from the front of the cases.

6.8 Printed Circuit Boards (PCBs)

The PCBs shall conform to IS 7405. These shall be of fibre or epoxy glass moulded of minimum thickness 1.5 mm and shall have gold plated contacts and silver or nickel plated tracks. All PCBs shall be of plug-in type contained in a dust proof box. PCBs shall be self diagnostic type and shall be provided with status indication. Metering points shall be provided on each PCB and the PCBs shall be clamped in position so that vibration or long usage does not result in loose contacts.

6.9 Timers
The timers shall be electronic, pneumatic or synchronous type conforming to IS: 5834 with manual/auto reset features as per the functional requirements. The repeat accuracy shall be within 5%.

6.10 Control and Selector Switches

6.10.1 All the control and selector switches shall be of rotary type with thermal utilization category of AC 11 or DC 11 as per IS/IEC:60947.

6.10.2 The control switches shall be spring return type and provided with pistol grip type handles.

6.10.3 The selector switches shall be stay-put type and provided with oval handle.

6.11 Signal Lamps

6.11.1 Signal lamps shall be provided to indicate the various circuit conditions and these shall be placed at a suitable height. The colour of the lamps for various functions shall be as follows:

Red -- Circuit ‘ON’
Green -- Circuit ‘OFF’
Amber -- Alarm and auto trip.

6.11.2 The lamps shall be LED type having lumen output of 200 millicandella in axial direction.

6.12 Audio Visual Alarm Annunciation

6.12.1 A solid state audio-visual alarm annunciation system shall be provided for the board. Audible annunciation shall be provided by means of hooter with provision of remote alarm and acknowledgment. Visual annunciation shall be provided by flashing of the respective facia window. The facia window shall have translucent glass or plastic cover with inscription in black letters. Each facia window shall be provided with two lamps connected in parallel. The cover plate of the facia window shall be flush with the panel and shall be capable of easy removal to facilitate replacement of lamps.

6.12.2 The following operating sequence shall be adopted for audio visual alarm and indication:

<table>
<thead>
<tr>
<th>System Condition</th>
<th>Visual Signal</th>
<th>Audible Signal</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal</td>
<td>OFF</td>
<td>OFF</td>
</tr>
<tr>

</tr>
<tr>
<td>Return to normal</td>
<td>OFF</td>
<td>OFF</td>
</tr>
<tr>
<td>Test</td>
<td>Steady ON</td>
<td>ON</td>
</tr>
</tbody>
</table>

7.0 ACCESSORIES

7.1 The supply shall include the following accessories:

7.1.1 Space Heater

Each cubicle of the board shall be provided with a thermostatically controlled space heater, rated for 240 V, 50 Hz and controlled through double pole miniature circuit breaker. The space heater supply shall be tapped from incomer power supply.

7.1.2 Name Plates
7.1.2.1 The board shall have a large name plate on the top to indicate its name and designation.
7.1.2.2 Each cubicle shall be provided with a name plate.
7.1.2.3 All control switches, push buttons, lamps etc. shall have function identification labels.
7.1.2.4 Name plate shall be of black perspex with white engraving of minimum 3 mm thickness.
7.1.3 Fuse Puller
7.2 Any other accessories required but not specified shall also be supplied to make the board complete in all respects and ensure its safe and proper operation.

8.0 PAINTING
8.1 The enclosure after suitable pre-treatment shall be painted with two coats of anti-rust paint followed by two coats of anti-corrosive paint.
8.2 Epoxy based paint shall be used.
8.3 All paints shall be carefully selected to withstand tropical heat and extremes of weather. The paint shall not scale off, crinkle or be removed by abrasion due to normal handling.
8.4 Unless otherwise specified the finishing shade shall be light grey having Shade No. 631 as per IS 5.

9.0 TESTS AND INSPECTION
9.1 The board shall be subjected to routine tests as per IS 8623 and other relevant standards. Heat run test, if required, shall be carried out.
9.2 Additional tests, wherever specified shall be carried out on one board of each rating.
9.3 All the above tests shall be carried out in presence of purchaser’s representative. In addition, the equipment shall be subjected to stage inspection during process of manufacture at works and site inspection.
9.4 These inspections shall however, not absolve the vendor from his responsibility for making good any defects which may be noticed subsequently.

10.0 DRAWINGS AND DOCUMENTS
10.1 Drawings and documents as per Annexure-II shall be supplied unless otherwise specified.
10.2 All drawings and documents shall have the following description written boldly:
   - Name of client
   - Name of consultant
   - Enquiry / Order Number with plant / project name
   - Code No. and Description

11.0 SPARES
11.1 Spares for operation and maintenance
Item wise unit prices of spare parts shall be quoted.

11.2 Commissioning Spares
Commissioning spares, as required, shall be supplied with the main equipment. Item wise list of recommended commissioning spares shall be furnished for approval.

11.3 Any other spare parts not specified, but required, shall also be quoted along with the offer.

11.4 All spare parts shall be identical to the parts used in the equipments.

12.0 PACKING

12.1 The board shall be properly packed before despatch to avoid damage during transport, storage and handling.

12.2 The packing box shall contain a copy of the installation, operation and maintenance manual along with one set of drawings.

12.3 A sign to indicate the upright position of the panels to be placed during transport and storage shall be clearly marked. Also proper arrangement shall be provided to handle the equipment.

13.0 DEVIATIONS

13.1 Deviations, if any, from this standard shall be clearly indicated in the offer with reasoning.

</tbody>
</table>
1.0 SCOPE

1.1 This standard covers the technical requirements of design, manufacture, testing at works and despatch in well packed condition of batteries and accessories.

1.2 This standard shall be read in conjunction with the relevant part of Design Philosophy - Electrical.

2.0 STANDARDS TO BE FOLLOWED

2.1 The design, manufacture and testing of the battery shall conform to the latest issue of the following standards:

- IS: 1651 -- Stationary cells & batteries, lead-acid type (with tubular positive plate)
- IS: 1652 -- Stationary cells & batteries, lead-acid type with plante positive plates.
- IS: 10918 -- Vented type nickel cadmium batteries

All accessories shall also conform to the relevant Indian Standard. Equipment complying with equivalent IEC standards shall also be acceptable.

2.2 The design and operational features of the equipment offered shall comply with the provisions of the latest issue of the Indian Electricity Rules and other Statutory Acts and Regulations. The supplier shall, wherever necessary, make suitable modifications in the equipment to comply with the above.

2.3 Wherever any requirement, laid down in this standard, differs from that in Indian Standard specifications, the requirement specified herein shall prevail.

3.0 SERVICE CONDITIONS

3.1 Ambient Conditions

These shall be as indicated in Design Philosophy - Electrical.

3.2 System Details

These shall be as indicated in Design Philosophy - Electrical.

4.0 OPERATING REQUIREMENTS

The battery shall be able to deliver rated ampere hours when discharged at the 10 hours rate of discharge to a final voltage of 1.85 V per cell for Lead Acid and at the 5 hours rate of discharge to a final voltage of 1.1 V per cell for Ni-Cd battery under the ambient conditions indicated in Design Philosophy - Electrical.

5.0 GENERAL DESIGN AND CONSTRUCTIONAL FEATURES

5.1 The battery shall be of lead acid plante type and rated for 220V. Each battery bank shall consist of 110 number of cells.

5.2 Each cell shall be contained in a closed top container preferably transparent and unbreakable and shall incorporate positive plates, negative plates and separators of adequate dimensions. Lead acid battery shall be of plante plate type (positive plate).
5.3 The battery bank shall be complete with all necessary components such as lids, plugs, separators and buffers, inter-cell connectors, lead coated bolts and nuts, cell insulators etc.

5.4 The required quantity of electrolyte plus 10% extra quantity shall be supplied in suitable non-returnable containers along with the battery.

6.0 ACCESSORIES

The following accessories shall be supplied with each battery bank:

(a) 1 Set -- Battery Stand constructed out of teak wood without the use of any metal fastenings and coated with 3 coats of anti-acid paint. The stand shall be properly designed so that each cell shall be easily accessible for inspection, topping up etc. However, for Ni-Cd battery mild steel stand with alkali resistant paint may also be accepted.

(b) 1 Set -- Inter-row, inter-tier and inter-stand connectors and takeoffs. These shall be sized suitably to have adequate current carrying capacity and mechanical strength.

(c) 1 Set -- Cell Insulators

(d) 1 Set -- Stand Insulators

(e) 1 No. -- Centre zero cell testing voltmeter scaled 3-0-3 volts

(f) 2 Nos. -- Syringe type Hydrometers for measuring the specific gravity of the electrolyte

(g) 2 Nos. -- Gravity correction thermometers, mercury-in-glass type

(h) 1 Set -- Connecting bolt wrenches

(i) 1 No. -- Rubber syringe for tapping cells

(j) 1 No. -- Wall mounting type teak wood holder for Hydrometer and Thermometer.

(k) 1 No. -- Acid/Alkali resisting funnel.

(l) 1 No. -- Acid/Alkali resisting jug.

(m) 1 Pair -- Rubber gloves.

(n) 1 No. -- Rubber Apron.

All other accessories, not specified above, but required for satisfactory operation and maintenance shall also be supplied.

7.0 TESTS AND INSPECTION

7.1 Type tests shall be carried out as per relevant standards on two cells in the presence of Purchaser’s representative.

7.2 Acceptance tests shall be carried out as per relevant standards on each cell after installation at site.

7.3 In addition, the battery shall be subjected to stage inspection at works and inspection at site for final acceptance.
7.4 These inspections shall, however, not absolve the vendor from his responsibilities for making good any defect which may be noticed subsequently.

8.0 DRAWINGS AND DOCUMENTS

8.1 Drawings and documents as per Annexure-I shall be furnished by the Vendor unless otherwise specified.

8.2 All drawings and documents shall have following description written boldly:
- Name of client
- Name of consultant
- Enquiry / Order Number with plant / project name
- Code No. and Description

9.0 SPARES

Item wise unit prices of spare parts shall be quoted.

9.1 Any other spare parts required, but not specified, shall also be quoted.

10.0 PACKING

The battery cells and accessories shall be properly packed to safeguard against weather conditions and rough handling. It shall be wrapped in polythene bags with an additional wrapping bitumen paper to make it completely water proof before it is packed in crates. The packing box shall contain a copy of the installation operation and maintenance manual.

11.0 DEVIATIONS

11.1 Deviations, if any, from this standard shall be clearly indicated in the offer with reasoning.

1.0 SCOPE

1.1 This standard covers the technical requirements of design, manufacture, testing at works and dispatch in well packed condition of power and control cables.

1.2 The standard shall be read in conjunction with relevant part of Design Philosophy - Electrical and other relevant references as specified therein.

2.0 STANDARDS TO BE FOLLOWED

2.1 The design, manufacture and testing of cables covered by this standard shall comply with the latest issue of following Indian Standards, unless otherwise specified. Equipment complying with equivalent IEC standards shall also be acceptable.

- IS: 1554 Part (I) -- PVC insulated (heavy duty) electric cables for working voltages upto and including 1100 volts.
- IS: 1554 Part (II) -- PVC insulated (heavy duty) electric cables for working voltages from 3.3 KV upto and including 11 KV.
- IS: 7098 Part (I) -- Cross linked polyethylene insulated PVC sheathed cables for working voltages upto and including 1100 volts.
- IS: 7098 Part (II) -- Cross linked polyethylene insulated PVC sheathed cables for working voltages from 3.3 KV upto and including 33 KV
- IS: 694 -- PVC insulated cables for working voltages upto and including 1100 volts
- IS: 5831 -- PVC insulation and sheath of electric cables

2.2 The design and operational features of the cables offered shall also comply with the provisions of latest issue of the Indian Electricity Rules and other relevant Statutory Rules & Regulations. The supplier shall, whenever necessary, make suitable modification in the cables to comply with the above mentioned rules.

2.3 Wherever any requirement, laid down in this standard, differs from that in Indian Standard Specifications, the requirement specified herein shall prevail.

3.0 SERVICE CONDITIONS

3.1 Ambient Conditions

These shall be as indicated elsewhere in Design Philosophy - Electrical.

3.2 System Details

These shall be as indicated elsewhere in Design Philosophy - Electrical.

4.0 OPERATING REQUIREMENTS

The cables shall be suitable for operating continuously at the rated capacity as specified in relevant I.S. under the ambient conditions without exceeding the permissible temperature rise and without any detrimental effect on any part.
5.0 GENERAL DESIGN AND CONSTRUCTIONAL FEATURES

5.1 The design, manufacture and workmanship of cables shall be in accordance with the latest practice.

5.2 All materials to be used shall be new, unused and of the best quality.

5.3 Conductors

The power cables shall be of stranded Aluminium / copper round or shaped conductors and control cables shall be of annealed high conductivity stranded copper round conductors. The conductors shall comply with the requirements of IS: 8130.

5.4 Insulation

The conductor insulation shall be XLPE and shall comply with relevant IS.

5.5 Fillers

The cables shall have suitable fillers wherever required, laid up with conductors to provide substantially circular cross section before the inner sheath is applied.

5.6 Inner Sheath

Inner sheath, wherever applicable shall be ST1/ ST2 type compound applied by extrusion process except for paper cables for which it shall be of lead or lead alloy.

5.7 Armouring

All power and control cables shall be armoured. The single core cables shall be armoured with hard drawn Aluminium taps/ wires or any other suitable nonmagnetic material. All other cables shall have galvanized steel wire / strip armouring.

5.8 Outer Sheath

The outer sheath shall be ST1/ ST2 type compound applied by extrusion process and suitable to withstand atmospheric pollution, resistance to termites, fire retardant and coloured black.

5.9 Screening

Screening over conductor and insulation shall be provided as per relevant standard unless specified otherwise. The screening for control cables if specified shall be of aluminium, mylor or equivalent and provided with tinned drain wire which shall be continuous and permanently connected to the screen.

5.10 Identification

The individual cores of cables shall be coloured as per relevant IS. Where it is not possible to distinguish the cores by colour, coloured strip shall be applied on the cores or core nos. shall be marked on each core at regular intervals. All cables shall carry the manufacturer’s name or trade mark, the cable size, voltage rating and year of manufacture at intervals not exceeding 100 meters. Running meter markings shall also be provided throughout the length of the cable.

5.11 Dimension
The overall dia. and dia. under armour of the cables shall be indicated by the vendor in the technical particulars. These shall be guaranteed with a tolerance of ± 5% but not exceeding 2 mm.

5.12 The cut ends of the cables shall be sealed by means of non-hygroscopic materials.

6.0 SPECIAL PURPOSE CABLES

6.1 Flame Retardant Low Smoke Cables

Flame retardant low smoke cables shall have outer sheath of PVC having following values.

- Minimum oxygen index - 29%
- Minimum temperature index - 250°C
- Maximum acid gas generation - 20%
- Maximum smoke density rating - 60%

6.2 Heat Resistant Cables

Heat resistant cables shall be of silicon rubber insulated laid circular with asbestos worming and overall glass fibre braided and varnished. Silicon rubber insulating compound shall conform to IS: 6380 and the constructional features shall conform generally to IS: 9968.

7.0 CABLE DRUM

7.1 The cables shall be supplied in non-returnable wooden drums (or steel drums if specified) of heavy construction. The wood used for construction of the drums shall be properly seasoned, sound and free from defects.

7.2 Cables shall be supplied in specified drum lengths. Where no such indication is given, standard drum lengths may be offered.

7.3 The tolerance on each drum of cable shall not exceed ± 2.5%. However, no negative tolerance on HV cables is acceptable.

7.4 All cable drums shall have stencilled data as per relevant IS as well as the purchaser’s order no., item no. & drum no.

8.0 TESTS AND INSPECTION

8.1 The following tests shall be carried out on the cables as per relevant IS.

i) Routine Tests - On all cables
ii) Acceptance tests - On representative length of each size
iii) Type tests - Wherever specified on one cable drum of each size

8.2 In addition, the following tests shall be carried out on all fire retardant low smoke cables as per IS or as per the following standards:

i) Oxygen and temperature index test as per ASTM-D-2863
ii) Acid gas emission test as per IEC-754 Part-I
iii) Smoke density test as per ASTM-D-2843
iv) Flammability test as per IEC-332 Part-I or IS-10810

8.3 All the above mentioned tests shall be carried out in the presence of purchaser’s representative. In addition, the cables shall be subjected to stage inspection at works and inspection at site for final acceptance.

8.4 These tests and inspections shall, however, not absolve the vendor from their responsibility for making good any defect which may be noticed subsequently.

9.0 DRAWINGS AND DOCUMENTS

9.1 Drawings and documents as per Annexure-I shall be supplied, unless otherwise specified.

9.2 All drawings and documents shall have the following descriptions written boldly.

- Name of client
- Name of consultant
- Enquiry / Order Number with plant / project name
- Code No. and Description

10.0 DEVIATIONS

10.1 Deviations, if any, from this standard shall be clearly indicated in the offer with reasoning.

1.0 SCOPE

1.1 This standard covers the technical requirements of design, fabrication, testing at works and delivery in well-packed condition of prefabricated ladder type cable racks.

1.2 The standard shall be read in conjunction with Drawing Nos. PDS: E 530 to 538 (9 Sheets).

2.0 STANDARDS TO BE FOLLOWED

2.1 The design, manufacture and testing of the cable racks covered by this standard shall comply with the latest issue of following and other relevant Indian Standards, unless otherwise specified. Equipment complying with equivalent IEC standards shall also be acceptable.

- IS: 733 -- Wrought aluminium and aluminium alloy bars, rods and sections for general engineering purposes
- IS: 2629 -- Recommended practice for hot dip galvanising on iron and steel
- IS: 4759 -- Hot dip zinc coatings on structural steel and other allied products

2.2 Wherever any requirement, laid down in this standard, differs from that in Indian Standard Specifications, the requirement specified herein shall prevail.

3.0 GENERAL DESIGN AND CONSTRUCTIONAL FEATURES

3.1 Ladder type cable racks shall be fabricated as per attached Drawing Nos. PDS: E 530 to PDS: E 538 (9 Sheets).

3.2 Cable racks and accessories such as coupler plate, tees, bend, elbows etc. shall be fabricated from 3 mm thick mild steel galvanised sheet or 4 mm thick aluminium 19000 H2 alloy sheet extrusion conforming to designation No. 64430 and condition WP as per IS: 733.

3.3 G.I. racks and accessories shall have zinc coating of 800 gm/sq. metre applied by hot dip galvanising process. Galvanising shall be uniform, adherent, smooth and free from defects.

3.4 The finished rack and accessories shall be free from sharp edges and corners, burrs and un-evenness. Stepped arrangement of bending is not acceptable. The channel members in the bending shall have uniform curvature and shall be made out of single piece.

3.5 The racks shall be supplied in minimum length of 2.4 metre.

3.6 Each straight length and bend shall be supplied with two coupling plates fitted at each side channel at one end. The coupling plates shall be supplied with bolts, nuts and washers fitted at the other four holes for fixing to adjoining member.

3.7 Coupling plate shall be designed to permit longitudinal adjustment upto ± 10 mm and skew upto 10°.
3.8 Clamping arrangement as per attached drawings shall be provided for fixing the rack with the cross support as required.

3.9 All the bends, tees and junctions shall be made sufficiently rigid by providing suitable reinforcement on rungs as required.

3.10 The rungs shall be connected to the side channels by continuous welding alongwith three sides of rung. Aluminium rack shall be welded by TIG welding process.

3.11 All hard wares such as nuts, bolts, washers and crank bolts shall be cadmium plated.

3.12 Tolerances in various dimension shall be follows:

<table>
<thead>
<tr>
<th>Dimension</th>
<th>Tolerance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Length</td>
<td>± 5 mm</td>
</tr>
<tr>
<td>Width</td>
<td>± 2 mm</td>
</tr>
<tr>
<td>Height</td>
<td>± 1 mm</td>
</tr>
<tr>
<td>Bend</td>
<td>± 1 mm</td>
</tr>
<tr>
<td>Thickness</td>
<td>± 0.2 mm</td>
</tr>
</tbody>
</table>

Positive tolerance on total quantity upto ± 5% is acceptable. However, negative tolerance on total quantity is not acceptable.

4.0 MARKING

The packing shall be clearly marked on the outside (on top side & ends) in indelible ink with the following minimum details:

- Part No.
- Size of Tray (Length x Width x Height)
- No. of Tray / Section, Total Weight
- Material Specification
- Client's Name
- Purchase Order No.
- Manufacturer’s Name

5.0 TESTS AND INSPECTION

5.1 Following tests shall be carried out on prefabricated cable racks:

Visual inspection and checking for

i) Quality and thickness of raw material

ii) Dimensions as per drawing.

iii) Quality of welding (before galvanising for G.I. racks)

iv) Preparation of metal surfaces (for G.I. racks).

5.2 After galvanising, G.I. cable racks shall be subjected to following tests as per IS:4759.

i) Mass of galvanising coating -- At any location the thickness of zinc coating shall not be less than 90 micron. However, average thickness of zinc coating shall not be less than 113 micron.
ii) Uniformity of galvanising coating.
iii) Adhesion of galvanising coating.
iv) 3 samples from each lot shall be taken for testing.
v) From each lot and size of rack, measure length of 10 trays and average length to be multiplied by number of trays to arrive for total length.

5.3 All the above tests shall be carried out in the manufacturer’s works in the presence of Purchaser’s representative. In addition to the above tests, the cable racks and its accessories shall be subjected to stage inspection at works and inspection at site for final acceptance.

5.4 These tests and the Purchaser’s inspection shall, however, not absolve the vendor from their responsibility for making good any defect which may be noticed subsequently.

6.0 DRAWINGS AND DOCUMENTS

6.1 Drawings and documents as per Annexure-I shall be supplied, unless otherwise specified.

6.2 All drawings and documents shall have the following descriptions written boldly.

- Name of client
- Name of consultant
- Enquiry / Order Number with plant / project name
- Code No. and Description

7.0 DEVIATIONS

7.1 Deviations, if any, from this standard shall be clearly indicated in the offer with reasoning.

ANNEXURE - I DOCUMENTATION FOR LOCAL CONTROL STATIONS
1.0 SCOPE

1.1 This standard covers the technical requirements of design, manufacture, testing at works and delivery in well-packed condition of Local Control Stations.

1.2 This standard shall be read in conjunction with relevant part of Design Philosophy - Electrical and other relevant references as specified therein.

2.0 STANDARDS TO BE FOLLOWED

2.1 The design, manufacture and testing of the equipment covered by this standard shall comply with the latest issue of IS/IEC:60947 and other relevant Indian Standards, unless otherwise specified. Equipment complying with equivalent IEC standards shall also be acceptable.

2.2 The design and operational features of the equipment offered shall also comply with the provisions of latest issue of the Indian Electricity rules and other relevant statutory Acts and Regulations. The supplier shall, wherever necessary, make suitable modification in the equipment to comply with the above.

2.3 Wherever any requirement, laid down in this standard differs from that in Indian Standard Specifications, the requirement specified herein shall prevail.

3.0 SERVICE CONDITIONS

3.1 Ambient Conditions

These shall be as indicated elsewhere in Design Philosophy - Electrical.

3.2 System Details

These shall be as indicated elsewhere in Design Philosophy - Electrical.

4.0 OPERATIONAL REQUIREMENTS

This equipment and associated components shall be suitable for operating satisfactorily under the specified ambient and system conditions.

5.0 GENERAL DESIGN AND CONSTRUCTIONAL FEATURES

5.1 The Control Stations shall be suitable for control voltage not exceeding 500V, 50 Hz AC or 220V D.C.

5.2 The enclosure shall be of die cast Aluminium alloy LM-6. As an alternative to cast Aluminium, fibre glass enclosure is also acceptable.

5.3 The equipment shall have dust, hose and weather proof construction equivalent to IPW-55 as per IS/IEC:60947. These shall be suitable for outdoor location without any additional protection or cover.

5.4 A rain-hood shall be offered as an additional item. It shall be made of 14 gauge Aluminium sheet bent to shape. In case of fibre glass enclosure, these can be made of fibre glass.
5.5 All external hardware of diameter less than 8 mm shall be of stainless steel and those of diameter 8 mm and above shall be of mild steel cadmium plated or zinc passivated. For fibre glass enclosure Nylon PVC bolts of diameter 8 mm may be used.

5.6 The control station shall preferably be with bolted cover. The bolts for retaining the cover in position shall be provided with 10 mm dia. stainless steel and these shall be so arranged that they do not pierce into the door gasket.

5.7 All the components shall be mounted on a base plate inside the enclosure. Necessary actuating system for control switch, push button, non yellowing acrylic/ glass cover for ammeter and indication lamps shall be provided on the front cover. No wiring shall be carried out on the front cover.

5.8 The layout of components in the control station shall be liberal and standardised. All mating surfaces shall be smoothly machined and shall be of sufficient width of at least 6 mm. The covers shall be provided with continuous gasket made of neoprene or synthetic rubber to prevent ingress of dust and moisture. The gasket shall be held in position in groove provided in the enclosure and shall be pressed all around uniformly by suitably shaped projection of the door. Gaskets simply glued to the surface are not acceptable.

5.10 The enclosure shall be suitable for mounting on wall or on steel structure. 4 Nos. holes suitable for 12 mm bolts shall be provided outside the enclosure for fixing the control stations.

5.11 The internal wiring shall be carried by means of single core PVC insulated 1.5 sq. mm stranded copper conductor cable. All termination shall be made with crimping type proper size lugs and shall be properly ferruled.

5.12 The control stations shall be completely factory wired and ready for external cable connection.

5.13 For easy identification, numbering ferrules shall be provided on all wiring at both ends i.e. equipment end and terminal block end. Terminals for external wiring shall be numbered.

5.14 The enclosure shall be provided with two earthing terminals with studs of 8 mm. dia. projecting outside the enclosure for connection to earth. These terminals shall not pierce through the enclosure and shall be marked with earthing symbol.

5.15 Each control station shall be provided with minimum 2 mm thick stainless steel name plates or consisting of black Perspex with white engraving indicating the code number and description of the equipment controlled by it. Similar labels shall be provided for all indication lamps, push buttons and control switches. The name plate and label shall be fixed with screws only.

6.0 SPECIAL FEATURES FOR FLAME PROOF LOCAL CONTROL STATION

6.1 The enclosure shall be in addition, of flameproof execution as per IS: 2148.

6.2 The control stations shall be suitable for hazardous area of enclosure group and temperature class as indicated in Design Philosophy - Electrical.

6.3 Cables shall enter the terminal box through flame proof cable gland. From the terminal chamber to the main enclosure, the connections shall be made through proper
bushings. Direct entry of external cables into the main enclosure shall not be accepted. All entries shall be provided with stainless steel inserts.

6.4 An additional earthing terminal inside the terminal chamber shall be provided.

6.5 Local control stations and cable gland must be certified by the Central Mining Research Institute, Dhanbad or any other statutory authority for use in the specified hazardous area.

7.0 COMPONENT DETAILS

7.1 Trip-Neutral-Close Switch

TRIP-NEUTRAL-CLOSE switch shall be double pole, 3 position, pistol grip, rotary type having self spring return feature to neutral position. The contacts shall be of phosphor bronze and shall be provided with two breaks in series. Mechanical sequence device to prevent two successive movements to the same position shall be fitted. The switch shall be capable of being padlocked in the ‘TRIP’ position.

7.2 ‘Auto-Manual’ Switch

‘Auto-Manual’ switch shall be single pole stay put type having three positions “AUTO-OFF-MANUAL”. Provision shall be made to padlock the switch in the “OFF” position.

7.3 Selector Switch / Lock Service Switch

These shall be single pole stay put type having two position with a pistol grip handle and capable of being padlocked in one of the position.

7.4 All the switches shall be rotary type with snap or wiping action contact and having a set of normally open and closed contacts in each position. All switches shall be provided with pistol grip handle.

7.5 ‘Off-Auto-On’ Switch

7.5.1 ‘OFF-AUTO-ON’ switch shall be in minimum three stack configuration, each stack having three positions with spring return from ‘ON’ to ‘Auto’ position and lockable in ‘OFF’ position by means of padlock.

7.5.2 The switch shall have sliding contact between ‘AUTO’ and ‘ON’ position. In ‘OFF’ position the contact shall be completely broken from ‘AUTO’ position.

7.6 Push Buttons

These shall be spring loaded, with a set of normally closed and open contacts. The push buttons for ‘start’ shall be shrouded type and coloured green while ‘stop’ push buttons shall be un-shrouded type and coloured red. Provision shall be made to padlock the ‘stop’ push button in ‘OFF’ position. The fixing ring shall be metallic white. An oil proof rubber cap shall preferably be provided.

7.7 The switches and push buttons shall conform to utilization category AC11/ DC11 as per IS/IEC:60947. The contact shall be rated to make, break and carry inductive current of 5 Amp. at 415 V AC and 1 Amp of 220V DC. The contact arrangement shall be as shown in the terminal drawings. Built in locks instead of padlocking are not acceptable.
7.8 Indication Lamps

7.8.1 LED type indication lamps shall be provided to indicate the various circuit conditions as shown in the terminal drawings.

7.8.2 The LEDs shall provide good illumination through a viewing angle of 180º. The LEDs shall have lumen output of 200 milli Candella in the axial direction.

7.8.3 The colour of the LED indication for various functions shall be as follows:-
   RED : For ‘ON’ Indication
   GREEN : For ‘OFF’ Indication
   WHITE : For “Ready for Service” Indication

7.9 A.C. Ammeters

The ammeter shall be flush mounting, moving iron spring controlled type, of accuracy class 1.5 as per IS:1248, with square face of minimum size 72 mm x 72 mm having scale range 0-240º. The ammeter shall be provided with uniform scale up to CT primary current and compressed end scale up to 6 times the CT primary current. Adjustable red pointer shall be provided to indicate the full load current of the motors. Zero adjusters shall be provided for operation from the front of the meter. All ammeters shall be operated through 1Amp. CTs only.

7.10 D.C. Ammeters

The D.C. ammeter shall be shunt operated. These shall be moving coil or moving iron type of accuracy class 1.5 as per IS: 1248.

7.11 Terminal Blocks

All control stations shall be provided with terminal blocks. Terminal blocks shall be located at a minimum distance of 50 mm from the bottom of the enclosure. The terminal blocks for the control station shall be suitable for conductor sizes of 2.5 mm². These shall be of pressure clamp type design mounted on the base channel. The minimum rating of terminal block shall be 16 Amp.

7.12 Cable Glands

The cables for the external connections, shall enter the terminal chamber through heavy duty double compression type rolled Aluminium cable glands suitable for 2.5 sq. mm PVC insulated, armoured, and PVC sheathed copper conductor 1.1 KV grade cables. The number and cores of control cables shall be as per requirement. The cable gland shall be fitted in a threaded hole.

8.0 PAINTING

8.1 The enclosure after suitable pre-treatment shall be painted with two coats of anti-rust paint followed by two coats of anticorrosive paint.

8.2 Epoxy based paint shall be used.

8.3 All paints shall be carefully selected to withstand tropical heat and extremes of weather. The paint shall not scale off, crinkle or be removed by abrasion due to normal handling.
8.4 Unless otherwise specified, the finishing shade shall be of light grey having shade no. 631 as per IS: 5.

9.0 TESTS AND INSPECTION

9.1 All equipment shall be routine tested as per relevant standards.

9.2 Additional tests, wherever specified, shall be carried out.

9.3 All the above mentioned tests shall be carried out in the presence of purchaser’s representative. In addition, the equipment shall be subjected to stage inspection at works and inspection at site for final acceptance.

9.4 These inspections shall, however, not absolve the vendor from their responsibility for making good any defect which may be noticed subsequently.

10.0 DRAWINGS AND DOCUMENTS

10.1 Drawings and documents as per Annexure-I shall be supplied, unless otherwise specified.

10.2 All drawings and documents shall have the following descriptions written boldly.

- Name of client
- Name of consultant
- Enquiry / Order Number with plant / project name
- Code No. and Description

11.0 SPARES

11.1 Spares for operation and maintenance

Item wise unit prices of spare parts shall be quoted.

11.2 Commissioning Spares

Commissioning spares, as required, shall be supplied with the main equipment. Item wise list of recommended commissioning spares shall be furnished for approval.

11.3 Any other spare parts not specified, but required, shall also be quoted along with the offer.

11.4 All spare parts shall be identical to the parts used in the equipment.

12.0 PACKING

12.1 The local control stations shall be properly packed to safeguard against weather conditions and handling during transit. It shall be wrapped in polythene bags and an additional wrapping of bitumen paper shall also be provided to make it completely water proof before the equipment is packed in wooden crates.

12.2 The packing box shall contain a copy of the installation, operation and maintenance manual.
13.0 DEVIATIONS

13.1 Deviations, if any, from this standard shall be clearly indicated in the offer with reasoning.

1.0 SCOPE

1.1 This standard covers the technical requirements of design, manufacture, testing and inspection at works and delivery in well packed condition of junction boxes.

1.2 This standard shall be read in conjunction with relevant part of Design Philosophy - Electrical and other relevant references as specified therein.

2.0 STANDARDS TO BE FOLLOWED

2.1 The design, manufacture and testing of the equipment covered by this standard shall comply with the latest issue of relevant Indian standards unless otherwise specified. Equipment complying with equivalent IEC standards shall also be acceptable.

2.2 Flameproof & increased safety junction boxes shall in addition, comply with the requirement as laid down in IS: 2148 & IS: 6381 respectively.

2.3 The design and constructional features of the junction boxes offered shall also comply with the provision of latest issue of the Indian Electricity Rules and other relevant Statutory Rules & Regulations. The supplier shall, whenever necessary, make suitable modification in the equipment to comply with the above mentioned rules.

2.4 Wherever any requirement laid down in this standard differs from that in Indian Standard specifications, the requirement specified herein shall prevail.

3.0 SERVICE CONDITIONS

3.1 Ambient Conditions

These shall be as indicated in Design Philosophy - Electrical.

3.2 System Details

The details of power supply system shall be as indicated in Design Philosophy – Electrical.

4.0 GENERAL DESIGN & CONSTRUCTIONAL FEATURES

4.1 The junction boxes shall be dust and weather proof and suitable for installation outdoors without extra protection. The degree of protection shall be IP-55 as per IS/IEC:60529.

4.2 The junction boxes shall be of die cast aluminium alloy LM-6 with domed / suspension covers.

4.3 The casting of the junction boxes and their cover shall be pressure die cast. The casting shall be uniform and free from blow holes. All mechanical surfaces shall be free from burrs, dents and internal roughness.

4.4 All external hardware of diameter less than 8 mm shall be of stainless steel and those of diameter 8 mm and above shall be of mild steel cadmium plated or zinc passivated. For fibre glass enclosure Nylon PVC bolts of diameter 8 mm may be used.

4.5 The clearances and creepage distances shall be maintained inside the junction boxes as per relevant Indian standard.
4.6 The junction boxes shall be suitable for wall / structure / ceiling mounting and necessary arrangement for mounting the same shall be provided.

4.7 The junction boxes shall be provided with continuous gasket made of neoprene or synthetic rubber to prevent ingress of dust. The gasket shall be held in position in groove provided in the enclosure and shall be pressed all around uniformly by suitably shaped projection of the door. Gaskets simply glued to the surface are not acceptable.

4.8 The junction boxes housing terminal block shall be moulded type made of DMC / Fibre glass. Threaded terminals shall be made of brass (nickel plated or tinned) and provided with two tightening threaded nuts and four washers all made of brass (nickel plated or tinned). The terminals shall have two shorting links each horizontally placed connecting three terminals.

4.9 The terminal block shall be fitted with junction boxes base by means of 2 nos. 1/2" long nickel plated brass screws.

4.10 The junction boxes shall be provided with two nos. external earthing terminals and 1 no. internal earthing terminal.

4.11 All live parts inside the junction boxes shall be insulated and shall withstand a test voltage of 2.5 KV for 1 minute.

4.12 The junction boxes shall be provided with heavy duty double compression type rolled Al cable glands to suit the cable entries.

4.13 Threaded blanking plugs shall be provided for junction boxes to plug out the entries not in use as indicated in bill of quantities enclosed.

4.14 The junction boxes shall be provided with a blank stainless steel tag plate fastened to the junction box top cover with two stainless steel screws. The plate shall be at least 25 mm wide, 100 mm long and 1 mm thick.

4.15 For flameproof / increased safety junction boxes, the manufacturer shall submit copies of test certificates from statutory authorities clearly stating that the junction boxes as well as cable glands / blanking plugs are suitable for hazardous area.

4.16 **15 Amp. Junction Box**

4.16.1 The junction boxes shall be 4 way dome cover type.

4.16.2 The dimensions of the junction boxes with their cover and accessories shall be generally as per PDS: E-547.

4.16.3 The junction boxes housing terminal block shall be moulded type made of DMC / Fibre glass as per Drg. no. PDS: E-557.

4.17 **63 Amp. Junction Box**

4.17.1 The junction boxes shall be 3 / 4 way dome cover type.

4.17.2 The minimum internal diameter of the box shall be 240 mm.

5.0 **SPECIAL FEATURES FOR JUNCTION BOXES FOR HAZARDOUS AREA**

5.1 For increased safety junction boxes, the terminals shall be provided with positive locking device against loosening.
5.2 The enclosure shall be in addition, of increased safety execution, Exe, as per relevant standard and shall be suitable for installation in classified hazardous area.

5.3 The junction boxes shall be liberally dimensioned in order to avoid temperature rise inside the enclosure which may damage the insulating materials or gaskets employed therein.

5.4 Cables shall enter the terminal box through increased safety compression type cable glands. From the terminal chamber to the main enclosure, the connections shall be made through proper bushings.

5.5 An additional earthing terminal inside the terminal chamber shall be provided.

5.6 The junction boxes shall be provided with Brass-Nickel plated shorted links. The terminal block shall be made of non-hygroscopic compound. Bakelite / Hylam shall not acceptable.

5.7 All screws / bolts and nuts shall be of stainless steel.

5.8 Junction boxes and cable glands must be certified by Statutory Authorities for use in the specified hazardous area. Equipments certified by overseas authorities shall obtain certificate of compliance / letter of opinion from respective statutory authorities.

5.9 Duly wired prototype samples for junction boxes shall be submitted for scrutiny as and when called for.

5.10 Type Test certificates for increased safety type junction boxes and cable glands along with blanking plugs shall be supplied.

6.0 PAINTING

6.1 Epoxy based electrostatic powder coating paint shall be provided on exterior surface while the interior of junction boxes shall be painted with anti-condensate paint. The painting shall be able to withstand corrosive atmosphere.

6.2 Unless otherwise specified, the finishing shade shall be grey having shade no. 632 as per IS-5.

6.3 The terminal block of junction boxes shall be painted with Red, Yellow, Blue & Black colour for phase indication.

7.0 TESTS AND INSPECTION

7.1 The junction boxes shall be routine tested as per relevant standards.

7.2 Additional tests, wherever specified, shall be carried out on one unit of each rating.

7.3 The procedure & extent of the physical checks, routine & type test shall be governed by Quality Assurance Plan mutually agreed and approved by Inspection Authority.

7.4 All the above mentioned tests shall be carried out in the presence of purchaser’s representative. In addition, the equipment shall be subjected to stage inspection at works and inspection at site for final acceptance.

7.5 These inspections shall, however, not absolve the vendor from their responsibility for making good any defect which may be noticed subsequently.
8.0 PACKING

Each junction box and cable gland shall be suitably packed and protected from damage due to transportation, loading and unloading. Threaded fittings shall have plastic caps to protect the threading.

9.0 DRAWINGS AND DOCUMENTS

9.1 Drawings and documents as per Annexure-I shall be supplied, unless otherwise specified.

9.2 All drawings and documents shall have the following descriptions written boldly:
   - Name of client
   - Name of consultant
   - Enquiry / order number with plant / project name
   - Motor Code No. and Description

10.0 SPARES

10.1 Spares for operation and maintenance
Item wise unit prices of spare parts shall be quoted.

10.2 Commissioning Spares
Commissioning spares, as required, shall be supplied with the main equipment. Item wise list of recommended commissioning spares shall be furnished for approval.

10.3 Any other spare parts not specified, but required, shall also be quoted along with the offer.

10.4 All spare parts shall be identical to the parts used in the equipment.

11.0 DEVIATIONS

11.1 Deviations, if any, from this standard shall be clearly indicated in the offer with reasoning.

1.0 **SCOPE**

1.1 This standard covers the technical requirements of design, engineering, manufacture, testing at works, supply at site, erection, site testing and commissioning of the complete electrical equipment and accessories as required for the overhead travelling crane and hoists.

1.2 This standard shall be read in conjunction with relevant mechanical specifications, other relevant standards / specifications.

1.3 The scope of work shall include but not limited to the following items:

   i) Drive motors
   ii) Starting resistors (in case of slip ring motors)
   iii) Power control panel
   iv) Control stations
   v) Limit switches
   vi) Electromagnetic brakes
   vii) Power and control cables with accessories
   viii) Earthing of all equipment
   ix) All other items, not specified but, required for safe and proper operation

1.4 The owner shall provide one no. medium voltage feeder for each crane / hoist and terminate the feeder cable in an isolator located at one end of the bay at a height of 1.5 m from the operating floor. The vendor shall indicate the exact power requirement (running and peak) to enable the owner to size and provide the power supply feeder.

1.5 Further distribution of power from this isolator onwards shall be in the vendor’s scope.

2.0 **STANDARDS TO BE FOLLOWED**

2.1 The design, manufacture, testing and installation of the equipment shall comply with the latest issue of IS-6547, IS-807 and other relevant Indian Standard specifications and codes of practices. Equipment complying with equivalent IEC standards shall also be acceptable.

2.2 The equipment and installation shall also comply with the provisions of latest issue of Indian Electricity rules and other statutory acts and regulations.

2.3 Wherever any requirement, laid down in this standard, differs from that in Indian Standard Specification, the requirement specified here-in shall prevail.

3.0 **SERVICE CONDITIONS**

3.1 **Ambient Conditions**

   These shall be as indicated in Design Philosophy - Electrical.

3.2 **System Details**

   These shall be as indicated in Design Philosophy - Electrical.
3.3 The owner shall provide only three phase power at the specified medium voltage. For lighting, control and plug supply the vendor shall provide necessary single phase step-down transformers.

3.4 All the electrical equipment shall be so designed that enable the crane / hoist to operate at its rated capacity and specified duty cycle with the system variation under the ambient conditions without exceeding the permissible temperature rise and without any detrimental effect on any part.

4.0 GENERAL DESIGN AND CONSTRUCTIONAL REQUIREMENTS

4.1 The electrical system and installation shall be designed as per latest practice to provide maximum reliability, flexibility, safety to personnel and equipment and ease of operation and maintenance.

4.2 All equipment shall have adequate and standard ratings as per ISS.

4.3 All electrical equipment to be located in indoor plant area shall be enclosed in dust, damp and vermin proof enclosure equivalent to IP-54 as per IS/IEC:60529.

4.4 Equipment to be located outdoor shall be weather proof and have IPW-55 protection as per IS/IEC:60529 and shall also be provided with canopy as far as practicable.

4.5 The equipment to be located in hazardous area shall have additional protection as follows:

a) Zone – I All the equipment shall be in flameproof execution.

b) Zone – II The equipment producing sparks under normal operation shall be in flameproof execution and others shall be in increased safety execution.

The equipment shall be suitable for the enclosure group and temperature class as indicated in Design Philosophy - Electrical. The equipment selected shall conform to relevant Indian Standard Specification and must be certified by Central Mining Research Institute, Dhanbad or any other statutory authority for use in the specified hazardous area.

4.6 The pendant push button shall be light weight enclosure of aluminium/ polypropylene etc. In case of hazardous areas, the loop between the pendant push button and the crane control panel shall be made intrinsically safe by using suitable isolators. Alternatively certified flame proof components and increased safety terminals can be hosed in the hose proof aluminium / polypropylene enclosure.

4.7 Special care shall be taken to ensure that the parts to be opened for inspection and maintenance retain their dust tightness even after repeated opening and closing operations.

4.8 All mating surfaces shall be properly machined. Neoprene gaskets shall be used for dust and weather proofing. The gaskets shall be without any discontinuity.

4.9 Only non-hygroscopic materials shall be used for insulation. All insulation shall be specially impregnated to withstand ambient conditions and atmospheric pollution.

4.10 All live parts shall be adequately protected to prevent inadvertent or accidental contact.
4.11 The minimum clearance and creepage distance of M.V. equipment shall be 20 and 28 mm respectively and shall be positively maintained after connections.

4.12 All external hardware of diameter less than 8 mm shall be of stainless steel and those of diameter 8 mm and above shall be of mild steel cadmium plated or zinc passivated.

4.13 Earthing terminals complete with sockets and identification marks shall be provided on the enclosure of all electrical equipment. The number of terminals shall be two for equipment rated above 240V and one for those rated 240V and below. Additional internal earthing arrangement shall be provided for flameproof equipment.

4.14 All equipment shall be provided with stainless steel name plates containing the particulars as per relevant IS along with the description and code nos. of equipment.

4.15 All the electrical equipment shall be provided with separate terminal box, heavy duty double compression type rolled aluminium cable glands, proper crimping lugs and anti-vibration type terminals suitable for the cable sizes required.

4.16 Enclosure for limit switches, pendant push button, junction boxes and magnets etc. shall be of cast aluminium. Enclosure for control panel, transformer and resistors may be of sheet steel. The thickness of the sheet steel for the enclosure shall not be less than 2.5 mm. All enclosures shall be suitably painted to withstand atmospheric pollution as mentioned in the Design Philosophy - Electrical.

4.17 The doors or inspection covers shall be provided with threaded knobs or butterfly nuts made of plated carbon steel. Copper or copper alloys shall not be used outside the enclosures.

4.18 To facilitate maintenance and testing of all electrical equipment:
   a) Disconnecting links shall be provided where necessary.
   b) All cable lugs and terminals shall be numbered in a permanent form corresponding to the wiring diagram.
   c) Easy access and adequate working space shall be provided around all motors, panels, limit switches etc. safety railing shall be provided, where necessary.

5.0 EQUIPMENT SPECIFICATION

5.1 Power Connection

5.1.1 The main supply shall be obtained by flexible cable or otherwise as per requirement.

5.1.2 In case of overhead bare conductors, they shall be of copper and mounted on side of the crane bridge. Four number of gunmetal type current collector with renewable carbon inserts shall be used for power connection. One end of the bare conductor shall be connected to the owner's isolator by means of fixed cable.

5.1.3 In case of flexible cable arrangement, the cable shall be connected at one end of the crane and the other end to owner's isolator. The cable shall be hung at intervals by festooned type arrangement.

5.1.4 In either case the power fed to the trolley shall be by means of flexible cables fixed and supported by festooned arrangement.
5.1.5 The arrangement of fixing and supporting the flexible cables shall be such that the cable is not damaged due to repeated travelling of the crane and trolley. Supporting G.I. wire shall be provided, wherever required.

5.1.6 The collector rollers and shoes shall be designed to avoid sparking.

5.2 **Power Control Panel**

5.2.1 The panel shall house all the necessary electrical equipment for distribution of power and control of individual equipment/circuit.

5.2.2 The panel shall be totally enclosed, floor mounting, dead front, free standing type in cubicle construction.

5.2.3 The panel shall house the following:
   i) For incoming supply
      - Triple pole switch fuse units
      - Supply ‘ON’ signal lamps (LED Type)
   The above switch shall cut off all power driven and associated equipment on the crane except lighting and plug supply circuits.
   ii) For motors
      - Reversing type starter with necessary contactors and timers.
      - Other controlling relays and devices.
   iii) For lighting, control and plug supply
      - Single phase transformers
      - Isolating switch fuse units on primary and secondary sides.

5.2.4 All switches shall be motor duty type (AC 23) and rated for 1.5 times of the full load current of the circuit. The incoming switch shall be interlocked with the panel door.

5.2.5 All contactors shall be air break type and of AC4 utilization categories. The thermal rating of the contactor shall be 1.5 times the full load current of the circuit.

5.2.6 The power contactors shall be interlocked electrically and mechanically so that there shall be no possibility of simultaneous operation of two contactors for the same motor.

5.2.7 Electrical interlock shall be provided between main hoist and micro hoist motors.

5.2.8 All thermal overload relays shall have in-built single phasing feature and ambient compensated, separately mounting and hand reset type. The reset push bottom for thermal overload relays shall be provided on the cover of the control panel so that it is possible to reset the relay from outside without opening the cover of the panel. Also indication shall be provided for hoisting/travel motors tripping on overload.

5.2.9 The panel shall be installed on properly levelled base frame fabricated out of channels of suitable size.

5.3 **Motors**

5.3.1 The design and specification of all motors shall comply with requirements stated elsewhere in the specifications.

5.3.2 The power rating of the motors shall be 25% higher than the design requirement of the driven equipment, under the specified service and duty conditions.
5.3.3 All motors shall preferably be of squirrel cage type and so designed that smooth acceleration or deceleration of the load is possible without any jerks. Further a maximum displacement of 2 mm when starting and stopping the motor in quick succession shall be guaranteed.

5.3.4 The motors for main hoist and micro hoist shall be suitable for intermittent duty type S4 with 60% C.D.E. and 300 starts / stops per hour. The motors for long travel and cross travel shall be suitable for S2 duty for 60 minutes.

5.3.5 The motors shall be so located that all parts are accessible for inspection and maintenance without affecting normal ventilation.

5.4 Brakes

5.4.1 The brakes for each motor shall be suitable for duties as specified below:

a) Main / Micro hoist S4 duty
b) Long / cross travel S2 duty

5.4.2 The coil of the brake shall be wound with fibre glass covered annealed copper conductor suitable for class H application. An additional covering with glass taps shall be provided over the coil. The maximum temperature of the coil for continuous operation shall be limited to 140º C. The coil shall be vacuum impregnated.

5.4.3 For other design details refer mechanical engineering standard.

5.5 Limit Switches

5.5.1 Limit switches of both shunt and series type shall be used in control and power circuit.

5.5.2 These shall be heavy duty type and of sturdy construction in cast aluminium enclosure.

5.5.3 The mode of operation of these limit switches shall be positive and direct acting type.

5.5.4 The contacts shall be rated 50% more than the required current ratings.

5.5.5 The width of the roller of limit switches shall be sufficient to avoid slippage of contact with the striker.

5.5.6 The striker provided for operating these limit switches shall have rubber padding on surface which will make contact with roller to actuate it. The limit switches and its roller should be designed to withstand the frequent impact pressure.

5.5.7 Switches in which the contacts are operated by spring or gravity or both on the withdrawal of a chain or similar devices, shall not be used.

5.6 Transformers

5.6.1 These shall be of dry type, class H insulated, air cooled, double wound and mounted inside the panel.

5.6.2 The transformers shall be provided with switch fuse unit on their primary side of suitable rating. One side of secondary windings of the transformers shall be earthed and other shall be provided with fuse of suitable rating.

5.6.3 The rating of the transformers shall be at least 2.5 times the continuous load.

5.7 Junction Box
Junction boxes shall be of cast aluminium construction and adequately sized to enable easy termination of cables.

5.8 **Hand Lamps**

5.8.1 Provision shall be made in the crane for use of hand lamps by installing 2 nos. 24 volts, 2 pin metal clad switch sockets. One of the sockets shall be on the bridge (outside the panel) and the other on the trolley.

5.8.2 The transformer primary and secondary voltage shall be 250V and 25V respectively.

6.0 **CABLES, CABLE TERMINATION AND CONNECTIONS**

6.1 The cables used for fixed wiring shall be 1.1 KV grade PVC insulated armoured and PVC sheathed overall, and shall conform to IS: 1554 Part-I.

6.2 The flexible cable used for power supply to crane and also for interconnection of equipment mounted on moving and fixed part of the crane shall be 1.1 KV grade heavy duty type.

6.3 All cables shall be properly laid and supported with adequately sized aluminium clamps at 500 mm interval.

6.4 Cable entry on all electrical equipment e.g. panels, motors, limit switches, brakes, junction boxes etc. shall be through double compression type rolled aluminium cable glands.

6.5 The internal power wiring of panels shall be carried out by PVC insulated stranded copper flexible cable.

6.6 The wiring shall be arranged in a neat fashion and supported on PVC channel or PVC stand of screw support.

6.7 For equipment mounted on the doors, the wiring shall be carried out with flexible stranded copper cables in such a way that no strain is put on the wires and equipment when the door is opened for inspection and maintenance.

6.8 External looping of wires shall be done through separate dust tight junction boxes.

6.9 The sizes of power cables to be used shall be subject to owner’s approval. The minimum size of power and control cables shall be 16 sq. mm (Al) & 2.5 sq. mm (Cu) respectively.

7.0 **EARTHING**

7.1 The earthing of all electrical equipment shall be carried out in accordance with IS: 3043.

7.2 The enclosures of electrical equipment shall be connected to an aluminium earth ring on the crane which in turn shall have effective electrical connection with the bridge.

7.3 The crane bridge shall be earthed through the bridge travel runway rails on both sides which in turn shall be earthed to owner’s earth ring located on the ground floor.

7.4 Further the power supply cable for the crane shall have an additional conductor for earth connection. Both sides of this conductor shall be earthed.
7.5 All earth conductors shall be of aluminium.

7.6 This size of earth conductor shall be equal to half the size of the power conductor subject to a minimum size of 10 sq. mm.

8.0 CONTROL DESK / CONTROL STATION

8.1 The crane shall be controlled either from the floor by means of a pendant control station or from bridge mounted control desk as indicated in the mechanical data sheet.

8.2 In either case, the units shall have the following control devices:
   - Main off push button with padlocking arrangement.
   - Indication lamps for supply ‘ON’
   - Control push buttons, as specified in the mechanical data sheet.
   - All other devices required for safe and proper operation of the crane / hoist.

8.3 All push buttons shall be momentary contact type, coloured as per IS: 6875 and have 1 NO and 1 NC contacts.

8.4 The bridge mounted control desk, where specified, shall be of totally enclosed and dust tight construction. All controlling equipment shall be mounted on the top. It shall be located at most convenient location to allow movement of the operator. The installation shall be equipped with adjustable chair, fan, light and main isolating switch.

8.5 The pendant control station, where specified, shall be in a single enclosure and in totally enclosed dust light execution. The unit shall be suspended and supported from the bridge platform by flexible steel wire rope. The connection shall be made with a multi core flexible copper conductor cable and shall have 20% spare cores. One core shall be provided for earth connection of the circuit.

9.0 PAINTING

Enclosures of all electrical equipment shall be painted with two coats of epoxy based primers after suitable pre-treatment. Two coats epoxy based paint of approved colour shall be provided.

10.0 TESTS AND INSPECTION

10.1 All equipment shall be routine tested as per relevant Indian Standard Specifications.

10.2 Additional tests, wherever specified, shall be carried out on one equipment of each rating.

10.3 All the above mentioned tests shall be carried out in presence of owner’s representative.

10.4 The owner’s inspection shall, however, not absolve the vendor from his responsibility for making good any defects which may be noticed subsequently.

10.5 Despatch of materials shall be subject to written consent of owner or his representative.

11.0 INSTALLATION, TESTING AND COMMISSIONING
11.1 The vendor shall undertake installation of all electrical equipment in accordance with latest code of practices, in conformity with recommendation of the respective equipment manufacturer, drawings approved by the owner or owner’s representative, direction of Engineer-in-charge, statutory regulations and to the entire satisfaction of the owner.

11.2 The vendor shall arrange all the necessary erection tools and tackles, testing and measuring instruments and shall supply the required erection materials including structural steel.

11.3 Following tests shall be specifically conducted before commissioning in presence of owner’s representative. All the test results shall be recorded and submitted to the owner.
   i) Insulation test.
   ii) Continuity test.
   iii) High voltage test.
   iv) Simulation test.

12.0 DRAWINGS AND DOCUMENTS

12.1 Drawings and documents as per Annexure-I shall be supplied unless otherwise specified.

12.2 All drawings and documents shall have the following description written boldly :
   - Name of client
   - Name of consultant
   - Enquiry / Order Number with plant / project name
   - Code No. and Description

13.0 SPARES

13.1 Spares for operation and maintenance
   Item wise unit prices of spare parts shall be quoted.

13.2 Commissioning Spares
   Commissioning spares, as required, shall be supplied with the main equipment. Item wise list of recommended commissioning spares shall be furnished for approval.

13.3 Any other spare parts not specified, but required, shall also be quoted along with the offer.

13.4 All spare parts shall be identical to the parts used in the equipments.

14.0 DEVIATIONS

14.1 Deviations, if any, from this standard shall be clearly indicated in the offer with reasoning.

1.0 SCOPE

1.1 The scope of this specification is to define the minimum technical requirements for the design, manufacture, testing and supply of High Voltage, AC Variable Frequency Drive system. The VFD system shall be complete with Squirrel Cage Induction Motor/ Synchronous Motor as specified in data sheet, Converter, Converter input transformer, drive output transformer, DC link reactor with associated auxiliaries, harmonic filters and field mounted local motor control panel.

1.2 The Vendor shall be responsible for engineering and functioning of the complete system, meeting the intent and requirement of this specification and data sheets. This shall include but not be limited to inverter sizing, transformer sizing, transformer impedance selection, vector group, input and output harmonic filter design and sizing, output dv/dt filter sizing, motor cable selection and motor sizing/selection.

1.3 This specification applies to drive systems having converter input voltage above 1000 V AC and up to and including 11000V AC.

2.0 CODES AND STANDARDS

2.1 The equipment shall comply with the requirements of latest revision of the following standards issued by BIS, unless otherwise specified:

- IS:325 Three-phase Induction Motors
- IS:3700 Essential Ratings and Characteristics of Semiconductor Devices
- IS:3715 Letter symbols for semi-conducting devices
- IS:4411 Code of designation of semi-conducting devices
- IS:5001 Guide for preparation of drawings of semiconductor devices and Integrated Circuits
- IS:5469 Code of practice for the use of semiconductor Junction Devices
- IS:14901 Semi-conductor devices- Discrete devices & Integrated Circuits
- IS:15880 Three Phase Cage Induction motors when fed from IGBT Converters Application Guide
- IS:8789 Values of Performance characteristics for Three Phase induction motor
- IS: 12615 Energy Efficient Induction Motors - Three Phase Squirrel Cage
- IS:12729 Common specification for High-Voltage Switchgear and Control gear standards
- IEC:60 146-1-3 Semiconductor Convertors general requirements and line commutated converters-Transformer & reactors
- IEC:61800 Adjustable speed electrical power drive systems
- IEEE:519 Recommended Practices and requirements for Harmonics Control in Electrical power system

2.2 In case of imported equipment, standards of the country of origin shall be applicable, if these standards are equivalent or stringent than the applicable Indian standards.

2.3 The equipment shall also conform to the provisions of Indian Electricity rules and other statutory regulations currently in force in the country.

2.4 In case Indian standards are not available for any equipment, standards issued by IEC/BSNDE/IEEE/NEMA or equivalent agency shall be applicable.
2.5 In case of any contradiction between various referred standards/specifications/data sheet and statutory regulations the following order of priority shall govern:

- Statutory regulations
- Data sheets
- Job specification
- This specification
- Codes and standards

3.0 GENERAL REQUIREMENTS

3.1 The offered equipment shall be brand new with state of art technology and proven field track record. No prototype equipment shall be offered.

3.2 Vendor shall ensure availability of spare parts and maintenance support services for the offered equipment for at least 15 years from the date of supply

3.3 Vendor shall give a notice of at least one year to the end user of equipment before phasing out the product/spares to enable the end user for placement of order for spares and services.

3.4 Vendor shall ensure proper co-ordination with the driven equipment supplier in selection/sizing of offered variable frequency drive system.

4.0 SITE CONDITIONS

4.1 The drive system shall be designed to operate under specified site conditions as specified in the data sheets. If not specifically mentioned therein, a design ambient temperature of 50°C and an altitude not exceeding 1000 metres above mean sea level shall be considered.

4.2 The AC drive shall be installed indoors in a non-hazardous, air-conditioned or pressurized room, as specified in data sheet. Transformer installation (outdoor/ indoor) shall be as indicated in datasheet. Motor shall be installed outdoors in safe or hazardous area as specified in datasheet.

4.3 All the equipment shall be designed for continuous duty as per nameplate rating under the specified ambient conditions.

5.0 DESIGN AND FABRICATION REQUIREMENTS

5.1 Performance Requirement

5.1.1 The system shall be energy efficient, designed as standard product and shall provide very high reliability, high power factor, low harmonic distortion and low vibration/ wear / noise. It shall be easy to install in minimum time and expense and no special tools shall be required for routine maintenance.

5.1.2 The system shall be designed to deliver the motor input current and torque for the complete speed torque characteristics of the driven equipment, with input supply variation of ±10% and frequency variation of ±3%. The system shall be suitable for the load characteristics and the operational duty of the driven equipment. It shall be capable of withstanding the thermal and dynamic stresses and the transient mechanical torque, resulting from short-circuit.

5.1.3 The drive system shall be designed to operate in one or more of the following operating modes as to suit characteristics of the driven equipment or specified in the data sheet:
5.1.4 The drive controller shall be equipped with microprocessor based digital regulator with programmable functions. The power control regulator logic shall provide for an acceleration/deceleration current limit curve and shall be capable of field adjustments without shutting the system down. Linear acceleration and deceleration shall be separately programmable from 0.1 to 20 seconds.

5.1.5 The System shall be suitable for single quadrant operation and the speed variation shall be with range 10-100 % unless otherwise specified in data sheet with speed set accuracy of ±1% of rated maximum speed and steady state regulation of±0.5% of rated speed.

5.1.6 The total harmonic distortion (THD) of the voltage and current at inverter output shall be as per IEC 61800 and same shall be considered in the design of the motor. The dv/dt limits & Vpeak shall also be as per IEC-61800-2.

5.1.7 Harmonics at the supply side of the drive system at primary of the main input transformer shall be restricted within the maximum allowable levels of current and voltage distortion as per recommendations in the latest edition of IEEE-519. The vendor shall perform design calculation for harmonic filter system considering VFD connected to the power system and including the supply of harmonic filters along with all accessories which shall be installed at owner's power system unless otherwise specified. These harmonic studies shall be conducted with maximum and minimum system fault level, cable capacitance, system equipment reactance etc. The studies shall highlight but not be limited to maximum load current, expected resonant frequencies, need of harmonic filters, sequence of switching of filters, voltage wave form, rating of equipments/ feeder for feeding filters from owner's switchgear etc.

5.1.8 Unless otherwise specified, the overload capacity of the controller shall be 150% of rated current of motor for one minute for constant torque applications, and 110% of rated current for one minute for variable torque applications at rated voltage. If the motor load exceeds the limit, the drive shall automatically reduce the frequency and voltage to the motor to guard against overload. If load demands exceed the current limit for more than 1 minute, the drive shall shutdown to prevent over heating of the motor and damage to the drive.

5.1.9 During operation, the system shall be capable of developing sufficient torque under all load conditions to respond to a 20% alteration in speed set point within a time limit upto 60 seconds.

5.1.10 The integrator action of the speed set point alteration shall be independently adjustable for both an upward and a downward alteration. The minimum time interval between set point adjustments by the distributed control system shall be considered as 10 seconds.

5.1.11 The drive shall trip in case the speed exceeds 105%of the maximum operational speed or reduces to 95% of the minimum operational speed for more than 10 seconds.

5.1.12 Maximum noise level from the drive at 1-meter distance, under rated load with all normal cooling fans operating shall not exceed 85 dBA.

5.1.13 Variable frequency drive shall be arranged so that it can be operated in an open circuit mode, disconnected from the motor for start up adjustments and troubleshooting/maintenance.
5.1.14 Voltage at motor neutral shall be maintained at ground potential for the total operating condition.

5.2 Control Requirement

5.2.1 The system shall operate on constant V/f supply with required voltage boost capability in low frequency mode of operation.

5.2.2 Short time voltage dips up to 20% of nominal voltage (e.g. in case of a large motor start up connected to the same bus as VFD) shall not cause the control system to stop functioning and shall not trip the drive system.

5.2.3 The system shall also be equipped with a momentary powerloss ride through feature which will restart the system in case of voltage dip over 20% or power interruptions for less than 2 seconds, with recovery of the voltage to its nominal value. The drive shall have the facility to block this feature, if required by the operator. Upon restart, the converter shall be capable of synchronizing onto a rotating motor and develop full acceleration torque within 10 seconds.

5.2.4 The system shall be suitable for number of starts as per attached specification for High Voltage Motors.

5.2.5 The power controller shall be controlled to always start the motor in the forward direction. Logic shall be provided to prevent the motor from being started in the reverse direction.

5.2.6 The drive motor shall be speed controlled corresponding to 4-20mA or 0-10 V reference input signal. Unless otherwise specified, upon complete loss of the user's speed reference signal, the drive shall automatically run at constant speed as at 80-100% of the last speed reference available prior to the loss of signal.

5.2.7 It shall be possible to vary the speed of the drive in either manual or auto mode. Auto/Manual selection shall be from VFD panel unless otherwise specified.

a. With the selector switch in "manual" mode, the operator shall be able to set the speed through key pad (mounted on front of the drive panel) or from speed increase/decrease push buttons (from the field). Motor operated potentiometer shall be provided as a speed set point device.

b. With the selector switch in "auto" mode, speed of the motor shall be controlled from a 4-20 mA signal, from owner's PLC/DCS (Process Control) system. Necessary equipment required for interfacing with PLC/DCS shall also be provided in the VFD panel.

c. Local/Remote selector switch shall be provided in local control station (in Field). With the selector switch in "Local" mode, the operator shall be able to start and set the speed through local control station (in Field). With the selector switch in "Remote" mode, speed of the motor shall be controlled either from VFD panel or from Owner's PLC/DCS as explained in a) and b) above.

5.2.8 The required provision for the interface with remote PLC/DCS located at control room shall be either through hardwired connection (with potential free contacts and transducers as described elsewhere in this specification) or through serial communication link as defined in the datasheet.

5.2.9 Drive system shall have provision for interface with upper level automation such as Substation monitoring system or electrical control system in case specified in the data sheet/job specification.
5.2.10 The closed loop control feedback for the drive system having output transformer shall be tapped from the secondary side of the output transformer.

5.3 Panel Construction

5.3.1 The panel shall include suitable semi-conducting power devices (Diodes/IGBT/IGCT/IEGT/SGCT) modules with protective devices, reactors (if required), filters, control circuit, control accessories, indication and annunciation etc. The construction of the panel shall provide effective protection against electromagnetic emissions and shall meet the design requirement of relevant standards.

5.3.2 Upstream breaker ‘ON/OFF/TRIP’ indications and remote breaker closing and trip push buttons shall be provided on the front door.

5.3.3 Safety Interlock shall be provided so that power cabinet can't be opened unless the upstream breaker is disconnected, safety-grounding switch is closed and DC link capacitor is discharged. Power source breaker can only be closed once the earthing switch is open and panel door is closed with lock defeat facility.

5.3.4 The drive shall be suitably housed in sheet steel panels and shall be fabricated using cold rolled sheet steel. The sheet steel used for the panel shall be of minimum 2 mm CRCA. The panel shall be suitable for indoor installation, if not otherwise specified. The panel shall be free standing with degree of enclosure protection as IP-31. Maximum and minimum operating height shall be 1900 mm and 300 mm respectively.

5.3.5 Bolted un-drilled gland plate shall be provided at bottom. Clamp type terminals shall be used for connection of all wires up to 10 mm², and terminal for higher sizes shall be bolted type suitable for cable lugs. Minimum space for power cable termination shall be 600mm clear from bottom of the cable gland plate.

5.3.6 Bus bars shall be of electrolytic copper/aluminium, sleeved, color coded separately for AC and DC system. All the live parts shall be sleeved / shrouded to ensure complete safety to personnel intending to carry out routine inspection by opening the panel doors. All the equipment inside the panel and on the doors shall be provided with suitable nameplate.

5.3.7 All the switches, component and accessories which are essential for normal and emergency operation shall preferably be mounted on the door and shall be operable externally. All the analogue instruments, where provided, shall be switchboard type, back connected & of size 96x96mm. Scale shall have red mark indicating maximum permissible operating rating.

5.3.8 Each panel shall be provided with illuminating lamp/11 W CFL with switch and fuse. 5/15A, 240V power socket with switch and fuse shall be provided. Each panel shall have space heater with switch fuse and variable setting thermostat.

5.3.9 Copper earth bus of min. 30x6 sq.mm. upto short circuit withstand capacity of 31.5kA and 50x6 sq.mm. for a short circuit withstand capacity above 31.5kA shall be provided in the panel with provision for connection to owner's plant earth grid. All the non-metallic components/parts shall be connected to the main earth bus bar. Separate earth bus bar and stud for electronic control system if required shall be provided.

5.3.10 All panels shall be of same height so as to form a uniform line-up, to give good aesthetic appearance.

5.3.11 All the control wiring shall be enclosed in plastic/ metal channel. Each wire shall be identified at both ends by self-sticking wire marker tapes or PVC ferrules. Power and control wiring
inside the panel shall be done with BIS approved, PVC insulated, fire retardant, low smoke, copper conductor wire 1.5mm² size wire shall normally be used provided the control fuse rating is 10 Amps or less and 2.5 mm² size for control fuse rating above 16 A for electrical circuits and 0.5mm² for electronic circuits. All wires shall be ferruled and terminals shall be properly numbered, minimum 20% spare terminals shall be provided.

5.3.12 All electronic modules and components shall be accessible from front of panel only. Modular assemblies for both the system control electronic equipments and power electronic equipments shall be used.

5.3.13 Low voltage compartment and cabling shall be electrically and physically separated from the high voltage compartment.

5.3.14 DC link capacitor and pre-charging & discharging circuit shall be preferably mounted in the rear of the panel.

5.3.15 Suitable eyebolts/ lifting clamps/ strap & cradle arrangement shall be provided for lifting of the panel/shipping section. The bolts, when removed shall not leave any opening in the panel.

5.3.16 Acrylic type transparent insulating material shall be used for covering live components.

5.3.17 Drive keypad, operator control panel required for control, monitoring and measurements shall be supplied and installed outside the panel on the front door. It shall be accessible for operation without opening the front door and shall be non-removable type.

5.3.18 All equipment shall be complete with cable glands, lugs etc. and cable glands shall be single or double compression type for indoor and outdoor equipment respectively. Cable glands shall also be suitable for the hazardous area application if specified in data sheet.

5.4 Cooling

5.4.1 The drive panel shall be naturally cooled or water cooled type as per manufacturer's standards. However, it is preferred to have natural air cooled system. If unavoidable, forced type-cooling system shall be provided. Cooling system shall include well-dimensioned panel, adequate cooling airflow path, modular cooling fan and if necessary, panel cooling fan or water-cooling system shall be considered. Vendor shall ensure that the panel dimensions and flow paths have been designed for continuous running at the specified ambient without overheating. For fan cooled drives, redundant ventilating fans (N+1) shall be provided. In case redundant cooling fan is not possible to be mounted in the panel, same shall be supplied loose.

5.4.2 For water-cooled drives, entire cooling system including but not limited to heat exchanger, flow and pressure meters and pumps shall be in vendor's scope. The system shall be provided with closed circuit water cooling system, requiring only make up water required for topping up. The cooling water pumps, in case provided, shall have 100% redundancy. Water quality/characteristics shall be as defined in the data sheet and selected cooling water system components/material shall be suitable for the same. Adequate safety measures shall be incorporated in water cooled drives such that no leakage is there which results in malfunctioning of electronic devices. Proper segregation between water cooling system and other equipment shall be provided. It is preferred that cooling cabinet panel shall be separated from the main panels.

5.4.3 Necessary starters shall be provided within the VFD panels for the Ventilation fans, Cooling Water circulation pumps, any other auxiliary motor etc. The system provided shall be interfaced with drive starting and shutdown so that safety interlocks such as start permit from
cooling system to drive and trip signal from cooling system to drive in case of cooling system failure etc., are incorporated in the overall sequence logic.

5.4.4 MCB for motor space heater, auxiliary power supply if required for local panel, drive panel space heater etc. shall be included and mounted in easy accessible location.

5.5 Equipment/ Component Specification

5.5.1 Motor

The motor shall be designed, constructed and tested in accordance with the latest revision of Specification /data sheet for High Voltage Induction / Synchronous Motor, in addition to the following requirements:

a. The motor shall be suitable for operation with a solid-state power supply consisting of an adjustable frequency inverter for speed control.

b. The motor shall be suitable for the current waveforms produced by the power supply including the harmonics generated by the drive.

c. The motor shall be designed to operate continuously at any speed over the range (10-100%) of rated speed unless otherwise specified in data sheet.

d. The permitted voltage variation should take into account the steady state voltage drop across the AC drive and all other system components upstream of the motor.

e. Motors required to be transferred to DOL by-pass mode shall be rated for specified variations in system line voltage and frequency. Starting current of motor in DOL bypass mode shall be limited to value specified in motor specifications, unless otherwise specified in datasheets.

f. The motor shall be constructed to withstand torque pulsations resulting from harmonics generated by the solid-state power supply.

g. The motor insulation shall be designed to accept the applied voltage waveform, within the Vpeak and dv/dt limits as per IEC-61800-4 and necessary co-ordination between the VPD manufacturer & motor manufacturer W.r.t. incorporation of VPD output parameter in the design of motor shall be carried out.

h. The drive manufacturer shall be solely responsible for proper selection of the motor for the given load application and the output characteristics of the drive.

i. Motors shall be provided with Resistance Temperature Detectors (RTDs).

5.5.2 Converter Transformer/ Output transformer

a. The converter transformer shall be dry type or oil filled type as specified in the data sheet. In case of the dry type transformer, it shall be mounted in the drive system panel unless specified otherwise in the datasheet. Offered transformer shall be as per enclosed Specifications/data sheet.

b. The impedances of converter input transformers with more than one secondary windings for 12/18/24/36 pulse systems shall be selected to ensure equal load/current sharing between the secondary windings, the converters and the motor windings under all operational conditions including starting and restarting.
c. Drive output transformer considered only for the purpose of meeting standard rated motor voltage i.e. 3300, 6600V, 11000V shall not be provided unless otherwise agreed between purchaser and the manufacturer.

5.5.3 Power Converter

a. The static power converter shall consist of a line side power converter for operation as a rectifier and a load side power converter for operation as a fully controlled inverter. Power converter shall be fast switching, most efficient and low loss type.

b. Adequate short circuit and over voltage protection shall be provided for the converter and inverter system.

c. All power converter devices shall include protective devices, snubber networks and dv/dt networks as required.

d. The current rating of the converter’s semi-conductor components shall not be less than 120% of the nominal current flowing through the elements at full load of the VFD through the entire speed range.

e. All power diodes shall be of silicon type with minimum $V_{BO}$ rating as 2.5 times the rated operating voltage.

f. The power converter circuit shall be designed so that motor can be powered at its full nameplate rating continuously without exceeding its rated temperature rise due to harmonic currents generated by the inverter operation.

g. The conversion devices and associated heat sinks shall be assembled such that individual devices can be replaced without requiring the use of any special precautions/tools.

h. The cooling system of the electronic components, if provided, shall be monitored and necessary alarms shall be provided to prevent any consequential damage to the power control devices.

i. Offered system shall also take into account the distance between Drive panel and motor and system shall include all material and accessories to make system suitable for a distance of 350m unless otherwise specified in the data sheet.

5.5.4 DC Link Reactor

a. Smoothing reactors for the DC link shall be designed to sufficiently decouple the rectifier and inverter portion of the converter and to limit fault currents in this circuit.

b. Unless otherwise specified, the reactor shall be air-cooled or fan cooled type located within the panel.

c. Reactor shall be suitable for operation with the non-sinusoidal current wave shapes and DC components under all operational conditions of the system without exceeding its temperature limits.

5.5.5 Output Filter

VFD output current waveform should be inherently sinusoidal at all speeds, with harmonic limits as specified in this specification. Output filter shall be provided, if required. Output filter capacitors shall be provided with discharge circuits to ensure that all residual stored charge is
reduced to less than 50 V DC within 300 seconds after a loss of AC voltage. All capacitor shall be maintenance-free and self-healing type. The VFD system shall inherently protect motor from high voltage dv/dt stress, independent of cable length to motor. Output filter shall be an integral part of the VFD system and included within the VFD enclosure.

5.5.6 Bypass Feature

a. Bypass feature along with motor protection relay and output side isolator/breaker shall be provided by purchaser unless otherwise specified in the datasheet. All necessary interlocks as required for safe and reliable operation of VFD system along with bypass feeder and output side isolator/breaker provided by Purchaser shall be provided in VFD system.

b. Bypass starter shall be in separate compartment and switching scheme shall be such that in case of drive mal-operation, the motor could be taken on bypass control manually, while the drive could be attended independently. Suitable interlock shall be provided such that bypass mode and VFD mode shall not operate simultaneously.

5.5.7 Local Motor Control Station

a. The local motor control station, to be installed in the field near the motor shall conform to the attached specifications. Components and accessories that are required in the local motor control station may be mounted on the local field mounted panel envisaged for the driven equipment.

b. Meters in the local control station shall be suitable for 4-20mA transducer outputs and shall be calibrated for the actual motor current. Further, for drives with bypass facility, the meters shall be capable of reading bypass mode full load and starting currents as well as the VFD mode drive current.

5.6 Protection, Control, Metering, Indication and Annunciation

5.6.1 The system vendor shall provide all the necessary system control, protection, alarm and metering equipment for the entire drive system and its auxiliary equipment.

5.6.2 Automatic sequence control shall include start-up of cooling system, auxiliary system of the motor, interlock checking, automatic start and run-up of drive, planned and emergency shutdown. The same shall be processed through microprocessor-based system.

5.6.3 Operator Control Panel

a. Each drive shall be equipped with a front mounted operator control console consisting of a backlit alphanumeric display and a keypad with keys for parameterization and adjusting parameter which shall not be limited to Start/Stop, Local/Remote, Auto/Manual, Increase/Decrease, menu navigation and protection and measurement parameter selection, etc.

b. All parameter names, fault messages, warnings and other information shall be displayed in complete English words or standard English abbreviations to allow the user to understand the display without the use of a manual or cross-reference table. This shall also be used for the modification of all electrical values, configuration parameters, drive menu parameters, application and activity function access, faults, local control, adjustment storage, self test and diagnostics. Keypad shall be operable with password for changing the protection setting, safety interlock etc. However, the parameters such as measurements, setting, mode of drive etc. shall be allowed to be viewed without any password.
c. Operator console shall have facility/ port to connect external hardware such as Laptop etc. Console shall have facility to upload and download all parameter settings from one drive to another identical drive for start-up and operation.

d. Drive system control shall also have facility to receive tripping signal from upstream breaker for tripping and also provision for closing upstream breaker after all required process parameters are achieved.

e. User-friendly software for operation and fault diagnostic shall be loaded in the drive system panel before commissioning.

5.6.4 Protective Features

The system shall incorporate adequate protective features, properly coordinated for the drive control and for the motor but not limited to the following:

I. Incoming line surge protection
II. Under / Over voltage protection
III. Phase loss protection.
IV. Programmable over current protection and under load protection.
V. Inverter Fault.
VI. Over frequency/Over speed of motor
VII. Ventilation loss (In case same is not provided, drive shall generate an over temperature fault alarm and suitable sensors, as required for same, shall be provided).
VIII. Over temperature of equipment.
IX. Specific motor protection, including motor winding, bearing temperatures, over current, overload, negative phase sequence and earth fault protections etc.
X. System earth fault protection.
XI. Excitation system protection for synchronous motor
XII. Over and under frequency, rotor earth fault (if applicable), field failure protection for synchronous motor
XIII. Additional protection, if any for the drive system

5.6.5 Control

The following controls shall be provided as a part of the Operator Control Panel or through separate switches.

I. Start/Stop
II. Speed control (Raise/Lower)
III. Forward/Reverse (if specified)
IV. Auto/Manual /Test mode
V. Local/Remote
VI. Emergency stop
VII. Start/Stop for bypass starter (where specified)
VIII. Trip-Remote Breaker
IX. Excitation control system for synchronous motors
X. Sequential switching of filters

5.6.6 Indications

Vendor shall provide indications as required for normal operation and for ease of maintenance, which shall not be limited to the following indications.

I. Motor running
II. Motor stopped
III. VFD System Fault
IV. System ready to start
V. AC mains ON
VI. Motor over speed
VII. Rectifier output 'ON'
VIII. Motor zero speed
IX. Remote breaker trip
X. Excitation system healthy for synchronous motors

Above indications may be provided as a part of the operator control panel, i.e. door mounted keypad or through hardwired LEDs. LEDs provided for indication shall be cluster type with adequate brightness and minimum 2 Nos LEDs chips per light. LEDs shall be connected in parallel and each LED chip having diameter not less than 3mm.

Potential free contacts for items i to iv shall be wired separately for remote indications in DCS system.

5.6.7 Metering

Digital display of the following parameters shall be as a part of the Operator Control Panel, selectable by the operator.

I. Output voltage
II. Output current-VFD model Bypass mode
III. Output frequency
IV. Drive thermal state
V. Motor speed
VI. Motor energy meter
VII. Hour Run
VIII. Voltage and current meter for excitation system of synchronous motor
IX. KVAR, power factor meter for synchronous motors
X. Necessary transducer shall be provided with 4-20mA output for indicating motor speed and motor current in DCS unless otherwise specified for other parameters.

5.7 Fault Diagnostic

Fault diagnostic shall be built into the system to supervise the operation and failure of the system. The information regarding failure of any of the system including, shutdown of the system, shall be available for a period of minimum 4 days (96 hours) after a shutdown, even though no supply would be available to the system. The system may be totally de-energized for maintenance or otherwise. It shall be possible to retrieve the record of events prior to tripping of the system or de-energisation. Auxiliary supply to the system components or to the electronics (firmware) for the diagnostics / display shall be taken care by the manufacturer for this purpose.

5.8 External Power supply for auxiliary and Control Circuit

Auxiliary power supply for devices external to VFD module, space heater supply for Motor, VFD panel space heater, auxiliary power supply for transformers, cubicle 11W CFL lamps, indicating lamps, digital meters (Ammeter, Speedometer) etc. shall operate on 240 volts single phase AC supply provided by purchaser.

All control circuit shall operate at maximum voltage of 240V AC or 220V DC unless otherwise specified in the datasheet.

Vendor shall include supply of all control transformers, protective devices, associated
accessories etc. and any other control supply voltage required for the system shall be derived by the vendor from the power supply made available by purchaser.

5.9 Reliability Features

The expected lifetime of the drive system shall be min. 20 years. The system including all individual components forming part of the system shall have an availability of minimum 0.997 and a minimum MTBF of 4 years.

5.10 Maintenance features

The controller design shall incorporate the following maintenance features:

- Modular construction
- All components shall be easily accessible.
- Standard diagnostics to aid maintenance personnel. These shall include LED or alphanumeric displays, test or measurement points.

5.11 Painting

5.11.1 After preparation of the under surface, the panel shall be spray painted with two coats of epoxy based final paint or shall be powder coated. The colour shade of final paint shall be as RAL 7032, unless specified otherwise. Panel finish shall be free from imperfections like pinholes, orange peels, runoff paint, etc.

5.11.2 All unpainted steel parts shall be zinc passivated, cadmium plated or suitably treated to prevent rust and corrosion. If these parts are moving elements, then these shall be greased.

6.0 INSPECTION, TESTING AND ACCEPTANCE

6.1 During fabrication, the drive shall be subject to inspection by PDIL / Owner, or by an agency authorized by the Owner, to assess the progress of work, as well as to ascertain that only quality raw material is used.

6.2 All tests shall be carried out at the manufacturer's works under his care and expense. The tests shall be witnessed by an inspector of PDIL/Owner or of an agency authorized by the owner. Prior notice of minimum 4 weeks shall be given to the inspector for witnessing the tests.

6.3 All Routine & Type Tests shall be conducted as per the NIT for HV variable frequency drive 6-81-1050 as per IEC 61800-2. However, combined test for VFD and motor at vendor's works shall be carried out if specified in the datasheet.

6.4 String Test with driven equipment

If a string test with driven equipment is specified in the data sheet of the driven equipment, it shall be carried out with the job equipment.

7.0 SPARES

7.1 Spares for operation and maintenance

Item wise unit prices of spare parts shall be quoted.

7.2 Commissioning Spares

Commissioning spares, as required, shall be supplied with the main equipment. Item wise list of recommended commissioning spares shall be furnished for approval.
7.3 Any other spare parts not specified, but required, shall also be quoted along with the offer.

7.4 All spare parts shall be identical to the parts used in the switch boards.

8.0 DRAWINGS

8.1 Vendor shall submit to Purchaser, for approval, before completion of manufacturing and assembly of equipment following drawings and literature.

   (i) Installation and maintenance manual including trouble-shooting chart.
   (ii) Panel drawings and cable schedule
   (iii) Block diagram and control logic.

9.0 CERTIFICATION

The motors and associated Variable frequency drive system equipment shall have test certificates issued by recognized independent test house (CIMFRI BASEEFA/ LCIE/UL/FM or equivalent). All indigenous motors shall conform to Indian Standards and shall be certified by Indian testing agencies. All motors (indigenous and imported) shall also have valid statutory approvals as applicable for the specified hazardous location. All indigenous flameproof motors shall have valid BIS license and marking as required by statutory authorities.

Also the motor nameplate shall clearly indicate that the motor is suitable for operation with variable frequency drive along with VFD make and model number.

10.0 PACKING AND DESPATCH

All the equipment shall be divided into several shipping sections for protection and ease of handling during transportation. The equipment shall be properly packed for selected mode of transportation i.e. ship/rail or trailer. The equipment shall be wrapped in polyethylene sheets before being placed in wooden crates/cases to prevent damage to the finish. Crates/cases shall have skid bottoms for handling. Special notations such as 'Fragile', 'This side up', 'Weight', 'Owner's particulars', 'PO nos.' etc., shall be clearly marked on the package together with other details as per purchaser for scrutiny. The equipment may be stored outdoors for long periods before installation. The packing shall be completely suitable for outdoor storage, in areas with heavy rains/high ambient temperature.
TECHNICAL SPECIFICATION

MEDIUM VOLTAGE VARIABLE FREQUENCY DRIVE SYSTEM

1.0 SCOPE

1.1 The scope of this specification is to define the minimum technical requirements for the design, manufacture, testing and supply of Medium Voltage, AC Variable Frequency Drive system. The VFD system shall be complete with Squirrel Cage Induction Motor/ Synchronous Motor as specified in data sheet, Converter, Converter input transformer, drive output transformer, DC link reactor with associated auxiliaries, harmonic filters and field mounted local motor control panel.

1.2 The Vendor shall be responsible for engineering and functioning of the complete system, meeting the intent and requirement of this specification and data sheets. This shall include but not be limited to inverter sizing, transformer sizing, transformer impedance selection, vector group, input and output harmonic filter design and sizing, output dv/dt filter sizing, motor cable selection and motor sizing/selection.

1.3 This specification applies to drives connected to line voltage up to 1000 V, AC.

2.0 CODES AND STANDARDS

2.1 The equipment shall comply with the requirements of latest revision of the following standards issued by BIS, unless otherwise specified:

- IS:325 Three-phase Induction Motors
- IS:3700 Essential Ratings and Characteristics of Semiconductor Devices
- IS:3715 Letter symbols for semi-conducting devices
- IS:4411 Code of designation of semi-conducting devices
- IS:5001 Guide for preparation of drawings of semiconductor devices and Integrated Circuits
- IS:5469 Code of practice for the use of semiconductor Junction Devices
- IS:14901 Semi-conductor devices - Discrete devices & Integrated Circuits
- IS:15880 Three Phase Cage Induction motors when fed from IGBT Converters Application Guide
- IS:8789 Values of Performance characteristics for Three Phase induction motor
- IS: 12615 Energy Efficient Induction Motors - Three Phase Squirrel Cage
- IEC:60947 Low Voltage Switchgear and Control gear
- IEC:60 146-1-3 Semiconductor Convertors general requirements and line commutated convertors-Transformer & reactors
- IEC:61800 Adjustable speed electrical power drive systems
- IEEE:519 Recommended Practices and requirements for Harmonics Control in Electrical power system

2.2 In case of imported equipment, standards of the country of origin shall be applicable, if these standards are equivalent or stringent than the applicable Indian standards.

2.3 The equipment shall also conform to the provisions of Indian Electricity rules and other statutory regulations currently in force in the country.

2.4 In case Indian standards are not available for any equipment, standards issued by IEC/BSNDE/IEEE/NEMA or equivalent agency shall be applicable.

2.5 In case of any contradiction between various referred standards/specifications/data sheet and statutory regulations the following order of priority shall govern:
3.0 GENERAL REQUIREMENTS

3.1 The offered equipment shall be brand new with state of art technology and proven track record. No prototype equipment shall be offered.

3.2 Vendor shall ensure availability of spare parts and maintenance support services for the offered equipment for at least 15 years from the date of supply.

3.3 Vendor shall give a notice of at least one year to the end user of equipment before phasing out the product/spares to enable the end user for placement of order for spares and services.

3.4 The vendor shall be responsible for design, engineering and manufacturing of the complete VFD system to fully meet the intent and requirements of this specification and attached data sheets.

4.0 SITE CONDITIONS

4.1 The AC drive system shall be designed to operate under specified site conditions as specified in the data sheets. If not specifically mentioned therein, a design ambient temperature of 50°C and an altitude not exceeding 1000 metres above mean sea level shall be considered.

4.2 The AC drive shall be installed indoors in a non-hazardous, air-conditioned or pressurized room, as specified in data sheet.

4.3 All the equipment shall be designed for continuous duty as per nameplate rating under the specified ambient conditions.

5.0 DESIGN AND FABRICATION REQUIREMENTS

5.1 Performance Requirement

5.1.1 The system shall be energy efficient, designed as standard product and shall provide very high reliability, high power factor, low harmonic distortion and low vibration/wear/noise. It shall be easy to install in minimum time and expense and no special tools shall be required for routine maintenance.

5.1.2 The system shall be designed to deliver the motor input current and torque for the complete speed torque characteristics of the driven equipment, with input supply variation of ±10% and frequency variation of ±3%. The system shall be suitable for the load characteristics and the operational duty of the driven equipment. It shall be capable of withstanding the thermal and dynamic stresses and the transient mechanical torque, resulting from short-circuit.

5.1.3 The drive system shall be designed to operate in one or more of the following operating modes as to suit characteristics of the driven equipment or specified in the data sheet:

   a. Variable torque changing as a function of speed i.e. Speed squared
   b. Constant torque over a specific speed range
   c. Constant power over a specific speed range where the torque decreases when speed increases
   d. Any other as specified in data sheet
5.1.4 The drive controller shall be equipped with microprocessor based digital regulator with programmable functions. The power control regulator logic shall provide for an acceleration/deceleration current limit curve and shall be capable of field adjustments without shutting the system down. Linear acceleration and deceleration shall be separately programmable from 0.1 to 20 seconds.

5.1.5 The System shall be suitable for single quadrant operation and the speed variation shall be with range 1:100 unless otherwise specified in data sheet with speed set accuracy of ±1% of rated maximum speed and steady state regulation of ±0.5% of rated speed.

5.1.6 The total harmonic distortion (THD) of the voltage and current at inverter output shall be as per IEC 61800 and same shall be considered in the design of the motor. The dv/dt limits & Vpeak shall also be as per IEC-61800-2.

5.1.7 Harmonics at the supply side of the drive system at primary of the main input transformer shall be restricted within the maximum allowable levels of current and voltage distortion as per recommendations in the latest edition of IEEE-519. The vendor shall perform design calculation for harmonic filter system considering VFD connected to the power system and including the supply of harmonic filters along with all accessories which shall be installed at owner's power system unless otherwise specified. These harmonic studies shall be conducted with maximum and minimum system fault level, cable capacitance, system equipment reactance etc.

5.1.8 The controller output overload capacity shall be 150% of rated current of motor for one minute for constant torque applications, and 110% of rated current for one minute for variable torque applications at rated voltage. If the motor load exceeds the limit, the drive shall automatically reduce the frequency and voltage to the motor to guard against overload. If load demand exceeds the current limit for more than 1 minute, the drive shall shut down to prevent over heating of the motor and damage to the drive.

5.1.9 During operation, the system shall be capable of developing sufficient torque under all load conditions to respond to a 20% alteration in speed set point within a time limit upto 60 seconds.

5.1.10 The integrator action of the speed set point alteration shall be independently adjustable for both an upward and a downward alteration. The minimum time interval between set point adjustments by the distributed control system shall be considered as 10 seconds.

5.1.11 The drive shall trip in case the speed exceeds 105% of the maximum operational speed or reduces to 95% of the minimum operational speed for more than 10 seconds.

5.1.12 Maximum noise level at the drive at 1-meter distance, under rated load with all normal cooling fans operating shall not exceed 85 dBA.

5.1.13 Variable frequency drive shall be arranged so that it can be operated in an open circuit mode, disconnected from the motor for start up adjustments and troubleshooting/ maintenance.

5.2 Control Requirement

5.2.1 The system shall operate on constant V/f supply with required voltage boost capability in low frequency mode of operation.

5.2.2 Short time voltage dips up to 20% of nominal voltage (e.g. in case of a large motor start up connected to the same bus as VFD) shall not cause the control system to stop functioning and shall not trip the drive system.
5.2.3 The system shall also be equipped with a momentary powerloss ride through feature which will restart the system in case of voltage dip over 20% or power interruptions for less than 2 seconds, with recovery of the voltage to its nominal value. The drive shall have the facility to block this feature, if required by the operator. Upon restart, the converter shall be capable of synchronizing onto a rotating motor and develop full acceleration torque within 10 seconds.

5.2.4 The system shall be suitable for number of starts as per attached specification for Medium Voltage Motors.

5.2.5 The power controller shall be regulated to always start the motor in the forward direction. Logic shall be provided to prevent the motor from being started in the reverse direction.

5.2.6 The drive motor shall be speed controlled corresponding to 4-20mA or 0-10 V reference input signal. Upon complete loss of the user's speed reference signal, the drive shall automatically run at constant speed as at 80-100% of the last speed reference available prior to the loss of signal.

5.2.7 It shall be possible to vary the speed of the drive in either manual or auto mode. Auto/Manual selection shall be from VFD panel unless otherwise specified.

   a. With the selector switch in "manual" mode, the operator shall be able to set the speed through key pad (mounted on front of the drive panel) or from speed increase/decrease push buttons (from the field). Motor operated potentiometer shall be provided as a speed set point device.

   b. With the selector switch in "auto" mode, speed of the motor shall be controlled from a 4-20 mA signal, from owner's PLC/DCS (Process Control) system. Necessary equipment required for interfacing with PLC/DCS shall also be provided in the VFD panel.

   c. Local/Remote selector switch shall be provided in local control station (in Field). With the selector switch in "Local" mode, the operator shall be able to start and set the speed through local control station (in Field). With the selector switch in "Remote" mode, speed of the motor shall be controlled either from VFD panel or from Owner's PLC/DCS as explained in a) and b) above.

5.2.8 The required provision for the interface with PLC/DCS (located at remote control room) including the details of communication module and data transfer facility, 1/0 details shall be furnished. The communication interface shall be via serial communication link with industry standard open protocol i.e. MODBUS/IEC-61850/ RS-485 etc. and same shall be coordinated with the interfacing equipment. In case the vendor is using their proprietary software, the interface software for use with owner's system (software) shall be provided.

5.2.9 Drive system shall have provision for interface with upper level automation such as Substation monitoring system or electrical control system in case specified in the data sheet/job specification.

5.2.10 The closed loop control feedback for the drive system having output transformer shall be tapped from the secondary side of the output transformer.

5.3 Panel Construction

5.3.1 The panel shall include suitable isolating device (i.e. Circuit breaker/MCCB/ Switch fuse) for main supply, contactors, semi conducting power devices (Diodes / IGBT) modules with protective devices, reactors, filters, output isolating device, control circuit, control accessories, indication and annunciation etc.
5.3.2 Main isolating device shall function as a manual disconnect and shall be an AC thermal magnetic circuit breaker or a fused switch with dual element fuse to trip automatically on fault currents, as specified in data sheet. Devices shall be lockable in the open position and shall have a minimum interrupting capacity as specified in data sheet. Interlock shall be provided between the door, so that door cannot be opened unless the breaker/switch is open.

5.3.3 Safety Interlock shall be provided so that power cabinet can't be opened unless the upstream breaker is disconnected, safety-grounding switch is closed and DC link capacitor is discharged. Power source breaker can only be closed once the earthing switch is open and panel door is closed with lock defeat facility.

5.3.4 The drive shall be suitably housed in sheet steel panels and shall be fabricated using cold rolled sheet steel. The sheet steel used for the panel shall be of minimum 2 mm CRCA except the doors & covers that may be made of 2mm CRCA. The panel shall be suitable for indoor installation, if not otherwise specified. The panel shall be free standing with degree of enclosure protection as IP-31. Maximum and minimum operating height shall be 1900 mm and 300 mm respectively.

5.3.5 Bolted un-drilled gland plate shall be provided at bottom. Clamp type terminals shall be used for connection of all wires up to 10 mm² and terminal for higher sizes shall be bolted type suitable for cable lugs. Minimum space for power cable termination shall be 300mm clear.

5.3.6 Bus bars shall be of electrolytic copper/aluminium, sleeved, color coded separately for AC and DC system. All the live parts shall be sleeved / shrouded to ensure complete safety to personnel intending to carry out routine inspection by opening the panel doors. All the equipment inside the panel and on the doors shall be provided with suitable nameplate. All wires shall be ferruled and terminals shall be properly numbered, minimum 20% spare terminals shall be provided.

5.3.7 All the power and control switches shall preferably be mounted on the door and shall be operable externally. All the analogue instruments, wherever provided, shall be switch board type, back connected, 96x96mm size. Scale shall have red mark indicating maximum permissible operating rating.

5.3.8 Each panel shall be provided with illuminating lamp/Il W CFL with switch and fuse. 5/15A, 240V power socket with switch and fuse shall be provided. Each panel shall have space heater with switch fuse and variable setting thermostat.

5.3.9 Copper earth bus of min. 30X6 mm size shall be provided at the bottom of the panel extending outside the panel on both sides. All the non-metallic components/parts shall be connected to the main earth bus bar. In case a separate earth bus for electronic control system is required, the same shall be indicated in the drawings.

5.3.10 All panels shall be of same height so as to form a uniform line-up, to give good aesthetic appearance.

5.3.11 All the control wiring shall be enclosed in plastic/ metal channel. Each wire shall be identified at both ends by self-sticking wire marker tapes or PVC ferrules. Power and control wiring inside the panel shall be done with BIS approved, PVC insulated, fire retardant, low smoke, copper conductor wire 1.5mm² size wire shall normally be used provided the control fuse rating is 10 Amps or less and 2.5 mm² size for control fuse rating above 16 A for electrical circuits and 0.5mm² for electronic circuits. All wires shall be ferruled and terminals shall be properly numbered, minimum 20% spare terminals shall be provided.
5.3.12 All electronic modules and components shall be accessible from front of panel only. Modular assemblies for both the system control electronic equipments and power electronic equipments shall be used.

5.3.13 DC link capacitor and pre-charging & discharging circuit shall be preferably mounted in the rear of the panel.

5.3.14 Suitable eyebolts/ lifting clamps/ strap & cradle arrangement shall be provided for lifting of the panel/shipping section. The bolts, when removed shall not leave any opening in the panel.

5.3.15 Acrylic type transparent insulating material shall be used for covering live components.

5.3.16 All equipment shall be complete with cable glands, lugs etc. and cable glands shall be single or double compression type for indoor and outdoor equipment respectively. Cable glands shall also be suitable for the hazardous area application if specified in data sheet.

5.4 Cooling

5.4.1 Cooling system shall include well-dimensioned panel, adequate cooling airflow path, module cooling fan and if necessary, panel cooling fan. Vendor shall ensure that the panel dimensions and flow paths have been designed for continuous running at the specified ambient without overheating. For fan cooled drives, redundant ventilating fans (N+1) shall be provided. Necessary starters shall be provided within the VFD panels for these fans. In case redundant cooling fan is not possible to be mounted, same shall be supplied loose.

5.4.2 MCB for motor space heater, auxiliary power supply if required for local panel, drive panel space heater etc. shall be included and mounted in easy accessible location.

5.5 Equipment/ Component Specification

5.5.1 Motor

The motor shall be designed, constructed and tested in accordance with the attached standard specification for Medium Voltage Induction Motor, in addition to the following requirements:

a. The motor shall be suitable for operation with a solid-state power supply consisting of an adjustable frequency inverter for speed control.

b. The motor shall be suitable for the current waveforms produced by the power supply including the harmonics generated by the drive.

c. The motor shall be designed to operate continuously at any speed over the range (10-100%) of rated speed unless otherwise specified in data sheet.

d. Motor shall be provided with thermistor type temperature detector

e. The motors shall be provided with Class 'F' insulation with temperature rise limited to Class ‘B’.

f. The permitted voltage variation should take into account the steady state voltage drop across the AC drive and all other system components upstream of the motor.

g. Motors required to be transferred to DOL by-pass mode shall be rated for specified variations in system line voltage and frequency. Starting current of motor in DOL bypass mode shall be limited to value specified in motor specifications, unless otherwise specified in datasheets.
h. The motor shall be constructed to withstand torque pulsations resulting from harmonics generated by the solid-state power supply.

i. The motor insulation shall be designed to accept the applied voltage waveform, within the Vpeak and dv/dt limits as per IEC-61800-2.

j. The drive manufacturer shall be solely responsible for proper selection of the motor for the given load application and the output characteristics of the drive.

k. Motors shall be provided with Resistance Temperature Detectors (RTDs).

l. Induced voltage at the shaft end of the motor at no load shall not exceed 250 mV rms for roller and ball bearings and 400 mV for sleeve bearings. The non driving end bearing shall be insulated from the motor frame to avoid circulating current. The insulated bearing end shield or pedestal shall bear a prominent warning.

5.5.2 Converter Transformer/ Output transformer

The converter transformer shall be suitable for use with the variable frequency drive system. The impedances of transformers with two secondary windings for 12 pulse systems shall be selected to ensure equal load/current sharing between the two secondary windings, the converters and the motor windings under all operational conditions including starting and restarting. The transformer shall be provided with ± 5% off circuit taps in steps of ± 2.5%.

5.5.3 Power Converter

a. The static power converter shall consist of a line side power converter for operation as a rectifier and a load side power converter for operation as a fully controlled inverter. Power converter shall be fast switching, most efficient and low loss type.

a. Normally, for all output short circuits, the inverter shall interrupt the current before any semi-conductor fuse blows. For internal short circuits, semi-conductor fuse protection shall be provided, and for faults upstream of semi-conductor fuses, the converter shall be able to withstand a three-phase short circuit current until interrupted by normal breaker operation. In case of fuseless design, the failure shall be limited to the particular device, without causing any damage to other parts of the power module. There must be clear annunciation of the failure of the device.

b. All power converter devices shall include protective devices, snubber networks and dv/dt networks as required.

c. The current rating of the converter's semi-conductor components shall not be less than 120% of the nominal current flowing through the elements at full load of the VFD through the entire speed range.

d. All power diodes shall be of silicon type with minimum VBO rating as 2.5 times the rated operating voltage.

e. The power converter circuit shall be designed so that motor can be powered at its full nameplate rating continuously without exceeding its rated temperature rise due to harmonic currents generated by the inverter operation.

f. The conversion devices and associated heat sinks shall be assembled such that individual devices can be replaced without requiring the use of any special precautions/tools.
g. The cooling system of the electronic components, if provided, shall be monitored and necessary alarms shall be provided to prevent any consequential damage to the power control devices.

h. All the power transistors, thyristors and diodes shall be protected with high-speed semiconductor grade fuse. I2t particulars of the power controller devices and the fuses shall be properly co-ordinated for the selection of fuses.

5.5.4 DC Link Reactor

a. Smoothing reactors for the DC link shall be designed to sufficiently decouple the rectifier and inverter portion of the converter and to limit fault currents in this circuit. AC line reactors, if provided as per standard vendor design, shall be suitable for harmonic suppression and fault current limitation.

b. The reactor shall be dry type, air cooled or fan cooled type located within the panel. In case of fan cooled type, operation of fans shall be monitored.

c. Reactor shall be suitable for operation with the non-sinusoidal current wave shapes and DC components under all operational conditions of the system without exceeding its temperature limits.

5.5.5 Output Filter

VFD output current waveform shall be inherently sinusoidal at all speeds, with harmonic limits as per C1.5.1.6. Output filter capacitors shall be provided with discharge circuits to ensure that all residual stored charge is reduced to less than 50 V DC within 60 seconds after a loss of AC voltage. The VFD system shall inherently protect motor from high voltage dv/dt stress, independent of cable length to motor. Output filter shall be an integral part of the VFD system and included within the VFD enclosure.

5.5.6 Bypass Feature

5.5.6.1 Output contactor/Load Break Switch shall be provided for isolation between the output of the controller and the motor for VFD systems with Bypass feature.

5.5.6.2 Bypass feature shall be provided, if specified in the data sheet. Accordingly Bypass feature with Bypass starter shall meet the following requirements, unless otherwise specified in the data sheet:

Bypass starter shall comprise of switch-fuse, contactor, bimetal relay meeting the requirements of Type-2 coordination as per IS/IEC-60947. CBCT and ELR shall be provided for motors rated above 22kW & upto 55kW unless otherwise specified in the data sheet. Heavy duty starters shall be provided with saturable type current transformer operated overload relay only, which shall be suitable for motor starting time of 15-60 seconds. For motors rated above 55kW, ACB/MCCB and motor protection relay along with necessary metering shall be provided.

Bypass starter shall be in separate compartment and it shall be possible to isolate and maintain the VFD while drive motor runs in Bypass mode. Three contactors/ breakers shall be used for this purpose, one contactor in the bypass and two contactors across the drive, such that in case of drive mal-operation, the motor could be taken on bypass control, while the drive could be attended by opening its contactors. Suitable interlock shall be provided such that bypass mode and VFD mode shall not operate simultaneously.

5.5.7 Local Motor Control Station
a. The local motor control station, to be installed in the field near the motor shall conform to the attached specifications. Components and accessories that are required in the local motor control station may be mounted on the local field mounted panel envisaged for the driven equipment.

b. Meters in the local control station for motors rated above 5.5kW shall be suitable for 4-20mA transducer outputs and shall be calibrated for the actual motor current unless specified otherwise. Further, for drives with bypass facility, the meters shall be capable of reading bypass full load and starting currents, as well as the drive current. Local-off-Remote selector switch shall be provided in the LCS for selection of control from Local (i.e. LCS in Field) and Remote (i.e. from VFD panel / DCS / PLC).

5.6 Protection, Control, Metering, Indication and Annunciation

5.6.1 The system vendor shall provide all the necessary system control, protection, alarm and metering equipment for the entire drive system and its auxiliary equipment.

5.6.2 Automatic sequence control shall include start-up of cooling system, auxiliary system of the motor, interlock checking, automatic start and run-up of drive, planned and emergency shutdown. The same shall be processed through microprocessor-based system.

5.6.3 Operator Control Panel

a. Each drive shall be equipped with a front mounted operator control console consisting of a backlit alphanumeric display and a keypad with keys for parameterization and adjusting parameter which shall not be limited to Start/Stop, Local/Remote, Auto/Manual, Increase/Decrease, menu navigation and protection and measurement parameter selection, etc.

b. All parameter names, fault messages, warnings and other information shall be displayed in complete English words or standard English abbreviations to allow the user to understand the display without the use of a manual or cross-reference table. This shall also be used for the modification of all electrical values, configuration parameters, drive menu parameters, application and activity function access, faults, local control, adjustment storage, self test and diagnostics. Keypad shall be operable with password for changing the protection setting, safety interlock etc. However, the parameters such as measurements, setting, mode of drive etc. shall be allowed to be viewed without any password.

c. Operator console shall have facility/ port to connect external hardware such as Laptop etc. Console shall have facility to upload and download all parameter settings from one drive to another identical drive for start-up and operation.

d. Drive system control shall also have facility to receive tripping signal from upstream breaker for tripping and also provision for closing upstream breaker after all required process parameters are achieved.

e. User-friendly software for operation and fault diagnostic shall be loaded in the drive system panel before commissioning.

5.6.4 Protective Features

The system shall incorporate adequate protective features, properly coordinated for the drive control and for the motor but not limited to the following:

I. Incoming line surge protection
II. Under / Over voltage protection
III. Phase loss protection.
IV. Programmable over current protection and under load protection.
V. Inverter Fault.
VI. Over frequency/Over speed of motor
VII. Ventilation loss (In case same is not provided, drive shall generate an over temperature fault alarm and suitable sensors, as required for same, shall be provided).
VIII. Over temperature of equipment.
IX. Specific motor protection, including motor winding, bearing temperatures, over current, overload, negative phase sequence and earth fault protections etc.
X. System earth fault protection.
XI. Excitation system protection for synchronous motor
XII. Over and under frequency, rotor earth fault (if applicable), field failure protection for synchronous motor
XIII. Additional protection, if any for the drive system

5.6.5 Alarms

The system shall incorporate protection alarms, required for various fault conditions, for the Drive motor, Supply cables, Converter Transformer, DC Reactor and the Converter. Alarms shall also be included for the failure of various auxiliaries together with identification of the failing unit, loss of cooling system, various protection devices provided for converter transformer etc.

5.6.6 Control

The following controls shall be provided as a part of the Operator Control Panel or through separate switches.

I. Start/Stop
II. Speed control (Raise/Lower)
III. Forward/Reverse (if specified)
IV. Auto/Manual /Test mode
V. Local/Remote
VI. Emergency stop
VII. Start/Stop for bypass starter (where specified)
VIII. Trip-Remote Breaker
IX. Excitation control system for synchronous motors
X. Sequential switching of filters

5.6.7 Indications

Vendor shall provide indications as required for normal operation and for ease of maintenance, which shall not be limited to the following indications.

I. Motor running
II. Motor stopped
III. VFD System Fault
IV. System ready to start
V. AC mains ON
VI. Motor over speed
VII. Rectifier output ’ON’
VIII. Motor zero speed
IX. Remote breaker trip
X. Excitation system healthy for synchronous motors

Above indications may be provided as a part of the operator control panel, i.e. door mounted keypad or through hardwired LEDs. LEDs provided for indication shall be cluster type with adequate brightness and minimum 2 Nos LEDs chips per light. LEDs shall be connected in parallel and each LED chip having diameter not less than 3mm. Potential free contacts for items i to iv shall be wired separately for remote indications in DCS system.

5.6.8 Metering

Digital display of the following parameters shall be as a part of the Operator Control Panel, selectable by the operator.

I. Output voltage
II. Output current-VFD model Bypass mode
III. Output frequency
IV. Drive thermal state
V. Motor speed
VI. Motor energy meter
VII. Hour Run
VIII. Voltage and current meter for excitation system of synchronous motor
IX. KVAR, power factor meter for synchronous motors
X. Speed and motor current in DCS unless otherwise specified for other parameters.

5.6.9 Annunciations

Potential free contacts shall be provided for following annunciations and shall be wired up to terminal block for owner's use for remote monitoring:

I. Rectifier fuse failure/Drive fault
II. Main AC failure
III. Inverter fuse failure/Drive fault
IV. Inverter overload
V. Inverter high temperature/Drive fault
VI. Failure of panel cooling system
VII. Motor failed to start/Drive fault

All drive internal faults will be annunciated as drive fault.

5.7 Fault Diagnostic

Fault diagnostic shall be built into the system to supervise the operation and failure of the system. The information regarding failure of any of the system including, shutdown of the system, shall be available for a period of minimum 4 days (96 hours) after a shutdown, even though no supply would be available to the system. The system may be totally de-energized for maintenance or otherwise. It shall be possible to retrieve the record of events prior to tripping of the system or de-energisation. Auxiliary supply to the system components or to the electronics (firmware) for the diagnostics / display shall be taken care by the manufacturer for this purpose.

5.8 External Power supply for auxiliary and Control Circuit
Control supply for devices external to VFD module i.e. contactors control, space heater supply for Motor / VFD, indicating lamps digital meters (Ammeter, Speedometer) etc. shall operate on 240 V control supply derived from single-phase control supply transformer, with switchfuse provided in primary and MCB in secondary, located inside the drive controller.

5.9 Reliability Features

The expected lifetime of the VFD shall be minimum 20 years. The VFD including all individual components forming part of the system shall have an availability of minimum 0.997 and a minimum MTBF of 4 years.

The controller design shall incorporate the following reliability features:

- Pre-tested components with power components to be 100% tested under dynamic conditions.
- Printed circuit boards shall be computer tested and adjusted.
- Printed circuit boards shall be temperature cycled for a minimum of 40 hours.
- Printed circuit boards shall be treated for tropical, humid and corrosive environment.

5.10 Maintenance features

The controller design shall incorporate the following maintenance features:

- Modular construction
- Printed circuit boards shall be plug connected.
- All components shall be easily accessible.
- Standard diagnostics to aid maintenance personnel. These shall include LED or alphanumeric displays, test or measurement points.

5.11 Painting

5.11.1 After preparation of the under surface, the panel shall be spray painted with two coats of epoxy based final paint or shall be powder coated. The color shade of final paint shall be as RAL 7032, unless specified otherwise. Panel finish shall be free from imperfections like pinholes, orange peels, runoff paint, etc.

5.11.2 All metal surfaces shall be thoroughly cleaned and de-greased to remove mill scale, rust, grease and dirt. Fabricated structures shall be pickled and then rinsed to remove any trace of acid. The under-surface shall be prepared by applying a coat of phosphate paint and a coat of yellow zinc chromate primer. The under-surface shall be made free from all imperfections before undertaking the finishing coat.

5.11.3 All unpainted steel parts shall be zinc passivated, cadmium plated or suitably treated to prevent rust and corrosion. If these parts are moving elements, then these shall be greased.

6.0 INSPECTION, TESTING AND ACCEPTANCE

6.1 All tests shall be carried out at the manufacturer's works under his care and expense. The tests shall be witnessed by an inspector of PDIL/Owner or of an agency authorized by the owner. Prior notice of minimum 4 weeks shall be given to the inspector for witnessing the tests.

6.2 During fabrication, the drive shall be subject to inspection by PDIL/Owner, or by an agency authorized by the Owner, to assess the progress of work, as well as to ascertain that only quality raw material is used.
6.3 All Routine & Type Tests shall be conducted as per the NIT for HV variable frequency drive 6-81-1050 as per IEC 61800-2. However, combined test for VFD and motor at vendor's works shall be carried out if specified in the datasheet.

6.4 String Test with driven equipment

If a string test with driven equipment is specified in the data sheet of the driven equipment, it shall be carried out with the job equipment.

7.0 SPARES

7.1 Spares for operation and maintenance

Item wise unit prices of spare parts shall be quoted.

7.2 Commissioning Spares

Commissioning spares, as required, shall be supplied with the main equipment. Item wise list of recommended commissioning spares shall be furnished for approval.

7.3 Any other spare parts not specified, but required, shall also be quoted along with the offer.

7.4 All spare parts shall be identical to the parts used in the switch boards.

8.0 DRAWINGS

Vendor shall submit to Purchaser, for approval, before completion of manufacturing and assembly of equipment following drawings and literature.

(i) Installation and maintenance manual including trouble-shooting chart.
(ii) Panel drawings and cable schedule
(iii) Block diagram and control logic.

9.0 CERTIFICATION

The motors and associated Variable frequency drive system equipment shall have test certificates issued by recognized independent test house (CIMFR BASEEFA/ LCIE/UL/FM or equivalent). All indigenous motors shall conform to Indian Standards and shall be certified by Indian testing agencies. All motors (indigenous and imported) shall also have valid statutory approvals as applicable for the specified hazardous location. All indigenous flameproof motors shall have valid BIS license and marking as required by statutory authorities.

Also the motor nameplate shall clearly indicate that the motor is suitable for operation with variable frequency drive along with VFD make and model number.

10.0 PACKING AND DESPATCH

All the equipment shall be divided into several shipping sections for protection and ease of handling during transportation. The equipment shall be properly packed for selected mode of transportation i.e. ship/rail or trailer. The equipment shall be wrapped in polyethylene sheets before being placed in wooden crates/cases to prevent damage to the finish. Crates/cases shall have skid bottoms for handling. Special notations such as 'Fragile', 'This side up', 'Weight', 'Owner's particulars', 'PO nos. etc., shall be clearly marked on the package together with other details as per purchaser for scrutiny. The equipment may be stored outdoors for long periods before installation. The packing shall be completely suitable for outdoor storage, in areas with heavy rains/high ambient temperature.

1.0 SCOPE

The intent of this specification is to define the requirements for design, manufacture and supply of Flame Retardant type PVC sheathed cables for use in plant communication and fire alarm systems and Jelly filled telecommunication cables.

2.0 CODES AND STANDARDS

2.1 The equipment shall comply with the requirements of the latest revision of the following standards issued by BIS and DOT, unless otherwise specified:

2.1.1 BIS standards:

- **IS-694**: PVC insulated cables for working voltages upto and including 1100V.
- **IS-1554 (Part-I)**: PVC insulated (heavy duty) electric cables-(Part-I for working voltages up to and including 1100V).
- **IS-5831**: PVC insulation and sheath of electric cable.
- **IS-8130**: Conductors for insulated cables and flexible cords.
- **IS-9938**: Recommended Colours for PVC insulation for LF wires and cables.
- **IS-10418**: Drums for electric cables.
- **IS-10462 (Part-1)**: Fictitious calculation method for determination of dimensions of protective coverings of cables:(Part-I Elastomeric and thermoplastic insulated cables).
- **IS-10810 (Part- 61)**: Methods of test for cables (Part 61. Flame retardant test)
- **IS-12444**: Continuously cast and rolled electrolytic copper wire rods for electrical conductors.

2.2 DOT Standards:

- **GRJWIR-06/03**: Specification for cable - switchboard (Screened and Unscreened) Generic Requirements.
- **G/CUG-O1/02**: Specification for solid polythene insulated fully filled, Polythene sheathed underground telecom cables.

2.3 In case of imported cables, standards of the country of origin shall be applicable, if these standards are equivalent to or stringent than the applicable Indian standards.

2.4 The cables shall also conform to the provisions of the Indian Electricity rules and other statutory regulations currently in force in the country.

2.5 In case Indian standards are not available for any material, standards issued by IEC / BS / VDE / IEEE / NEMA or equivalent agency shall be applicable.
2.6 In case of any contradiction between various referred standards/ specifications/ datasheets and statutory regulations the following order of priority shall govern:

- Statutory regulations.
- This specification.
- Codes and standards.

3.0 SITE CONDITIONS

Cables shall be suitable for installation in following conditions:

i. Above ground in open-air locations (trays / ducts) in tropical, humid and corrosive atmosphere prevalent in refineries/petrochemical plants with severe weathering and exposure to solar radiation.

ii. Directly buried in underground trenches, conduits with uncontrolled back-fill and possibility of flooding by water and chemicals.

iii. Unless otherwise specified, the design ambient air temperature of 45° C / ground temperature of 30° C.

iv. Cables shall be operating near electromagnetic radiations due to high voltage installation and other wireless equipments. Adequate screening shall be provided to make build the electromagnetic immunity.

4.0 TECHNICAL REQUIREMENTS - NON JELLY FILLED CABLES

4.1 Conductors

4.1.1 The size of conductor shall be as per job requirement.

4.1.2 The conductors shall consist of annealed, high conductivity solid copper wire, smoothly drawn, circular in cross-section, uniform in quality, free from defects and uniformly coated with pure tin and shall conform to Cl. 3.0 of DOT specification GR/WIR-06/03. For telecommunication cables conductor shall be 0.5 mm and for PA system conductor dia shall be 0.6 mm as minimum. For fire alarm cables size of conductor shall be chosen based on sum of the current drain of all field points in that circuit.

4.2 Insulation

4.2.1 The core insulation shall be with PVC compound applied over the conductor by extrusion.

4.2.2 PVC insulation, when used shall meet the following requirements:

<table>
<thead>
<tr>
<th>Conductor (Area)</th>
<th>Diameter</th>
<th>Type of Insulation</th>
<th>Thickness of Insulation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Upto 0.63 mm (0.3mm²)</td>
<td>Type-2 of Table-3 as per IS-13176</td>
<td>As per Table-I of DOT Specs. GR/WIR-09/02</td>
<td></td>
</tr>
<tr>
<td>Above 0.63mm (Above 3.0 MM²)</td>
<td>Type-A as per IS-5831</td>
<td>Table-2 as per IS-1554 (Part-I)</td>
<td></td>
</tr>
</tbody>
</table>

4.2.3 The colours used for insulation shall conform as nearly as practicable to the standard colours as per 18-9938. The wire insulation shall have colours in accordance with Table-2 of DOT specification GR/WIR-06/03. The applied colour shall neither have deleterious effect on the electrical, mechanical or ageing properties of basic insulation nor shall get damaged by any friction etc.
4.2.4 For single pair cables, the colour shall be incorporated in the insulation.

4.2.5 For multi pair cables, cores shall have uniform pattern of continuous spiral (Pitch not exceeding 25mm) to facilitate easy identification. This may be done by the application of one or more coloured strips on a base colour or by direct extrusion.

4.2.6 Alternately, colouring may consist of concentric coloured rings or dots or dashes on the base colour. The coloured rings, dots or dashes shall have a width of not less than 1.0mm and shall be repeated along the length of the insulation at an interval not less than 15mm and not more than 25mm.

4.2.7 The dots or dashes shall be applied on diametrically opposite sides of the insulation, so that all colours are visible when the insulation is viewed from any side.

4.3 Twisting
The two insulated conductors of a pair shall be uniformly twisted with a suitable right hand lay, which shall not exceed 80mm.

4.4 Core Formation
The core formation shall conform to C1.6.0 of DOT specification no. GR/WIR-06/03.

4.5 Screen
4.5.1 Unless otherwise specified the cables used for fire alarm and detection shall be provided with overall screen. The screen shall be of aluminium tape with minimum thickness of 0.04mm. The overlap shall be minimum 3mm for cables up to 50 pair & minimum 6mm for cables above 50 Pair. The screen shall be backed by an outer protective layer of 0.13mm PVC tape or other non hygroscopic material lapped applied longitudinally or helically with overlap.

4.5.2 The cables shall be provided with a drain wire. Drain wire shall have a minimum cross-section of 0.5mm², shall be composed of multistrand bare tinned annealed copper conductor. The drain wire shall be in continuous contact with the aluminium side of the overall screen. The drain wire resistance including screen shall not exceed 30 ohm/km.

4.6 Ripcord
A non-metallic ripcord of suitable quality shall be laid longitudinally under the inner sheath & screen. The ripcord when pulled shall cut through the sheath and strip the core.

4.7 Inner Sheath
4.7.1 An extruded inner sheath of type ST1 PVC, as per IS-5831, with minimum thickness as per Table-4 of IS-1554 (Part-1) shall be applied over the laid up core, by extrusion to fit closely on it.

4.7.2 The inner sheath shall be as circular as possible. It shall be possible to remove the inner sheath without damage to the insulation.

4.7.3 When one or more layers of non-hygroscopic tape is helically applied over the laid up cores, as a binder, the thickness of such tape(s) shall not be construed as a part of the inner sheath.

4.8 Armour
4.8.1 The cables shall be provided with armouring, made of hot dip galvanised steel wire /strip over the inner sheath.
4.8.2 The armour shall be by means of 10.4mm thick round wires for cables with under armour diameter upto 13mm. For cables with an under armour diameter above 13mm, the armour shall either be of steel strip or round wire with thickness as per IS-1554 (Part-1).

4.9 Outer Sheath

4.9.1 The cables shall be provided with an extruded PVC sheath for external protection. The PVC shall be type ST1 PVC, as per IS-5831.

4.9.2 The other sheath shall be with oxygen index 29 at 27±2°C and possess flame retardant properties meeting the requirements of IS 10810 Part-62 category - AF. In addition, suitable chemicals shall be added to the PVC compound of the outer sheath to protect the cable against rodent and termite attack.

4.9.3 The thickness of outer sheath shall be as per IS-1554 (Part 1).

4.9.4 The outer sheath shall fit tightly on the armour and shall be applied in such a manner that no undue residual strain is left in the material.

4.9.5 The outer sheath shall be grey in colour except for cables to be used for fire alarm system where it shall be red.

4.9.6 Sequential marking of the length of the cable, in meters, shall be provided on the outer sheath at every one meter. The marking shall be legible and indelible by suitable method.

4.9.7 The overall diameter of the cables shall be strictly as per the values declared in the technical information furnished along with the bids, subject to a maximum tolerance of ±2 mm.

4.10 Cable Capacitance

4.10.1 The core to core capacitance of the cables shall not exceed 100nF/Km at 1KHz.

4.10.2 The core to screen capacitance for the screened cables shall not exceed 250nF/Km at 1KHz.

5.0 TECHNICAL REQUIREMENTS FOR JELLY FILLED CABLES

5.1 Jelly filled telecom cables shall in general conform to the requirements of DOT specification G/CUG-01/02, unless otherwise specified in this specification.

5.2 Conductors

5.2.1 The conductors shall consist of annealed, high conductivity solid copper wire, smoothly drawn, circular in cross-section, uniform in quality, free from defects and uniformly coated with pure tin and shall conform to cl. 3.0 of DOT specification G/CUG-01/02.

5.3 Insulation

5.3.1 Each conductor shall be insulated with insulating grade PE conforming to C1.4.0 of DOT specification G/CUG-01/02.

5.4 Twisting

The two insulated conductors of a pair shall be uniformly twisted with a suitable right hand lay, which shall not exceed 150mm.

5.5 Core Formation

The core formation shall conform to C1.6.0 of DOT specification G/CUG-01/02.
5.6 **Filling Compound**

5.6.1 The cable shall be filled with a suitable stable water resistant compound, which shall be compatible with the insulation, binders and tapes used in the cable.

5.6.2 It shall be homogeneous and uniformly mixed material containing an anti-oxidant.

5.6.3 The compound shall not obscure the identification of the colour of the insulation of the conductors.

5.6.4 It shall not contain dirt, metallic particles or other foreign matter.

5.6.5 The compound shall be readily removable from the insulated conductors by wiping.

5.6.6 It shall be free from any unpleasant odour and shall have no toxic or dermatic hazards.

5.6.7 The flash point of the compound shall not be less than 200°C.

5.6.8 The volume Resistivity measured at 100°C shall not be less than 1010 ohm·em.

5.6.9 The permittivity at 1 MHz tested as per ASTM 0-924 shall not be greater than 2.3 at 20°C.

5.7 **Core Wrapping**

At least one closed helical or longitudinal application of a non-hygroscopic and non-wicking polyester tape or tape of any other suitable material shall be provided over the cable core.

5.8 **Screen**

5.8.1 The cables shall be provided with overall screen. The screen shall be of aluminium tape with minimum thickness of 0.2mm. The overlap shall be minimum 3mm for cables having maximum diameter over inner sheath < 30mm & minimum 6mm for cables having maximum diameter over inner sheath ~ 30mm. The screen shall be coated with 0.05 mm nominal thickness polythene/copolymer on both sides. The thickness of the composite tape shall be 0.3mm±15%.

5.8.2 The aluminium tape shall be electrically continuous throughout the length of the cable.

5.9 **Inner Sheath**

5.9.1 The inner sheath shall be as circular as possible and free from pinholes and other defects. It shall be possible to remove the inner sheath without damage to the insulation.

5.9.2 The inner sheath shall be of polythene conforming to type 03C or H03C of BS 6234 and shall contain a suitable antioxidant system. The material shall be virgin as per ASTM 0-883 and meet the following requirements.

- **Density**: 0.910 to 0.940 g/100g for 03C and > 0.940 g/100g for H03C
- **Melt Flow index**: Maximum 1.0 g/10 minutes (190 °C, 2160 g load)

5.9.3 The thickness of inner sheath shall conform to Table - 6 of DOT specification no. G/CUG01/02.

5.9.4 The maximum diameter over inner sheath shall conform to Table - 7 of DOT specification no. G/CUG-O 1/02.

5.10 **Armour**
5.10.1 The cables shall be provided with bedding and armour over the inner sheath.

5.10.2 The bedding shall consist of two close helical lappings of polythene or polypropylene tape. Each tape shall be applied with a minimum of 5% overlap.

5.10.3 The armour shall be made of hot dip galvanised steel tape of thickness as per Table - 8 of DOT specification G/CUG-01/02.

5.11 Outer Sheath

5.11.1 The external protection shall consist of a polythene sheath conforming to the material specification defined in Clause 5.9 above.

5.11.2 The thickness of outer sheath shall conform to Table - 9 of DOT specification G/CUG-01/02.

5.11.3 The outer sheath shall be as circular as possible and free from pinholes and other defects. It shall be possible to remove the inner sheath without damage to the insulation.

5.11.4 The outer sheath shall be grey in colour except for cables to be used for fire alarm system where it shall be red.

5.11.5 The maximum diameter over outer sheath shall conform to Table - 7 of DOT specification G/CUG-01/02.

5.12 Cable Capacitance

The average mutual capacitance of the pairs measured at 800 to 1000Hz shall be 52 ± 3 nF/km.

However, the mutual capacitance of individual pairs shall be within the limits of 52 ±4.5 nF/km.

6.0 INSPECTION, TESTING AND ACCEPTANCE

6.1 The cables shall be tested and examined at the manufacturer's works. All the materials employed in the manufacture of the cable shall be subjected to examination, testing and approval by PDIL/Owner. Manufacturer shall furnish all necessary information concerning the supply to PDIL/Owner's inspectors. The inspector shall have free access to the manufacturer's works for the purpose of inspecting the process of manufacture in all its stages and he will have the power to reject any material, which appears to be of unsuitable description or of unsatisfactory quality.

6.2 The following acceptance tests shall be conducted on the completed jelly filled cables as per the test procedures given in DOT specification G/CUG-01/02 and this specification:

i. Measurement of diameter of conductor, over inner sheath & over outer sheath.

ii. Measurement of Thickness of insulation, inner sheath, screen, armour & outer sheath.

vi. Colour coding.

vii. Conductor continuity test.
viii. Mutual Capacitance test.
ix. Capacitance Unbalance test.
x. Cross talk test.
xi. Attenuation test.
xii. Insulation resistance test.
xiii. Dielectric strength test.
xiv. Drip test.
 xv. Armour Galvanisation Test.
 xvi. Conductor Annealing Test.
 xvii. Measurement of drum length.

6.3 The following tests shall be conducted on the completed non jelly filled cables as per the test procedures given in DOT specification GR/WIR-06/03 and this specification:

6.3.1 Acceptance tests:
i. Measurement of diameter of conductor, over inner sheath & over outer sheath.
ii. Measurement of Thickness of insulation, inner sheath, screen, armour & outer sheath.
iv. Colour coding.
v. Conductor continuity test.
vi. Mutual Capacitance test.
vii. Capacitance Unbalance test.
viii. Insulation resistance test.
ix. High Voltage test.
x. Armour Galvanisation Test.
 xi. Conductor Annealing Test.
 xii. Measurement of drum length.

6.3.2 Special Tests
The non jelly filled cables shall also be subjected to following special tests.
i. Oxygen Index test as per IS-1 0810 (Part 58).
ii. Flammability test on finished cable as per IS-10810 (part 61 & 62).

The special test shall be conducted on one sample from each lot. The sample will be selected by the inspector.

7.0 PACKING AND DESPATCH
7.1 Cables shall be despatched in non-returnable wooden drums of suitable barrel diameter, securely battened, with the take-off end fully protected against mechanical damage. The wood used for construction of the drum shall be properly seasoned, sound and free from defects. Wood preservatives shall be applied to the entire drum. Ferrous parts used shall be treated with a suitable rust preventive finish or coating to avoid rusting during transit and storage.

7.2 On the flange of the drum, necessary information such as project title, manufacturer's name, type, size, length of cable in meters, drum no., cable code, BIS certification mark, gross weight, 'Owner's particulars', 'P.O. numbers' etc., shall be printed. An arrow shall be printed on the drum with suitable instructions to show the direction of rotation of the drum.

7.3 Cables shall be supplied in drum lengths of 1000 meters, if not specified otherwise.

7.4 For non jelly filled cable, PVC / rubber end caps shall be supplied free of cost for each drum with a minimum of eight per thousand meter length. In addition, ends of the cables shall be properly sealed, with caps, to avoid ingress of moisture/water during transit and storage.

7.5 For jelly filled telephone cables, the ends of the cable shall be sealed by thermo shrinkable end caps of adequate wall thickness. Alternately ends may be sealed by enclosing them in rubber or PVC caps of wall thickness not less than 1.8mm. The caps shall be secured to the outer sheath with hose clips or ties or black adhesive tape or heat shrinkable sleeves.

7.6 The cables may be stored outdoors for long periods before installation. The packing shall be suitable for outdoor storage in areas with heavy rains / high ambient temperature, unless otherwise agreed.

1.0 SCOPE

1.1 This standard covers the technical requirements of design, manufacture, testing at works and delivery in packed condition of “Indoor type Shunt Capacitor Bank & Associated Equipment” required for system power factor improvement.

1.2 This standard shall be read in conjunction with relevant part of Design Philosophy - Electrical.

1.3 The capacitor bank and associated equipment shall generally consist of the following.
   i) Basic Star connected capacitor bank
   ii) Basic capacitor unit with built in fuse
   iii) Discharge resistor
   iv) Series reactor
   v) Residual V. T. for mounting voltage unbalance
   vi) Set of Raychem make heat insulated sleeved of suitable voltage rating for bus bars.
   vii) Copper bus bar interconnecting the basic units.
   viii) Set of supporting insulators
   ix) Hot dip galvanised Steel stand/racks / cabinets of mounting capacitor units complete with interconnection insulator etc.
   x) Door limit switch
   xi) Control panel for automatic operation
   xii) Any other equipment not specified, but required for safe & proper operation of the system.

2.0 STANDARDS TO BE FOLLOWED

2.1 The design, manufacture & testing of the equipment covered by this specification shall comply with the latest issues of following Indian standards, unless otherwise specified.

2.2 The design & operation features of equipment shall also comply with provision of the latest issue of the Indian Electricity Rules & other relevant statutory acts & regulation. The supplier shall, wherever, necessary, make suitable modification in the equipment to comply with the above.

2.3 Wherever, any requirement laid down in this standard differs, from that in Indian standard specification, the requirement specified herein shall prevail. Equipment complying with equivalent IEC standards shall also be acceptable.

3.0 SERVICE CODITIONS

3.1 Ambient Conditions

These shall be as indicated in Design Philosophy - Electrical.

3.2 System Details

These shall be as indicated in Design Philosophy - Electrical.

4.0 OPERATING REQUIREMENTS

4.1 The capacitor bank and associated equipment shall be suitable for operating at the specified rating continuously with the specified voltage and frequency variation under the ambient condition without exceeding the permissible temperature rise and without any detrimental effect on any part of equipment.

4.2 The capacitor bank and associated equipment shall be suitable for parallel switching and withstand the thermal and dynamic stresses caused by transient during switching operations.

5.0 GENERAL DESIGN FEATURES

5.1 Capacitor Unit

5.1.1 The capacitor bank / sub bank shall comprise of appropriate number of basic single phase units & which shall be connected in star formation to obtain rated KVAR at rated voltage.

5.1.2 Each unit shall have required number of capacitor elements housed in hermetically sealed, leak proof, sheet steel container. The container shall be provided with suitable brackets, supporting insulators, terminal & bushing for external connections.

5.1.3 Each element of basic units has its own built in fuse which shall isolate the faulty element automatically without affecting the healthy elements.

5.1.4 The capacitor units shall have overload capacity as per IS 13925. The capacitor bank shall be suitable for continuous operation at 110% of rated RMS voltage and at 130% of rated RMS current.

5.1.5 Capacitor units shall be all high grade All Polypropylene type with non-PCB base, bio degradable, non-toxic impregnant. The capacitors offered shall be built from best material and shall develop minimum losses. Capacitor bank losses shall be given at
45°C. Capacitor shall be compact in size, metal enclosed and hermetically sealed. Internal silver wire fuses shall be provided for protection of each capacitor element.

5.1.6 The Capacitor bank and associated equipments shall be suitable for parallel switching and withstand the thermal and dynamic stresses by transient during switching operation.

5.1.7 All the fasteners and bolts shall be hot dip galvanized or zinc passivated.

5.1.8 Capacitors shall be provided with Overpressure protection as necessary for safety. Overpressure switches shall be fitted to the capacitor units and connected to trip the capacitor bank.

5.1.9 Each unit shall have required number of capacitor elements housed in sealed, leak proof, sheet steel container. The container shall be provided with suitable mounting brackets, supporting insulators, terminal & bushing for external connections.

5.1.10 The indoor capacitor bank units shall be installed in metallic housing with minimum IP-43 protection.

5.1.11 Each capacitor unit shall be mounted so that it can be easily removed from the racks and replaced without removing other units, de-assembling any part of the rack.

5.1.12 The outside of the capacitor units and other structures should have smooth and tidy look and should be coated with weather-proof, corrosion resistant epoxy paint of light gray shade, shade no. 631 of IS 5. The structure shall be suitably GI coated. Minimum coating shall not less than 600 micron / sq meters.

5.1.13 Each element of basic units has its own built in fuse which shall isolate the faulty element automatically without affecting the healthy elements. In case of one element failure, harmful over voltage shall not be generated across remaining elements and shall not make appreciable change in the operation of capacitor bank. An operation of a single fuse element does not cause cascaded fuse blowing. Permissible over voltages and surges do not cause fuse blowing.

5.1.14 The operating & design temperature category of the capacitor unit shall be +5°C as per IS-13925 part-1. Only 5°C temperature rise is permissible above the design temperature of 45°C. So maximum temperature in any case shall not exceed 50°C (i.e. 45°C (design) +5°C (temperature rise)).

5.1.15 The capacitor shall have low value of loss which shall not exceed 0.2 watt per KVAR. The loss value of discharge device/resistor and capacitor unit shall be indicated. The tan delta characteristics of the capacitor units shall be furnished. The losses in watts for each capacitor unit including losses in fuses and discharge resistors forming integral part of the capacitors along with losses for series reactor shall be guaranteed. If these figures of capacitor losses exceed 0.2 watt per KVAR, the capacitors will be liable for rejection. However owner reserve the right to use the faulty capacitor unit till the same are replaced/rectified. The loss temperature characteristics, capacity temperature characteristics and insulation resistance temperature characteristics shall also be furnished.

5.1.16 The bidder shall furnish calculations for rise in voltage in other units in the event of failure of element(s) of a capacitor unit. The maximum rise in voltage shall not be more than 10% of rated voltage even if the entire capacitor unit failed/short circuited and relevant calculations in support of this shall also be furnished.

5.1.17 The bidder shall furnish calculation of voltage drop at rated capacitor unit per phase & losses of the reactor.

5.1.18 For both capacitor and reactor, mounting arrangement and minimum clearance required from live parts shall be indicated clearly and shall be as per Indian Electricity Act/BS162 & IS-13925-Part2 / IEC-60871-2.
5.2 Discharge Device

5.2.1 A suitable discharge resistor of adequate rating shall be permanently connected across the terminals inside the container to discharge the residual voltage to 50V or less within 1 minute for capacitor rated upto 650V and within 5 minute for capacitor rated above 650V.

5.3 PROTECTIVE FUSES

5.3.1 An internal current limiting fuse with high rupturing capacity conforming to relevant IS/IEC and the specific requirements mentioned in IS13925-Part-3/IEC 60871- 3, shall be provided. The characteristics of the fuse shall be such that it shall isolate the faulty unit only, and protect it against mechanical destruction due to internal failure. The fuses shall not melt or deteriorate when subjected to inrush currents which occur during the life of the bank.

5.3.2 The fuses shall not make any healthy capacitor element out of circuit, either in course of isolating the faulty element or due to any external fault.

5.3.3 The selection of fuse to be done in such a manner that characteristic of fuse shall match suitably with over-current withstand characteristic of associated capacitor unit.

5.3.4 The fuses shall be of adequate thermal capacity to cater for the increased heating which may occur due to harmonics and capacitor current fluctuations.

5.3.5 The number of externally connected capacitors and the available short-circuit current of the supply system should not affect the current-limiting of internal fuses.

5.3.6 It may be noted that provided internal fuses do not lead to case rupture.

5.4 Series Reactor

5.4.1 A suitable series reactor conforming to IS: 5553 to limit the inrush current and suppress the harmonics shall also be provided whenever required.

5.4.2 The reactor shall be copper wound, non-magnetically shielded, oil immersed, natural cooled, sealed type and shall be provided with following fittings.

i) Oil sampling cum drain valves.

ii) Filter valves with plugs.

iii) Buchholz relay with shut off valves, air release device & alarm and trip contact.

iv) Oil temperature indicator with minimum marking.

v) Oil level indicator with minimum marking.

vi) Oil conservator complete with drain plugs and oil filling hole with cover.

vii) Silica gel breather with oil seal & connecting pipes.

viii) Explosion vent.

ix) Bi-directional rollers.

x) Thermometer pocket.

xi) Radiator with isolating valves.

xii) Marshalling box.

xiii) Rating plate, wiring diagram plate & terminal marking plate.

xiv) Lifting lugs.

xv) Earthing terminals.

xvi) Air release device.

xvii) Cable termination arrangement for incoming & outgoing device.
5.4.3 Dry type/ Oil filled reactor shall only be offered. Such reactors shall be class F/H insulated.

5.4.4 The reactor shall have linear volt ampere characteristics upto 150% of rated capacitor current.

5.5 Residual voltage transformer

5.5.1 3 phase dry type residual voltage transformer of adequate capacity to facilitate neutral unbalance protection and rapid discharging of capacitor shall be provided.

5.5.2 The primary winding of voltage transformer shall be star connected while the secondary winding shall be in open delta for connection to neutral phase displacement relay.

5.5.3 The accuracy class shall be 3P for protection & 1 for metering.

5.5.4 RVT shall have primary and secondary windings made of copper.

5.6 Door limit switch

5.6.1 A door limit switch suitable for mounting on the door frame of the capacitor room shall be provided for each bank. This door limit switch shall be used to trip the power supply to capacitors with initiation of opening action of the door of the capacitor room.

5.6.2 A door limit switch shall be totally enclosed in the aluminium / cast iron housing, fully oil, water & dust tight and shall conform to utilization category AC 11 / DC 11 as per IS: 6875. This shall be fast actuation type provided with 6 sets of 1 NO & 1 NC contacts rated for 5 amps at 415V AC and 1A at 220V DC.

5.7 Capacitor control panel

5.7.1 Capacitor control panel for control, protection and automatic switching operation of MV capacitor bank shall be provided.

5.7.2 Capacitor control panel shall be of dust, damp & vermin proof construction having enclosure class IP-51 as per IS/IEC:60947.

5.7.3 The enclosure shall be fabricated out of the cold rolled sheet steel having minimum thickness of 2 mm. The doors shall have concealed hinges & provided with neoprene gaskets.

5.7.4 The panel shall be liberally designed. All the components shall be accessible from the front. It shall be possible to attend any component without the necessary removing adjacent ones. All the relays, meters, push buttons including lamps etc. shall be flush mounted. The mounting height of components requiring operation & observation shall not be lower than 300 mm & higher than 1800 mm.

5.7.5 The capacitor control panel shall control the capacitor bank which in turn shall have a number of sub banks for easy of control & to maintain the desired power factor under varying load conditions.

The owner shall arrange C.T supply to sense the power factor. Necessary C.T., selector switch, power factor meter and power factor correction relay shall be provided in the control panel. In addition, the control panel shall have Photo manual selector switch and P.F. raise lower push buttons for manual operation. These common features shall be located near the incoming unit.

5.7.6 Each control shall be provided with TPN switch, voltmeter with selector switch, Ammeter with selector switch and other auxiliaries, as required to receive the incoming power.
5.7.7 No. of outgoing feeders for the control panel shall be decided as per the no. of sub banks to be controlled by it. Each feeder shall be provided with TP switch, fuses, contacts, "ON" & "OFF" indication lamps and other auxiliaries as required.

5.7.8 Required no. and size of heavy duty double compression type Aluminium cable glands suitable for incoming and outgoing power and control cables shall be mounted on removal gland plate provided at a minimum height of 75 mm from the bottom of the panel. Crimping type Aluminium and copper lugs for aluminium and for copper cable respectively shall be provided for termination of cables.

5.7.9 The control panel shall be complete with its base channels, foundation bolt etc.

5.7.10 A continuous earth bus of aluminium, running along the entire length of the lower part of the control panel shall be provided with lugs at two ends for connection with external earth grid. The minimum size of earth bus shall be 150 sq. mm.

5.7.11 Components Details

5.7.11.1 The switches shall be of capacitor duty type rated for 1.5 times the rated capacitor current with a minimum rating of 25 A and shall conform to IS/IEC:60947.

5.7.11.2 The fuses shall be of non-deteriorating HRC link type and suitably rated for capacitor switching. These shall conform to IS: 13703.

5.7.11.3 All contactors shall be of capacitor duty type rated for 50% higher than rated capacitor current & shall conform to IS/IEC:60947. Control supply voltage shall be 240V single phase AC unless otherwise stated. One set of NO & NC potential free contacts shall be made available as spare.

5.7.11.4 Ammeter, Voltmeter & power factor meter shall be of accuracy class 1.5 as per IS: 1248 of minimum 96 sq.mm size & shall have 0-2400 scale.

5.7.11.5 The push buttons & selector switches shall conform to utilisation category AC11/ DC11 as per IS: 6875. Contacts shall be rated for 5A at 415V AC and 1A at 220V DC. The push button shall be of momentary contact spring loaded type with a set of 1 NO & 1 NC contacts. The selector switches shall be stay put type and provided with oval shaped handles.

5.7.11.6 The signal lamps shall be LED type. Colour of lamp shall be “Red” for “ON” & “Green” for “OFF” signals.

5.7.11.7 Terminal blocks shall be pressure clamp type up to 35 sq. mm. cable and bolted lugs type for higher sizes of cables. The minimum current rating of terminal block shall be 16A. 20% extra terminals shall be provided in the terminal block.

5.8 BUS BARS

5.8.1 All bus bars interconnecting the basic units shall be of copper and shall be fully insulated by using Raychem make heat shrinkable sleeves. All bus bar joints and tap-off connections shall be provided with removable FRP shrouds. The sleeves shall be rated to withstand the system Line-to-Line voltage for 1 minute.

5.8.2 The minimum clearances shall be as per relevant standards suitable for the nominal voltage of capacitor banks.

5.9 External cable termination

5.9.1 Each capacitor bank / sub bank shall be provided with proper termination arrangement where terminal connection from all the three phases shall be brought for connection with external cable. The termination arrangement shall include cable glands, cable lugs, termination kits, supporting arrangements etc. complete in all respect.
5.9.2 A cable box for termination of control cables shall be provided on the RVT. The cable boxes shall be provided with adequately sized cable entries and suitable double compression cable glands made of stainless steel. Tinned copper lugs shall be provided for the connection of all cable cores.

5.10 Interlocks
All necessary interlocks to ensure correct & safe operation of capacitor banks shall also be provided.

5.11 Earthing
Each basic capacitor unit shall be connected to the earth strip provided on the steel racks which in turn shall be connected to the main earth grid through two nos. suitable earth terminals provided on the racks.

6.0 PROTECTIVE SCHEME (PROVIDED BY PURCHASER)
6.1 The vendor shall confirm the adequacy of these protective devices and also suggest the setting and any other additional protective devices required.

7.0 ACCESSORIES
The supply shall include the following accessories.

7.1 Control panel space heater
The control panel shall be provided with a thermostatically controlled space heater, rated for 240V, 50Hz & controlled through double pole miniature circuit breaker.

7.2 Name plate
7.2.1 All the equipment shall be provided with name plates containing all the information’s as per relevant standard.
7.2.2 All control switches, push buttons, lamps etc. shall have functional identification labels.
7.2.3 Name plate of capacitor control panel shall be of black prespex with white engraving and of minimum 3 mm thickness while those on other equipment shall be of stainless steel.

7.3 WARNING PLATES
7.3.1 Warning plates shall be provided on the door and inside of the equipment, comprising following information:
    CAUTION: HIGH VOLTAGE CAPACITORS.
    AT BLOWN FUSES, CHARGES MAY REMAIN
7.3.2 The warning plates shall be UV resistant engraved plastic.

7.4 Steel racks
7.4.1 Sheet steel racks shall be provided to house the capacitor units, residual P. T. etc. in tier formation.
7.4.2 The racks shall be suitable for assembly at site. The racks & hardware used for assembly shall be hot dip galvanized.
7.4.3 The rack shall be complete with rack insulators, foundation bolts or any other hardware etc. for assembly into complete bank.
7.4.4 Complete assembly of capacitor bank shall be mounted on a pedestal GI frame, which shall be 300 mm high.
7.4.5 Any other accessories required but not specified, shall be supplied to make the capacitor installation complete in all respect and ensure safe & proper operation.

8.0 PAINTING

8.1 The sheet steel enclosure after degreasing, pickling in acid, cold rinsing, phosphatising passivating etc. shall be painted with two coat of anti-rust paints followed by two coats anti corrosive paints.

8.2 Epoxy based paint shall be used.

8.3 All paint shall be carefully selected to withstand tropical heat and extremes of weather. The paint shall not scale off, crinkle or be removed by abrasion due to normal handing.

8.4 Unless otherwise specified, the finishing shade shall be light gray shade no. 631 as per IS: 5.

9.0 TESTS AND INSPECTION

9.1 All capacitor banks and control panel shall be subjected to routine tests as per IS: 2834 and its associated equipment as per relevant standards.

9.2 Additional tests, wherever specified, shall be carried out.

9.3 All the above tests shall be carried out in presence of purchaser’s representative. In addition, the equipment shall be subjected to stage inspection during process of manufacture at works & site inspection.

9.4 These inspections shall, however, not absolve the vendor from his responsibility for making good any defect which may be noticed subsequently.

10.0 DRAWINGS AND DOCUMENTS

10.1 Drawings and documents as per Annexure-I shall be supplied, unless otherwise specified.

10.2 All drawings and documents shall have following description written boldly.

- Name of client
- Name of consultant
- Enquiry / Order Number with plant / project name
- Code No. and Description

11.0 SPARES

11.1 Spares for operation and maintenance
Item wise unit prices of spare parts shall be quoted.

11.2 Commissioning Spares
Commissioning spares, as required, shall be supplied with the main equipment. Item wise list of recommended commissioning spares shall be furnished for approval.
11.3 Any other spare parts not specified, but required, shall also be quoted along with the offer.

11.4 All spare parts shall be identical to the parts used in the equipments.

12.0 PACKING

12.1 All the equipment shall be properly packed before despatch to avoid damage during transport, storage & handling.

12.2 The packing box shall contain a copy of the installation, operation & maintenance manual.

12.3 A sign to indicate the upright position on the position of the package to be placed during transport and storage shall be clearly marked. Also proper arrangement shall be provided to handle the equipment.

13.0 DEVIATIONS

13.1 Deviations, if any, from this standard shall be clearly indicated in the offer with reasoning.
## ANNEXURE - I

1.0 SCOPE

This specification covers the requirements for the design, manufacture and testing of Cathodic Protection Power Supply Module (CPPSM) working on controlled switch mode principle intended to supply power to cathodic protection system.

2.0 CODES AND STANDARDS

2.1 The system design, performance and materials to be supplied shall conform to the requirements of the latest revision of following standards:

- IS: 1248 (Parts-I, 2, 8 & 9) Direct acting indicating analogue electrical measuring instruments and accessories.
- IS: 3700 (Parts-I to 11) Essential rating and characteristics of semiconductor devices.
- IS: 3715 (Parts-I to 4) Letter symbols for semiconductor devices.
- IS: 4411 Code of designation of semiconductor devices.
- IS: 6619 Safety code for semiconductor rectifier equipment.
- IS: 7204 (Parts-I to 4) Stabilised power supplies DC output.
- IS: 12021 (Parts-I to 4) Control transformers for switchgear and control gear for voltages not exceeding 1000 V AC.
- IS: 13703 (Parts-I to 4) Low voltage fuses for voltages not exceeding 1000 V AC or 1500 V DC.
- IS/IEC:60947 Low voltage switchgear and control gear.

2.2 In case of imported equipment, standards of the country of origin shall be applicable if these standards are equivalent or stringent than the applicable Indian standards.

2.3 The equipment shall also conform to the provisions of Indian Electricity rules and other statutory regulations currently in force in the country.

2.4 In case of any contradiction between various referred standards/ specifications/ and statutory regulations the following order of priority shall govern:

- Statutory regulations.
- This specification.
- Codes and standards.

3.0 SITE CONDITION

The CPPSM shall be suitable for installation in non air-conditioned room with restricted ventilation or in outdoor kiosk in locations having generally corrosive, warm, humid and dusty atmosphere. Service conditions shall be as per actual site conditions. If not specifically mentioned therein, a design ambient temperature of 45°C and an altitude not exceeding 1000 m above mean sea level shall be considered.

4.0 GENERAL REQUIREMENTS

The offered equipment shall be brand new with state of art technology and proven field track record. No prototype equipment shall be offered.
4.1 Vendor shall ensure availability of spare parts and maintenance support services for the offered equipment for at least 15 years from the date of supply.

4.2 Vendor shall give a notice of at least one year to the end user of equipment and owner before phasing out the product/spares to enable the end user for placement of order for spares and services.

5.0 TECHNICAL REQUIREMENTS

5.1 Fabrication and General Details

CPPSM shall be housed in sheet steel enclosure. The front, rear walls and doors shall be made by using minimum 2 mm thick sheet steel and side walls shall be made of minimum 1.6 mm thick sheet steel. Wherever required, suitable stiffeners shall be provided. The Unit shall be freestanding type. Hinged doors "Shall be provided at the front and back as required. The unit shall be natural cooled type. Louvered openings with wire mesh for natural ventilation may be provided. Degree of protection for the panel shall be minimum IP-41. The CPPSM panel shall, preferably, not need rear access for operation, maintenance and shall be suitable for mounting flushed to the wall.

5.1.2 Suitable hooks shall be provided for lifting the panel. These hooks when removed shall not leave any hole in the panel or imperfection in the paint finish.

5.1.3 All instruments shall be panel mounted type and back connected. All fuses shall be provided inside the panel and shall be of link type. 660 V grade PVC insulated BIS approved wires with stranded copper conductor of size minimum 2.5 mm2 shall be used for power and auxiliary wiring. Control wiring for electronic circuits shall be through flat ribbon cable or through copper wire of minimum 0.5 mm diameter. All wirings shall be ferruled with PVC ferrules at both ends for ease of identification. Clamp type terminals suitable for termination up to 10 mm conductor shall be provided for all control cable connection. Suitable power terminals shall be provided for power cables. Minimum 20% spare terminals shall be provided. The terminal blocks shall be mounted minimum 300 mm above the gland plate.

5.1.4 All live parts shall be properly shrouded. This shall ensure complete safety to personnel intending routine maintenance by opening the panel doors.

5.1.5 CPPSM shall be suitable for bottom cable entry unless otherwise specified and shall be supplied complete with crimping type tinned copper lugs and cable glands. Cable glands shall be of rolled aluminium single compression type for indoor installations and double compression type for outdoor installations. The space in the terminal chamber shall be adequate for termination of required number and sizes of cables.

5.1.6 The CPPSM shall be field proven. The design, internal component layout and rating of component shall ensure high MTBF and low MTTR. Prototype equipment shall not be acceptable. Layout of panel components shall enable easy access to the components for maintenance.

5.1.7 All the control equipment like switches, push buttons, potentiometers etc. shall be located at a convenient height of minimum 300 mm and maximum 1800 mm from the bottom of the panel.

5.1.8 The printed circuit boards (PCBs) shall be of copper clad glass epoxy laminate. PCB tracks shall be tinned and solder masked. The PCB shall be coated with suitable lacquer to make it immune to dust, moisture and fungal growth. Where plug in type of PCBs are used gold plated male-female connectors shall be used for the purpose.
5.1.9 If required the panel shall be provided with space heater to prevent moisture condensation. The space heaters shall be located at the bottom of the panel and shall be provided with a manually operated switch and HRC fuse. The space heater shall have porcelain-insulated connectors. Where space heater is not provided, the electronic PCBs/components and other control devices shall be made immune to moisture condensation.

5.1.10 Panel shall be provided with integral base frame channel. The integral base frame of panel shall be suitable for directly bolting with the help of foundation bolts and shall also be suitable for tack welding to purchaser's insert plate/flat/channel embedded in the floor. Amply dimensioned oblong holes shall be provided at the bottom of the panel for its bolting to the embedded insert plate/channel.

5.1.11 An earth bus bar of minimum (25 x 3) mm² copper or equivalent aluminium shall be provided throughout the length of the panel. Provision shall be made for connecting this earth bus at two ends with the plant earth grid by means of (40 x5) mm² GI flat. All non-current carrying metallic parts of the panel and mounted equipment shall be connected to the panel earth bus. All doors and movable parts shall be connected to the earth bus by flexible copper cables.

5.1.12 All panel mounted equipments (e.g. lamps, push buttons, switches, meters, PCBs, etc.) shall be provided with suitable nameplates. Nameplates shall be engraved out of 3-ply (black-white-black) lamicoid sheets or anodised aluminium. Back-engraved perspex sheet nameplates may also be acceptable. Engraving shall be done with groove cutters. Hard paper or self-adhesive plastic tape nameplates shall not be acceptable. Nameplates shall be fastened by screws and not by adhesive. Labels shall be provided for every component on the cards, connecting wires as well as for the terminals in the terminal strip inside the panel.

5.1.13 Where specified, the CPPSM shall be housed in an outdoor kiosk. The kiosk shall be made of sheet steel of minimum 3 mm thick and epoxy painted on both internal and external surfaces. Hinged lockable doors shall be provided at the front and back. Acrylic transparent glass window shall be provided on the front door of the kiosk so that the meters, indications and positions of the control switches on the CPPSM can be seen without opening the door of the kiosk. The kiosk shall be suitable for outdoor mounting and shall give proper protection to the CPPSM against rain, other harsh weather conditions. Necessary ventilation arrangement with louvers and wire mesh shall be provided for proper operation of the CPPSM. The cable entry to the kiosk shall be from bottom through cable glands. Suitable canopy shall be provided on the top of the kiosk.

5.1.14 **Painting**

All metal surfaces shall be thoroughly cleaned and degreased to remove mill scale, rust, grease and dirt.

Fabricated structures shall be pickled and then rinsed to remove any trace of acid. The under surface shall be prepared by applying a coat of phosphate paint and a coat of yellow zinc chromate primer. The undersurface shall be made free from all imperfections before undertaking the finishing coat.

After preparation of the under surface, the panel shall be spray painted with two coats of final paint or shall be powder coated. Colour shade of final paint shall be approved by the purchaser before final painting is started. The finished panels shall be dried in stowing ovens in dust free atmosphere. Panel finish shall be free from imperfections like pin holes, orange peels, run off paint, etc.
All unpainted steel parts shall be cadmium plated or suitably treated to prevent corrosion. If these parts are moving elements, then they shall be greased.

6.0 EQUIPMENT DESCRIPTION

The CPPSM shall be complete with following main sections:
- Input controls.
- Power converter and filters.
- Output protections
- System controls
- Current interrupter
- Control, indication and metering

6.1 Input Controls

6.1.1 A moulded case circuit breaker with thermal over load and short circuit release (rated for the input power supply short circuit current) shall be provided at the input for power supply control.

6.2 Power Converter and Filters

6.2.1 The CPPSM shall convert and control the input DC power supply voltage/current through switching power semiconductor devices (Thyristor/power transistor/power MOSFET, etc.). The variation in the output voltage/current shall be achieved through control of duty cycle of conduction of the switching power semiconductor devices. The current and voltage ratings of the power semiconductor devices shall be at least two times the maximum device current and min. two times the maximum voltage coming across it respectively. The voltage rating of the power semi-conductor devices shall be co-coordinated with the breakdown voltage of lightning arrester provided at the output so that the power semiconductor devices are protected from any voltage surge coming from the pipeline. Shunt zeners / MOV shall be provided across the power semiconductor devices for protection. The power semiconductor devices shall have humidity/moisture resistant finish and mounted in sufficiently sized heat sink designed to provide adequate cooling under worst conditions of operation. The power semiconductor devices shall have adequate protection against high dv/dt and di/dt.

6.2.2 Where specified, the converter shall electrically isolate the input power to CPPSM from its output so that the grounding of the positive output of the CPPSM through anode ground bed shall not affect the grounding system of the input power supply. Alternatively, a separate DC to DC converter having electrical isolation between input and output power supply shall be provided at the input of the CPPSM.

6.2.3 The power semiconductor devices shall be protected by semiconductor fuses or the system shall have instantaneous short circuit-current limit feature to protect the devices against output short circuits. An adjustable output over current limit feature shall be provided.

6.2.4 Filter shall be provided in the input power supply circuit to minimise the AC injected into the DC input power supply system.

6.2.5 Adequate filtering shall be provided on the DC output of the converter to limit the ripple content in the output to less than 5% at rated output.

6.2.6 The converter system shall be of natural air cooled type.
6.2.7 For CPPSMs with multiple output circuits, each output circuit shall have independent output converter and output filters.

6.3 Output Protections

Two pole moulded case circuit breaker or miniature circuit breaker rated for the DC output current, short circuit current and having thermal over load, short circuit release shall be provided in the output. A lightning arrester rated for minimum 10KA impulse current discharge capacity and rated voltage & max. spark over voltage rating suitable to protect the CPPSM components against lightning and switching surges shall be provided at the output. For CPPSMs with multiple output circuits, each output circuit shall have independent protections.

6.4 System Controls

6.4.1 The CPPSM shall have two distinct modes of operation (independent for each output circuit) as below:

a) Constant Voltage - Constant Current Mode (CVCC)

In this mode the output voltage (Vos) of CPPSM shall be continuously adjustable from 0.5V DC to the rated output voltage. Current limit feature shall be provided in this mode of operation. The current limit (ilos) shall be continuously adjustable from zero to rated output current.

For constant voltage mode of operation the output current limit shall be set at maximum and output voltage setting shall be varied. Irrespective of output current demand the chosen value of the output voltage shall be maintained by the control system till the current limit is reached. After that the output current limit shall be maintained and output voltage shall decrease to keep the current constant.

For constant current mode of operation the output voltage shall be set at maximum and output current shall be varied through varying the setting of output current limit. Irrespective of output voltage requirement the control system shall maintain the output current to the set current limit value till the voltage limit is reached. After that the output voltage limit shall be maintained and output current shall decrease to keep the voltage constant.

b) Auto PSP Mode

In this mode of operation the output of the CPPSM shall operate in an external closed loop with pipe-to-soil potential (PSP) in feedback loop. The CPPSM control shall adjust the output voltage such that the PSP as measured by reference cell always remains equal to the set potential on the unit. The set potential (Vps) shall have high long time stability and minimum temperature drift. The set potential shall be continuously adjustable over the range as required. An adjustable over current limit shall be provided to limit the maximum output current.

The unit shall be designed to operate with the number of reference cells connected to it (to be provided by others). In case of more than one reference cell being specified, CPPSM shall have feature to automatically select the reference cell having less negative potential than the others and use the same for auto control of the unit (e.g. (-) 0.8 V is less negative than (-) 0.9 V). Adequate hysteresis shall be provided in selecting the less negative potential reference cell, to avoid hunting between the reference cells at change over conditions.

In case of open circuit or short circuit of the reference cell or potential being less negative than a minimum set potential (Vrs), for the controlling reference cell, the
unit shall sense these conditions as reference cell failure and shall automatically switch over to the other healthy reference cell for control. Should fault occur in all the reference cells, the output voltage or current of the CPPSM shall adjust automatically to a preset value (Vas/las), which shall be adjustable.

In both CVCC and auto PSP modes of operation the electronic over current limit shall be fast enough to protect the active devices of the unit and fast enough to act before tripping of MCCB/MCB or blowing of fuse.

6.4.2 The unit shall continuously monitor the PSP and necessary annunciation shall be provided in case of PSP either exceeding the specified maximum limit (Vpm) or remaining lower than the specified minimum limit (Vpn).

6.4.3 The output voltage regulation for no load to full load variation with input voltage variation from maximum to minimum shall not be more than 2.5% of rated voltage throughout the range of output voltage and over the specified ambient temperature variation, in CVCC-constant voltage mode of operation. In auto PSP mode the closed loop PSP regulation for no load to full load variation with input voltage variation from maximum to minimum shall be within 20mV throughout the PSP setting range specified.

In CVCC-constant current mode of operation, the current regulation for minimum to maximum output voltage and minimum to maximum variation in input voltage shall not be more than 2.5% throughout the range of output current.

6.4.4 The output of the unit shall be ungrounded and shall allow grounding of positive terminal of the output through the anode ground bed.

6.4.5 For CPPSMs with multiple output circuits, each output circuit shall have independent control system.

6.5 Current Interrupter

6.5.1 If required a current interrupter for CPPSM output current interruption shall be provided.

6.5.2 The current interrupter shall have an output contactor with current rating minimum 125% of the output current rating of the CPPSM and a digital timer to operate it.

6.5.3 The timer shall have ‘ON’ and ‘OFF’ timings. When the timer is turned on the ‘ON’ timing shall start and shall close the output contactor till the end of the ‘ON’ timing. At the end of the ‘ON’ timing the ‘OFF’ timing shall start and keep the contactor open till the end of the ‘OFF’ timing. At the end of the ‘OFF’ timing the ‘ON’ timing shall start again. This process of ‘ON’ and ‘OFF’ timing shall continue.

6.5.4 The ‘ON’ and ‘OFF’ timings of the timer shall be settable by separate 2 digit thumbwheel switches, each settable from 1 to 99 seconds. The timing error of the timer shall be less than 5 parts per million. In case of microprocessor based system keypad with display may be provided in place of thumbwheel switches.

6.5.5 Whenever the timer is switched on it shall always start with ON ‘timing’. A timer-reset push button shall be provided. On pressing this pushbutton during operation of the timer, the timer shall get reset and upon release of the button, the timer shall restart with ‘ON’ timing.

6.5.6 The power required for operation of the timer and contactor shall be derived from the main power supply to the CPPSM.
6.5.7 The following controls and indications shall be provided for current interrupter. The controls shall be housed in a lockable cover, so that normally they are not accessible. The indications shall be mounted on the door.

a) Controls
   - Timer power 'ON' / 'OFF'
   - Timer reset
   - Thumb wheel switch for 'ON' timing
   - Thumb wheel switch for 'OFF' timing
   In case of microprocessor based system, keypad with display may be provided in place of thumbwheel switches.

b) Indications (LED)
   - Timer power 'ON'
   - 'ON' timing
   - 'OFF' timing

6.5.8 The output contact of the current interrupter contactor shall be wired in the positive DC output of the CPPSM. A link shall be provided for shorting these terminals whenever the current interrupter is not in use.

6.5.9 If required the current interrupter shall be an independent unit of portable type. The interrupter unit shall have terminals for input power supply and terminals of the contactor in the timer output. The input power supply and the rating of the timer output contactor shall be as required.

6.5.10 Where the current interrupter is not specified with CPPSM or is specified as portable type external to the CPPSM, then the CPPSM shall have provision for connection of input power supply terminals and output contacts of external current interrupter for current interruption test. A link shall be provided for shorting the output terminals provided in CPPSM for current interruption, whenever the current interrupter is not connected.

6.5.11 For CPPSMs with multiple output circuits, each output circuit shall have independent current interrupter.

6.6 Controls, Indication and Metering

6.6.1 Following controls shall be provided on CPPSM front door.

a) ON/OFF control for input through MCCB.

b) ON /OFF control for output through MCCB/MB.

c) Auto/CVCC mode selector switch.

d) Potentiometers for Vos, Vps and los settings.

e) Selector switch for selecting indication of PSP set and PSP actual for all the reference cells.

6.6.2 Following controls shall be provided inside the module at user accessible common location:

a) Potentiometer for Vrs, Vpm, Vpn and Vas/ias settings.

b) Controls for current interrupter:
   - Timer power 'ON' / 'OFF'
   - Timer reset
- Thumb wheel switch for 'ON' timing
- Thumb wheel switch for 'OFF' timing

6.6.3 CPPSM shall have following indicating lights (lamps or minimum 5 mm dia LEDs):

a) CPPSM ON/OFF
b) Unit in auto/CVCC (2 lamps)
c) Reference cell controlling the closed loop control of the CPPSM (number of lamps same as number of reference cells).
d) Reference cell faulty (number of lamps same as number of reference cells).
e) Pipeline over protected.
f) Pipeline under protected
g) Indications for current interrupter:
   - Timer power 'ON'
   - 'ON' timing
   - 'OFF' timing

It shall be possible to switch-off all the indication lamps by a single switch. In case of LED indication lights this facility may not be provided.

6.6.4 Following meters having min cl. 1.5 accuracy shall be provided on the CPPSM:

a) Digital meter for output voltage
b) Digital meter for output current
c) Digital voltmeter to measure PSP set (Vps) and PSP actual for all the reference cells. The meter shall have range from (-) 4 V to 0 V and shall have cl. 0.5 accuracy.
e) Digital meters for measuring Vrs, Vpm, Vpn and Vas/las settings.
f) Meters for input voltage and current

It shall be possible to switch-off all the digital meters preferably by a single switch.

6.6.5 If specified, CPPSM shall incorporate provision for remote monitoring of the unit through SCADA system as below:

a) Potential free contacts for the following:
   - All the reference cells failed. (Contact open on alarm condition)
   - Pipeline overprotected. (Contact open on alarm condition)
   - Pipeline under protected. (Contact open on alarm condition)
   - System in auto-mode. (Contact close in auto condition)
   - System in CVCC mode. (Contact close in CVCC mode)
b) 4 to 20 mA electrically isolated signal for the following:
   - PSP (-4V to OV)
   - CPPSM output voltage
   - CPPSM output current

The transducers shall have electrical isolation between input and output. The isolation insulation shall withstand 2 kV, 50 Hz for minimum 1 minute. The accuracy class of the transducer shall be 0.5. The transducers shall be protected against input and output voltage surges. The transducer shall be suitable for driving up to 600 ohms load impedance located up to 500 m away and wired with 0.5 mm- copper conductor cable. The transducers shall be suitable for minimum 125% continuous over load in the input voltage/current parameter.

6.6.6 For units having multiple outputs, each output circuit shall have independent controls, indication and metering.

7.0 TESTS AND ACCEPTANCE

7.1 During fabrication, the equipment shall be subjected to inspection by owner or his authorised representative to assess the progress of the work as well as to ascertain that only quality raw materials are used for the same. He shall be given all assistance to carry out the inspection.

7.2 Final acceptance test shall be carried out at manufacturer's works under his care and expense. Instruments and equipments required for testing shall be arranged by manufacturer. Owner's representative shall be given minimum 2 weeks prior notice for witnessing the tests. Test certificates indicating test results shall be furnished by the manufacturer. Acceptance tests shall include but not be limited to the tests listed below.

7.2.1 Visual Inspection

This shall include-
   - Completeness of the equipment in line with specification.
   - Checking of all settings.
   - All labels provided and satisfactory.
   - Dimensional checking.
   - Proper mounting of components and neatness of wiring etc.
   - Model number.

7.2.2 Insulation tests

The voltage specified in the table below shall be applied for one minute to the circuits indicated:

<table>
<thead>
<tr>
<th>Withstand voltage</th>
<th>Control electronics &lt;60V</th>
<th>Power electronics Un₁</th>
<th>Auxiliary circuits Un₂</th>

</table>

(Un₁ and Un₂ are nominal voltage rating of power electronics and auxiliary circuits respectively).

D.C. test voltages may be applied instead of A.C. The magnitude of D.C. test voltages to be applied shall be 2 times the above-mentioned A.C. (r.m.s) Values.

Insulation resistance test shall be conducted before and after heat run test.

### 7.2.3 Heat run test

All CPPSMs shall be subjected to a heat run test performed at rated voltage for period not less than 16 hours prior to execution of functional tests.

At least one CPPSM of each rating shall be loaded to its rated output throughout 16 hour test period. All other CPPSMs shall be energized under partial load or zero load current condition throughout the test period.

### 7.2.4 Functional tests

Functional tests as below shall be performed on each CPPSM. If during execution of functional tests, any electronic component of the unit is required to be replaced e.g. due to malfunction or failure of the unit to fulfil the performance requirements of the specification, then the load test shall be repeated at rated current following which functional tests shall be carried out.

#### 7.2.4.1 CVCC mode operation testing

a) **Constant voltage operation**

During the test, current limit shall be set to rated output current. Performance testing shall be carried out for various output voltage settings and load varying from zero to maximum. The verification of operation of the control functions, measurement of output voltage, current, input voltage, current, ripple in the output, input, evaluation of output voltage regulation and efficiency of the unit shall be carried out during the testing.

b) **Constant current operation**

During the test, voltage limit shall be set to rated output voltage. Performance testing shall be carried out for various output current limit settings and load resistance varied to achieve output voltage from minimum to maximum. The verification of operation of the control functions, measurement of output voltage, current, input voltage, current, ripple in the output, input, evaluation of output current regulation of the unit shall be carried out during the testing.

#### 7.2.4.2 Auto PSP mode operation
Suitable set-up shall be arranged for output loading and reference cell feedback. The closed loop performance and regulation shall be checked with the PSP set voltage varied from 0.85V to 1.2V.

Disconnecting the reference cell feedback connection in the above set up shall simulate the reference cell failed condition. The output voltage/current of the unit shall go to the value set on the potentiometer Vas/ias provided inside the CPPSM. The settings on Vas/ias shall be varied and the output voltage/current shall be observed.

7.2.4.3 Operation of sensors for pipeline over protection, under protection, reference cell failure and reference cell selection logic in auto PSP mode shall be verified by connecting variable external voltage sources to reference cell inputs of the CPPSM. The number of external voltage sources shall be same as number of reference cell inputs specified for the CPPSM.

7.2.4.4 The unit shall be checked for operation of the current limit by over loading the unit in both CVCC and auto PSP modes of operation. For Units where semiconductor fuses are not provided for protection of the power semiconductor device, the protection of same shall be tested as below:

A switch rated for making and carrying CPPSM output short circuit current shall be connected to the output terminals of the unit. The output voltage and the output current limit settings of the unit shall be set to the maximum rated values. The switch connected in the output shall be shorted quickly.

The unit shall go to current limit mode and shall not damage any active component of the unit.

7.2.4.5 The current interrupter shall be tested for time interval settings and specified operation.

8.0 PACKING AND DESPATCH

The equipment shall be properly packed for selected mode of transportation i.e. by ship/rail or trailer. The panels shall be wrapped in polythene sheets before being placed in crates to prevent damage to finish. Crates shall have skid bottom for handling. Special notations such as 'Fragile', 'This side up', 'Centre of gravity', 'Weight' etc., shall be clearly marked on the package together with Tag nos., P.O. Nos. etc.

The equipment may be stored outdoors for long periods before erection. The packing shall be completely suitable for outdoor storage in areas with heavy rains/high ambient temperature.

9.0 DEVIATIONS

9.1 Deviations, if any, from this standard shall be clearly indicated in the offer with reasoning.

1.0 SCOPE

This specification covers the requirements for the design, manufacture and testing of Cathodic Protection Transformer Rectifier units (CPTR units) working on controlled rectification principle intended to supply power to cathodic protection system for underground pipelines/structures.

2.0 CODES AND STANDARDS

2.1 The system design, performance and materials to be supplied shall conform to the requirements of the latest revision of following standards:

- **IS: 1248 (Parts-I, 2,8 & 9)** Direct acting indicating analogue electrical measuring instruments and accessories.
- **IS: 3700 (Parts-I to 11)** Essential rating and characteristics of semiconductor devices
- **IS: 3715 (Parts-I to 4)** Letter symbols for semiconductor devices
- **IS: 4411** Code of designation of semiconductor devices.
- **IS: 5469 (Parts-I to 4)** Code of practice for the use of semiconductor junction devices.
- **IS: 6619** Safety code for semiconductor rectifier equipment.
- **IS:7204 (Parts-I to 4)** Stabilized power supplies DC output
- **IS: 12021 (Parts-I to 4)** Control transformers for switchgear and control gear for voltages not exceeding 1000 V AC.
- **IS: 13703 (Parts-I to 4)** Low voltage fuses for voltages not exceeding 1000 V AC or 1500 V DC.
- **IS/IEC:60947** Low voltage switchgear and control gear.

2.2 In case of imported equipment, standards of the country of origin shall be applicable if these standards are equivalent or stringent than the applicable Indian standards.

2.3 The equipment shall also conform to the provisions of Indian Electricity rules and other statutory regulations currently in force in the country.

2.4 In case of any contradiction between various referred standards/ specifications and statutory regulations the following order of priority shall govern:

- Statutory regulations.
- This specification.
- Codes and standards

3.0 SITE CONDITIONS

The CPTR unit shall be suitable for installation in non air-conditioned room with restricted ventilation or in outdoor kiosk, in locations having generally corrosive, warm, humid and dusty atmosphere. Service conditions shall be as actual site conditions. If not specifically mentioned therein, a design ambient temperature of 45°C and an altitude not exceeding 1000 m above mean sea level shall be considered.

4.0 GENERAL REQUIREMENTS
4.1 The offered equipment shall be brand new with state of art technology and proven field track record. No prototype equipment shall be offered.

4.2 Vendor shall ensure availability of spare parts and maintenance support services for the offered equipment for at least 15 years from the date of supply.

4.3 Vendor shall give a notice of at least one year to the end user of equipment and PDIL before phasing out the product/spares to enable the end user for placement of order for spares and services.

5.0 TECHNICAL REQUIREMENTS

5.1 Fabrication and General Details

5.1.1 CPTR unit shall be housed in sheet steel enclosure. The front, rear walls and doors shall be made by using minimum 2 mm thick sheet steel and side walls shall be made of minimum 1.6 mm thick sheet steel. Wherever required, suitable stiffeners shall be provided. The Unit shall be freestanding type. Hinged doors shall be provided at the front and back as required. The unit shall be natural cooled type. Louvered openings with wire mesh for natural ventilation may be provided. Degree of protection for the panel shall be minimum IP-41. The CPTR unit panel shall, preferably, not need rear access for operation, maintenance and shall be suitable for mounting flushed to the wall.

5.1.2 Suitable hooks shall be provided for lifting the panel. These hooks when removed shall not leave any hole in the panel or imperfection in the paint finish.

5.1.3 All instruments shall be panel mounted type and back connected. All fuses shall be provided inside the panel and shall be of link type. 660 V grade PVC insulated BIS approved wires with stranded copper conductor of size minimum 2.5 mm² shall be used for power and auxiliary wiring. Control wiring for electronic circuits shall be through flat ribbon cable or through copper wire of minimum 0.5 mm diameter. All wirings shall be ferruled with PVC ferrules at both ends for ease of identification. Clamp type terminals suitable for termination up to 10 mm conductor shall be provided for all control cable connection. Suitable power terminals shall be provided for power cables. Minimum 20% spare terminals shall be provided. The terminal blocks shall be mounted minimum 300 mm above the gland plate.

5.1.4 All live parts shall be properly shrouded. This shall ensure complete safety to personnel intending routine maintenance by opening the panel doors.

5.1.5 CPTR unit shall be suitable for bottom cable entry unless otherwise specified and shall be supplied complete with crimping type cable termination lugs and cable glands. Cable glands shall be of rolled aluminium, single compression type for indoor installations and double compression type for outdoor installations. The space in the terminal chamber shall be adequate for termination of required number and sizes of cables.

5.1.6 The input power factor of the unit at rated load shall be 0.8 lag or better.

5.1.7 The CPTR unit shall be field proven. The design, internal component layout and rating of component shall ensure high MTBF and low MTTR. Prototype equipment shall not be acceptable.

5.1.8 All the control equipment like switches, pushbuttons, potentiometers etc. shall be located at a convenient height of minimum 300 mm and maximum 1800 mm from the bottom of the panel.

5.1.9 The printed circuit boards (PCBs) shall be of copper clad glass epoxy laminate. PCB tracks shall be tinned and solder masked. The PCB shall be coated with suitable lacquer to
make it immune to dust, moisture and fungal growth. Where plug in type of PCBs are used
gold plated male-female connectors shall be used for the purpose.

5.1.10  If required the panel shall be provided with space heater to prevent moisture condensation.
The space heaters shall be located at the bottom of the panel, and shall be provided with a manually operated switch, HRC fuse and link for phase and neutral respectively. The space heater shall have porcelain connectors. Where space heater is not provided the electronic PCBs/components and other control devices shall be made immune to moisture condensation.

5.1.11  Panel shall be provided with integral base frame channel. The integral base frame of panel shall be suitable for directly bolting with the help of foundation bolts and shall also be suitable for tack welding to purchaser's insert plate/flat/channel embedded in the floor. Amply dimensioned oblong holes shall be provided at the bottom of the panel for its bolting to the embedded insert plate/channel.

5.1.12  An earth bus bar of minimum (25 x 3) m² copper or equivalent aluminium shall be provided throughout the length of the panel. Provision shall be made for connecting this earth bus at two ends with the plant earth grid by means of (40x5) mm- GI flat. All non-current carrying metallic parts of the panel and mounted equipment shall be connected to the panel earth bus. All doors and movable parts shall be connected to the earth bus by flexible copper cables.

5.1.13  All panel mounted equipments (e.g. lamps, pushbuttons, switches, meters, PCBs, etc.) shall be provided with suitable nameplates. Nameplates shall be engraved out of 3-ply (black-white-black) lamicoid sheets or anodised aluminium. Back-engraved Perspex sheet nameplates may also be acceptable. Engraving shall be done with groove cutters. Hard paper or self-adhesive plastic tape nameplates shall not be acceptable. Nameplates shall be fastened by screws and not by adhesive. Labels shall be provided for every component on the cards, connecting wires as well as for the terminals in the terminal strip inside the panel.

5.1.14  Where specified, the CPTR unit shall be housed in an outdoor kiosk. The kiosk shall be made of sheet steel of minimum 3 mm thick and epoxy painted on both internal and external surfaces. Hinged lockable doors shall be provided at the front and back. The kiosk shall be suitable for outdoor mounting and shall give proper protection to the CPTR unit against rain, other harsh weather conditions. Necessary ventilation arrangement with louvers and wire mesh shall be provided for proper operation of the CPTR unit. The cable entry to the kiosk shall be from bottom through cable glands. Suitable canopy shall be provided on the top of the Kiosk.

5.1.15  **Painting**

All metal surfaces shall be thoroughly cleaned and degreased to remove mill scale, rust, grease and dirt.

Fabricated structures shall be pickled and then rinsed to remove any trace of acid. The under surface shall be prepared by applying a coat of phosphate paint and a coat of yellow zinc chromate primer. The under surface shall be made free from all imperfections before undertaking the finishing coat.

After preparation of the under surface, the panel shall be spray painted with two coats of final paint or shall be powder coated. Colour shade of final paint shall be approved by the purchaser before final painting is started. The finished panels shall be dried in stowing ovens in dust free atmosphere. Panel finish shall be free from imperfections like pin holes, orange peels, run off paint, etc. All unpainted steel parts shall be suitably treated to prevent corrosion. If these parts are moving elements, then they shall be greased.
6.0 EQUIPMENT DESCRIPTION

The CPTR unit shall be complete with following main sections:
- Transformer and input controls.
- Rectifier and filter
- Output protections
- System controls
- Control, indication and metering

6.1 Transformer and Input Controls

6.1.1 The transformer shall be natural cooled dry type with separate primary and secondary windings.

An intermediate earth screen shall be provided between primary and secondary windings. CPTR Units having multiple output circuits shall have separate secondary windings for each output circuit. Transformer shall be vacuum impregnated with epoxy varnish and baked. The safety factor for transformer rating shall be minimum 125%.

6.1.2 Single-phase transformers may be provided up to 50V, 50A DC output rating of the CPTR units. Beyond this rating, 3 phase transformers shall be provided. A moulded case circuit breaker with thermal over load and short circuit release shall be provided at the input of the transformer. Miniature circuit breaker with thermal overload and short circuit release in place of moulded case circuit breaker may be provided, where the miniature circuit breaker rated for the incoming AC supply short circuit current.

6.2 Rectifier and Filters

6.2.1 The rectifier shall be made of thyristors and diodes as basic components. The CPTR unit shall be suitable for 415 V AC, 3-ph power supply. Rectifier shall be 3 phase full wave type and controlled type. For CPTR units rated 50V, 50A DC or less, the unit may be suitable for 240V AC, 1 ph power supply and the rectifier shall be full wave type and controlled type. Alternatively, for single phase AC CPTR units, diode rectifier of full wave type in the secondary of the transformer and triac or back to back connected thyristors in the transformer primary AC supply circuit may be provided. The current and voltage ratings of thyristors, diodes shall be at least two times the actual maximum device current and minimum two times the actual maximum voltage coming across the device respectively. The thyristors/ triac/ rectifier elements shall be protected against voltage surges coming from the incoming power supply and from output side from the pipeline. Required shunt zeners / MOV shall be provided across the rectifier elements for protection.

The rectifier elements shall have humidity/moisture resistant finish and mounted in sufficiently sized heat sink designed to provide adequate cooling under worst conditions of operation. The rectifier elements shall have adequate protection against high dv/dt and di/ dt. 6.2.2 The thyristors/triacs shall be protected by semiconductor fuses. For units rated 50V, 50A DC or less, if the thyristors or triacs are adequately over rated and system has enough inductance so that in case of sudden output short circuit the over current limit feature comes into action before short circuit current rises beyond the rating of the thyristors/triacs, then the semiconductor fuses may not be provided. This feature shall be demonstrated during testing of the unit at works.

6.2.3 Adequate filtering shall be provided on the DC output of the rectifier to limit the ripple content in the output to less than 5% at rated output.

6.2.4 The rectifier system shall be of natural air cooled type.

6.2.5 For CPTR units with multiple output circuits, each output circuit shall have independent rectifier and filter.
6.3 Output Protections

Two pole moulded case circuit breaker or miniature circuit breaker (if available) rated for the DC output current, short circuit current and having thermal over load, short circuit release shall be provided in the output. A lightning arrester rated for minimum 10KA impulse current discharge capacity and rated voltage & maximum spark over voltage rating suitable to protect the CPTR unit components against lightning and switching surges shall be provided at the output. For CPTR units with multiple output circuits, each output circuit shall be provided with circuit breaker and lightning arrester.

6.4 System Controls

6.4.1 The CPTR unit shall have two distinct modes of operation (independent for each output circuit) as below:

a) Constant Voltage and Constant Current Mode (CVCC)

In this mode the output voltage of CPTR unit shall be continuously adjustable from 0.5V DC to the rated output voltage. The set output voltage (Vos) shall remain constant irrespective of output current. Current limit feature shall be provided. The current limit (los) shall be continuously adjustable from zero to rated output current.

For constant voltage mode of operation the output current limit shall be set at maximum and output voltage setting shall be varied. Irrespective of output current demand the chosen value of the output voltage shall be maintained by the control system till the current limit is reached. After that the output current limit shall be maintained and output voltage shall decrease to keep the current constant.

For constant current mode of operation the output voltage shall be set at maximum and output current shall be varied through varying the setting of output current limit. Irrespective of output voltage requirement the control system shall maintain the output current to the set current limit value till the voltage limit is reached. After that the output voltage limit shall be maintained and output current shall decrease to keep the voltage constant.

b) Auto PSP Mode

In this mode of operation the output of the CPTR unit shall operate in an external closed loop with pipe to soil potential (PSP), measured by reference cell, in feedback loop. The CPTR unit control shall adjust the output voltage such that the PSP as measured by reference cell always remains equal to the set potential on the unit. The set potential (Vps) shall have high long time stability and minimum temperature drift. The set potential shall be continuously adjustable over the range required.

The unit shall be designed to operate with number of reference cells connected to it (to be provided by others). In case of more than one reference cell being specified, CPTR unit shall have feature to automatically select the reference cell having less negative potential than the others and use the same for auto control of the unit (e.g. (-) 0.8 V is less negative than (-) 0.9 V). Adequate hysteresis shall be provided in selecting the less negative potential reference cell, to avoid hunting between the reference cells at change over conditions.

In case of open circuit or short circuit of reference cell or potential being less negative than a minimum set potential (Vrs), the unit shall sense these conditions as reference cell failure and shall automatically switch over to the other healthy reference cell for control. Should fault occur in all the reference cells, the output voltage or current of
the CPTR unit shall adjust automatically to a preset value (Vas/ias), which shall be adjustable.

In both CVCC and auto PSP modes of operation a fast acting electronic over current limit protection shall be provided. This protection shall be fast enough to protect the active devices of the unit and fast enough to act before tripping of MCCB/MCB or blowing of fuse.

6.4.2 The unit shall continuously monitor the PSP and necessary annunciation shall be provided in case of PSP either exceeding the specified maximum limit (Vpm) or remaining lower than the specified minimum limit (Vpn).

6.4.3 The output voltage regulation for no load to full load variation with input voltage variation from maximum to minimum shall not be more than 2.5 % of rated voltage throughout the range of output voltage and over the specified ambient temperature variation, in CVCC-constant voltage mode of operation. In auto PSP mode the closed loop PSP regulation for no load to full load variation with input voltage variation from maximum to minimum and PSP feedback varying over the specified range shall be within Zf mV.

In CVCC-constant current mode of operation, the current regulation for minimum to maximum output voltage and minimum to maximum variation in input voltage shall not be more than 2.5% throughout the range of output current.

6.4.4 The DC output of the CPTR unit shall be floating (ungrounded) in the Unit. However the CPTR Unit shall allow grounding of positive output terminal through the anode ground bed.

6.4.5 For CPTR units with multiple output circuits, each output circuit shall have independent control system.

6.5 Current Interrupter

6.5.1 If required, a current interrupter for CPTR Unit output current interruption shall be provided.

6.5.2 The current interrupter shall have an output contactor with current rating minimum 125% of the output current rating of the CPTR unit and a digital timer to operate it.

6.5.3 The timer shall have 'ON' and 'OFF' timings. When the timer is turned on the 'ON' timing shall start and shall close the output contactor till the end of the 'ON' timing. At the end of the 'ON' timing the 'OFF' timing shall start and keep the contactor open till the end of the 'OFF' timing. At the end of the 'OFF' timing the 'ON' timing shall start again and close the output contactor. This process of 'ON' and 'OFF' timing shall continue.

6.5.4 The 'ON' and 'OFF' timings of the timer shall be settable by separate 2 digit thumbwheel switches, each settable from 1 to 99 seconds. The timing error of the timer shall be less than 5 parts per million. In case of microprocessor based system keypad with display may be provided in place of thumbwheel switches.

6.5.5 Whenever the timer is switched on it shall always start with ON 'timing'. A timer-reset push button shall be provided. On pressing this pushbutton during operation of the timer, the timer shall get reset and upon release of the button the timer shall restart with 'ON' timing.

6.5.6 The power required for operation of the timer and contactor shall be derived from the main power supply to the CPTR unit.

6.5.7 The following controls and indications shall be provided for current interrupter. The controls shall be housed in a lockable cover, so that normally they are not accessible. The indications shall be mounted on the door.
a) Controls
   - Timer power 'ON' / 'OFF'
   - Timer reset
   - Thumb wheel switch for 'ON' timing
   - Thumb wheel switch for 'OFF' timing

   In case of microprocessor based system keypad with display may be provided in place of thumbwheel switches.

b) Indications (LED)
   - Timer power 'ON'
   - 'ON' timing
   - 'OFF' timing

6.5.8 The output contact of the current interrupter contactor shall be wired in the positive DC output of the CPTR unit. A link shall be provided for shorting these terminals whenever the current interrupter is not in use.

6.5.9 If required the current interrupter shall be an independent unit of portable type. The interrupter unit shall have terminals for input power supply and terminals of the output contactor. The input power supply and the rating of the output contactor shall be as required. Terminals shall be provided in the CPTR unit for taking power supply to the current interrupter.

6.5.10 Where the current interrupter is not specified with CPTR unit or is specified as portable type external to the CPTR unit, then the CPTR unit shall have provision/ terminals for connection of input power supply and output contacts of external current interrupter, for current interruption test. A link shall be provided for shorting the output terminals provided in CPTR unit whenever the current interrupter is not connected.

6.5.11 For CPTR units with multiple output circuits, each output circuit shall have independent current interrupter.

6.6 Controls, Indication and Metering

6.6.1 Following controls shall be provided on CPTR unit front door.
   a) ON/OFF control for input through MCCB/MCB.
   b) ON/OFF control for output through MCCB/MCB.
   c) Auto/CVCC mode selector switch.
   d) Potentiometers for Vos, Vps and los settings.
   e) Selector switch for selecting indication of PSP set and PSP actual for all the reference cells.

6.6.2 Following controls shall be provided inside the module at user accessible common location:
   a) Potentiometer for Vrs, Vpm, Vpn and Vas/las settings.
   b) Controls for current interrupter:
      - Timer power 'ON' / 'OFF'
6.6.3 TR unit shall have following indicating lights (lamps or minimum 5 mm dia LEDs):

a) CPTR unit ON/OFF
b) Unit in auto/CVCC (2 lamps)
c) Reference cell controlling the closed loop control of the CPTR unit (number of lamps same as number of reference cells).
d) Reference cell faulty (number of lamps same as number of reference cells).
e) Pipeline over protected.
f) Pipeline under protected
g) Indications for current interrupter:
   - Timer power 'ON'
   - 'ON' timing
   - 'OFF' timing

It shall be possible to switch-off all the indication lamps by a single switch. In case of LED indication lights this facility may not be provided.

6.6.4 Following meters having min cl.1.5 accuracy shall be provided on the CPTR unit:

a) Digital meter for output voltage
b) Digital meter for output current
c) Digital voltmeter to measure PSP set (Vps) and PSP actual for all the reference cells. The meter shall have range from -4 V to 0 V and shall have cl.0.5 accuracy.
d) Digital meters for measuring Vrs, Vpm, Vpn and Vas/ias settings.
e) Meters for input voltage and current

It shall be possible to switch-off all the digital meters preferably by a single switch.

6.6.5 If required, CPTR unit shall incorporate provision for remote monitoring of the unit through SCADA system as below:

a) Potential free contacts for the following:
   - All the reference cells failed. (Contact open on alarm condition)
   - Pipeline overprotected. (Contact open on alarm condition)
   - Pipeline under protected. (Contact open on alarm condition)
   - System in auto-mode. (Contact close in auto condition)
   - System in CVCC mode. (Contact close in CVCC mode)
6.6.6 For units having multiple outputs, each output circuit shall have independent controls, indication and metering.

7.0 TESTS AND ACCEPTANCE

7.1 During manufacture, the equipment shall be subjected to inspection by owner or his authorised representative to assess the progress of the work as well as to ascertain that only quality raw materials are used for the same. He shall be given all assistance to carry out the inspection.

7.2 Final acceptance test shall be carried out at manufacturer's works under his care and expense. Instruments and equipments required for testing shall be arranged by manufacturer. Owner's representative shall be given minimum 2 weeks prior notice for witnessing the tests. Test certificates indicating test results shall be furnished by the manufacturer. Acceptance tests shall include but not be limited to the tests listed below.

7.2.1 Visual Inspection

This shall include-
- Completeness of the equipment in line with specification.
- Checking of all settings.
- All labels provided.
- Dimensional checking.
- Proper mounting of components and neatness of wiring etc.
- Model number.

7.2.2 Insulation tests

The voltage specified in the table below shall be applied for one minute to the circuits indicated:

<table>
<thead>
<tr>
<th>Withstand voltage</th>
<th>Control electronics (&lt;60V)</th>

<td>(\text{-})</td>
<td>(\text{-})</td>
</tr>
</tbody>
</table>
electronics | To auxiliary circuits | 2xUn₂ + 1000V | 2xUn₁ + 1000V | -

(Un₁ and Un₂ are nominal voltage rating of power electronics and auxiliary circuits respectively).

D.C. test voltages may be applied instead of A.C. The magnitude of D.C. test voltages to be applied shall be 2 times the above-mentioned A.C. (r.m.s) Values.

Insulation resistance test shall be conducted before and after heat run test.

7.2.3 Heat run test

All CPTR units shall be subjected to a heat run test performed at rated voltage for period not less than 16 hours prior to execution of functional tests.

At least one CPTR unit of each rating shall be loaded to its rated output throughout 16 hour test period. All other CPTR units shall be energized under partial load or zero load current condition throughout the test period.

7.2.4 Functional tests

Functional tests as below shall be performed on each CPTR unit. If during execution of functional tests, any electronic component of the unit is required to be replaced e.g. due to malfunction or failure of the unit to fulfil the performance requirements of the specification, then the load test shall be repeated at rated current following which functional tests shall be carried out.

7.2.4.1 CVCC mode operation testing

a. Constant voltage operation

During the test, current limit shall be set to rated output current. Performance testing shall be carried out for various output voltage settings and load varying from zero to maximum. The verification of operation of the control functions, measurement of output voltage, current, input AC voltage, current, power factor, ripple in the output, evaluation of output voltage regulation and efficiency of the unit shall be carried out during the testing.

b. Constant current operation

During the test, voltage limit shall be set to rated output voltage. Performance testing shall be carried out for various output current limit settings and load resistance varied to achieve output voltage from minimum to maximum. The verification of operation of the control functions, measurement of output voltage, current, input AC voltage, current, power factor, ripple in the output, evaluation of output current regulation of the unit shall be carried out during the testing.

7.2.4.2 Auto PSP mode operation

Suitable set up shall be arranged for output loading and reference cell feedback. The closed loop performance and regulation shall be checked with the PSP set voltage varied from 0.85V to 1.2V.

Disconnecting the reference cell feedback connection in the above set up shall simulate the reference cell failed condition. The output voltage/current of the unit shall go to the value set on the potentiometer Vas/Ias provided inside the CPTR UNIT. The settings on Vas/Ias shall be varied and the output voltage/current shall be observed.
7.2.4.3 Operation of sensors for pipeline over protection, under protection, reference cell failure and reference cell selection logic in auto PSP mode shall be verified by connecting variable external voltage sources to reference cell inputs of the CPTR unit. The number of external voltage sources shall be same as number of reference cell inputs specified for the CPTR unit.

7.2.4.4 The unit shall be checked for operation of the current limit by over loading the unit in both CVCC and auto PSP modes of operation. For Units where semiconductor fuses are not provided for protection of the thyristors/triacs, the protection of same shall be tested as below:

A switch rated for making and carrying CPTR unit output short circuit current shall be connected to the output terminals of the unit. The output voltage and the output current limit settings of the unit shall be set to the maximum rated values. The switch connected in the output shall be shorted quickly.

The unit shall go to current limit mode and shall not damage any active component of the unit.

7.2.4.5 The current interrupter shall be tested for time interval settings and specified operation.

8.0 PACKING AND DESPATCH

The equipment shall be properly packed for selected mode of transportation i.e. by ship/rail or trailer. The panels shall be wrapped in polythene sheets before being placed in crates to prevent damage to finish. Crates shall have skid bottom for handling. Special notations such as 'Fragile', 'This side up', 'Centre of gravity', 'Weight' etc., shall be clearly marked on the package together with Tag nos., P.O. Nos. etc.

The equipment may be stored outdoors for long periods before erection. The packing shall be completely suitable for outdoor storage in areas with heavy rains/high ambient temperature.

9.0 DEVIATIONS

9.1 Deviations, if any, from this standard shall be clearly indicated in the offer with reasoning.

1.0 SCOPE

1.1 This specification defines the requirements of system design, engineering, installation, testing and commissioning of an Impressed Current Cathodic Protection System for underground pipelines / structures including supplementing of corrosion survey, close interval potential logging survey, investigations for interaction/interference problems and mitigation of the same.

1.2 This specification provides the basic parameters to develop a suitable impressed current cathodic protection system for the pipelines/structures requiring protection. LSTK contractor shall include, site survey to collect required information, design, supply, installation, commissioning of impressed current cathodic protection system. All data required in this context shall be taken into consideration to develop an acceptable design and for proper engineering of the system.

1.3 In addition to this specification, other requirement, if any, for complete cathodic protection shall be considered by LSTK contractor.

1.4 Compliance with these specifications, and/or approval of any documents submitted by contractor shall in no case relieve the contractor of his contractual obligations.

2.0 CODES AND STANDARDS

2.1 The system design, performance and materials to be supplied shall conform to the requirements of the latest revision of following standards as a minimum:

i) NACE Standard RP-0169 : Standard Recommended Practice Control of External Corrosion on Underground or Submerged Metallic Piping Systems

ii) NACE Publication l0A190 : Measurement technique related to criteria for CP of Underground or Submerged Steel Piping System (as defined in NACE Standard RPO169-83)

iii) NACE Standard RP-0177 : Standard Recommended Practice Mitigation of Alternating Current and Lightning Effects on Metallic Structures and Corrosion Control Systems

iv) NACE Standard RP-0286 : Standard Recommended Practice The Electrical isolation of Cathodically Protected Pipelines.

v) NACE Publication No. 54276 : Cathodic Protection Monitoring for Buried Pipelines.

vii) DNV RP-B403 : Recommended Practice Monitoring of Cathodic Protection Systems

viii) DNV RP-B401 : Recommended Practice Cathodic Protection Design

ix) IS 8062 : Recommended Practice ICCP for Underground Piping

x) BS 7361 Part I : Code of Practice for Cathodic Protection for land and marine application.

xi) VDE 0150 : Protection against Corrosion due to Stray Current from DC Installations.

xii) IS: 1554 Part I : PVC insulated (heavy duty) cables.

2.2 In case of imported equipments standards of the country of origin shall be applicable if these standards are equivalent or stringent than the applicable Indian standards.

2.3 The equipment shall also confirm to the provisions of Indian Electricity rules and other statutory regulations currently in force in the country.

2.4. In case of any contradiction between various referred standards/specifications and statutory regulations the following order of priority shall govern:
- Statutory regulations
- This specification
- Codes and standards

3.0 SYSTEM IMPLEMENTATION

All work to be performed and supplies to be effected as a part of contract shall require specific review by Owner or his authorised representative. Major activities requiring review shall include but not be limited to the following:

i) Corrosion survey data interpretation report and plot plans for land acquisition.
ii) Conceptual system design.
iii) Basic engineering package.
iv) Detailed engineering package.
v) Field testing and commissioning procedures.
vi) Procedures for interference testing and mitigation
vii) Close interval potential logging survey procedure
viii) As built documents.

4.0 CORROSION SURVEY
4.1 General

4.1.1 The details of corrosion survey including soil resistivity data along ROW and other data required for C.P. design if available with the owner shall be included. However, verification of its veracity and adequacy shall be the entire responsibility of the contractor. In addition, contractor shall have to generate/collection additional data as per clause 4.4 below required for completeness of the job.

Contractor shall carry out soil resistivity survey at anode ground bed locations for design of ground bed. Contractor shall also carry out corrosion survey along the ROW of the pipeline.

4.1.2 To carry out soil resistivity measurement Wenner's 4-pin method or an equivalent method approved by Owner shall be used. Survey instruments shall have maximum AC and DC ground current rejection feature.

Care shall be taken to ensure that the resistivity observations are not influenced by the presence of foreign pipelines/structures, and earth currents in the vicinity of EHV/HV lines and installations using earth return in their power system etc.

4.2 Soil Resistivity Survey at Impressed Current Anode Ground Bed Plot

4.2.1 Each selected anode bed plot shall be sub-divided into sub-plots. Sizes of sub-plots shall depend upon the expected depth for soil resistivity investigations. Each of these sub-plots shall be investigated for resistivity data individually. Sufficient observations shall be taken at each of these sub-plots as required and desired by Owner/Owner's representative to obtain sufficient information about sub-soil stratification and, wherever possible, to establish the depth of water table. The number of subplots at each ground bed plot shall be decided at site in consultation with Owner/Owner's representative.

4.2.2 Number, location, demarcation and size of sub-plots and number of sets of resistivity observations required for each sub-plot shall be individually decided for each ground bed plot location.

4.2.3 One or more ground bed plots may be required to be selected and surveyed at each CP station to form a suitable ground bed.

4.3 Topographic Surveys

Cathodic protection stations consisting of anode ground bed, CP station, etc. As applicable, along with all associated cabling up to pipeline and any other related equipment and accessories for CP station shall be demarcated on the ground. Ground plots so demarcated shall be surveyed for all other topographical and cadastral features and topo-sheets shall be developed by the CONTRACTOR, which shall be suitable for use in land acquisition etc.

4.4 Additional Data to be Collected

The following data shall be collected to generate design data for evaluation of interaction/interference possibilities due to presence of other services in ROW or in its vicinity. OWNER shall provide assistance for liaison work to the extent possible.

i) Route and types of foreign service/pipeline in and around or crossing the right of way (including those existing and those which are likely to come up during contract execution).
ii) Diameter, wall thickness, pressure, soil cover, and coating scheme used, type of cathodic protection system provided, if any, year of laying/commissioning in case of foreign pipelines.

iii) Details of the existing cathodic protection systems protecting the services i.e. type of protection, location, type, rating of anode beds, test station locations and their connection schemes. Present output current and voltage readings of the CP power supply units.

iv) Remedial measures existing on foreign pipelines/services to prevent interaction.

v) Graphical representation of existing structure / pipe-to-solid potential records.

vi) Possibility of integration/isolation of CP systems, which may involve negotiations with owners of other services.

vii) Existing and proposed DC/AC power sources and systems using earth return path such as HVDC substations/ earthing stations, fabrication yards with electric welding etc. in the vicinity of the entire pipeline route.

viii) Crossing and parallel running of electrified and non-electrified traction (alongwith information regarding, operating voltage, AC/DC type etc.) as well as abandoned tracks near ROW having electrical continuity with the tracks in use.

ix) Crossing or parallel running of any existing or proposed EHV/HV AC/DC overhead power lines along with details of voltage, AC/DC type etc.

x) Voltage rating, phases, sheathing details of underground power cables along ROW or in its vicinity.

xi) Any other relevant information that may be needed in designing and implementing proper cathodic protection scheme for the proposed pipeline. Graphical representation of existing structure/ pipe-to-soil potential records.

Contractor shall conduct necessary potential gradient surveys for any existing anode ground beds that may interfere with the CP system of the pipelines covered under this project.

4.5 Report

On completion of all field work, a report incorporating all the results generated from surveys and details of additional data collected shall be prepared. The report shall also contain detailed interpretation of survey results and resistivity data, probable interference prone areas, selected locations for anode ground beds, etc., to form a design basis for the scheme of cathodic protection. This report shall also include various drawings prepared in connection with the above work. Soil resistivity values shall be plotted on semilog graph sheets.

5.0 CATHODIC PROTECTION DESIGN PARAMETERS

A distinctly independent impressed current cathodic protection system shall be provided to protect the external surfaces of the complete pipeline/structure installation as specified.

Unless otherwise stated, the following parameters shall be used for design of permanent cathodic protection system:

5.1 Protection Current Density Range

i) Pipelines having coal tar coating with two/three layers of reinforcement.
## TECHNICAL SPECIFICATION - IMPRESSED CURRENT CATHODIC PROTECTION SYSTEM FOR PIPELINES (PC150-TS-0825)

* Actual current density to be adopted shall be decided based upon soil and other environmental conditions, current drainage survey data, proximity of foreign pipe lines/structures and other interference areas affecting the installation. Where considered necessary for satisfactory protection of pipeline the current density shall be suitably increased by contractor. Also refer to clause 7.1 iv) below.

At HDD (horizontal direction drilling) crossing, the pipe protection current density applicable for marshy area shall be considered.

5.2 The pipe protection Current Density indicated in the clause 5.1 above shall be applicable where the temperature of the fluid transported by the pipeline/ the surface temperature of the buried portion of the pipeline does not exceed 30°C. Where this temperature exceeds 30°C, the protection Current Density shall be increased suitably in consultation with the Owner/PMC.

5.3 Safety factor for current density : 1.3

5.4 Anode utilisation factor : 0.85 for centre connected anode.

(For high silicon cast iron anode) 0.6 for end connected anode.

5.5 Anode surface current density : 10 Amp./Sq.m. (max.)

For high silicon cast iron anode

For continuous operation
5.6 Anode consumption rate : 0.2 Kg./Amp.yr.

5.7 Pipeline natural potential : (-) 0.45 V

5.8 Design life of CP System : 30 years

5.9 Anode ground bed loop resistance: 1 ohm (max.).

including anode to ground resistance, anode and cathode cable resistances.

(The output voltage rating of the CPTR unit /CPPSM shall in minimum be adequate to drive the specified end of life cathodic protection current with safety factor, considering the total anode ground bed loop resistance as the sum of the resistance specified in this clause and pipe to earth resistance).

5.10 For mixed metal oxide coated titanium anodes the anode utilisation factor, anode surface current density and anode consumption rate etc. shall be as per the guaranteed values published by the manufacturer and supported by test certificates/field proven ness.

6.0 CATHODIC PROTECTION DESIGN CRITERIA

Cathodic protection system shall be designed to meet the following criteria :

i) The pipe to soil potential measurements shall be between (-) 0.9V (OFF) and (-) 1.18V (OFF) with respect to a copper/copper sulphate reference electrode.

ii) In rare circumstances, a minimum polarisation shift of (-) 100 millivolts may be accepted as an adequate level of cathodic protection for the pipeline with the approval of Owner.

iii) A positive potential swing of 100 millivolts or more shall be considered sufficient to indicate the presence of an interaction/interference situation requiring investigation and incorporation of mitigation measures by the CONTRACTOR.

7.0 SYSTEM DETAILS

The system shall include the following major equipment/sub-systems unless otherwise specified in project specifications:

- CP stations
- CPTR units/cathodic protection power supply modules (CPPSM)
- Anode ground beds and anodes
- Anode junction box
- Cathode junction box
- Test stations
- Permanent reference cells
- Electrical resistance probes
- Polarisation cell and surge diverter
- Polarisation coupons
All equipment shall be new and procured from approved reputed manufacturers. Equipment offered shall be field proven. Equipment requiring specialised maintenance or operation shall be avoided as far as possible. Prototype equipment shall not be accepted.

All equipment/materials shall conform to the relevant specifications included in the tender document.

All equipment including CPTR unit, CPPSM, test stations, anode lead junction boxes etc. shall be located in safe non-hazardous areas.

Where it is essential to install the equipment in hazardous area, such equipment shall be flame proof type and shall meet the requirement of IS: 2148, 5572 or equivalent international standard and shall be suitable for gas group, temperature class T3 (200°C). Indigenous equipment shall be certified by CMRI or any other recognised testing body and shall be approved by the concerned statutory authority. All flameproof equipment shall carry the BIS license marking as per the requirement of statutory authorities.

All Imported equipment for hazardous area may be tested and certified by an independent certifying agency of country of equipment origin and shall be approved by the concerned statutory authority in India.

7.1 Cathodic Protection Stations

The number and exact locations of CP stations shall be worked out based on the corrosion survey data collected. In addition, the following guidelines shall be followed for selecting the locations:

i) Number of CP stations and their selected locations shall ensure that these remain valid and are adequate for the full design life of the system after considering all foreseeable factors.

ii) As far as possible, the availability of nearby low resistivity areas for location of associated ground beds must be ensured while selecting the locations of CP stations.

iii) As far as possible, locations of intermediate CP stations shall coincide with the locations of SV stations.

iv) The locations of CP stations and anode ground bed current ratings shall be suitably selected. The same shall be verified for adequacy by the contractor. The requisite current drainage tests/survey shall be conducted by the contractor to establish the adequacy of CP current requirement indicated in clause 5.0 above and adequacy of number, ratings of CP stations for permanent CP system selected. The minimum end of life pipe protection current requirement shall be considered as the current requirement indicated in the clause 5.0 above or 3 times the current density value measured by the current drainage survey for polyethylene coated pipeline and 4 times the current density value measured by the current drainage survey for fusion bonded epoxy, coal tar enamel with reinforcement coated pipeline, whichever is maximum.

7.2 CP Transformer Rectifier Unit / CPPSM

The supply, installation, testing and commissioning of cathodic protection power supply module (CPPSM) / indoor type Cathodic Protection Transformer Rectifier Unit (CPTR unit)/
outdoor type CPTR unit installed in kiosk along with kiosk shall be included in contractor's scope. The CP TR units shall be provided at CP stations where reliable AC power supply is available. CPPSM shall be provided at other CP stations where reliable DC power supply instead of reliable AC power supply is available. The CPTR unit / CPPSM shall be installed in nonhazardous (safe) area.

For more details refer: 4001-TS-0823 & 4001-TS-0824

7.3 **Anode Ground Beds**

i) Each CP station shall have an independent anode ground bed, which may be of shallow or deep well construction depending upon the data collected by the contractor. Deep well ground beds may also be used in the congested locations where availability of suitable land for spread out ground beds is restricted.

ii) Ground bed shall be located electrically remote from the pipeline and foreign pipeline/other buried metallic structures. Nearest part of the anode bed shall at least be 100 meters away from the pipeline and foreign pipeline/other buried metallic structures. The anodes installed in the ground shall be located in perennially moist strata, wherever possible. Horizontal ground beds shall be at right angles to the pipeline, as far as possible.

The location of ground bed shall be checked and ensured for remoteness from the pipeline and other buried foreign pipelines/structures, building foundations, switchyards, electrical earthing systems, etc.

iii) Unless otherwise agreed, anodes shall be of high silicon cast iron type or mixed metal oxide coated titanium anodes.

iv) Sheet steel anode canisters of adequate size shall be provided for each anode. Anode canisters shall be filled with petroleum coke breeze. In case of deep well ground beds non-canistered anodes with petroleum coke breeze in the well surrounding the anodes shall be provided.

v) Each shallow anode-bed shall contain anodes with canisters positioned horizontally or vertically in the soil with suitable backfill. The depth of anodes (depth of top of anode in case of vertically laid anodes) shall not be less than 2 meter from grade level

vi) Layout of anode installation in anode bed shall be detailed out in drawings showing anode installation details, anode grouping, anode wiring, anode cable routing, etc. The deep well anode ground bed details shall include the details of anodes, deep well casing, anode positioning, anode cable supporting, deep well gas venting, active, passive portions of the ground bed, etc.

vii) Anodes shall be supplied complete with tail cables, which shall be long enough for termination on their associated anode lead junction boxes without intermediate joints. Exact lengths and termination details shall be indicated in construction drawings.

viii) Potential gradient around the anode bed shall be within safety requirements with regard to interference on foreign structures and its effective boundary shall be defined.

ix) In case of two parallel pipelines running in the same ROW, the anode ground beds of the respective pipelines shall be located on the respective sides of the pipelines.

7.4 **Anode Junction Box**
Depending on the size and configuration of anode ground beds, one or more anode junction boxes shall be provided at each ground bed. All cable tails from individual anodes shall be terminated onto the respective anode junction boxes, which shall be further connected to the main anode junction box (where applicable). The main anode junction box shall be connected to the cable coming from CP power source. Each outgoing circuit in main junction box (where applicable) and each anode circuit in junction shall have provision for measurement and control of individual circuit/anode current.

7.5 **Cathode Junction Box**

Where output of the CP power supply unit is connected to multiple pipelines a cathode junction box shall be provided near the pipelines at the location of connection of the negative drainage cable to the pipelines.

The negative of the CP power source shall be connected to the incoming circuit of the cathode junction box. The junction box shall have separate outgoing circuit one for each pipeline to collect the negative drainage currents from each of the parallel pipelines.

The incoming circuit shall have a current measurement facility. Each outgoing circuit shall have provision for measurement and control of current.

7.6 **Test Stations**

7.6.1 Test stations shall be provided along the pipeline ROW for monitoring the performance of the cathodic protection system at the following locations. Test stations shall be provided at additional locations, if required, so that distance between any two adjacent test stations does not exceed 1000 meters in inhabited areas and 2000 meters in uninhabited areas like forest/deserts:

i) At all insulating joints.
ii) At both sides of metallised road crossings.
iii) At vulnerable locations with drastic changes in soil resistivity.
iv) At locations of surge diverters, pipeline grounding through polarisation cells, zinc and magnesium anodes.
v) At EHV/HV AC/DC overhead line crossings and selected locations where EHV/HV overhead line is in the vicinity of the pipeline.
vi) At railway line crossings and at selected locations along lines running parallel to the pipeline.
vii) At both sides of major river crossings.
viii) At EHV/HV cable crossings or along routes where EHV/HV cables are running in parallel.
ix) In the vicinity of DC networks or grounding systems and HVDC grounding systems where interference problems are suspected.
x) At crossings of other pipelines/structures.
xi) At the locations of reference cell, electrical resistance probe and polarization coupon installation.

xii) At the location of computerised test stations.
xiii) At both sides of cased crossings.
xiv) Locations where interference is expected.

xv) At locations of sectionalising valve (SV) stations.

xvi) At any other locations considered necessary by Owner/Owner's representative.

7.6.2 Test stations for bonding shall be provided with shunt and resistor as a means to monitor and control current flow between the pipeline and foreign pipelines or structures that may exist in common ROW.

7.6.3 Test stations with current measuring facility shall be provided at each CP station drainage point (to measure pipeline current on anyone side of pipeline from drainage point at intermediate CP station and towards protected side of the pipeline at starting, end point CP stations), at interference prone areas, on both sides of major river crossings, near marshy areas and minimum one for every 10 km max. along the pipeline.

7.6.4 Test stations shall be installed with the face of the test station facing the pipeline. The nameplate of test stations shall carry the following minimum information:

- Chainage in km.
- Test station connection scheme
- Distance from pipeline in meter.
- Direction of product flow.

7.6.5 Number of terminals and different schemes of wiring shall be as per the test station connection scheme. Minimum twenty percent spare terminals shall be provided in each test station.

7.6.6 Minimum two cables from the pipeline shall be provided at any test station.

7.6.7 The location of all the test stations shall be marked with their connection schemes and other relevant information on alignment sheets. A detailed test-station schedule shall be prepared.

7.7 Permanent Reference Cells

7.7.1 High purity copper/copper sulphate reference cells with proven high reliability shall be provided for stable pipe to soil potential measurement at CP stations, polarization coupons and computerized test station locations along ROW.

7.7.2 Silver/Silver Chloride reference cells in place of copper/copper sulphate cells shall be provided at marshy area locations, where water table is high and chloride concentration is more than 300 ppm. The test station connection scheme shall clearly indicate the type of the reference electrode (Cu CUS04/Ag AgCl) at these locations.

7.7.3 The life of the reference cells shall be minimum 20 years under the installed conditions.

7.7.4 The cable from reference cells shall be provided up to CP power source at CP stations and up to test stations at the locations of polarization coupons, computerised test stations. The cable up to CP power source shall be routed through test stations near pipeline.

7.8 Electrical Resistance Probe

7.8.1 The electrical resistance probes (E/R probes) utilising the electrical resistance technique shall be provided along the pipeline at marshy areas and at vulnerable locations to monitor...
the external corrosion activity on the pipeline. The lead-wires of the probe shall be connected to pipeline through test station and terminated inside test station enabling periodic resistance measurement of the probe using a portable probe measuring instrument.

7.8.2 The material of the E/R probe element shall be of the same alloy as of the pipeline material. The probes shall be provided preferably at the bottom portion of pipeline.

7.8.3 Sufficient number of E/R probes, the locations of their installation and the number of portable E/R probe reading instruments shall be provided.

7.9 Polarisation Cell and Surge Diverter

7.9.1 Polarisation Cell

i) Where extra high voltage (66 KV and above) transmission line runs in parallel or crosses the pipeline, the pipeline shall be grounded through polarisation cell with zinc galvanic anodes of min. 20 kg net each. Grounding shall be done at regular intervals of maximum 1 km where transmission lines run parallel within 25 metres of the pipeline to control any surges in the pipeline potential that may appear in case of transmission line faults.

ii) Locations along pipeline where continuous induced over-voltage due to EHV/HV line etc. is expected or observed during commissioning, the pipeline shall be earthed through polarisation cell to the earth system of the EHV/HV tower causing the voltage induction or to a separate earthing system of zinc anodes through polarisation cell.

iii) Polarisation cell shall be installed inside test station of suitable size.

7.9.2 Surge Diverter

Explosion proof spark gap surge diverter shall be provided across each insulating joint to protect it from high voltage surges. surge diverters shall be provided for classified areas.

7.9.3 The total system including cables, cable termination, anodes/surge diverters, polarisation cell shall be suitable for the anticipated fault current at the location of installation.

7.9.4 The surge diverter and polarisation cell system shall be suitable for the design life of permanent CP system. The grounding system shall have minimum resistance to earth to restrict the pipeline voltage as per NACE/VDE criteria but shall not exceed 5 ohms.

7.9.5 The anodes shall be pre packed with special backfill adequately so that the performance of the anode is not affected by the carbonates, bicarbonates, nitrates, etc, present in the soil. In any case, the thickness of back fill shall not be less than 50mm on all the sides of the anode.

7.10 Motor operated valves where located on the cathodically protected portion of the pipeline shall be grounded by a zinc anode of 20 kg net. Magnesium anodes grounding, if any, provided during temporary CP system shall be disconnected. The MOV power supply cable armour shall be insulated (by cutting and taping with insulation tape) at MOV end to avoid armour carrying CP current.

7.11 The above ground cathodically unprotected pipeline at terminals, intermediate SV stations, pigging stations, etc. shall be earthed with GI earth electrodes. The resistance to earth of grounding shall be limited to 5 ohms max.

7.12 Polarisation Coupons
The steel coupons of pipeline material shall be provided along the pipeline to monitor the adequacy of the CP system to polarize/protect coating holidays. Coupon shall be installed at CP station drainage points, predicted cathodic protection mid points along the pipeline, at locations where the pipeline is bonded to foreign pipeline/structures, interference prone areas, marshy areas and at other locations such that minimum one coupon is installed maximum every 10 km approximately. Coupons shall be installed at bottom 113rd portion of the pipeline and 250 mm away from the pipe surface.

The coupons shall be constructed from the pipeline material and shall have uncoated surface of 100 mm x 100 mm exposed to soil. Two cables one for connection to pipeline for protection and other for potential measurement shall be provided for each coupon. The protection cable hall be connected through a magnetic reed switch inside the test station to enable measurement of coupon ‘OFF’ potential.

A permanent reference electrode shall be installed adjacent to the coupon in a manner so as to measure the representative potential of the coupon.

Magnets for operation of reed switch shall be provided.

7.13 Computerized Test Stations

Computerized test stations shall be provided along the ROW of the pipeline for automatically monitoring and recording the pipe to soil potential, pipe current, etc. of the pipeline, casing pipeline and foreign pipelines, etc. as required. The computer within the test station shall measure and record these parameters regularly at programmed intervals. The computers shall have required number of input ports for measurement of potentials and current as applicable at the location of its installation. Computers shall have real time clock and record the time of data measurement. Each computer shall an identification number incorporated in its software, which shall be clearly indicated along with the data display/print out.

The computers shall be programmed to collect and store all the field parameters at regular intervals.

Data-retrieval computer of portable type suitable for use in field for programming the field computers and retrieving the data stored by the field computers.

7.14 CP at Cased Crossing

7.14.1 At cased crossings where casing is coated, the casing shall be protected by sacrificial anode installations provided at both ends of casing. The anode installation shall be sized based on the permanent C.P. design parameters and design life of permanent CP system. At cased crossings where casing is uncoated or painted, additional protection for casing pipes may not be provided.

7.14.2 The carrier pipe inside the painted or coated casing shall be protected by zinc ribbon anodes weld connected to the outer surface of bottom of carrier pipe extending up to hour hand positions of 4 and 8 O'clock. The anodes shall be placed at close intervals as per design calculations with minimum one number of anode installed between every two supports provided between carrier and casing. The anodes shall be sized based on the permanent CP design parameters for marshy area and design life of permanent CP system.

7.14.3 Where casing is uncoated or unpainted additional protection for carrier pipe may not be provided.

7.15 Reference Cell Access Points
Reference cell access points shall be provided near insulating joint locations and at SV stations, where the ground is paved, for measurement of pipe to soil potentials. A perforated PVC pipe filled with native soil and buried at the location shall be provided for the purpose. The length of the PVC pipe shall be adequate to reach the native soil below the paving.

7.16 Cables

7.16.1 Cables shall be with annealed high conductivity stranded copper conductor, PVC insulated, 650/1100 V grade, armoured, PVC sheathed conforming to IS 1554 part-I, except for the cables for anode tail, reference cells and pipeline for potential measurements. The size of the copper conductor shall be minimum 35 sq.mm. for anode and cathode cables, 6 sq.mm. for current measurement, 10 sq.mm. for anode tail cables and polarization coupon protection cables. The size of cable for bonding, polarisation cell, grounding anodes and surge diverter connections shall be suitable for the maximum fault current subject to minimum 25 sq mm.

7.16.2 The anode tail cables shall be PE insulated, 650V grade, unarmoured, PVC sheathed and length shall be sufficient for termination on anode lead junction box without any joint in between.

7.16.3 The cables for reference cells, coupon and pipeline potential measurements shall be of 4 sq.mm copper conductor, PVC insulated, Aluminium backed by mylar/polyster tape shielded, PVC sheathed, armoured, PVC over all sheathed type.

1.16.4 The CPTR unit incomer cable shall be minimum 4 sq.mm. Copper conductor, 650/1100 V grade, PVC insulated, armoured, PVC sheathed. The cable shall be of 3 core type for single phase CPTR units and of 4 core type for 3 phase CPTR units.

7.16.5 The cables for connecting various transducers from CPTR unit/CPPSM to telemetry interface junction box shall be twisted pair with individual pair shielded and overall shielded with aluminium backed by mylar/polyster tape, PVC sheathed, armoured, PVC over all sheathed type.

8.0 INSTALLATION

8.1 Cable Laying

i) Cables shall be laid in accordance with layout drawings to be prepared by the contractor. No straight through joint shall be permitted. Cable route shall be carefully measured and cables cut to required length. Minimum half metre cable slack shall be provided near anodes, anode junction box, pipeline and test stations to account for any settling.

ii) All cables inside station/plant area shall be laid at a depth of 0.75 metre. Cables outside station/plant area shall be laid at a depth of minimum 1.5 metres. Cables shall be laid in sand under brick cover and back filled with normal soil. For cables laid outside the station/plant area, polyethylene warning mats shall be placed at a depth of 0.9 metre from the finished grade, to mark the route. iii) In case of above ground cables, all unarmoured CP cables shall be laid in GI conduits of sufficiently large size, up to accessible height for protecting against the mechanical damage.

iii) All underground unarmoured cables including anode tail cables shall run through PE sleeves. Distant measurement cables and permanent reference cell cables routed along the pipeline shall be carried at the top of the carrier pipe by securely strapping it at intervals with adhesive tape or equivalent as required.
iv) PVC pipes of proper size shall be provided for all underground cables for road crossings.

v) Cables shall be neatly arranged in trenches in such a manner that crisscrossing is avoided and final take-off to equipment is facilitated.

vi) The cables for reference cells and pipeline potential measurement shall be routed in a separate trench other than the trench provided for the rest of the CP system cables, AC cables for CPTR Units etc.

vii) The armour of the cables from CP station to test station (potential measurement, reference cell & drainage cables etc.), CP station to ground bed (anode cable) and test station to pipeline shall be earthed only at CP station end and test station end respectively of the cables. The cable armour shall be insulated (by taping with insulation tape) to avoid armour carrying CP current.

8.2 Permanent Reference Cells

The permanent reference cells shall be installed in natural soil conditions as per the recommendations of the cell manufacturer. Installations in highly acidic/alkaline soil and soil contaminated by hydrocarbons shall be avoided.

8.3 Cable to Pipe Connections

Connections of all cables other than cathode drainage cables to the pipeline or to charged pipelines shall be made by pin brazing. The resistance of the cable to pipe at the pin brazing connection point shall not exceed 0.1 ohm.

The cathode drainage cable shall be connected to a bolt welded to a metal plate, which is weld connected to the pipeline. The material of the plate shall be same as that of the material of the pipeline.

Pipe coating shall be repaired after connection of cable to pipeline. At cathode drainage point the cable joint including the bolt, metal plate and the exposed portion of the pipeline shall be covered by the coating repair material against ingress of water/moisture. The coating repair material shall be compatible with the original coating and shall prevent ingress of water along the cable surface and at the interface of coating repair with the original pipe coating.

8.4 Ground Bed Fencing

Chain link fencing shall be provided around the location of each ground bed/anode lead junction box.

9.0 FIELD TESTING AND COMMISSIONING

9.1 System testing at site

Field tests as per the reviewed field testing and commissioning procedures prepared by the Contractor shall be carried out on the equipment/systems before these are put into service. Acceptance of the complete installation shall be contingent upon inspection and test results. Field testing shall include but not be limited to the following:

i) Contractor shall carry out pre-commissioning operations after completion of installation of the system including all pre-commissioning checks, setting of all equipment, control and protective devices. All site tests, reliability and performance tests shall be carried out by Contractor.
ii) Before the electrical facilities are put into operation, necessary tests shall be carried out to establish that all equipment and devices have been correctly installed, connected and are in good working condition as required for the intended operation. Owner/Owners representative may witness all tests. At least one week's intimation notice shall be given before commencing the tests.

iii) All tools, equipment and instruments required for testing shall be provided by Contractor.

iv) Generally, the following minimum tests must be carried out and results shall be recorded:

- Visual Inspection : Comparison with drawings, specifications, detailed physical inspection and, if necessary, by taking apart the component parts.

- Testing : Simulation tests of equipment to determine

a) Cables

- Cable No.
- Voltage grade.
- Conductor cross section
- Continuity check
- Voltage test.
- Insulation resistance values between each core & earth, between cores (between core and earth for single core cable).

All cables shall be tested by 500 V megger.

b) E/R Probe

- Location/Identification number
- Checking of wiring as per schematics
- Resistance reading of probe
- Installed on top/bottom!side of the pipeline

c) Reference Cell

- Location
- Type of cell
- Potential reading
- Installed on top/bottom level of pipeline

d) Insulating joint

- Location
- Pipe to soil potential of both protected and non-protected sides of the insulating joint before and after energisation of CP system.

e) Surge diverter
- Location/identification number.
- Rating
- Type
- Check for healthiness.

f) Polarisation Cell
- Location/Identification number
- Rating
- Check for wiring
- Check standby current drain after CP system energisation. (Current drain with respect to voltage across the cell shall be recorded).
- Details of grounding provided for the polarisation cell.

g) Anode Ground Bed
- Location/Station
- Check for actual layout and compliance with drawings.
- Resistance of each individual anode.
- Current dissipation by each individual anode.
- Total resistance of complete anode bed.
- Mutual interference.

h) Computerised test station
- Location/Identification number
- Checking of wiring as per schematics
- Checking programmed interval for collection of the field data by the computer
- Type of reference cell

i) Polarisation Coupons
- Location
- Exposed area/size of coupon.
- Coupon to soil 'ON' and 'OFF' potentials.
- Type of reference cell.
- Magnetic reed switch rating.
9.2 CP Commissioning Procedure

A model commissioning procedure for a three stations CP system of a pipeline is given below for general guidance. Contractor shall develop detailed commissioning procedure as per this guideline.

i) On completion of installation of anode beds and other systems as envisaged in this specification, they shall be individually checked, tested and compared against the agreed specifications and procedure.

ii) Electrical continuity of the entire pipeline shall be verified in conformity with design.

iii) Input resistance of the pipeline at all the drainage points shall be checked and recorded.

iv) All current measuring test stations shall be calibrated and recorded using portable battery, variable resistances, voltmeters, ammeters, etc. as required.

v) Temporary protection facilities provided (if any) which do not form part of permanent CP shall be disconnected from the system & removed unless agreed otherwise.

vi) Anodes provided for grounding at the MOVs on cathodically protected portion of the pipeline shall be disconnected. Sacrificial anode where provided for the protection of the casing pipe at cased crossings shall be disconnected.

vii) The pipeline shall be allowed to depolarize for at least 72 hours after switching ‘OFF’ the protection (if any) of all other pipelines in the common ROW.

viii) Before the pipelines are put on charge by switching 'ON' any of the CP stations, natural pipeline to soil, casing pipe to soil and coupon to soil potential values at all the test stations of the system (coupon to soil potential at the locations of the coupon installations) shall be measured with respect to Copper/Copper Sulphate half cell.

ix) CP station no.1 shall be energised without put potential adjusted to achieve a maximum pipe to soil potential (PSP) as specified, at the test station nearest to the drainage point. Observations on either spread of protected portion of pipeline and coupons under this CP station shall be taken for PSP values at each of the installed test stations (coupon to soil potential at the locations of the coupon installations). The pipeline current values across the cross section of the pipeline shall also be determined at all the intended test stations influenced by this station.

x) CP station no.1 shall now be switched ‘OFF’, CP station no. 3 shall be switched 'ON' and measurement procedure as detailed in clause ix) above shall be repeated.

xi) Similarly CP station no. 1 and 3 shall now be switched 'OFF', CP station no.2 shall be switched 'ON' and measurement procedure as detailed in clause ix) above shall be repeated.

xii) All the CP stations of the system shall be switched 'OFF' and the pipelines shall be allowed to depolarize. All the three CP stations in the system shall then be simultaneously switched 'ON' and PSP values at the drainage points of pipeline shall be brought to a value of maximum PSP as specified and a complete set of observations shall be taken.

Another complete set of pipe to soil and coupon to soil observations shall be taken after lines have stayed on charge for 48 hours. If there are appreciable differences
in these observations as compared to those of earlier set, a third set of observations shall be taken after 72 hours. Maximum drainage point protective potentials shall not be allowed to go beyond the maximum PSP values as specified, in any case.

Coupon to soil 'OFF' potential shall be measured at all locations of coupon installations by operation of magnetic reed switch in the test station. The PSP of the coupons shall be within the PSP range specified in clause 6 of this document. The output of all CP stations shall then be so adjusted that the sites of occurrence of least negative protective potentials are not less negative than (-) 0.95V (OFF) and sites of occurrence of the most negative protective potential are not more negative than (-) 1.18V (OFF). A full set of pipe to soil, coupon to soil observations shall again be taken 72 hours after the adjustment of potentials and the protection system shall be left in this state of operation.

xiii) Care shall be exercised to ensure that power supply remains uninterrupted during the period of commissioning. In case of an interruption, the test in progress shall be repeated after allowing time for polarisation. More sets of observations shall be taken in any of the steps specified above, if advised by the Owner/Owner's representative.

xiv) The zinc anodes for grounding of MOVs at the locations of MOVs on cathodically protected portion of the pipeline shall be reconnected to the MOVs.

xv) At cased crossings where casing is protected, sacrificial anodes provided for the casing shall be connected to the casing pipe. The casing to soil potential and anode output current shall be measured and recorded. Where casing pipe protection is inadequate or the output current of the anode is more than the designed current, then additional anodes shall be provided as required.

xvi) PSP values at each of the test stations of the existing pipelines shall be measured, plotted, where existing pipelines run in parallel to the new pipeline, mutual interference situations between the pipelines shall be identified and necessary mitigation measures shall be provided. Interference situations shall also be identified and mitigated by comparing different sets of readings taken at same test stations at different intervals of time under identical conditions where positive potential swing is 100 mV or more.

xvii) Current readings at all the current measuring test stations shall be measured and recorded.

xviii) Where computerized test stations are provided the computer shall be initialized /started to collect and store the field data of potentials, current readings, etc as programmed.

xix) After one month of starting the computers to collect the field data, the data stored by the computers at all the computerized test stations shall be retrieved/downloaded using the field data-retrieving computer. The data shall be analysed with the help of a station main computer.

xx) At the locations of the Electrical resistance probe installations the resistance readings of the probes shall be measured using probe reader.

xxi) Final records of testing and commissioning including graphical representation of final pipe to soil potential readings shall be compiled with interpretation in consultation with Owner/Owner's representative and submitted.

xxii) If any deficiencies are found in the system, the same shall be rectified by the contractor, at no extra cost or time schedule impact, to the complete satisfaction of
Owner/Owner's representative. Such deficiencies shall include mitigation of stray current electrolysis and interference problems that may be found existing in the course of testing and commissioning. A set of PSP observations shall also be taken during the peak of the first dry season after commissioning the system into regular operation. Any deficiency found in the protection of the pipeline shall be rectified by the contractor at his own cost.

xxiii) If it is found during commissioning that the sites of occurrence of least negative or most negative protective potentials are less negative than (-) 0.95V (OFF) or more negative than (-) 1.18V (OFF) respectively even after 72 hours of operation, then the drainage point potentials shall be adjusted depending upon anode ground bed currents in consultation with Owner/Owner's representative. In any case, the protective 'OFF' potential values of pipeline and polarization coupons shall not exceed the PSP value range specified in cl. 6 of this document, at any location on the pipeline.

xxiv) The reference cell shall be calibrated minimum once in 24 hours during the commissioning.

xxv) The current dissipated by individual anodes shall be measured from the anode lead junction box and corrected for equal dissipation to the extent possible keeping the total ground bed current same.

10.0 INTERFERENCE MITIGATION

10.1 Investigations shall be made for stray current electrolysis of the pipeline, mutual interference between the pipeline and foreign pipelines/structures, interference on foreign pipelines/structures due to the CP of the pipeline and ground bed, interference on metallic structures which lie in between pipeline and ground bed or near to ground bed, AC induction on pipeline due to overhead EHV/HV lines, interference due to high voltage DC lines, HVDC earthing system, electric traction, etc.

10.2 Measurements including pipe/structure to soil potentials and pipe/structure currents etc. on the pipeline/structure being CP protected and on foreign pipelines/structures, and ground potential gradient etc. shall be made to investigate the current discharge and pickup locations. In case of fluctuating stray currents, investigations shall be made continuously over a period of time and if required simultaneously at different locations to find out the stray current source(s). Recorders shall preferably be used for long time measurements.

10.3 Wherever foreign pipelines which may or may not be protected by an independent CP system run in parallel to the protected pipeline, either in the same trench or very near to the protected pipeline and are not bonded to it, investigations shall be performed for current discharge points on both the pipelines.

10.4 Mitigative measures shall be provided depending upon the type of stray current electrolysis/interference. These shall include installation of bond with variable resistor, diodes, installation of galvanic anodes for auxiliary drainage of current, adjustment/relocation (if possible) of offending interference source, provision of electrical shield etc. depending on the type of interference.

10.5 Bonding with foreign pipelines/structures as a mitigation measure shall be provided where the owners of the foreign pipelines/structures have no objection. Otherwise alternative mitigation measures shall be provided. Wherever bonding is provided for mitigation, the bonding resistor shall be adjusted for optimum value for minimum/no interference. Galvanic anodes installed as a mitigation measure shall be adequately sized for the life specified for permanent CP system.
10.6 Where transmission lines cross the pipeline or run in parallel with it or more than 25m from the pipeline, A.C. Voltage measurements shall also be made on the pipeline to find out continuous induction of voltage. In case of the induced voltage being beyond the safe limits, the pipeline shall be grounded to the nearest transmission tower earth system through polarisation cell or to a separate earthing system of zinc anodes of minimum 20 kg net each through polarisation cell.

11.0 CLOSE INTERVAL POTENTIAL SURVEY

Where specified, contractor shall carry out a close interval 'ON'/"OFF" potential survey over the entire length of pipeline by computerised potential logging method and identify the under protected/over protected area, any major coating damage on the pipeline, after the backfilling has been consolidated sufficiently and CP system has stabilized. Contractor shall provide required mitigation measures and rectify the under/over protected zones, identify if any, the major pipeline coating defects, required to be repaired. During the survey the reference cell shall be calibrated minimum once in 24 hours. Detailed procedures for running this survey shall be submitted for review.

Additional tests for detailed identification of coating defects shall be conducted by the contractor.

12.0 DEVIATIONS

12.1 Deviations, if any, from this standard shall be clearly indicated in the offer with reasoning.

1.0 SCOPE

1.1 The intent of this specification is to define the functional and design requirements for an Integrated Fire Alarm System for industrial plants and buildings. This specification covers the requirements for selection, design, and engineering, manufacture, testing at vendor's works, supply, installation, testing at site and commissioning of the system.

1.2 The Integrated Fire Alarm System shall be conventional or microprocessor based analog addressable system comprising of MCP, detectors; conventional or microprocessor based Fire Alarm panels, CFAP and associated equipments detailed hereunder and in Project data sheets/ drawings.

2.0 CODES AND STANDARDS

2.1 The system and equipment shall comply with relevant BIS (Bureau of Indian Standards) and other Indian/ International standards, as applicable. In case Indian standards are not available for any equipment, standards issued by IEC/ BS/ VDE/ IEEE/ NEMA/ INFPA or equivalent agency shall be applicable. In case of imported equipment, the standards of the country of origin shall be applicable if these standards are equivalent or more stringent than the applicable Indian standards.

2.2 The equipment shall also conform to the special requirement/ provisions of applicable statutory regulations currently in force in the country.

2.3 In case of any contradiction between various referred standards/ specifications/ data sheets and statutory regulations, the following order of decreasing priority shall govern:

- Statutory regulations
- This specification
- Codes and standards

2.4 The fire alarm system and the components used shall conform to the latest edition of the following and also the other Indian and International Standards as applicable.

- IS-5 Colours for ready Mixed Paint & Enamels.
- IS - 513 Specification for cold rolled low carbon steel sheets and strips
- IS/IEC:60079 Flameproof enclosures for electrical apparatus
- IS - 1646 Code of practice for fire safety of buildings (general): Electrical Installations
- IS - 2175 Specification for heat sensitive fire detectors for use in automatic fire alarm system
- IS - 2189 Code of practice for selection; installation and maintenance of automatic fire detection and alarm system.
- IS - 3034 Code of practice for fire safety of Industrial buildings: Electrical generating and distributing stations
- IS - 3700 Essential ratings and characteristics of semi conducting devices (Applicable parts)
- IS - 3826 Connectors for frequencies below 3 kHz General requirements Part-I and tests
IS/IEC:60079  Code of practice for the use of semi-conductor junction devices (Applicable parts)
IS - 5780  Specification for Intrinsically safe electrical apparatus and circuits
IS - 11360  Specification for smoke detectors for use in automatic electrical fire alarm system.
IS - 12459  Code of practice for fire safety in cable runs
IS - 13346  General requirements for electrical apparatus for explosive gas atmosphere
IS-14154 Part 2  Electrical apparatus with protection of enclosure for use in the presence of combustible dust
NFPA 72 Vol 4  National Fire Alarm code
LPC  Loss prevention council recommendations.
BS - 5839  Specifications for manual call points.
BS-EN 50081-1  EMC (Electromagnetic compatibility test)
BS-EN 50082-1  EMC (Electromagnetic compatibility test)

3.0 GENERAL REQUIREMENTS

3.1 The offered equipment shall be brand new with state of the art technology and a proven field track record. No prototype equipment shall be offered.

3.2 Vendor shall ensure availability of spare parts and maintenance support services for the offered equipment for at least 15 years from the date of supply. The spares shall be available ex-stock with the vendor.

3.3 Vendor shall give a notice of at least one year to the end user of equipment and PMC before phasing out the product/ spares to enable the end user to place order for spares and services.

3.4 The vendor shall be responsible for design, engineering and manufacturing of the complete system and equipment to fully meet the intent and requirements of this specification and attached data sheets.

3.5 All equipment and accessories required for completeness of the system, whether specifically mentioned or not but considered essential for satisfactory performance, shall be included as a part of the offered system.

3.6 The system integrator shall coordinate with the manufacturers of various bought-out items associated with the system, as required, and shall freely and readily supply all technical information as and when called for.

3.7 Equipments to be located in hazardous areas shall have test certificates issued by recognized independent test house such as CMRI, ERTL, BASEEFA, UL, FM or equivalent. All indigenous equipment shall conform to Indian standards and shall be certified by Indian testing agencies. All equipment (indigenous & imported) shall also have valid statutory approvals as applicable for the specified location. All indigenous flameproof equipment shall have valid BIS license and marking as required by statutory authority.
4.0 DEFINITIONS

4.1 CFAP

It is a fire alarm panel located in fire station or in disaster management control rooms. It is electronic for conventional and microprocessor based for addressable system. CFAP is designed to gather information from distributed fire alarm panels provided in the plant/buildings and have features such as provision to activate plant-wide sirens, have interface with telephone exchange, plant's public address system etc. It has mimic for geographical display of alarms either on panel or as graphic displays on MMI.

4.2 DGFAP

It is a Microprocessor based fire alarm panel, designed for use with addressable fire alarm system. It has alpha-numerical LCD displays along with LED displays for fire/fault conditions. It also includes loop cards (for field devices), I/O cards for interface with other Purchaser's equipment, exit sign and hooters. It functions as fire alarm panel located centrally to population of fire detectors distributed over an area for optimizing and limiting the loop lengths.

4.3 ZFAP

It is a fire alarm panel for conventional fire alarm system. This has functionality similar to what is provided for DGFAP. This has LEDs for fire/fault annunciations.

4.4 Repeater Panel

It is similar to distributed fire alarm panels (DGFAP/ZFAP) but will not have Zone card/Loop card for field devices. These are provided at manned locations and are configured to acquire information about the fire/fault of selected zones from DGFAP/ZFAP and annunciate.

4.5 Integrated Fire Alarm System

It signifies a comprehensive fire alarm system comprising all the distributed fire alarm panels (DGFAP, ZFAP, repeater panels etc) having integration with CFAP for fire monitoring of total plant/building. It provides audio/visual alarm building/plant-wide having provisions for connectivity with telephone exchange, pager system and public address system. It shall provide interfaces with fire protection system and other systems like pressurization systems, air conditioning etc.

4.6 System Architecture

System architecture is line diagram defining the connectivity of DGFAPs, repeater and CFAP. This also specifies various system requirements such as redundancy, communication protocol, communication hardware, cable requirement, workstation and programming tools.

4.7 Data High Way

This term is meant to define the communication path between DGFAPs, CFAP and other network components in microprocessor based fire alarm system. Physical media for Data highway can be fibre optic (FO) cable or twisted pair copper conductor, screened cable.

4.8 Field Devices
Devices such as detectors, MCP, exit signs, hooters, siren etc. are termed as field devices.

4.9 **HAB**

This term is defined as Hooter Acknowledgement Box. HAB for individual buildings shall be provided at its exit.

4.10 **Hazardous Area**

An area in which an explosive gas/ dust atmosphere is present, or likely to be present in quantities such as to require special protection for the construction, installation and use of electrical apparatus.

5.0 **SYSTEM AND SITE CONDITIONS**

All equipment shall be designed to operate with power supply and site conditions as specified below:

5.1 **Input Power Supply**

5.1.1 Unless stated otherwise, purchaser shall provide one point power supply to each fire alarm panel (ZFAP/DGFAP/CFAP/ repeater panel), details of which are indicated in data sheet. A suitable power distribution to various equipment and sub system shall be included in vendor’s scope.

5.1.2 Power supply for fire alarm panels shall have battery backup as per IS-2189. Battery AH rating shall be determined on the basis of maintaining the system in normal operation for a period of not less than 48 hours (quiescent condition) and successive full load alarm condition of period not less than 30 min after the failure of normal mains supply. The switch over from mains to back up, in the event of mains failure, shall be automatic.

Batteries shall be Ni-Cd type. Suitable and adequately rated battery charger shall be supplied as a part of back up battery system.

(The full load alarm condition is defined as operation of all panel/field audio and visual alarm and the alarm load of 25 percent of total zones besides other normal operation loads.)

5.2 **Site Conditions**

The offered equipment shall be capable of operating continuously and maintaining its guaranteed performance at the site ambient conditions indicated in data sheet.

Unless specified otherwise, fire alarm panels along with associated hardware shall be suitable for installation and operation in a closed building/ room with restricted ventilation. Any specific requirements for air conditioned/ dust free environment, etc. for the panels, if absolutely necessary, shall be clearly highlighted by the vendor in the offer.

6.0 **FIRE ALARM SYSTEM DESCRIPTION**

6.1 **General**

Fire alarm system under this specification is envisaged to provide fire monitoring in industrial plants/ chemical plants/ plant and non-plant buildings. The system shall be designed to detect incipient fires and generate audio/ visual alarm in case of fire.

The system shall consist of automatic fire detectors and manual call point or break glass unit. Automatic fire detectors shall work on the principle of sensing of smoke, heat or
infrared rays. Depending on type of smoke, optical or ionization type detectors shall be used. Detectors shall generally be provided in plant/ non-plant buildings. Manual Call Point shall be provided at exit doors of the buildings and at exit route of industrial plants. Number of detectors and break glass unit shall be decided as per guidelines given in applicable codes and standards.

The plant/ building shall be divided into fire monitoring zones. Detectors and MCP at these buildings and plants shall be connected to DGFAP/ ZFAP. These panels shall continuously monitor the state of these devices. On sensing fire condition, an audio/ visual alarm shall be initiated identifying the zone where fire is detected. Panels shall continuously monitor the health of the cabling and in case of short circuit or open circuit fault alarm shall be actuated. Fire alarm panels shall also have powered outputs for switching on exit signs and hooters as specified in data sheet. Further, panels shall provide required output for interfacing with the Purchaser's systems such as air conditioning system or pressurization system or fire protection systems.

Alarms, if specified, shall be relayed to repeater panel provided in buildings like control rooms/administrative buildings to provide zone wise annunciation. In addition facility shall be provided to actuate siren/ hooter.

For integrated fire alarm system where plant-wide large numbers of fire alarm panels are envisaged, these panels shall be integrated to CFAP, which shall be located in fire station or in administrative control room of the building as per the job requirements. The connectivity shall be achieved using data high way or dedicated cable connection from each fire alarm panel to CFAP. Mimic at CFAP shall be provided for fire/ fault annunciation on geographical location in addition to the text/ LED. If defined, CFAP shall have provision for automatic and manual actuation of plant-wide siren as per operator's choice. Interface with other systems such as telephone exchange/ plant's public address system/Pager system shall be provided for communication required for disaster management.

6.2 Conventional/Addressable fire alarm systems

Fire alarm system shall be conventional fire alarm system or microprocessor based fire alarm system as specified in data sheet. Conventional fire alarm system shall have conventional field equipment and Microprocessor based system shall have addressable type field devices.

6.2.1 Conventional fire alarm system shall generally comprise but not be limited to the following equipment used in conjunction with conventional automatic fire alarm detectors and manual call points as a minimum.

i. CFAP with/ without mimic (as per data sheet)
ii. ZFAPs
iii. Repeater Fire Alarm Panel
iv. Plant-wide Sirens and starters
v. Hooters, exit sign and HAB in buildings
vi. Interface with Purchaser's systems
vii. Any other hardware as required to render system complete
6.2.2 Microprocessor based fire alarm system shall generally comprise but not be limited to the following equipments used in conjunction with addressable automatic detectors and addressable MCP as a minimum.

i. CFAP consisting of computer based graphic workstation and engineering station.

ii. Multi loop DGFAPs

iii. Plant-wide sirens and starters

iv. Hooters, exit sign and HAB in buildings

v. Interface with Purchaser's systems

vi. Dual redundant copper/FO cable data highway complete with dual redundant architecture for communication hardware including communication port, switches, processor and power supply

vii. Any other hardware/Software required for rendering system complete

6.2.3 As specified in data sheet, the system shall be provided with siren/s to be located at a suitable location/s in the plant and it shall be actuated manually and automatically as selected by operator from CFAP/DGFAP located at fire station/other buildings.

7.0 CONVENTIONAL FIRE ALARM SYSTEM

7.1 Design Features

7.1.1 The system shall be modular and shall facilitate future extension/ modification. Panel design and component selections shall be done for future extension up to 100/0 of specified zones or one zone whichever is maximum in each panel. The design of common facility and hardware shall be provided for required future extension of zones.

7.1.2 PCBs shall have watchdog feature for self-diagnostic. Each PCB shall have LED for annunciating card failure. Following self-diagnostic features may be considered as minimum.

i. Open loop detection

ii. Short circuit detection

iii. Earth faults

iv. Power supply failure e.g. low battery voltage, main incoming supply fail

v. System faults (PCB failure)

7.1.3 Logic of operation shall be built on "Fail safe" feature i.e. NC contact of field devices shall be considered as healthy condition and NO as fire condition. 1NO+1NC contact of output relays shall be wired to terminal block for interface with Purchaser's other equipment.

7.1.4 It shall be possible to test lamps, hooters, flasher circuit, and functional tests etc through common "Test" push button.

7.1.5 The circuit shall be so designed that silencing of the current alarm by ACCEPT push button shall not prevent annunciation of subsequent fire alarm received from any other location

7.1.6 Signal-to noise ratio shall be high to avoid spurious actuation due to noise induced in the field wiring because of proximity with power cables. Cables for field devices shall be
multicore copper conductor, unscreened, armoured, copper conductor cable. If required noise filters shall be provided at fire alarm panel.

7.1.7 Detectors and MCPs in a loop shall be wired through 1.5 mm² multi-core, Copper conductors, PVC insulated, armoured cable. Limiting distance from fire alarm panel to last detector/MCP shall not be less than 2 km or as specified in data sheet whichever is maximum.

7.1.8 LEDs shall be provided for fire/ fault visual annunciation on the panel front. LED shall also be provided for Power supply healthy, Battery backup ON, Battery/ Charger status.

7.1.9 If zone is protected with clean agent/ CO2 system, the detectors and MCPs of the zone shall be wired in cross-zones by providing minimum two loops in a zone. The last device in each loop shall be provided with end of line resistor of suitable value as per circuit design to facilitate cable open circuit and short circuit detection.

7.1.10 Scheme for FIRE/ FAULT annunciation shall be as per the following.

7.1.11 Fire alarm panels including repeater panels and CFAP shall be certified/ approved by applicable approving agency of country of origin as required.

7.2 Zonal Fire Alarm Panel

7.2.1 ZFAP shall consist number of zones as specified in data sheet. Detectors/MCP/ heat sensing cables etc shall be connected zone wise in a loop. It shall monitor fire/ fault condition of the zone. ZFAP shall be located indoor in safe area.

7.2.2 ZFAP shall be free- standing, floor mounting vertical panel consisting of audio/visual annunciation with Alarm Accept; Test and Reset Push Buttons, Auto/Manual control of hooters provided in buildings. Provision to actuate siren shall be provided if specified in data sheet. Circuit shall be designed to provide annunciation if any detector in a zone senses fire. Annunciation scheme shall be as per clause 7.1.10

7.2.3 Audio/ Visual indication and annunciation shall be as per clause 7.1.8.

7.2.4 ZFAP shall have required interface hardware where integration with CFAP/ repeater panel is envisaged as per data sheet.

7.2.5 Output contacts (1NO+ 1NC) shall be provided for interface with Purchaser's systems as per clause 9 of this specification. The rating of output contact shall be 0.5A, 220V DC or 2A, 240V AC.

7.2.6 Input power supply and battery backup for ZFAP shall be as per data sheet and as per clause 5.1 of this specification.
7.3 Repeat Alarm Panel-Conventional

7.3.1 Repeat fire alarm panel shall be similar to ZFAP except providing zones for detector loops. Fire/ fault annunciation of ZFAP shall be repeated to repeater panel. Annunciation scheme shall be as per 7.1.10 Depending on the size Repeat Fire Alarm panel may be floor mounting type or wall mounting type.

7.3.2 Where required, input power supply from purchaser shall either be 240V or 110V, 1 phase, 50Hz. It shall be possible to select supply either 240V or 110V at site without modifying or adding additional equipment in the panel.

7.4 Central Fire Alarm Panel

7.4.1 CFAP shall be located in fire station in plants or in building control room. Fire and fault annunciation for each Zone or group of zones at ZFAP shall be repeated at CFAP. Annunciation scheme at CFAP shall be provided as per the clause 7.1.10.

7.4.2 CFAP shall be in vertical panel construction or desk type construction having controls such as Accept, Test and Reset Push Buttons, Auto/Manual control of siren etc.

7.4.3 Unless otherwise specified in the data sheet, CFAP shall have mimic to display geographical location of fire. Mimic shall form an integral part of the CFAP and shall be located at the top of the panel. When separate mimic panel is specified, it shall either be wall mounting or freestanding floor mounted type. Two LEDs shall be provided for each zone on mimic panel for display of fire alarm. Mimic panel shall be powered by CFAP. Mimic made out of plastic stickers shall not be acceptable.

7.4.4 Input supply and battery backup for CFAP and MIMIC shall be as per data sheet and as per clause 5.1 of this specification.

8.0 MICROPROCESSOR BASED FIRE ALARM SYSTEM

8.1 Design Feature

8.1.1 Unless otherwise specified Microprocessor based system shall be analog addressable type. The system shall be integrated as per 'system architecture' indicated in data sheets.

8.1.2 Microprocessor based fire alarm system shall be designed to use state of the art technology. All fire alarm panels including repeater panel shall be networked through data high way. The system supplied shall not pose any limitation for future expansion by way of networking of fire alarm panels, data transfer, parameterization of addressable field devices, graphic displays etc.

8.1.3 The system shall be modular and shall facilitate future extension/ modification. Panel design and component selections shall be done for future extension up to 10% of specified zones or one zone whichever is maximum in each panel. The design of common facility and hardware shall be provided for required future extension of zones.

8.1.4 PCBs shall have watchdog feature for self-diagnostic. Each PCB shall have LED for annunciating card failure. Following self-diagnostic features may be considered as minimum.

i. Open loop detection

ii. Short circuit detection

iii. Earth faults

iv. Power supply failure e.g. low battery voltage, main incoming supply fail
8.1.5 Unless specified otherwise in data sheet, system architecture shall have minimum redundancy indicated below however not limited to the same.

i. Dual redundant at processor level (communication processor and I/O card processor)

ii. Dual redundant communication port

iii. Dual redundant data highway cable

iv. Dual redundant microprocessor at CFAP

v. Dual redundant work station/MMI (engineering station+ operator’s station)

vi. Dual redundant power supply card at all fire alarm panels (but with single source of battery backup)

8.1.6 Data highway shall be Fibre optic or twisted pair shielded copper cable as specified in data sheets. Whether specified or not, data highway shall include all necessary hardware such as modem, repeaters, network switches/ hubs etc including power supply system as required to suit the length of data highway.

8.1.7 The communication shall be peer to peer between various OGFAPs, repeater Panels, CFAP and other system components connected on fire alarm system data highway.

8.1.8 Any fault in Analog detector addressable loop and data highway shall not impair communication i.e. Communication/ flow of analog signal shall be possible from either end of the loop.

8.1.9 The loop cabling for wiring detectors and MCPs shall be class A, fault tolerant type as per NFPA 72.

8.1.10 Fire alarm logic shall be programmable type. The logic for zone protected with clean agent system/ CO₂, shall be programmed to provide output for actuation after ensuring that there is no false alarm. Similarly logic to switch ON the exit sign and sound the hooters shall be programmable type.

8.1.11 The logic shall be so programmed that silencing of the current alarm by ACCEPT push button shall not prevent annunciation of subsequent fire alarm received from any other location.

8.1.12 Signal-to noise ratio shall be high to avoid spurious actuation due to noise induced in the field wiring because of proximity with power cables. Unless otherwise specified, fire alarm cables laid in buildings shall be twisted pair, screened and unarmoured and shall be laid in conduits while cable laid outdoor in plant shall be twisted pair, screened and armoured. If required noise filters shall be provided at fire alarm panel.

8.1.13 Unless otherwise specified in data sheet, the minimum number of detectors/ MCP/ addressable devices in a signal loop shall be 60.

8.1.14 Unless otherwise specified in data sheet, conductor size of loop cable shall be 1.5 sqmm copper. The allowable signal loop length shall not be less than 2 km. To optimize length, circuit design for loop shall allow the use of spur connection.

8.1.15 DGFAP and repeater panel shall have backlit alphanumeric LCD display to provide addresses, status of each field device. In addition LEOs shall be provided for fire/ fault
visual annunciation. LED shall also be provided for Power supply healthy, Battery backup ON, Battery/Charger status.

8.1.16 Fire station shall be provided with dual redundant PC with monitor for operator's workstation and for engineering station. Any of the two should be possible to configure as engineering station for programming offline. After Programming, the engineering station will be connected to network as online operator's workstation. Programming shall also allow activating Siren from the keyboard in manual mode as per operator's choice.

8.1.17 Scheme for FIRE/FAULT annunciation shall be as per the following.

8.1.18 All field devices such as detectors and MCPs shall be addressable type. If available in vendor's design, hooters and exit sign may also be connected in addressable loop. Fault isolators shall be provided to minimize outage of number of detectors/MCPs in case of loop cable fault. For hazardous area flame proof equipment shall be used. As far as possible, the use of intrinsically safe field devices in hazardous area should be avoided. If unavoidable, due care shall be taken care in design to avoid signal distortion and thus the mal-operation due to cable capacitance and inductance.

8.1.19 System shall provide adequate EEPROM size to store minimum of 10 events fire/fault. The event shall be stored in LIFO structure. All events shall be time stamped. DGFAP shall have real time clock for event time stamping.

8.1.20 Software access for either Zone programming or access to plant/building graphic on monitor shall be password protected. For viewing status of various field devices e.g. fire and fault status password protection shall not be given.

8.1.21 Fire alarm panels including repeater panels and CFAP shall be certified/approved by an international approving agency/approving agency of country of origin as applicable.

8.2 Data Gathering Cum Fire Alarm Panel (DGFAP)

8.2.1 DGFAP shall have basic design features as per clause 8.1 above. Number of signal loops in each DGFAP shall be as defined in the data sheet. Number of loops shall be basic part of main PCB and should not be extended by providing external electronic devices. LCD display and annunciation scheme shall be as per clause 8.1.17.

8.2.2 It shall be possible to change the reference value of detector sensitivity either manually or automatically as required during the operation to avoid false alarms prior to detector maintenance.

8.2.3 DGFAP shall have serial port for communication to data highway. It should be possible to communicate all the information to CFAP/FA system workstation located with fire marshal. The protocol of communication shall preferably be open protocol.
8.2.4 In the event of non-availability of data highway, DGFAP shall work as stand alone intelligent panel monitoring fire in the zones connected to it.

8.2.5 It shall be possible to configure DGFAP to access data of any other DGFAP and display as per the operation requirement to be finalized during engineering/ commissioning.

8.2.6 It shall be possible to interface with existing fire alarm system consisting of conventional zone detectors and MCPs with end of line resistor as a part of retrofitting.

8.2.7 DGFAPs shall have output relays to provide interface with Purchaser's system defined in clause 9 as minimum.

8.3 Repeat Alarm Panel

8.3.1 These panels shall be required for repeat of alarm in building/ plant control rooms. These panels shall be similar to DGFAP and shall be connected to data highway through serial communication. Panels shall have programming facility to inhibit the display of information that is not required in a particular repeater panel.

8.4 CFAP/ PC based monitoring station or Work station

Based on vendor's system design CFAP shall include network PC based monitoring station directly connected to data highway with other peripherals such as network switches/ controller (HUB). Alternatively, vendor may supply CFAP similar to DGFAP along with PC based monitoring station. Application software shall be installed in PC as GUI. The graphic shall include geographical location of various plant areas including location of addressable detectors and MCPs. The navigation between various graphic pages shall be user friendly. The screen shall have defined area to display the latest fire or fault alarm and shall also have facility to pop up the graphic displaying the location of fire event.

8.4.2 Unless stated otherwise, CFAP shall have all the features and facilities of the DGFAPs. It shall monitor the status of each addressable field device indirectly from the DGFAPs connected on data highway.

8.4.3 Engineering workstation shall be used for programming off-line. After programming, the changed parameters shall be downloaded to other PC to work in synchronism as normal operation. This station shall also have two printers connected to PCs working as SOE printer and engineering printer. SOE printer shall be high-speed dot matrix printer and engineering printer shall be laser printer.

8.4.4 Unless specified otherwise, adequately rated UPS with bypass shall be provided for PC based monitoring station. Battery backup shall be sized as per criteria given under 5.1. Only normal supply shall be made available at one point by Purchaser at the location of central fire alarm panel.

8.4.5 It shall be possible to actuate plant-wide siren in auto/ manual mode. Unless otherwise specified, manual actuation shall be done from keyboard of workstation. Auto actuation shall be through software logic, which shall be finalized with end user during implementation. Auto/Manual selection shall be provided at operator's workstation. The actuation signal under manual mode selection shall be communicated serially to DGFAP to which siren starter is connected. Siren starters shall be hardwired to DGFAP.

8.4.6 The minimum requirements for the PC and other peripherals shall be as stated below:

* Industrial type Latest generation PC Intel Core i7, 7th Generation

* 4MB ( Min.) Cache memory.

* 8 GB RAM. ( Min.)
Application software supporting graphics with no limitation on number of graphics, events, alarms, number of field devices as required for any large plant like refinery, petrochemical complex or the large multistory building.

8.4.7 It shall be possible to provide multilevel access of fire alarm system. Read only access shall not require password protection. Access for programming and access for controls from keyboard shall be password protected. The levels of password protection shall be agreed with plant operators at the time of commissioning of system.

8.4.8 Printer

i. Printer options shall include both graphic laser printer and dot-matrix event text printer.

ii. Printer used in the system shall provide real time records of the system events and provide system reports on demand, and shall be microprocessor controlled, high speed, read only (RO) letter quality dot-matrix type 132 characters wide and 96 character set.

9.0 INTEGRATION WITH VARIOUS PLANT SYSTEMS

9.1 Fire Alarm System shall have required hardware to have interface with following plant systems as specified in data sheet.

i. Public Alarm Announcement system

ii. Paging and plant intercom systems.

iii. Plant data network

iv. ISDN telephone exchange and pager system

v. Fire suppression system

9.2 ZFAP as a minimum shall be provided with the following interface with fire suppression system unless specified otherwise.

i. Automatic signal for release of clean agent/CO₂, release for protected area and RELEASE audio/Visual alarm for evacuation.

ii. Selector switches for primary or secondary clean agent/CO₂ supply for each protected area.

iii. Manual push button for discharge of clean agent/CO₂, in each protected area. The actual release of clean agent/CO₂ shall however be delayed by 30 sec after the alarm.
iv. Clean agent/CO₂ Discharge inhibit push button for each protected area.

v. Deluge valve activation push buttons, deluge valve test push buttons and deluge valve activated status lamps.

vi. Shutdown signals to various air-handling units relative to the zone of fire.

vii. Firewater pumps start push buttons.

viii. Firewater pumps running indications.

10.0 PANEL CONSTRUCTION (CFAP, DGFAP, ZFAP, REPEATER)

10.1 All fire alarm Panels shall be free standing, floor mounting type unless specified otherwise and shall be fabricated out of minimum 2mm thick CRCA sheets and doors shall be fabricated out of minimum 1.6mm CRCA sheets. The panel shall be naturally ventilated in IP-41 enclosure protection as minimum.

10.2 Equipment Mounting

10.2.1 All apparatus, display screen, instruments and indicating lamps mounted on the panel front shall be flush mounting type. The external cabling shall not be terminated directly on the base connector of PCBs but shall be terminated on separate terminal block. Further connection to PCBs shall be as per manufacturer's standard. Routine calibration, adjustments, programming and operation shall be accessible from the front of the panel without opening the door. External cabling shall preferably be done from the rear.

10.2.2 Power supply system including battery bank shall be mounted inside the panel.

10.2.3 Doors shall be provided with pistol grip handle with lock. Lamps shall be provided inside the panel to provide adequate light for maintenance of equipments.

10.2.4 Cable entry shall be from bottom unless otherwise specified in the data sheet. Terminal strip shall be provided for incoming / outgoing cables.

10.3 Wiring and Terminals

10.3.1 Wiring within the panel shall be laid in slotted plastic raceways enclosed with cover. Control connections shall be done with 660V grade PVC insulated wires having stranded copper conductors. 1.5mm² size of wire shall normally be used for circuits with control fuse rating of IOA or less. Control wiring for electronic circuits shall be through ribbon cable or through copper wire minimum of 0.5mm dia. Panels shall be supplied completely pre-wired, such that only field termination shall be required at site before it is energized.

10.3.2 PCBs for identical functions shall be interchangeable. PCBs shall be plug in type having pin/edge connectors. PCBs shall be suitable for use in tropical, humid and dusty environment. These shall be protected with anti fungus treatment.

10.3.3 Cables shall be terminated on terminal blocks. Clamp type terminals shall be of spring-loaded, stacking type, mounted on rails. Terminals shall be sized to accept, as a minimum 2.5mm² cross section conductors. Not more than one conductor shall be terminated on the outgoing side of each terminal. At least 20 % spare terminals shall be provided in each panel for termination of spare cores of cables.

10.4 Earthing

10.4.1 A common earth bar of minimum 25 x 3 mm. copper or equivalent aluminium shall be provided throughout the length of the panel. All non-current carrying metallic parts of the panel mounted equipment shall be earthed. Flexible jumpers shall connect all doors and
movable parts to the earth bus. Two numbers earth lugs shall be provided outside the panel.

10.5 **Name Plates / Warning plates**

10.5.1 All nameplates for panel shall be engraved out of 3 ply (black-white-black) lamicoid sheets or anodized aluminum. Back-engraved Perspex sheet nameplates will also be acceptable. Engraving shall be done with square groove cutters. Hard paper or self-adhesive plastic tape nameplates shall not be acceptable.

10.5.2 Labels shall be provided for every component on the cards, connecting wires as well as for the terminals in the terminal strip inside the panel. Wiring diagram shall be pasted inside the panel door as required for termination and maintenance.

10.5.3 Special warning plates shall be provided on all removable covers or doors giving access to energized metallic parts above 24 volts.

10.6 **Painting**

10.6.1 All metal surfaces shall be thoroughly cleaned and degreased to remove mill scale, rust, grease and dirt. Fabricated structures shall be pickled and then rinsed to remove any trace of acid. The undersurface shall be made free from all imperfections before undertaking the finishing coat.

10.6.2 After preparation of the undersurface, the panel shall be powder coated. The colour shade of final paint shall be as approved by the purchaser. The finished panels shall be dried in dust free atmosphere. Panel finish shall be free from imperfections like pinholes, orange peels, fun-off paint etc.

10.6.3 All unpainted steel parts shall be cadmium plated or suitably treated to prevent rust-corrosion. Moving elements shall be greased.

11.0 **CABLE AND CABLE ACCESSORIES**

11.1 Unless otherwise specified, purchaser shall supply and lay only the following cables.

i. Signal Loop/ Zone Cables from outdoor field devices to the fire alarm panel except for buildings.

ii. Loop/ Zone cables from FA panel to JB (Vendor shall provide JBs in each building for signal loop cabling. Cables from J8 to fire alarm panel is included in purchaser's scope while cable from JB to detectors and all other field devices shall be included in vendor's scope.)

iii. Exit sign and hooter cables from FA panel to JB (Vendor shall provide separate JB for exit sign and hooter. Cables from JB to fire alarm panel is included in Purchaser's scope while J8 to exit sign and hooter is included in vendor's scope.)

iv. Cable from purchaser's switchgear to siren starter and siren starter to siren.

v. All interface cables from fire alarm panels to purchaser's system.

vi. Incoming power supply cables from purchaser's switchgear to Fire Alarm Panels All other cables as required for fire alarm system including the supply, laying and termination of cables and accessories within buildings from JBs to detectors/ MCPs, exist signs, hooters and also supply, laying, termination of data high way cables, high way accessories etc as required for successful commissioning shall be in vendor's scope.
Though the supply and installation of field cabling is excluded from vendor's scope but terminations of all cables (supplied by both vendor/purchaser) at both ends shall be in vendor's scope.

Bidder, as a part of integration and selection of fire alarm equipment, shall furnish detailed specifications for loop/zone cables, data highway cables, cables for hooter/exit signs etc giving details such as type of cables, number of pairs, size of cable, inductance and capacitance data, number of fibres/ connectors etc.

Data Highway Cables

Unless specified otherwise, vendor shall supply Copper cable/ FO type data highway cable to suit system design and equipment specification. Copper cables, if supplied, shall be of adequate size, twisted pair, PVC insulated, overall screened, PVC inner sheathed, armoured, FR type PVC outer sheathed as the minimum requirement. Fibre Optic cables, if supplied, shall be armoured, overall FR PVC outer sheathed and shall be as per ITU-T recommendation as a minimum.

Vendor shall supply and install all hardware and cabling accessories as per data highway design including modems, repeaters etc as part of the FA system. Modems/repeaters shall be powered by the supply provided for DGFAPs / CFAP.

Cable Glands / Accessories

All cable glands/ lugs/ connectors as required for the equipment shall be included in vendor's scope and shall be supplied along with the system, irrespective of whether installation is to be performed by vendor or not.

All the cable glands for outdoor application shall be weatherproof, nickel-plated brass and double compression type, whereas those for indoor application shall be single compression type.

Cable glands for hazardous area equipments shall be flameproof, weatherproof and nickel plated brass double compression type.

AUTOMATIC FIRE DETECTORS AND ACCESSORIES

General Specifications

Detectors for conventional fire alarm system shall be conventional type. End of line resistor shall be provided at the last detector in the zone. Detectors for microprocessor shall be addressable type. Detectors shall be plug-in type and shall have twist lock action fitting. Multicolour LEOs provided on the detectors shall indicate Normal and Alarm state. Essential features of detectors are indicated as below.

Detectors shall be supplied with mounting bases. Mounting base shall be identical for all type of detectors except special application detectors such as linear beam detectors etc. for installation as well as cable connection. Detector housing (body and cover) shall be made up of damage resistant, fire resistant polycarbonate and shall be suitable for either surface or recess mounting. Detector base shall be mounted on Junction boxes having terminals for cable termination. Where installation is included in vendor's scope, equipment such as GI conduits, GI junction box/ conduit box etc. shall also be included in vendor's scope.

Detectors shall be suitable for storage at ambient condition specified in data sheet.
12.1.4 Detectors, which employ Radio Active source, shall be such that the strength of the Radio Active material shall not exceed 1 micro curie or as per latest standard whichever is less.

12.1.5 All detectors shall be on the approved list of LPC, UL / FM/ equivalent international approving agency as applicable.

12.1.6 All detectors shall be suitable for operation at DC power supply extended from fire alarm panel.

12.1.7 The addressable detectors shall be continuously monitored to measure changes in their sensitivity due to the environment (dirt, dust, temperature, humidity etc.). These detectors shall give an advance indication to the panel regarding the need for maintenance. The analogue reading sent by the detectors shall be sensed and if there is a rapid increase, an alarm shall be generated. However, if there is a gradual increase in the analogue reading, a maintenance alert shall be generated by the fire alarm panel. It shall be possible to generate maintenance reports from the fire alarm panel. For the addressable detectors two-wire operation shall be possible.

12.1.8 All addressable detectors shall have selectable settings for pre-alarm and alarm and preferably have the facility to set the sensitivity and address from the fire alarm panel.

12.1.9 Manual call points / break glass boxes for microprocessor based fire alarm system shall be addressable type. Each device shall have its own address module.

12.1.10 All addressable detectors shall be suitable for installation using fault tolerant wiring (class-A, style - 6 wiring as per NFPA72). T-Tapping shall not be permitted in the case of such wiring.

12.1.11 All detectors must have insect screen to prevent entry and cause false alarm.

12.1.12 All field devices shall be from the latest generation in the manufacturer's range of products. Commonly used field devices are listed below. The specification given shall be considered as the minimum requirements.

12.2 Heat Detectors

12.2.1 Heat detectors shall use negative temperature coefficient thermisters for sensing and for reference. The detector shall be designed to give a response that depends on both absolute temperature and rate of rise in temperature.

12.2.2 The rate of rise element shall be carefully calibrated to ignore any normal fluctuation in temperature, but to respond quickly when the temperature rise is 9°C or more per minute.

12.2.3 The fixed temperature feature should be entirely independent of the rate of rise element. The operating temperature of fixed temperature element should be factory set at 57°C ± 5°C.

12.2.4 The detector shall be self-restoring type ensuring repeated use and easy maintenance.

12.3 Ionization Smoke Detector

12.3.1 Ionization smoke detector shall be solid-state type, working on ionization principle and shall preferably be of dual chamber and dual source type.

12.3.2 The detector shall be able to sense incipient fire by detecting the presence of visible and invisible products of combustion like wood, paper, ammonia processing paper, cloth, PVC, bakelite, nylon, foam, acrylic, thermocol, Photo film, nylon, polyester, painted sheets, Teflon, leather etc.
12.3.3 The sensitivity of the detector shall not vary with change in ambient temperature, humidity, pressure or permissible voltage variation. Its performance shall not be affected by an air current of 5 m/sec. It shall have an inbuilt arrangement such that puffs of smoke or hot air pockets do not inadvertently trigger the alarm. The detector shall be protected against dust accumulation/ ingress. It shall have insect resistant screen to prevent nuisance alarms.

12.3.4 Where air velocity is expected to be higher, smoke guard/ baffle shall be used.

12.3.5 Where specified, smoke detectors operating on laser diode principle shall be offered.

12.4 Photo Electric / Optical Smoke Detector

Photo electric/ optical smoke detectors shall work on the principle of light scattering utilizing a light emitting diode.

12.5 UV Flame Detectors

12.5.1 UV flame detectors shall work on the principle of a vacuum photodiode tube to detect the UV radiation that is produced by a flame.

12.5.2 UV flame detectors shall respond to ultraviolet rays of a flame. The detector shall not be actuated by artificial lights, sunlight incident through a windowpane or welding arc. False alarm check circuit shall be incorporated to prevent false alarm due to intermittent flash or lightning.

12.6 IR Detectors

12.6.1 IR detectors shall work on the principle of single wavelength infrared flame detector using one of several different photocell types to detect the infrared emissions in a single wave length band that are produced by a flame.

12.6.2 IR detectors shall react to the infrared rays of a flame. It should be sensitive enough to detect smoky fires in which flame is hardly recognizable. The detector should not react to extremely glaring artificial light or direct sunlight. The detector shall be completely solid-state type.

12.6.3 Where specified combination UV-IR detector shall be used.

12.7 Linear Beam Detector

12.7.1 Linear beam detector shall work on the principle of obscuration of infrared light beam by particles of smoke. The sensitivity shall be such as to enable operation at 30% to 500% obscuration.

12.7.2 Linear beam detector shall consist of separate transmitter and receiver. Linear beam detector shall be suitable for application in high roofed locations such as warehouses etc. The detector shall, preferably, be powered from the loop signal itself. However, if external power supply is required the same shall be explicitly stated by the vendor, which shall be covered under common power supply for the fire alarm panel and devices connected with it.

12.8 Heat Sensing Cables

12.8.1 Heat sensing cable shall be analogue type. It shall consist of four copper conductors, each covered with a colour coded, negative temperature co-efficient material. The cores shall be twisted together and protected by an outer sheath of high temperature, flame retardant PVC insulation. External mechanical protection shall be provided over the
sensor cables. Vendor shall provide control unit for each 100 m length of the sensor cable.

12.9 **Manual Call Point (MCP)/ Break Glass Unit (BGU)**

12.9.1 Manual break glass unit shall be fabricated out of 14-gauge cold rolled sheet steel. Alternately the break glass unit may be made of die cast aluminum alloy such as LM6. It shall have IP-55 enclosure and weatherproof construction suitable for outdoor installation. The break glass unit shall have a minimum dimension of 100x100x80mm.

12.9.2 The box shall be fabricated in such a way it can be mounted flush to the wall or on the surface without any modification. Two nos. 19 mm knockouts shall be provided at the bottom of the box to facilitate cable / conduit entry. The glass shall cover at least 30cm² area and shall have a thickness not exceeding 2mm.

12.9.3 The box shall have a push button element kept in pressed condition by a glass sheet fitted in the front of the box.

12.9.4 The enclosure shall be painted with fire red colour (shade 536 of IS-5) epoxy painting and an inscription" Break Glass in case of Fire", shall be painted in white letters or riveted on the enclosure by a steel nameplate. A suitable nickel-plated brass hammer, duly chained to the box with stainless steel chain shall be provided with each box for breaking the glass. Each box shall have a distinct identification number boldly painted on it.

12.9.5 If specified in the data sheet, the BGU shall have a suitably wired telephone hand set to facilitate communication between the BGU and the central annunciation panel. Telephone hand set mounted on hook switch shall be housed in a separate lockable weatherproof break glass window enclosure. The glass will be broken in case of fire with the hammer provided with the BGU.

12.9.6 Hazardous area Break Glass Units shall meet the requirement of clause 13 of this specification.

12.10 **Response Indicator**

12.10.1 If specified in the data sheet, response indicators shall be provided suitable for wall/ceiling mounting. Response indicator shall be provided where the detector is located either above false ceiling or below false floor or where detectors are not directly visible. The response indicators shall be connected to the detectors directly and shall be complete with terminal blocks suitable to accept cables with up to 1.5mm² copper conductor. In the normal state of detector, the LEO shall flicker, but in the event the detector goes into alarm condition, the LEO shall glow steadily. LEOs shall be red in colour with 5mm dia. as a minimum.

12.10.2 Use of Response indicators in addressable system is not envisaged unless otherwise specified in data sheet.

12.11 **Exit Signs**

12.11.1 Exit signs shall be fabricated out of 1.6mm thick cold rolled sheet steel. This shall be suitable for wall mounting or suspension from ceiling. Exit signs suspended from the ceiling shall have text/ direction printed on both the side of exit sign.

12.11.2 Fire exit shall be displayed by means of 5mm dia LEOs or backlit text. It shall be powered from the fire alarm panel. Exit sign shall operate on DC power supply 12.11.3. The exit sign shall be either in red letters on white background or white letters on green background.
12.11.4 Where specified in data sheet, self-luminous exit sign shall be provided.

12.12 **Hooters**

12.12.1 The unit shall consist of solid-state circuitry on a printed circuit board, a loudspeaker and a flashing lamp housed in a weatherproof dust tight, wall mounting type enclosure. The hooter shall, at least, have 102 db (A) output measured at 1-meter distance. The unit shall be powered from the fire alarm panel and operate on DC power. In the event of fire, the hooter shall raise pulsating audio alarm and the lamp shall start flashing.

12.12.2 HAB shall be provided at exit doors of buildings to mute the hooters after evacuation.

12.13 **Flashing Lights (Beacon)**

12.13.1 The unit shall consist of solid-state circuitry on a printed circuit board and a red-capped incandescent lamp and audio unit housed in a dust tight, wall/ ceiling mounting type enclosure. It shall derive power from the DGFAPI ZFAP and shall operate on DC supply.

12.13.2 Flashing lights shall be installed in the enclosed areas where clean agent/ CO₂ is to be released.

In the event a signal for clean agent/CO₂, release is given, the lamp shall start blinking with a warning sound enabling operating personnel to evacuate the area. The audio unit (hooter) shall have 102 db (A) output measured at 1-meter distance.

12.14 **Clean Agent / CO₂ Release and Inhibit Switches**

12.14.1 This unit is required to be provided at the exit of the protected buildings/ rooms. If specified, this unit is integrated with DGFAPI ZFAP. This shall consist of pull type release and inhibit switches clean agent / CO₂. The unit shall be fabricated out of 2mm thick cold rolled sheet steel suitable for wall mounting. Switches shall be pulled to release or inhibit clean agent / CO₂. Release switches shall have inscription:

"PULL TO RELEASE CLEAN AGENT / CO₂"

And inhibit switches shall have inscription:

"PULL TO INHIBIT CLEAN AGENT / CO₂"

12.15 **Zener Barrier**

12.15.1 Preferably flameproof (Ex'd') equipment that does not require the use of Zener barrier shall be used. When necessary, intrinsically safe (Ex 'i') detectors and MCPs, Zener barriers shall be provided. These shall be located in unclassified/ non-hazardous areas.

12.15.2 Normally not more than 10 detectors shall be connected to one zener barrier. However vendor shall indicate maximum number of detectors MCPs that can be connected to one Zener barrier without compromising on working of loopl zone. Vendor shall also indicate the maximum loop length from zener barrier considering 1.5 mm² copper conductor, screened cable.

12.15.3 In case loop length permits, zener barrier shall be located at DGFAP itself else it shall be located in safe area nearest to the detector/ MCP.

12.15.4 Wherever zener barriers are provided in safe area outside the Zonal panel or DGFAP, these shall be housed in their own enclosure with IP-55 degree of protection as a minimum.

12.16 **Fault Isolator**
12.16.1 Fault isolator shall be installed, if specified in the data sheet.

12.16.2 Fault isolator shall be designed to provide short circuit protection to an addressable detector loop. It shall be possible to wire the fault isolator at any point in the detector loop.

12.16.3 On occurrence of a fault (short circuit), the isolator shall cut power to all devices installed between the two isolators minimizing the outage of all the detectors in a loop.

12.16.4 The fault isolator shall have the capability to continuously check the faulted side of the loop to determine if the fault still exists. On rectification of the fault, the isolator shall automatically reset itself.

12.16.5 Fault isolator modules shall be housed in an enclosure having IP-55 degree of protection as a minimum. If located in hazardous area, it shall also be tested and approved for use in area classification defined in the data sheet.

12.17 Sirens

12.17.1 Sirens shall be industrial type with minimum 2.5 km unidirectional range (i.e. 5km diametrical range) against the wind direction.

12.17.2 The decibel level of the siren shall, at least be 132 db(A) at 1 meter, to meet the audibility requirement for the above range. Unless otherwise specified, Sirens shall operate at 415 V, 3 ph. AC supply. Sirens shall be housed in weatherproof enclosure. Starter shall be DOL and shall be housed in a separate IP55 enclosure suitable for installation indoor/ outdoor.

12.17.3 For three-phase siren, wall-mounting type three-phase DOL starter shall be supplied. Starter shall be mounted indoor in a building where siren is located. The supply to the siren starter shall be provided by purchaser from Normal or Emergency power source as defined in the data sheet.

13.0 FIELD DEVICES FOR HAZARDOUS AREA

13.1 Hazardous area is classified as Zone 1/ Zone 2, gas group IIA/ IIB or IIC, temperature class T3 (200 DC) as specified in data sheet. The field devices shall be suitable for installation in hazardous area as per specified area classification.

13.2 Field devices such as detectors, MCPs, fault isolators, Beacons, hooters etc for use in hazardous area, if specified in the data sheet shall have flame proof enclosure conforming to IS 2148. All equipment for hazardous area installation shall be complete with flame proof, weather proof cable glands as specified in clause 11.5.

13.3 Equipment, which cannot have flameproof construction, shall be intrinsically safe in design and shall be used with Zener barriers located in safe area.

13.4 Equipment that are tested / certified by a recognized test laboratory of country of origin shall only be offered. The vendor shall possess valid test certificate issued by a recognized independent test house such as CMRI/ BASEEFA/ UL/ FM or Equivalent for the offered equipment.

13.5 All equipment (indigenous or imported) shall have valid statutory approval as applicable for the specified hazardous location from CCE or any other applicable statutory authority. All indigenous flameproof equipment shall also have valid BIS license and corresponding marking as required by statutory authority.

13.6 A separate name plate shall also be provided on each equipment to indicate details of testing agency, test certificate number with date, statutory approval number with date,
approval agency, BIS license number with date, applicable gas group, temperature class etc. The nameplate shall be riveted/ fixed with screws and not pasted. In case above information are embossed on the enclosure, the same need not be repeated.

14.0 ENGINEERING REQUIREMENTS

Unless specified otherwise, vendor shall design entire fire alarm system including design of system architecture with details of integration, cabling requirement and protocol selection etc. Vendor's scope shall also include basic design and preparation of layouts for fire alarm system for plant/ buildings as specified in the data sheet/ purchase documents.

14.1 Conventional Fire Alarm System

i. For conventional fire alarm system, purchaser shall provide typical block diagram. On this basis, vendor shall prepare detailed drawing giving various system component details. The design and engineering shall include sizing and selection of various equipment such as fire alarm panels, batteries, battery chargers, field equipments, siren/ siren starter etc. including preparation of G.A. drawings of various equipment.

ii. The layout engineering for buildings shall include the drawings showing location of MCP/ Detector and other field devices, cable schedules, interconnection diagram, equipment installation drawings etc as minimum.

14.2 Addressable Fire Alarm System

i. Vendor shall develop a system architecture based on purchaser's requirement showing details of various network elements such as DGFAP, CFAP, Work station, networking hardware, redundancy, protocols, data highway etc. including the maximum permissible loop length and length of data highway.

ii. The design and engineering shall include sizing and selection of various equipment such as fire alarm panels, batteries, battery chargers, field equipments, siren/ siren starter etc. including preparation of G.A. drawings of various equipment.

iii. The layout engineering for buildings shall include the drawings showing location of MCP/ Detector and other field devices, cable schedules, interconnection diagram, equipment installation drawings etc. as minimum.

iv. The parameterization facilities of various field devices along with the geographic mimic, annunciation, text messages etc shall be available on the fire alarm panel.

15.0 INSPECTION, TESTING AND ACCEPTANCE

15.1 All the equipment shall be tested to the defined specifications as per mutually agreed test plan/ FAT procedure, which shall be submitted and got approved from Purchaser at least one month before inspection. PMC/ Purchaser's inspectors shall witness all the tests.

15.2 During manufacture, the equipment shall be subject to inspection as per attached inspection plan to assess the progress of work and to ascertain that the quality controls are being maintained. Vendor shall provide all necessary assistance and information concerning the supply to PDIL/Purchaser's inspectors.

15.3 Tests shall be carried out at the vendor's works under his care and expense and Purchaser shall be informed at least 4 weeks in advance regarding this.
15.4 FAT shall include simulation of operational field conditions and test for functional adequacy. Besides all routine, and acceptance tests specified by applicable codes and standards, shall be performed on the complete system.

15.5 For bought out items, the routine and acceptance tests shall be conducted at the respective equipment manufacturer's works.

15.6 At the time of inspection, vendor shall produce original of all the type test certificates, test and approval certificates for hazardous area equipment from testing and approving authority and any other certificates as required from statutory authority for the review of inspectors.

15.7 Vendor shall submit a SAT procedure for PMC/ Purchaser's approval. All equipment and systems shall be tested at site as per the approved SAT procedure.

15.8 SAT shall be conducted by vendor after the entire fire alarm system is installed and interconnected by cables. These tests shall establish the operational correctness of the system. Vendor shall rectify deficiencies noticed during SAT with no commercial implication to Purchaser including replacement of system components and supply of new component for making system successfully operational.

16.0 PACKING AND DESPATCH

All the equipment shall be divided into several sections for protection and ease of handling during transportation. The equipment shall be properly packed for selected mode of transportation i.e. by ship/rail or trailer. The panels shall be wrapped in polythene sheets before being placed in crates to prevent damage to finish. Crates shall have skid bottom for handling. Special notations such as 'Fragile', 'This side up', 'Center of gravity', 'Weight' etc., shall be clearly marked on the package together with Tag nos., Purchase order Nos. etc. The equipment may be stored outdoors for long periods before erection. The packing shall be completely suitable for outdoor storage in areas with heavy rains/ high ambient temperature.

17.0 INSTALLATION AND COMMISSIONING

Where installation of the system is included in the scope of the vendor, vendor shall arrange all necessary manpower and equipment required for the same. Commissioning of the complete system is to be carried out by vendor in all cases irrespective of whether the installation was performed by vendor or not. All tools, test equipment etc. for the successful commissioning of the system shall be arranged by the vendor. Only the cabling specifically excluded from vendor's scope shall be installed by others. However, termination at panels for purchaser's cables shall be done by the vendor.

18.0 TRAINING

The vendor shall provide, free of cost, comprehensive training to Purchaser's personnel on various operation and maintenance aspects of the Fire Alarm system as agreed during ordering.

1.0 SCOPE

1.1 This standard covers the technical requirements of design, manufacture, supply, erection, testing and commissioning of general purpose Passenger cum Goods Lift.

1.2 The scope of work shall include, but not limited to the following items:

i) Haulage mechanism
ii) Counter weights
iii) Guides
iv) Car with frame
v) Landing gates
vi) Door frames
vii) Control Panel
viii) Brakes
ix) Indication
x) Car lighting arrangement
xi) Car telephone
xii) Car Ventilation
xiii) Earthing
xiv) Gas Mask
xv) All other items not specified, but required for safe and proper operation of the lift.

1.3 The LSTK contractor will provide power/ lighting/ DC supply through a single feeder required at a suitable point in the machine room. The supplier shall include the isolation switch and all distribution equipment, cabling and wiring required for power, control and car lighting, telephones for the safe and proper operation of the lift. General lighting of the machine room and the landings are excluded.

1.4 Civil and structural work required for lift well, lift pit and machine room shall be provided by the LSTK contractor in accordance with the requirement indicated by the supplier. However, necessary scaffolding in the hoistway, minor civil work, pit ladder, hoistway wiring, all steel material required for supports, lift shaft, bearing plates, buffer support channel, separator channel, sill support angle etc. are included in the scope of work.

1.5 The manufacturer shall be responsible for obtaining statutory approval for all equipment in lift installation from the factory inspector/electrical inspector of the state where the same is installed.

1.6 The vendor shall indicate the power requirement, loads and other details for structural design within 6 weeks from the date of L.O.I. to enable the LSTK contractor to provide the above mentioned services.

2.0 STANDARDS TO BE FOLLOWED

2.1 The equipment and installation shall conform to the latest issues of the following relevant Indian Standards. Equipment complying with equivalent IEC standards shall also be acceptable.
The design, installation and operational features of the equipment shall also comply with the provisions of the latest version of the following Acts and Statutory Regulations.

b) Lift Act
c) The Indian Electricity Rules
d) Fire Insurance Regulations

The supplier shall make suitable modification, addition/ alterations in the equipment, wherever necessary to comply with the above mentioned Act/ Rules/ Regulations.

Wherever any requirement laid down in this standard differs from that in Indian Standards, the requirements specified herein shall prevail.

3.0 SERVICE CONDITIONS

3.1 Ambient Conditions

These shall be as indicated in Design Philosophy - Electrical.

3.2 System Details

These shall be as indicated in Design Philosophy - Electrical.

4.0 OPERATIONAL REQUIREMENTS

4.1 All electrical equipment shall be Flameproof/ Increased Safety/ hose proof type design for successful use in the extreme conditions of voltage and frequency variations without exceeding the maximum specified temperature.

4.2 For control and safety features, 115 Volts A.C. single phase, 50 Hz supply shall be used. This shall be arranged by the supplier by suitable double wound stepdown transformers with one pole earthed. Where D.C. supply is required, necessary rectifiers etc. shall be included in the offer. 110 V/ 220 V D.C. supply will be provided by the LSTK contractor for operating the emergency alarm bell and Emergency light in case of power failure.
4.3 **Method of Power Control**

4.3.1 The operation of the lift shall be automatic without the need for any car attendant.

4.3.2 **Operating Devices**

i) **In the Car**

Flush type attractively finished metal panel housing push-buttons one for each landing, an emergency stop push button, light switch, fan switch and an alarm switch shall be installed in the car.

ii) **In each landing**

a) Flush type attractively finished metal housing shall be installed at each landing with a single push button for calling the lift. The call button shall not be provided at emergency landings. However, door at all emergency landings shall be provided.

b) Dust protective (car door open) lights shall be provided at each landing in a separate metal housing installed on the wall.

c) All normal & emergency landing doors shall be manually operable having single leaf spring closing feature.

4.3.3 **Normal Operation**

The car cannot be started unless the car gate is in the closed position and all hoist-way doors are in the closed position. Momentary pressure on a car button shall move the car to the landing selected where the car shall stop automatically. Uninterrupted movement of the car shall be ensured until the desired landing is reached.

A time relay shall be provided to make the car inoperative for a few seconds after the desired landing is reached or whenever a stop command is given. This interval shall be adjustable but sufficient to permit a passenger to enter the car or leave the car including the close/open operations of the car gate and hoist-way door. The closing and opening of the car gate shall be done manually on entering the car.

4.3.4 **Emergency Operations**

In case of power failure, suitable provision shall be made for manual hoisting or lowering of the lift to the nearest landing. It shall be possible to open the car gate and landing doors manually at which the car is at rest in the event of failure of power.

5.0 **MACHINE ROOM**

The machine room shall be located at ground floor above 0.5 m from finished floor level. Machine room shall be freely ventilated through openings fitted with fixed louvers and exhaust fan. Access to this machine room shall be provided through an adequately sized aluminium door for an easier removal of the equipment installed therein. The supplier shall indicate the details of machine room viz size etc. Any other arrangement required for the safe operation of the equipment shall have to be provided by the lift vendor.

6.0 **GENERAL DESIGN & CONSTRUCTIONAL FEATURES**

The design of the lift and the associated equipment as well as their installations shall be in accordance with the latest engineering practice.
7.0 GENERAL DESIGN & CONSTRUCTIONAL FEATURES OF MECHANICAL EQUIPMENT

7.1 Loading and Stresses

7.1.1 All mechanical equipment shall be efficient in design for ease of erection, installation & maintenance.

7.1.2 The factor of safety for any part of the lift must not be less than 5 but higher factor shall be adopted for the parts specified in the relevant IS/IEC.

7.1.3 Loads and their combination thereof and maximum permissible stresses shall be as per relevant IS/IEC specifications.

7.2 Material of Construction

7.2.1 All materials of construction used for the lift shall conform to the relevant IS Standards and codes of practices or equivalent IEC.

7.2.2 All equipment enclosures shall preferably be of cast aluminium.

7.2.3 All external bolts and nuts including stay bolts up to 8 mm dia shall be of stainless steel and for sizes above shall be of M.S. cadmium plated.

7.2.4 Name plates on equipment shall be made of stainless steel with the letters embossed on them.

7.2.5 All pulleys shall be anti-spark type.

7.2.6 Exposed copper & copper alloys are not permitted to be used.

7.3 Lift Machine

The machine shall be of the single wrap traction type and shall include the driving motor, electromechanical brake, steel worm, bronze gear, steel sheave shaft and sheaves etc. mounted on a single base plate. The worm shaft shall be provided with ball bearings to take the end thrust. Roller bearings shall be provided for sheave shaft to ensure alignment and long bearing life. The driving sheave shall be helically grooved to ensure proper traction and minimize rope wear. Adequate arrangement for lubrication shall be provided for all bearings from single application point and oil filled worm gear.

7.4 Guides and Fixtures

Rigid guides of steel construction of sufficient strength, round section or ‘T’ section type with machined working surface shall be used for guiding lift car and counter-weight throughout their travel.

Guides of ‘T’ section shall be held rigidly to their fastenings by through bolts or by clips to restrict torsion. These shall be so jointed and fixed to their brackets that the guides shall not deflect by more than 3 mm laterally under normal operation. Guides and their fixing shall withstand application of safety gear when stopping a fully-loaded car or counterweight. Guide bracket shall be fixed to walls, plate inserts or stair stringer by bolts or bolted to the building or structural steel work.

7.5 Buffers

Buffers shall be installed under the lift car and top of the car and counterweight in
according to the requirement of IS or as per relevant IEC. These shall be complete with steel mounting members.

7.6 Lift Frame

The car shall be carried in steel car frame sufficiently rigid to withstand the operation of the safety gear without permanent deformation to the car frame. The deflection of the cross head members and the members carrying the platform shall not exceed 1/1000 of the span under static conditions with the contact load evenly distributed over the platform. At least 4 sets of roller guides shall be provided, two at the top and two at the bottom of the car frame. Necessary Facia Cover Plates for supporting the door frames on various landings shall be provided. Necessary safety devices shall be mounted underneath the car platform.

7.7 Lift Car

7.7.1 The car shall be of rigid construction for use in a chemical plant. The fittings inside the car should be properly protected against damage by tools or pipes, etc. carried by Workmen and by the corrosive action of chemical dusts and vapours.

7.7.2 Lift car shall be provided with roof, gates and car enclosure and the dimensions shall be as per IS: 4666 or as per relevant IEC.

7.7.3 Lift car shall have a 20 Watts fluorescent fixture suitable for hazardous area classification as per requirement.

7.8 Car Enclosure

The enclosure and door shall be of Stainless Steel 2.0 mm thick. Doors shall be able to withstand thrust of 35 Kg. applied normally at any point without any permanent deformation. Car enclosure shall be rigidly secured to the car floor & car frame.

7.9 Car Platform

Car platform shall be of steel construction suitable for specified contract load. The flooring shall be of 5 mm thick aluminium chequered plate bolted to the platform members. Car platform should have an apron of sufficient depth so as to prevent any object being trapped between car platform and lift landing.

7.10 Emergency Exit

A hinged cover not less than 600 mm x 450 mm opening upwards shall be provided in the car roof to serve as an emergency exit. The emergency exit shall be provided with an electrical interlock which will prevent the lift from being operated when the emergency exit is left open.

7.11 Load Plate

A plate showing the lift capacity shall be fitted inside the car. The load-plate shall indicate in a tabular form various combinations for number of passengers and goods loads permissible for safe operation in compliance with the applicable lift act.

7.12 Car Gate

The car gate shall be collapsible door and steel painted with anticorrosive paint. The gate shall be hung on an aluminium track by Nylon rollers and guided in a finished
groove sill on the car platform. The hangers and tracks for doors together with their fixtures shall be of adequate strength and rigidity. Means shall be provided to prevent the collapsible door from jumping the tracks or jamming. Suitable stops shall be provided to prevent the hanger carriage from leaving the end of the track. The distance between the collapsible car door & landing door shall be Min. 145 mm.

7.13 Hoist way Doors

The supplier shall furnish and install at each landing, steel swing doors with 2 mm thick & secured to give a clear opening of 900 mm width x 2000 mm height complete with door frames, hinges, handles, vision panels and door closures. The door shall be spring closing type.

7.14 Car Safety and Governor

Car safety device shall be provided to stop the car in case of excessive descending speed. The safety devices shall be operated by a centrifugal speed governor located at the top of the hoistway and connected to the governor through a continuous steel rope. The tension frame of the governor part at the bottom of the hoistway shall have stainless steel shaft. Suitable means shall be provided to cut-off power to the motor and apply the brake on application of the safety device. The rollers of the safety devices shall be of stainless steel.

7.15 Counterweight

The counter weight shall be provided for smooth operation. This shall be constructed of multiple sections of cast iron weighted with lead discs and two tie rods passing through holes in all sections. Two tie rods shall be provided for safety reasons. The counterweights shall withstand the effect of buffer impact. Renewable guide shoes shall be provided at the top and bottom of the weight. Screen protection for the counter weights shall also be provided.

7.16 Sheaves and Beams

Car and counter weight sheaves shall be provided as required. The sheaves shall be of cast iron grooved for the hoist ropes, sheaves shall have grease lubricated bearings.

7.17 Suspension Ropes

Hoisting ropes and compensating ropes of sufficient length made of galvanised traction steel shall be provided in the lift. They shall have PVC sleeving. Two ropes, independent of one another shall be used for suspension. Suspension ropes shall be in accordance with IS: 2365.

7.18 Cat Ladder

A cat ladder shall be provided throughout the length of the lift shaft for facilitating the escape of person trapped inside the lift car. The cat ladder shall be made of either stainless steel or suitable aluminium alloy. It shall be fixed to the lift well plate inserts or structure.

8.0 GENERAL DESIGN AND CONSTRUCTIONAL FEATURES OF ELECTRICAL EQUIPMENT
8.1 **Main Switch**

One No. heavy duty switch fuse unit rated for 415 V, 63 A shall be provided by the lift supplier in the Control Panel/Sub-control Panel to receive the incoming supply.

8.2 **Lift Motor**

Motor for use in the lift shall be as per IS: 8151 and suitable for lift duty. It shall be of squirrel cage design, class F insulated (temp. rise limited to that of Class B), totally enclosed fan cooled type, having an enclosure of IP55 as per IS: 4691. The temperature rise of the motor throughout the working range shall not exceed the value specified in IS: 325. The terminal box and cable glands for motor shall be suitable for classified hazardous area.

8.3 **Brake**

A Solenoid Operated brake having at least two brake shoes shall be provided. The brake shall be spring applied and electrically released type. This shall be capable of bringing the lift car to smooth stops under variable loads.

Earth fault, short circuit or residual magnetism shall not prevent the brake from being applied when the power supply to the lift motor is interrupted. Means of releasing the brake in emergency case shall be provided.

8.4 **Controller**

A floor mounting cubicle type control panel shall be supplied to control the operation of the lift. The controller shall house the devices for starting, stopping, speed control of the lift motor and automatic application of the brake after the desired operation, operation of the safety devices on power failure. Necessary protective equipment for each electrical equipment and circuits shall be provided. The components as well as their layout shall conform to the relevant ISS/IEC. The controller panel shall be fabricated out of CRCA steel having thickness of 2 mm or more. The doors shall be internally hinged type. The design shall be totally enclosed, dust tight and vermin proof. For dustproof-features neoprene gaskets properly held in positions shall be provided at all jointing surfaces. The panel shall be of adequate size (not less than 1000 mm width x 600 mm depth x 2200 mm height) so that the operating temperature in the panel is within the permissible limits. The controller shall be housed in the machine room without having any ventilation facilities. The entire panel shall be painted with 2 coats of epoxy based paints after suitable chemical treatments.

The main and auxiliary contactors and relays shall be liberally spaced inside the controller. They shall be marked with the designation. The wiring shall be carried out with 2.5 sq.mm solid copper PVC insulated conductors, neatly laid and bunched with PVC bands. They shall be numbered as per IS: 375.

A reverse phase relay shall be provided on the controller to protect the lift against phase reversal and phase failure.

A lockable maintenance/service control switch shall be provided. In service position all safety interlocks shall be in circuit whereas in maintenance position safety interlocks shall be by passed so as to carry out maintenance.

For external connections all the power and control wires shall be terminated in the terminal block. For power cable, crimped type Cu lugs shall be supplied. For control
cable, pressure clamp type terminal blocks shall be provided. Ferrules shall be provided on all the wires.

8.5 **Car Operating Panel and Hall Stations**

Both shall have heavily zinc plated sheet steel bore with aluminium cover fitted by means of stainless steel screws. A continuous neoprene rubber gasket shall be provided to make the box dust proof. The push button units shall be of reputed make subject to Purchaser’s approval.

8.6 **Car & Hoist way Junction Boxes**

The junction boxes shall be of 6 mm thick cast aluminium having neoprene rubber gasket for dust proofing. The size of the junction boxes shall be adequate for the termination of cables as required. The cover fixing arrangement shall be external and the fixing screws shall be of stainless steel.

8.7 **Terminal and Final Limit Switches**

The terminal switches shall be provided to slow down and stop the car automatically at the terminal landings.

The final limit switches shall be provided to automatically cut off the power and apply the brake in case of the car travelling beyond the terminal landings.

All the limit switches shall be of positive action type. The operating arms and rollers shall be of stainless steel. The moving pins shall be made of stainless steel supported on oil-less bronze bushings. The enclosure of the limit switches shall be of cast aluminium provided with neoprene gasket.

8.8 **Car Gate Interlock**

An electrical interlock shall be provided in the car gate to prevent the movement of the car away from a landing unless the car gate is in the closed position. Effective locking devices shall also be provided to prevent the opening of the gate unless the car is on a particular landing.

8.9 **Hoist way Door Interlock**

Each hoist way door shall be provided with an approved interlock to be operated by a retiring cam on the car to prevent the movement of the car away from the landing unless all the doors are closed and locked. The interlocks shall also prevent opening of the doors except at the landing where the car is stopping or has stopped. The retiring arm shall be provided with dust protective covers.

8.10 **Door Open Bell**

An industrial bell shall be installed on the car to ring while a landing button is pressed and the car gate is open. The bell shall be for 110 V DC.

8.11 **Car Travelling Cable**

All electrical connections to the car shall be made by means of a multi-core hanging copper conductor flexible cable, one end of which is connected to terminal box fitted above the car, the other to a terminal box fitted in the well at approximately the mid-
position. These travelling cables shall conform to B.S.S. 977 having FRLS properties also. All car connections from the controller shall run to the well terminal box. The length of the flexible cable shall be approximately equal to half the lift total travel plus 5 meters so that the car may travel from end to end of the well without subjecting the cable to any strain.

8.12 **Wiring**

From the safety aspect, it is essential that all electric cabling and wiring be carried out in a sound and efficient manner and be in accordance with IS:732.

8.13 **Telephone**

An arrangement for installation of a telephone set inside the lift car shall be provided. This shall include an aluminium cabinet for telephone set having hinged door and flushed with the lift car with proper nameplate on the door.

Necessary leads shall be provided on the travelling cable for this purpose. The LSTK contractor shall terminate the exchange cables in the machine room. Necessary arrangements shall be provided to receive this. The receiver shall be supplied and installed by the supplier. Necessary terminal block shall be provided in the cabinet for this purpose.

8.14 **D.C. Lighting**

One No. 60 W, 110 V DC lighting fixture shall be provided in lift car for lighting in case of power failure.

8.15 **Earthing**

The metal framework of the motors, controllers/switchgear, electrical equipment in the car, car metal framework, guide rails & buffers and the electric conduit shall be effectively earthed in accordance with the latest issue of Indian Electricity Rules and IS:3043. The cross-sectional area of the earth conductor in the travelling cable shall be equal to that of the current carrying conductors. All equipment shall be earthed at least by two separate earth conductors.

9.0 **PAINTING**

9.1 All vendor equipment shall be painted with two coats of corrosion resistant epoxy based paint after suitable pretreatment.

9.2 The pre-treatment shall include treatments for removal of dust, scale and other foreign matters, epoxy based primer coating and final painting by spraying.

9.3 All fabricated items shall have shop coating of the primer only. Painting shall be carried out at site after their installation. The site painting shall have one coat of corrosion resistant epoxy based primer followed by two coat of epoxy based paint by spraying.

10.0 **TESTS AND INSPECTION**

10.1 All the items shall be routine tested as per relevant Indian Standards in the presence of Purchaser’s representative. The supplier shall give a fortnight notice to the LSTK contractor to enable its representative to be present for these tests.
10.2 In addition all the equipment shall be subject to stage inspection at works.

10.3 These inspections shall, however, not absolve the vendor free from his responsibility for making good any defects which may be noticed subsequently.

11.0 ERECTION, TESTING AND COMMISSIONING

11.1 The supplier shall undertake the erection of all equipment in accordance with established practices, in conformity with the statutory regulations and to the entire satisfaction of the LSTK contractor.

11.2 The supplier shall arrange all the necessary erection, tools and tackles including the supply of erection materials. The manufacturer shall also supply bulk lead lighting fitting inside hoist way to be provided at every 20 metres interval suitable for classified hazardous area.

11.3 The supplier shall to obtain the necessary clearance from the statutory authorities for equipment supplies and installation. All necessary drawings and test certificates as required by the authorities shall be furnished. Any modification/rectification, as required by the authorities shall be carried out.

11.4 Approved tests shall be performed on all equipment to the LSTK contractor’s entire satisfaction. All the test results shall be recorded and submitted to the LSTK contractor.

11.5 The entire installation shall be tested to prove the required performance in the presence of Purchaser's representative.

12.0 SPARES

12.1 Spares for operation and maintenance

Item wise unit prices of spare parts shall be quoted.

12.2 Commissioning Spares

Commissioning spares, as required, shall be supplied with the main equipment. Item wise list of recommended commissioning spares shall be furnished for approval.

12.3 Any other spare parts not specified, but required, shall also be quoted along with the offer.

12.4 All spare parts shall be identical to the parts used in the equipments.

13.0 DRAWINGS AND DOCUMENTS

13.1 The drawings and documents as per Annexure-II shall be supplied unless otherwise specified.

13.2 All drawings and documents shall have the following descriptions written boldly:

i) Name of client
ii) Name of consultant
iii) Enquiry / order number with plant / project name
iv) Equipment Code No. and Description
13.3 At the time of handing over of the installation, the supplier shall supply as-built drawings taking into consideration the actual execution carried out.

14.0 DEVIATIONS

14.1 Deviations, if any, from this standard shall be clearly indicated in the offer with reasoning.

1.0 GENERAL

1.1 Scope

This specification covers the general requirements for design, manufacture, assembly, inspection and testing at the Manufacturer's works of high voltage indoor soft starters above 1100V grade.

1.2 Data sheet

Contractor shall submit the data sheet in the Bid.

1.3 Codes and standards

The design, manufacture, testing and performance of soft starter panel shall comply with all current statutes, regulations and safety codes in the locality where the equipment will be installed.

Unless otherwise specified, the soft starter shall confirm to the relevant Indian, IEC or British Standards. Nothing in this specification shall be construed to relieve the Contractor of his responsibility. The relevant Standards are:

2. IS: 3156 (1992) Voltage Transformers. (Part - I to IV)
7. IS: 694 (1990) PVC insulated cables for working voltage upto and including 1100V.
8. IS: 6875 (1973) Control switches for voltages upto and including 1000VAC and 1200V DC. (Part - I to IV)
16. IEC 297 Dimensions of panels and racks.
17. IEC352 Solderless wrapped connections.
18. IEC 446 Semi-conductor converters.

2.0 GENERAL TECHNICAL REQUIREMENTS
2.1 **Design features**

(1) The thyristorised starter shall be used for starting of large induction motors.

(2) The soft starter shall give an excellent voltage control during soft starts, smooth steeples acceleration.

(3) The soft starter shall be used during starting for smooth and step-less acceleration only. Once motor gains its full speed bypass vacuum contactor shall be operated to bypass thyristors. The thyristor shall be short time rated (2 min.).

(4) The soft starter drive shall consist of the following.
   - Isolation vacuum contactor.
   - Bypass vacuum contactor.
   - Thyristor unit.
   - Motor protective devices.
   - Indicating / Metering / Control circuits and accessories.
   - Cooling / ventilation equipments / accessories.

(5) Soft starter shall have following minimum in built protection and alarm, but not limited to,
   - Electronic over load.
   - Line fault.
   - Under voltage.
   - Over voltage.
   - Stall.
   - Phase reversal.
   - Open gate for thyristor.
   - Over temperature for thyristor.
   - Over load for thyristor.

(6) Soft starter panel shall be provided with following indicating, metering and control devices.
   Motor starting / protection devices.
   Selector switch – Auto / Manual.
   Start / Stop push buttons for manual operation.
   - Input voltmeter and ammeter.
   - Meters to indicate power in MW.
   - Current and potential transformers.
   - Auxiliary relays.
   - Audio-visual alarms / fault indicators.
   - Alarm acknowledge / reset / test push buttons.
   - Provision for wiring external sequential / process interlock / signals for starting / running / tripping.
   - Terminals for remote control / indication.
   - Space heater and ventilating fans / cooler, if required.

2.2 **Performance requirement**

Soft starter panel shall be designed for operation at design temperature of 50°C. Contractor shall provide the necessary arrangement within the panel for satisfactory operation of soft starter.

2.3 **Construction**

(1) Soft starter panel shall be industrial type (Non-hazardous), totally enclosed, dust and vermin proof, floor mounted, free standing cubicle type of construction.

(2) The panel cubicle shall comprise rigidly welded structural frame enclosed completely by sheet steel of minimum 14 SWG (cold rolled) thickness, smooth finished, leveled and free from flaws. All doors and removable covers shall be provided with neoprene
gasket all around to make the cubical dust and vermin proof.

(3) The panel shall be provided with bottom sheet steel plates of minimum 2mm thick. Panel shall be fitted with removable gland plates of sufficient thickness at the bottom of the panel for fixing cable glands for power and control cable termination. Sufficient space shall be provided for termination of power cable sizes, as specified in data sheet.

(4) Louvers shall be provided at front, rear, top and bottom of the panel to dissipate heat developed inside.

(5) Degree of protection shall not be less than IP 4X.

(6) Panel shall be fitted with a label and serial number on the front and rear. In addition, panel shall be fitted with a label indicating panel designation and rating. All devices shall be provided with separate labels to indicate the function and also device numbers as marked in wiring diagrams.

(7) Main equipment of the panel shall be accessible for maintenance from the front and rear. All insulating material shall be flame resistant, non-hygroscopic and antitracking.

(8) All hardware's used inside the panel shall be zinc passivated or cadmium plated.

3.0 EQUIPMENT SPECIFICATIONS

3.1 HT Fuses

(1) High voltage fuses shall be of HRC link type and shall comply with the requirements of relevant standards.

(2) The fuse link shall have a striker pin for indication and also for trip mechanism.

(3) It is Contractor’s responsibility to precisely co-ordinate these fuses with contactors and upstream protective devices in the same system and shall be adequately rated for short circuit capacity.

(4) The type of fuse chosen by Contractor shall subject to approval by the Owner/Consultant. Contractor to furnish fuse pre-arcing time shall be furnished by along with the offer.

(5) Thyristor units shall be protected by fast acting semiconductor fuses

3.2 Vacuum contactors

(1) Vacuum contactors of adequate rating for the compressor motor starting at 11 kV Voltage to match the bypass & isolation application and shall conform to relevant India / IEC standards.

(2) Vacuum contactor shall be provided with properly designed and co-ordinated HRC fuses as mentioned in clause no. 3.1 above.

(3) DC operating coill shall be rated to operate satisfactorily between 80% and 110 % of the rated voltage. The contactor shall not drop out, if the voltage drops to 70% of rated voltage shall make arrangements to derive the auxiliary power, using necessary control transformer, for operating the contactor.

(4) The vacuum contactors shall have exclusively for Owners use minimum 1 NO & 1 NC auxiliary potential free contacts, rated for 10 amps, 240V AC and 0.5 Amp (inductive breaking) 110V DC or as specified and shall be wired upto the terminal blocks.

3.3 Instrument transformers

(1) The current transformers and Voltage transformers shall conform to the requirements stipulated in relevant standards. It shall Contractor’s responsibility to ensure adequate size of CT & VT

(2) The CTs & VTs shall be of cast resin type (insulation class “E” or better) and shall be able to withstand the thermal and mechanical stress resulting from the maximum short circuit and momentary current ratings of the switchgear.

(3) CTs shall have polarity mrks on each transformer and at the associated terminal block
Facility shall be provided for short-circuit and earthing the CT secondary at the terminal blocks.

(4) VTs shall be protected on the primary side by limiting fused and by MCBs on secondary side with 9kA interrupting ratings.

(5) The MCBs shall have min 1 NO + NC auxiliary potential free contacts, for annunciation and interlocks.

(6) CTs shall withstand specified system fault current for 1 sec.

3.4 Measuring and recording instruments

(1) Microprocessor based measuring and recording instruments shall be provided. The unit shall have RS-485 port at the output for serial communication.

(2) These instruments shall be standalone type, shall be configurable and shall be compatible with higher level computer.

(3) The instrument shall be rectangular in shape and not greater than 150mm (W) x 150mm (H). The accuracy class shall be as per IS or international standards.

3.5 Control wiring and terminals

(1) Feeders for Control (DC) / Auxiliary supply shall be provided at one point of the panel and voltage level shall be as specified in data sheet. Terminals to receive AC/DC control and auxiliary power shall be provided in cubicle and the terminals shall adequately rated (min. 20A).

(2) Adequate rated 2 pole MCBs shall be provided for each of the AC/DC control circuits.

(3) Internal wiring shall be done with 650V grade PVC insulated, stranded copper conductor of minimum size 2.5mm2 size.

(4) Separate colour coding shall be used for AC / DC control and power circuits and earth wire.

(5) All incoming and outgoing and control wire connection shall be wired to adequately rated (min.20A), elmex type terminal blocks about 20% spare terminals shall be provided in cubicle. All terminals shall be easily accessible.

(6) All wire shall be bunched together and routed through wire ways inside cubicle.

(7) Separate schematics, wiring diagrams and termination schedule for external and internal cable/wire connections shall be furnished by the Contractor. External connections shall include Owner’s remote equipment, which will be furnished by Owner to the Contractor.

(8) Low watt consumption LED type indicating lamps shall be provided.

(9) All wires, terminals and all other devices shall be provided with appropriate ferrules to correspond with wiring diagrams, for circuit identifications Termination lugs to be provided wherever necessary.

4.0 EARTHING

(1) An earth bus having cross section as specified in data sheet A shall be provided and extended through the length of the panel. All electrical equipment shall be connected to this earth bus.

(2) Suitable clamp type terminals with hardware at each end of the panel shall be provided to suit the size of the OWNER’s earthing conductor of size 75 x 10 mm GI

(3) Hinged doors shall be earthed through flexible copper brand of adequate size paint at earthing points shall be removed for proper contact star washers for door earthing are not acceptable.

(4) Bolted joints, splices, taps. etc to the earth bus shall be with at least two bolts

5.0 NAME PLATES AND RATING PLATES
5.1 Name plate

(1) Nameplate with engraved letters shall be provided for both front and rear side of panel function of every instrument, relay fuse etc shall be indicated by labels fixed near each device.

(2) Non-corrosive name plates shall be manufactured in anodized aluminium sheet and the letters shall be engraved on black lettering on white background. The name plates/labels shall be held in position by self-tapping screws.

(3) All devices mounted inside the cubicle and instruments etc., shall be identified by marking the device numbers inside cubicle as per the wiring drawing.

5.2 Rating plates

(1) The panel shall have a rating plate fixed to the non-removable part of the enclosure.

(2) All electrical equipment like VTs, CTs, etc and all other electrical devices shall be provided with rating plate made of stainless steel which can be easily seen.

(3) The rating plates shall give all the relevant information as specified in relevant standards.

(4) Danger boards, caution boards, operating instruction plates, shall be fixed to panel as per the standard engineering practice and regulations.

6.0 ACCESSORIES

6.1 Heater

Soft starter panel shall be equipped with space heaters to prevent moisture condensation within the enclosure and shall be suitable for continuous operation on 240V, 1 phase, 50 Hz AC supply. The space heaters shall be controlled through thermostats. Supply for motor space heater shall be brought to separate terminals in respective cubicle.

6.2 Cooling

Soft starter panel shall be provided with necessary ventilation / cooling equipment's for smooth operation of soft starter at given design temperature.

6.3 Plug Point

A 240V, 1 phase, 50Hz AC plug point shall be provided in the interior of each cubicle with an on-off switch.

7.0 PAINTING

(1) Oil grease, dirt and rust from the sheet steelwork shall be thoroughly Cleaned and removed. Rust and scale shall be removes by picking process with dilute acid and alkaline solution. Phospating and thorough rinsing with clear water followed by final rinsing with dilute dichromate solution and oven drying shall follow this.

(2) The under surface shall he prepared by applying a coat of phosphate paint and coat of yellow zinc chromate primer. The under surface shall be made free from all imperfections before under taking the finishing coat.

(3) After application of Primer, two coats of finish epoxy paint shall be applied with each coat followed be stowing. The colour shade for the finish paint shall be shade 631 (Light Gray) as per IS 5, unless otherwise specified.

8.0 INSPECTION AND TESTS
(1) Routine tests shall be carried out at works in the presence of OWNER/Consultant/Third party inspector as per relevant IS / IEC Standards.
(2) Contractor shall furnish type and routine test certificates for all bought out components for the panel, as per relevant standards.
(3) Test certificates for type test carried out on similar equipment of identical design, if available, shall be submitted along with the offer.

9.0 INFORMATION REQUIRED BY OWNER FROM THE CONTRACTOR

The Contractor shall submit following information in Bid: -
(1) Full technical description and performance details of the equipment accessories and components offered including heat losses for all components in kW.
(2) Overall dimensions and shipping dimensions and weight.
(3) Deviation taken by the Contractor from the requirements of this specification.
(4) Guaranteed technical particulars.
(5) Man-day rates for commissioning supervision.

10.0 MISCELLANEOUS

Each panel shall be provided with the following
(1) Two sets of clearly identifiable key for all panel-locking devices.
(2) Complete set of special tools and equipment for installation maintenance and testing of each panel.

11.0 PACKING

11.1 The switchboard shall be properly packed before dispatch to avoid damage during transport, storage and handling.
11.2 The packing box shall contain a copy of the installation, operation and maintenance manual.
11.3 A sign to indicate the upright position of the panels to be placed during transport and storage shall be clearly marked. Also proper arrangement shall be provided to handle the equipment.

12.0 DEVIATIONS

12.1 Deviations, if any, from this standard shall be clearly indicated in the offer with reasoning.

1.0 SCOPE

1.1 This standard covers the technical requirements of design, manufacture, testing at works and despatch in well packed condition of auxiliary service transformers.

1.2 This standard shall be applicable for 3 phase / single phase, separate winding transformers of rating below 315 KVA used for Auxiliary services such as lighting, control, Instrument supply etc.

1.3 This standard shall be read in conjunction with the relevant specification sheet.

2.0 STANDARDS TO BE FOLLOWED

2.1 The design, manufacture and testing of the equipment covered by this standard shall comply with the latest issue of following Indian Standards. Equipment complying with equivalent IEC standards shall also be acceptable.

- IS: 1180 Part - 1 & 2 -- Outdoor type 3 phase distribution transformers up to and including 100 KVA, 11 KV
- IS: 2026 -- Power transformers
- IS: 11171 -- Dry type power transformers

2.2 The design and operational features of the equipment offered shall comply with the provisions of the latest issue of the Indian Electricity Rules and other relevant statutory acts and regulations. The supplier shall, wherever necessary, make suitable modifications in the equipment to comply with the above.

2.3 Wherever any requirement, laid down in this standard, differs from that in Indian Standard Specifications, the requirement specified herein shall prevail.

3.0 SERVICE CONDITIONS

3.1 Ambient Conditions

These shall be as indicated in Design Philosophy – Electrical.

3.2 System Details

These shall be as indicated in Design Philosophy – Electrical.

4.0 OPERATING REQUIREMENTS

4.1 The transformer shall be suitable for operating at the rated capacity continuously at any of the taps, under the ambient conditions and with the voltage and frequency variations as indicated in specification sheet without exceeding the permissible temperature and without any detrimental effect on any part.

5.0 GENERAL DESIGN FEATURES

5.1 Rated voltage and frequency

These shall be as indicated in Design Philosophy – Electrical.
5.2 Phase connections

5.2.1 Three phase transformer
The primary winding shall be connected in delta and secondary winding in star with neutral point earthed (Vector group Dyn-11)

5.2.2 Single phase transformer
Primary winding shall be connected between two phases of a 3 phase system or to the three phases in open delta execution as specified in specification sheet and secondary single phase winding shall have one terminal earthed with the tank through link inside the secondary terminal box.

5.3 Tapping

5.3.1 The transformers shall be provided with off circuit tap changer with tapping of ± 2.5% and ± 5%.

5.3.2 For transformers having primary 3.3 KV and above, tap changing shall be effected with an externally operated handle, capable of being padlocked in any position on the primary side.

5.3.3 For transformers having primary 415V and below, tap changing shall be effected by means of links in the terminal chamber on the primary side.

5.4 Impedance voltage

The impedance voltage of the transformer at 75ºC shall be 4% unless indicated otherwise in specification sheet.

5.4.1 Losses

The losses shall be indicated by the vendor and shall be guaranteed, within tolerable limits specified in IS: 2026 at rated voltage and frequency.

5.4.2 Terminal Arrangement

The primary and secondary side terminals shall be brought outside the tank through porcelain bushing in dust and weather proof terminal boxes, with links for tap changing where required and suitable heavy duty double compression type aluminium cable glands and cable lugs for receiving cables as indicated in specification sheet. The neutral point of the secondary winding shall be brought out separately and earthed to the transformer body through test link. Terminal board for the primary and the secondary winding shall be amply sized and made of SRBP/ FRP materials.

5.4.3 Resistance to short circuit

The transformers shall be able to with stand electrodynamic stresses due to terminal short circuit of the secondary assuming primary side fed from the infinite bus.

5.4.4 Cooling System

Transformers rated up to 50 KVA shall be natural air cooled type and above 50 KVA shall be natural oil cooled / natural air cooled type as indicated in specification sheet.
6.0 CONSTRUCTIONAL FEATURES

6.1 Core

The transformer core shall be of high grade non ageing electrical silicon cold rolled magnetic sheet steel of low hysteresis loss and high permeability. The maximum flux density in any part of the core and yoke at rated voltage and frequency shall not exceed 1.7 Tesla for oil cooled transformers and 1.3 Tesla for air cooled transformers.

6.1.1 The tank for oil cooled transformer shall be made of mild steel plate of adequate thickness. Cooling tubes, where necessary, shall be provided.

6.1.2 Air cooled transformer shall be sheet steel enclosed having minimum thickness of 2.0 mm and shall be provided with suitable reinforcement as required. The minimum degree of protection for the enclosure shall be IP: 31. Ventilating louvers, if provided, shall be covered by fine wire mesh.

6.1.3 All external hardware shall be cadmium plated.

6.2 Windings

6.2.1 Coil shall be made out of electrolytic grade copper conductor.

6.2.2 Class-F / class-H insulating material shall be used for air cooled transformers.

6.2.3 For oil cooled transformer class-A insulating material shall be used. Mineral oil shall comply with IS: 325. 10% extra oil shall be supplied along with transformer in non-returnable drums.

6.2.4 Winding assembly shall be dried and impregnated in vacuum with tested insulating oil / varnish.

6.3 Bushing

The bushing insulators shall be rated for the maximum system voltage and shall comply with the requirement laid down in IS: 2099 / IS: 7421. The minimum current rating shall be 250A.

7.0 FITTINGS

7.1 Following fittings shall be provided for air cooled transformers.

i) Rating and diagram plate
ii) Lifting lug
iii) Primary and secondary cable boxes with heavy duty double compression type aluminium cable glands and lugs.
iv) Earthing terminals
v) Rollers (for 25 KVA and above)

7.2 In addition to the above following fittings shall be provided for oil cooled transformer.

i) Oil conservator complete with drain plug, oil filling hole with cover and oil level indicator with minimum marking.
ii) Silica gel breather
iii) Dial type thermometer
iv) Oil sampling cum drain valve
v) Explosion vent
vi) Air release plug

7.3 Any other fittings which may be necessary for satisfactory operation of the transformer shall also be provided.

7.4 All fittings shall conform to relevant Indian Standards.

8.0 PAINTING

8.1 The surface shall be painted after removing all dust, scale and foreign adhering matter. All traces of oil and greases should be removed by suitable treatment.

8.2 All steel surfaces in contact with insulating oil shall be painted with heat resistant oil insoluble insulating varnish.

8.3 All steel surfaces exposed to outside shall be painted with suitable anti rust and anti corrosive paints. Epoxy paints shall be used, if indicated in specification sheet.

8.4 All paints shall be carefully selected to withstand tropical heat and extremes of weather. The paint shall not scale off, crinkle or be removed by abrasion due to normal handling.

8.5 Unless otherwise specified, the finishing shade shall be light grey shade no. 631 as per IS: 5.

8.6 1 litre paint per air / oil cooled transformer shall be supplied for touch up at site.

9.0 TESTS AND INSPECTION

9.1 All transformers shall be routine tested as per IS: 2026.

9.2 Additional tests, wherever specified, shall be carried out on one transformer of each rating.

9.3 All the above mentioned tests shall be carried out in the presence of purchaser’s representative. In addition, the transformer shall be subjected to stage inspection at works and inspection at site for final acceptance.

9.4 These inspections shall, however, not absolve the vendor from his responsibility for making good any defect which may be noticed subsequently.

10.0 DRAWINGS AND DOCUMENTS

10.1 The drawings and documents as per Annexure-I shall be supplied, unless otherwise specified.

10.2 All drawings and documents shall have the following descriptions written boldly.

- Name of client
- Name of Consultant
- Enquiry / Order No. with plant / project name
- Equipment Code no. and Description

11.0 SPARES
11.1 Spares for operation and maintenance
   Item wise unit prices of spare parts shall be quoted.

11.2 Commissioning Spares
   Commissioning Spares, as required, shall be supplied with the main equipment. Item
   wise list of recommended commissioning spares shall be furnished for approval.

11.2 Any other spare parts not specified, but required, shall also be quoted along with the
   offer.

11.3 All spare parts shall be identical to the parts used in the equipment.

12.0 PACKING

12.1 The transformers shall be suitably packed in wooden crates to avoid damage in transit. Oil
   cooled transformers shall be properly sealed so as to completely exclude oxygen
   and moisture from coming in contact with oil.

12.2 The packing box shall contain a copy of the installation, operation and maintenance
   manual.

13.0 DEVIATIONS

13.1 Deviations, if any, from this standard shall be clearly indicated in the offer with
   reasoning.

13.2 Deviations, if any, from the data furnished in specification sheet shall be indicated
   therein beside the data by encircling it.

### Note:

1. 4 hard copies & 1 soft copy shall be supplied for approval after order within 4 weeks from the date of LOI.

2. 8 hard copies & 2 soft copies in CD shall be submitted as final documents prior to despatch of the equipment. These shall be made in sets and supplied in fine plastic coated folder.

| ANNEXURE - I  | DOCUMENTATION FOR DIESEL GENERATOR SET           |
1.0 SCOPE

1.1 This standard covers the technical requirements of design, engineering, manufacture, assembly, testing at works and delivery in well packed condition of diesel generator set (D.G. Set) complete with all required accessories and control equipment to supply continuous electrical power.

1.2 This standard is applicable for D.G. set having rating more than 500 KVA.

1.3 The control panel for DG set shall be provided with Auto/manual starting/stopping facilities.

1.4. The scope of supply shall include, but not limited to the following:

a) Diesel engine, complete with all the required accessories and components.
b) Generator set, for operation with the above diesel engine, complete with all the required accessories and components.
c) Drive coupling between diesel engine and generator set complete with guard.
d) Engine flywheel, if required, with starter ring and guard.
e) Fuel oil system comprising of fuel oil tank, supply pump, filter, piping, valves, fittings etc.
f) Air intake system comprising of air blower, air filter, turbo charger etc.
g) Lubrication oil system comprising of lube oil pump, filter, cooler, piping, valves, fittings etc.
h) Jacket cooling system comprising of radiator, water circulation pump, necessary piping and fittings etc.
i) Starting system complete with battery, battery charger, starter motor, control system etc.
j) All inter connecting piping, valves and fittings up to the battery limits.
k) Torsional vibration damper at the free end of the crank shaft.
l) Speed regulation system.
m) Provision for hand barring of the engine along with the hand barring tool.
n) "Emergency-off" Push Button shall be provided on the enclosure if the DG set is provided with Acoustic enclosure. Emergency-off Push Button near DG set shall be provided even if acoustic enclosure is not provided.
o) Platforms, walkways, stairs and hand racks, as required, for adequate access during operation and maintenance.
p) A common base frame suitable for assembly of engine, radiator and alternator with there accessories. Anti, vibration mounting and foundation bolts shall also be supplied. Base frame shall be designed for transportation of above items duly assembled on it.
q) Exhaust manifold complete with silencers, asbestos lagging, metallic expansion bellows and piping.
r) All necessary instruments for monitoring and safe starting, running and stopping of the D.G. set their auxiliaries complete with tubing and cabling.

s) Control panel.

t) Cabling material between control panel and all equipment within the battery limit including cables, racks, earthing terminating materials etc.

u) All safety and protective devices.

v) Electrically operated Turning Gear Motor (DC powered).

w) All other items not specified here but, necessary for safe, satisfactory and uninterrupted operation of D.G. set.

x) Set of special tools and tackles required for installation and maintenance.

y) Spare parts for the specified duration.

z) All other services as required.

aa) These DGs shall feed to Main DG Power Supply Board. Emergency Power Distribution Switchboard shall have 2 Nos. incomers from Main DG Power Supply Board and shall feed emergency load of CPP, Coal Gasification Plant and other Offsite & Utilities of entire fertiliser complex.

1.5 Offered DG set shall also comply with CPCB/State Pollution Control Board norms/standards regarding emission & Noise. Necessary certificate regarding this shall be furnished by LSTK Contractor.

1.6 DG Set shall be designed to cater the non-linear loads i.e. VFD driven pump therefore effects of harmonics on DGs shall be considered while designing.

1.7 Erection and commissioning of the above shall be carried out by LSTK Contractor.

2.0 STANDARDS TO BE FOLLOWED

2.1 The design, manufacture and testing of the equipment covered by this standard shall comply with the latest issue of the following codes and other relevant Indian standard specifications unless otherwise specified. Equipment complying with equivalent IEC standards shall also be acceptable.

i) BS 649 - Diesel engines for general purpose.

ii) IS:7451 - Reciprocating internal combustion engines

iii) IS: 4691 - Degree of protection provided by enclosures for rotating electrical machines.

iv) IS-10000 - Methods of test for internal combustion engine.

v) IS: 13364 - Specifications for A.C. Generator

vi) IS:12065 - Permissible limits of noise levels for rotating electrical machine

vii) IS: 12075 - Mechanical Vibration of rotating electrical machine with shaft heights 56 mm and higher-measurements, evaluation and limits of vibration severity

viii) ISO:8528 - Reciprocating IC Engine driven AC generating sets

ix) ASME codes.

x) IS/IEC:60034 - Rotating Electrical Machines - Specification.

xi) Oil coolers as per TEMA class “C”
xii) Any other standards/codes (BS, IS & equivalent International Standards) applicable.

2.2 Equipment designed and manufactured to other national standards shall be acceptable provided they are in no way inferior to the above mentioned standards. The Contractor shall supply English version of the relevant standard in such case.

2.3 The design and operational features of the equipment offered shall also comply with the provisions of latest issue of the Indian Electricity Rules and other statutory regulations. The Contractor shall, wherever necessary, make suitable modification in the equipment to comply with the above.

2.4 Wherever any requirement, laid down in this standard, differs from that in Indian standard / IEC, the requirement specified here in shall prevail.

3.0 SERVICE CONDITIONS

3.1 Ambient Conditions

These shall be as indicated in Design Philosophy – Electrical.

3.2 System Details

These shall be as indicated in Design Philosophy – Electrical.

4.0 OPERATING REQUIREMENTS

4.1 The D.G. set shall be suitable for “black start” operation. The equipment offered shall be suitable for operating at their rated capacity continuously under the ambient conditions and voltage & frequency variations indicated in Design Philosophy – Electrical, without exceeding the temperature rise limits specified in relevant standards and without any detrimental effect on any part.

4.2 The D.G. set shall be designed for continuous operation at full load or partial load and have the capability to run at 110% of the MCR for one hour in every 12 hrs.

4.3 The D.G. set covered under this standard shall be meant to supply power in one of the following modes.

Type A - Emergency power i.e. to provide reliable power due to failure or outage of normal supply automatically within a specified time to critical devices and equipment of the installation.

Type B - Stand by power i.e. to provide reliable power due to failure or outage of the normal supply to all devices and equipment of the installation.

Type C - Backup power i.e. to provide reliable power due to restriction imposed by the supply authorities of the normal supply to some section of the installation.

4.4 The D.G. set meant to supply emergency power (Type A) should start automatically and quickly on receipt of starting impulse from owner’s remote panel. Under such conditions, the auxiliary power and cooling water shall not be available. The starting and lubrication system shall be suitably designed to take care of these conditions and allow easy, safe and quick starting. The loading sequence and its duration are as specified by Owner elsewhere.
4.5 An electronic tri-vector meter with maximum demand indicator shall be provided in generator control panel to measure KWH, KVARH, KVAH and maximum demand in KVA.

4.6 The D.G. set meant to supply standby power (Type-B) shall be started automatically and conditions mentioned above shall also apply. However, the loading sequence is not automatic and hence need not be defined by Owner.

4.7 The D.G. set meant to supply backup power (Type-C) shall be manually controlled and started manually. Idle period may not be long and the requirement of auxiliary power and cooling water can be ensured due to the availability of the normal supply.

5.0 DIESEL ENGINE

5.1 General Design Feature

5.1.1 The diesel engine shall be of multistroke, multicylinder with mechanical fuel injection arrangement and complete with all the required accessories.

5.1.2 The engine output shall be at least 25% greater than the power required for the loads (including internal consumption by D.G. set) and loading sequence as required.

5.1.3 The engine shall be suitable for trouble free operation with high speed diesel conforming to IS: 1460.

5.1.4 The unbalance force transmission to the foundation shall be minimum. Critical speed of the assembly shall be sufficiently higher than the rated speed of the engine.

5.1.5 The engine shall be provided with turbo charger, filter and silencer mounted suitably on the engine frame and complete with necessary ducts work for air intake.

5.1.6 The engine shall be provided with exhaust silencer, necessary ducts, minimum 2 nos. expansion bellows and supporting arrangement from ceiling for exhausting the gases to outside.

5.1.7 The diesel engine shall be totally enclosed continuous duty, turbo charged system.

5.1.8 The engine shall consist of the following items:

- Radiator Cooling
- Radiator fan with guard
- Suitable flywheel
- Flywheel housing complete with starter gearing
- Flexible coupling, suitable to match flywheel, with safety guard
- Pneumatic starting systems with compressors (1R+1S) and air receiver and other accessories shall be provided.
- Electronically controlled Governor
- Fuel Pump/ Fuel Solenoid - PT fuel system
- Lube Oil Pump
- Fuel & Lube Oil Filters
- Lube Oil Cooler
- Air Cleaner, dry type
- Residential Silencer
- Flexible pipe for silencer, with necessary flanges.
- Suitable Turbocharger, driven from exhaust gas.
In built safety controls against following:
- Over speed shutdown
- High coolant temperature warning / shutdown
- Low coolant temperature warning / shutdown
- Low coolant level warning / shutdown
- Low and high battery voltage warning
- Weak battery warning
- Over crank shutdown
- Fail to crank shutdown
- Over current
- High voltage
- Low voltage
- Under / over frequency
- Phase sequence
- Reverse power (kVA & kVar)
- Low Lube Oil Pressure shutdown

One No. 2 pole, AC/DC type, on-off switch, mounted on suitable frame, shall be provided and connected between the Battery and Engine (Starter) in order to isolate the battery supply to the engine when required.

5.2 Fuel Oil System

5.2.1 The system shall comprise of gravity fed oil tank, unless otherwise specified.

5.2.2 The gravity tank shall be complete with the provision of filling up by Motor driven pump and Hand Pump from the standard drums. The motor driven pump and associated hose pipe shall be provided by the Contractor.

5.2.3 Relief/bypass valve to regulate pressure in the fuel supply line, return excess fuel to a return line and prevent the build-up of excessive pressure in the fuel system shall be provided.

5.2.4 The gravity fed oil tank shall be located at a height from floor and near the wall of the engine room. Suitable brackets / structure shall be provided by the Contractor for this purpose. The tank shall be fabricated out of M.S. plates in cylindrical construction. The capacity of the tank shall be adequate for 24 hours continuous running of the engine at full load. It shall be complete with valves for filling & draining, vent connection, level gauge glasses, level switches for low level alarm.

5.3 Jacket Cooling System

5.3.1 The engine shall be provided with radiator type air cooling system.

5.3.2 All the necessary items for the system such as water pump, radiator, fan, piping and fittings shall be provided to make the system complete in all respects.

5.3.3 Head tanks, if required, shall be included in the scope of supply for make up water as well as taking care of the expansion of the jacket water.

5.4 Lube Oil System

5.4.1 Proper lube oil system shall be provided for all lubricating points of the engine. The system shall be automatic pressure feed type and provided with a gear type pump driven from the crank shaft. The system shall be complete with fine wire mesh duplex strainer, valves, tank, oil cooler, header and branch piping suitably mounted on bed plate. Necessary accessories like pressure gauge, temperature and pressure switches for alarm and controls shall be provided.
5.4.2 The cooler shall be shell and tube type and connected to the engine cooling water system.

5.5 Starting System

5.5.1 The Electrical starting system shall be provided up to 1000 KVA DG set. However, for more than 1000 KVA DG set electrical / pneumatic starting shall be provided.

5.5.2 Both manual and automatic starting scheme shall be provided. The manual starting system shall be local while automatic starting system shall be suitable for impulses from owner’s remote panel.

5.5.3 The starting system shall be such that the D.G. set shall start & come up to rated speed and be ready to accept full load within the period as per the process requirement.

5.5.4 Starting time of the DG set should be minimum, but not exceeding 15 seconds, to start, accelerate and build up the desired voltage and frequency. If the first starting operation is not successful, 2 more attempts to start with preset time intervals should be made. If all the three attempts fail, the set shall be locked out, alarm shall be given.

5.5.5 The electric starting system shall comprise of starter motor, battery, battery charger, necessary cabling, required instruments and accessories.

5.5.6 The Ni-Cd battery shall be heavy duty type and suitable for 20 successive starting attempts of the engine without draining. The charger shall have both float / boost charging facilities. The battery shall be complete with suitable stand and other required accessories.

5.5.7 The pneumatic starting system may comprise of a camshaft driven rotary air distributor admitting air to a series of automatic air starting valves fitted on individual cylinder heads or an air cranking motor operating through a ring gear on the engine fly wheel. The pneumatic starting system shall consist of:
   a) One 100% capacity A.C. motor driven air compressor, additional engine driven air compressor shall be provided, as required.
   b) One air receiver of adequate capacity to supply air for minimum six (6) starts of engine.
   c) Solenoid operated valves.
   d) Pressure switches for automatic starting and stopping of the compressor.
   e) After-coolers for compressor, if required, suitable for raw cooling water.

5.5.8 The compressor for charging the starting air receiver shall be driven by an A.C. motor. The starting and stopping of this motor driven compressor shall be controlled automatically by suitable pressure switches so that the air receiver remains charged always.

5.5.9 Contractor shall provide all necessary devices including solenoid valves so that with an impulse for starting of the engine received from emergency equipment or manual start push button, the entire operation of starting of the diesel set shall take place automatically.

5.6 Governing System

5.6.1 The speed governing system of the diesel engine shall satisfy the following requirements:
   a) Steady state speed regulation shall be adjustable between 0 to 5% manually.
   b) Steady state speed regulation once fixed, shall not vary beyond + 0.5%.
c) Transient speed regulation shall not exceed 4.5% of rated speed. Momentary under speed and over speed shall not exceed 2% and 8% respectively.

d) Recovery time shall be within 3 seconds.

5.6.2 The governor system shall be electronic type and provided with adequate scheme to control the speed in the event of failure of power to the governor.

5.6.3 The governor should have automatic start fuel limit feature so that fuel is limited during start up to prevent excess start up smoke and start up over speed. The automatic fuel limit should be adjustable.

5.6.4 A mechanical over speed trip device shall be provided to operate at 110% of rated speed.

5.6.5 An engine mounted emergency push button shall be provided to trip the engine in case of emergency.

5.6.6 Separate Tachometer shall be provided to indicate the speed of the engine locally.

6.0 GENERATOR

6.1 General Design Features

6.1.1 The generator shall be directly coupled to the engine.

6.1.2 The ingress protection class of the enclosure shall be IP44 as per IS/IEC:60529.

6.1.3 The generator and its accessories shall be capable of withstanding electrical, mechanical and thermal stresses while meeting the performance requirements.

6.1.4 The generator shall be synchronous A.C. Generator; star connected and shall have C.M.R. of specified output at 0.8 lag p. f. at rated voltage and frequency.

6.2 Winding and Insulation

6.2.1 The stator and rotor coils shall be made out of electrolytic grade copper conductors. Successive coils shall be connected by accessible and well brazed joints.

6.2.2 The coils shall be class F insulated and treated with tropical and fungicidal treatments.

6.2.3 The windings shall be dried, properly impregnated with suitable varnish to withstand the site conditions and properly baked. At least two additional impregnations and baking shall be applied to the assembled coil making a total of three impregnations and baking. Finally the windings shall be painted with special anti-acid and anti-alkali paint to withstand the site condition.

6.2.4 The leading wire between the windings and the outside terminals shall be through bushings.

6.3 Performance Requirement

6.3.1 The generator and the diesel engine shall match properly to deliver the rated load under the specified ambient and system conditions.

6.3.2 DG set shall be capable of starting from cold condition, taking up full load without undue wear and stress on equipment under the specified ambient and system condition. Also DG set shall be stopped manually using Emergency Stop push button, irrespective of the position of Auto/ manual selector switch located in Generator Control Panel.

6.3.3 The specified rating of the D.G. set indicated are net electrical power output required for owner’s use and does not include the power required by the auxiliaries of the diesel set.
The actual output rating of the generator to be offered by Contractor shall take into account the power requirement of the auxiliaries, 15% extra margin.

6.3.4 The generator shall have an overload capacity of 10% for 1 hour in any consecutive period of 12 hours after having attained the thermal equilibrium corresponding to the rated load. The terminal voltage shall be equal to the rated value. At the time of switching 'ON' the emergency loads, restarting or reacceleration of squirrel cage motors shall be required, in addition to switching 'ON' of the lighting loads, which will be six times the rated load at power factor of 0.35 lagging. The generator and its accessories shall be capable of supplying this load at the above mentioned low power factor. Limitations, if any, shall be clearly indicated by the Contractor.

6.3.5 The transient reactance shall be as low as possible to limit the voltage drop to 10% due to above loading conditions.

6.3.6 **Largest Motor Starting Requirement**

The D.G. set shall be designed such that it can start squirrel cage induction motor of specified rating by D.O.L. starting method when already loaded up to 80% of its rated load. The voltage dip at the generator terminal shall not exceed 10% of its rated voltage during the entire starting period which will not exceed 5 seconds.

Limitations of the engine size offered by the bidder, if any, shall be indicated clearly by the bidder.

Supporting calculation shall be supplied by the successful bidder for approval of the owner.

6.3.7 The short circuit ratio, of the generator at rated KVA and rated voltage shall not be less than 0.5.

6.3.8 The generator shall withstand 20% over speed for 2 minutes without any damage to any part.

6.3.9 The generator shall be capable of withstanding the three phase short circuit at its terminals while operating at its voltage without sustaining any damage.

6.3.10 The temperature rise of stator windings, exciter and other parts shall not exceed the limits specified in relevant IS.

6.4 **Excitation System**

6.4.1 The generator shall be provided with static brushless excitation system comprising of shaft driven rotor exciter, thyristor and other associated items.

6.4.2 The armature and field windings shall be class F insulated similar to that of generator.

6.4.3 The capacity of the system shall be adequate to meet the performance and largest motor starting requirement of the generator.

6.4.4 The AVR shall maintain the generator steady state terminal voltage within ±1% of nominal voltage for load variation from no load to full load at 0.8 P.F. (Lag) and for speed variation of 4.5%. Manual voltage trim facility for voltage adjustment of ±5% shall be provided for the AVR.

6.5 **Voltage Regulator**

6.5.1 The generator shall have static type voltage regulators to be mounted on the control panel. The regulator system shall be suitable to meet the following requirements:

a) Allow the generator to meet the performance requirements.
b) Both auto and manual control.
c) Prevent automatic rise of field voltage in the event of excitation supply failure.
d) Transfer to manual mode in the event of control circuit failure in auto mode.
e) Operated by the output current and voltage of the generator.

6.6 **Space Heater**

6.6.1 Space heaters rated for 240V A.C. shall be provided to keep the winding dry during idle conditions.

6.6.2 The location of the space heaters shall be such as to allow easy access for inspection, maintenance and replacement.

6.7 **Embedded Temperature Detectors**

6.7.1 The generators shall be provided with 6 nos. of embedded resistance temperature detectors for measurement of winding temperature. Three of these shall be provided between the coils, one in each phase and the other three at the base of the slots, one in each phase, placed 120° apart.

6.7.2 The ETD’s shall be of platinum having 100 ohm resistance at 0°C and temperature coefficient as 3.85 x 10⁻³.

6.7.3 The ETD’s shall be 3 lead type having power frequency insulation level of 2 KV.

6.7.4 The temperature indicator with selector switches shall be provided in the control panel.

6.8 **Terminal Boxes**

6.8.1 All the terminal boxes shall have IP-54 degree of protection.

6.8.2 The power and control terminal boxes shall be separate. All the six leads of the generator stator shall be taken out, three to one side and three to the other side to separate power terminal boxes.

6.8.3 The power terminal box shall be spacious and have adequate clearance between the terminals and the cable gland for proper termination of required nos. of aluminium cables.

6.8.4 The power terminal boxes shall be provided with tinned copper sockets suitable for crimping.

6.8.5 The control terminal boxes shall be provided with pressure type terminal blocks.

6.8.6 All terminal boxes shall be complete with heavy duty double compression type aluminium cable glands suitable for the cable sizes required.

7.0 **CONTROL PANEL BOARD**

7.1 **Requirements**

7.1.1 The control panel board shall comprise of control & instrument section, power & protection section and distribution section for satisfactory and trouble free operation of the set. Each section shall be a complete panel.

7.1.2 The control and instrument panel shall house the following:

a) All the required controlling elements for the engine, generator and exciter control, for both manual and automatic operations.

b) Panel mounted instrument
c) The required protective devices for the engine.

d) The audiovisual annunciation system indicating abnormal operating conditions.

e) Control switches and indicating lamps.

f) Automatic voltage regulator.

g) All other items, as required.

7.1.3 The power and protection panel shall house the following:

a) Circuit breaker in draw out execution suitable for local/remote operation and provided with protective relays, C.T.s, Ammeters, Voltmeters, KWH meters, Frequency meters, ON/OFF/Trip indicating lamps, control switches etc. for the control of generator.

b) M.W.S. operated A.C.B. in draw-out execution suitable for local remote operation and provided with protective relays, C.T.s, Ammeters, ON/OFF/Trip indicating lamps, control switches etc. for the control of outgoing power feeders, as indicated elsewhere.

7.1.4 The distribution panel shall house the following:

a) Necessary feeder circuit outlets complete with switches, fuses, contactors, overload devices, ON/OFF/Trip indicating lamps, Ammeters etc. for the D.G. set auxiliaries, if required.

b) D.C. battery charging equipment required for the start up and control of the D.G. set. The charger shall be complete with float and boost charging arrangement both in auto and manual mode.

7.2 General Design Features

7.2.1 The panels shall be free standing, floor mounting, identical, metal clad cubicle type in construction and placed side by side to form a compact assembly in dust/damp and vermin proof type equivalent to IP-54 as per IS-13947 Part-1.

7.2.2 The thickness of sheet steel members shall not be less than 2 mm for cold rolled steel. Suitable reinforcement, wherever necessary, shall be provided. The base channel shall be more than 3 mm thick.

7.2.3 The door hinge shall be concealed type. All threaded screws in the removable parts shall be provided with retaining rings.

7.2.4 All the components shall be accessible for checking and taking off without the necessity of removing the adjacent ones. Their mounting shall be accessible and ensure the necessary degree of safety.

7.2.5 The relays, meters, switches and lamps shall be flush mounted type. Their minimum mounting height shall be 900 mm from the base of the panel.

7.2.6 The bus bars shall be for three phase and neutral and made of electrolytic copper or aluminium of required cross section and PVC sleeved. These shall be amply sized to carry the rated continuous current under the specified ambient temperature without exceeding the total temperature of 90°C. The thermal rating of the bus bars shall be designed to withstand the system fault current for one second without exceeding the temperature of 250°C for bare copper.

7.2.7 The clearances and creepage distance shall not be lower the values specified below:

7.3 Control Wiring

7.3.1 The panel board shall be completely factory wired and ready for external connections.
i) Minimum clearance between two live conductors - 20 mm.
ii) Minimum clearance between live parts and accidentally dangerous part - 20 mm.
iii) Minimum creepage distance - 28 mm.

7.3.2 The wiring shall be carried out with flexible stranded PVC insulated copper conductor cables for 1100 volts grade.

The size of wires shall be as follows:

C.T. Circuit - 2.5 sq. mm copper
V.T. & Control circuits - 1.5 sq. mm copper

7.3.3 All wiring shall be marked in accordance with IS-375. Numbered Ferrules reading from the terminals outwards shall be provided at both ends of all wiring for easy identification. These shall be interlocking type plastic ferrules.

7.4 Circuit Breakers

7.4.1 The circuit breakers shall generally comply with the requirements of IS: 13947, having P2 category, capable of carrying the specified current at the site conditions and making/breaking of the system fault current.

7.4.2 Type test certificates from an independent testing authority shall be furnished along with the offer, for each circuit breaker rating, which shall clearly prove the capability of circuit breakers and include the short circuit tests, temperature rise test, electrical overload tests and endurance test (both electrical and mechanical).

7.4.3 The circuit breakers shall be provided with motor wound spring closing mechanism and electrically and mechanically trip free and have anti pumping features.

7.4.4 The circuit breakers shall have three positions for service, test and isolated with the cubicle door closed, and position indicators provided to indicate the positions of the breaker. Stoppers shall be provided to prevent excessive movement of the breaker cradle than desired, for each position. Each position of the breaker shall have monitoring switch having 1 NO + 1 NC contacts.

7.4.5 Provision shall be made for testing the circuit breaker in test position.

7.4.6 Automatic safety shutters shall be provided to screen the cable and the bus bars spouts when the circuit breaker is withdrawn from the cubicle.

7.4.7 The circuit breakers shall be provided with an emergency manual trip device, mechanical ‘ON’ ‘OFF’ and ‘ISOLATED’ position indicators and operation counter.

7.4.8 Mechanical safety interlock shall be provided for safe operation movement of the breaker.

7.4.9 The closing coil and other associated auxiliary relays shall operate satisfactorily at all voltages between 85 to 110% of the rated control voltage. The tripping coil and other associated relays shall operate satisfactorily at all voltages between 70 to 110% of the rated control voltage.

7.5 Control Fuses

The fuses shall be of non-deteriorating HRC cartridge link type and conform to IS: 2208. They shall be suitable for the load and the service required in the circuit.
7.6 Current Transformers

7.6.1 C.T’s shall be cast resin emulated, accuracy class as per IS-2705, 1 for metering and SP/PS for protection.

7.6.2 All the C.T’s shall be provided with terminals and shorting links. One of the terminals of the C.T.s shall be earthed. The polarity of the C.Ts shall be clearly marked.

7.7 Voltage Transformer

The V.T. shall be cast resin insulated having secondary terminal voltage of 110V unless specified otherwise and accuracy class of shall be 1 as per IS: 3155 and provided with primary / secondary fuses.

7.8 Relays

All protective relays shall be provided in drawout and dust proof cases and shall be flush mounted type. They shall be fully tropicalised. Relays shall be of make and type as approved.

The following protective relays shall be provided.

i)  IDMTL over current and Residual earth fault.
ii) IDMTL standby earth fault.
iii) Over voltage or under voltage
iv) Reverse power
v) Hand reset tripping relay

7.9 Battery Charger

The charger shall be float cum boost, 415V, 3ph with fully controlled full wave rectifier type. The battery charger is required to provide 24V DC control supply and to charge the boost / float 24V Ni-Cd / SMF batteries. DG set battery (Ni-Cd/ SMF) shall be dedicatedly used for DG related power & auxiliary supply. Ampere hours shall be worked out with at least 30% spare capacity and 1 hours backup time.

7.9.1 The AMF control panel shall be complete with necessary control circuit fuses, nameplates, internal wiring, control terminals and cable glands & lugs.

7.9.2 The AMF control panel shall have provision for receiving starting impulse for the DG set from DG Power Distribution Board as well as to send out tripping impulses from AMF panel to the DG incomer breaker on DG Power Distribution Board.

7.9.3 All cable entries to the AMF panel shall preferably be from the bottom.

7.9.4 Automatic shutdown feature shall be provided for faults such as low lube oil pressure/ over speed/ high water temperature.

7.10 Instruments and Metering

7.10.1 All instruments shall be flush mounting type with square face of 96 sq. mm. They shall be tropicalised and dust tight. Make and type of instruments shall be as approved.

7.10.2 Marking of the scale shall be black on white background and suitable for direct reading.

7.10.3 Zero adjusters shall be provided for operation from the front of the cases.
7.10.4 All indicating instruments shall be moving iron spring controlled type of class 1.5 accuracy as per IS: 1248.

7.10.5 The KWH meter shall be as per relevant IS and provided with test blocks for current and voltage coils for testing them at site without interrupting their recording while in service.

7.10.6 The following instruments shall be provided.
   i) Voltmeter with selector switch
   ii) Ammeter with selector switch
   iii) Frequency meter
   iv) KW meter
   v) KWH meter

7.11 Signal Lamps

LED type signal lamps shall be provided to indicate the various circuit conditions and these shall be placed at suitable height. The colour of the lamps for various functions shall be as follows:

Red - Circuit breaker ‘ON’
Green - Circuit breaker ‘OFF’
White - Trip circuit healthy
Amber - Alarm and auto trip fault
Blue - Non trip fault

7.12 Name Plate

7.12.1 The panel board shall have a large name plate on the top to indicate its name and designation. Each feeder shall be provided with name plates. Each panel shall have name plates both in front and back.

7.12.2 All control switches, push buttons, lamps etc. shall have function identification labels.

7.13 Cable Termination

Necessary cable glands and lugs for power and control cables shall be provided.

8.0 INSTRUMENTATION

8.1 The instrumentation requirement shall include field / panel mounted instruments, push buttons, lamps, audio-visual alarm system and other accessories as required.

8.2 The provision required in the control panel board shall include the followings:
   i. Multipoint electronic self balancing temperature indicator with selector switch for generator winding.
   ii. Tachometer for engine speed.
   iii. Fuel oil day tank level indicator.
   iv. Audio-visual alarm system for:
      a) Low lube oil pressure
      b) Over speed of engine
      c) High jacket water temperature
      d) Low jacket water pressure
e) Winding temperature high  
f) All shutdown condition  
g) Other abnormal conditions, as required  

v. Shutdown system for:  
a) Maximum jacket water temperature  
b) Engine over speed  
c) Minimum lube oil pressure  
d) High winding temperature  
e) Generator faults  
f) Faults in the excitation system  
g) Failure of engine to start after a preset time  
h) Other faults, as required  

vi. Excitation control system complete with:  
a) Rheostat for manual control  
b) Automatic voltage regulator  
c) Field discharge resistance  
d) Diodes / Rectifiers  
e) All other items, as required  

vii. Engine control system complete with:  
a) Auto / manual switch  
b) Control equipment and circuitry for Auto Mains Failure starting other than for type ‘C’ sets.  
c) Push buttons and other control equipment for manual start.  
d) Equipment and circuitry for pre-start priming, if required.  
e) Equipment and circuitry for repeated attempt to start.  
f) Indicating lamps for fail to start.  
g) Audio visual alarm as specified and required.  
h) Instrumentation as specified and required  
i) Operation hour counter  
j) All other items, as required  

8.3 The field mounted instruments shall include the followings:  
a) Pressure gauge for lube oil  
b) Dial type thermometer for jacket water and various bearings.  
c) Tachometer for engine speed.  
d) Fuel oil day tank level indicator.  
e) Other items, as required.  

8.4 The supply shall be complete with all instrument erection materials with 10% extra provision.  

8.5 All instruments, shall be suitable for site maximum ambient temperature, All electrical and electronic instruments shall be tropicalised and fungus proof.
9.0 ACCESSORIES

The D.G. set shall be complete with all required accessories, whether indicated or not, to make the installation complete in all respects and to ensure its safe and proper operation.

10.0 PAINTING

The enclosures, after suitable pre-treatment, shall be painted with two coats of anti rust paint followed by two coats of anti-corrosive epoxy based paints.

11.0 TOOL KIT

Special tool kit for the DG Set required for operation & maintenance of DG set shall also be supplied along with DG set.

12.0 TESTS AND INSPECTION

12.1 All routine tests as per relevant standards shall be carried out in the presence of Owner's representative.

12.2 The D.G. set shall be tested for output, general performance, overloads and other tests sufficient to prove the correctness of the design both at works and at site.

12.3 The tests to be carried out on various items are given below.

a) Diesel Engine

- Routine test as per relevant Indian / British / National standards.
- Test for speed regulation with a sudden loading of 50% of rated capacity with zero base load.
- Starting time of the engine from zero to full speed from the instant of start command.
- Operation check for satisfactory operation of the DG set.
- Over speed test at 120% rated speed and over speed trip.
- Load test and measurement of fuel oil consumption.

- 100% load for 4 hrs.
- 110% load for 1 hr.
- 75% load for 1/2 hr.
- 50% load for 1/2 hr.

All parameters such as jacket water temp., lube oil pressure and temperature will be checked.

b) GENERATOR

- Routine test as per IS 4722.
- Voltage regulation from no load to full load.
- Voltage trimming facility check.

c) Control Panel

- Routine tests as per IS 3623.
- Operation tests for AMF operation, operation of various devices and meters etc.
12.4 In addition, the equipment shall be subjected to stage inspection during process of manufacture at works and site inspection.

12.5 These inspections shall, however, not absolve the Contractor free from his responsibility for making good any defect which may be noticed subsequently.

13.0 SPARES

13.1 Spares for operation and maintenance
Item wise unit prices of spare parts shall be quoted.

13.2 Commissioning Spares
Commissioning spares, as required, shall be supplied with the main equipment. Item-wise list of recommended commissioning spares shall be furnished for approval.

13.3 Any other spare parts not specified, but required, shall also be quoted along with the offer.

13.4 All spare parts shall be identical to the parts used in the equipments.

14.0 PACKING

14.1 The equipment shall be properly packed before despatch to avoid damage during transport, storage and handling.

14.2 The equipment shall be wrapped in polythene to make it water proof. Bags of silica gel shall be kept inside to absorb moisture present during transport and storage. An additional wrapping with bitumen paper shall also be provided before the equipment is packed in wooden crates.

14.3 A sign indicating the position of the equipment placed during transport and storage shall be clearly marked. Also proper arrangement shall be provided to handle the equipment.

15.0 DRAWING AND DOCUMENTS

15.1 Drawings and documents as per Annexure-I shall be supplied unless otherwise specified.

15.2 All drawings and documents shall have the following descriptions written boldly.
- Name of client
- Name of consultant
- Enquiry / Order Number with plant / project name
- Code No. and Description

16.0 DEVIATIONS

16.1 Deviations, if any, from this standard shall be clearly indicated in the offer with reasoning.
## ANNEXURE – I

### DOCUMENTATION FOR DIESEL GENERATOR SET

**Note:**

1. 4 hard copies & 1 soft copy shall be supplied for approval after order within 4 weeks from the date of LOI.
2. 8 hard copies & 2 soft copies in CD shall be submitted as final documents prior to despatch of the equipment. These shall be made in sets and supplied in fine plastic coated folder.

Y - Yes, N - No
NOTE:

1. LAW ANNUNCIATION SHALL BE PROVIDED ON TRANSFORMER FEEDER.
2. COMMUNICATION PROTOCOL SHALL BE AS FOLLOWS:
   a. NUMERICAL RELAY – IS06550
   b. MULTIFUNCTION METER – INF10MODBUS
3. AUTO CHANGE OVER LOCK BETWEEN INCOMING AND BUS COUPLER SHALL BE DEVELOPED IN NUMERICAL RELAY
4. COMMANDS/INDICATION TO/FROM BOX SHOWN IN SLD ARE INDICATIVE.
5. THE SWITCH SHALL BE ABLE TO CLOSE ONLY IN TEST POSITION FOR ALL MOTOR FEEDERS
6. FOLLOWING MINIMUM METERING SHALL BE PROVIDED ON MULTIFUNCTION METER:
   - 3 PHASE CURRENT
   - LINE VOLTAGE
   - POWER FACTOR & FREQUENCY
   - ANALOGUE, ANALOGUE & DIGITAL
   - HOUR RUN (ONLY FOR MOTOR FEEDERS)
7. COMMON ALARM CIRCUIT FOR HONOR & BUZZER SHALL BE PROVIDED IN BUS COUPLER.
8. LAMP TEST PUSH BUTTON SHALL BE PROVIDED.
9. ALL RELAYS SHALL BE NUMERICAL TYPE UNLESS SPECIFICALLY MENTIONED IN SLD.
   AND EXCEPT THE FOLLOWING:
   - FTU FUSE FAILURE RELAY (80)
   - AC/DC SUPPLY SUPERVISION RELAY (80)
   - TRANSFORMER LOCKOUT RELAY (80)
   - TRIP CIRCUIT SUPERVISION RELAY (80)
   - BUS BAR DIFFERENTIAL SUPERVISION RELAY (9581 & 9582)
   - MOTOR FEEDER
   - 1S FOR ELECTRICAL TRIP (HARD RESET)
   - 3S FOR PROGRESSIVE TRIP (SOFT RESET)
   - ALL FEEDERs
   - 8S ELECTRICAL TRIP (HARD RESET)
10. SIGNALS/INDICATIONS TO/FROM BOX SHOWN IN SLD ARE INDICATIVE AND SHALL BE CONFIRMED DURING DETAL ENG.
11. CIRCUIT BREAKER 'ON', 'OFF' INDICATION SHALL BE PROVIDED AT THE BACK OF EACH PANEL. ALTERNATIVELY ALARM SHALL BE PROVIDED IN CASE PANEL BACK DOOR IS OPENED WITH BREAKER 'ON'.

PROJECT:

STEAM GENERATION PLANT FOR COAL BASED FERTILIZER PROJECT

TYPICAL 11KV SW. BD. SINGLE LINE DIAGRAM

PROJECTS & DEVELOPMENT INDIA LTD. – NOIDA
NOTE:

1. ENSURE TERMINAL PLATES FOR TRANSFORMER FEEDER PLAN FOR OTHER FEEDERS.
2. COMMUNICATION POINTS TO BE ADDED.
3. INSTRUMENTATION TO BE DATA.
4. AUTO CHARGE DURING SHORT BETWEEN POWER AND BUS COUPLER.
5. TWO SHUNT CAPACITORS TO BE PROVIDED IN BUS COUPLER.
6. BUS COUPLER SHUNT CAPACITORS TO BE PROVIDED ON INSTRUMENTATION PANEL.
7. AUTO CHARGE DURING SHORT BETWEEN POWER AND BUS COUPLER.
8. TWO SHUNT CAPACITORS TO BE PROVIDED IN BUS COUPLER.
9. BUS COUPLER SHUNT CAPACITORS TO BE PROVIDED ON INSTRUMENTATION PANEL.
10. STATION OR GENERATING TOWARDS BUS COUPLES FOR 35KV ARE RECOMMENDED AND SHALL BE CONNECTED USING BUS COUPLER.
11. CIRCUIT BREAKERS TO BE PROVIDED AT THE BACK OF EACH PANEL. ALTERNATIVELY, SHUNT CAPACITORS TO BE PROVIDED IN PLACE PANEL BACK DOOR IS OPENED WITH SHUNT CAPACITORS.
NOTE:

1. EIN ARRANGEMENT SHALL BE PROVIDED ON TRANSFORMER FEEDER FOR OTHER FEEDERS
2. COMMUNICATION PROTOCOL SHALL BE AS FOLLOWS
   - 4-20MA (RS-422) INTERFACE
3. LOAD CHARGE OVER LOCK BETWEEN GENERATOR AND BUS COUNTER SHALL BE DEVELOPED IN MANUFACTURED REPLACEMENT
4. DRAWINGS/PRINTING TYPING ETC. SHOWN IN RED ARE APPROVAL
5. THE FATIGUE WILL BE USED ONLY IN TEST POSITION FOR ALL MOTORS FEEDERS
6. FOLLOWING MECHANISM WEARING SHOE PROTECTED WITH INSULATION
   - 4-20MA INTERFACE
   - LINE VOLTAGE
   - VOLTAGE, CURRENT & FREQUENCY
   - TEMPERATURE & FLAME
   - WIND-UP PROTECTION
7. COMMUNICATION CIRCUIT FOR MOTOR & BUS COUNTER SHALL BE PROVIDED IN BUS COUNTER
8. LOAD FEEDER PROTECTED FEEDER SHALL BE PROVIDED
9. ALL FEEDER SHALL BE NUMBERED THE UNLESS SPECIFIED IN SHEET AND EFFECTUAL DESIGN
   - 4-20MA INTERFACE RELAY
   - LOAD CIRCUIT SUPPLY RELAY (10A)
   - WORKING CONTINUOUS CURRENT RELAY (10A)
   - LOAD SHUNT DIFFERENTIAL SUPERVISION RELAY (10A)
   - WORKING FEEDER PROTECTION (10A)
   - BUS FEEDER PROTECTION (10A)
   - 4-20MA INTERFACE RELAY
   - 4-20MA INTERFACE PROTECTION
10. DETAILS/POSITIONS WERE D.S. SHOWN ON SHEET ARE INDICATIVE AND SHALL BE CONFIRMED DURING ISSUE END
11. CIRCUIT BREAKER, MOVING PARTS, ETC. INDICATION SHALL BE PROVIDED AT THE SHOE OF EACH PANEL
    ALTERNATIVELY SHOW SHALL BE PROVIDED IN SHEETzeigt WURFEN & EFFECTUAL DESIGN.

THIS IS CONCEPTUAL ILO, DETAILS ILO SHALL BE PREPARED BY BIDDER & SUBMITTTER WITH BID

SWAGED POLE TYPE 'C'
(FOR PLANT GROUND MOUNTING)

NOTES:

1. NIPPLE OF DIA. 45 (NIPPLE TO BE PREPD. BY DIRECT REDUCTION OF DIA OF TOP PIPE WITHOUT USE OF ANY WASHER)

2. POLE MATERIAL MS AS PER IS 1239 ABOVE GROUND PORTION TO BE PAINTED 2 COATS OF RED OXIDE PRIMER, UNDER GROUND PORTION PAINTED BITUMINUS PAINT.

3. FOR FLOOD LIGHTING POLE THE TOP PORTION NOT TO BE TILTED BUT A 300 x 300 x 6mm THICK M.S. PLATE WELDED AT THE TOP SHALL BE PROVIDED TO MOUNT FLOOD LIGHT.

4. ALL DIMENSIONS ARE IN mm
1. FOR PAD USE:—
   a) 400x400x70 CONCRETE BLOCK FOR POLES.
   b) BASE PLATE AS SHOWN IN PDS:E 205 FOR STEEL TUBULAR POLES
      SHALL BE USED AS PAD
   C) RCC / WOOD POLES DO NOT NEED ANY PAD.

2. MUFF IS MUST FOR STEEL TUBULAR POLES AND OPTIONAL FOR
   OTHERS POLES, MUFF SHALL BE PROVIDED AFTER UNDER GROUND
   CABLEING FOR STREET LIGHTING IS COMPLETED.

3. MUFF HEIGHT FROM GROUND LEVEL SHALL BE 300mm FOR ORDINARY
   POLES AND 457mm FOR STREET LIGHTING POLES HAVING J.B.LOCATED
   ON THE MUFF

4. FOR MOUNTING OF JBS’ ON THE MUFF REFER PDS:E 209
