SECTION-I

INVITATION FOR BID (IFB)
SECTION-I
“INVITATION FOR BID (IFB)”

Ref No: PNMM/PC150/E-4003/NCB 07.02.2020

To,

PROSPECTIVE BIDDERS

SUB: TENDER DOCUMENT FOR STEAM GENERATION PLANT ALONG WITH ALL ASSOCIATED FACILITIES ON LSTK BASIS

Dear Sir/Madam,

1.0 INTRODUCTION:

1.1 GAIL (India) Limited (GAIL), Rashtriya Chemicals & Fertilizers Limited (RCF), Coal India Limited (CIL) and Fertilizer Corporation of India Limited (FCIL) have formed a Joint Venture company in the name of Talcher Fertilizers Limited (TFL) hereinafter also referred to as "Owner", intends to set up Steam generating Plant for its Coal gasification and Ammonia Urea Plant, an integrated fertilizer and chemical complex comprising of Coal Gasification and Gas Purification Unit, Ammonia Synthesis Unit, Urea Plant, along with necessary offsite and utility facilities, within the premises of existing closed coal based Ammonia-Urea Complex of Fertilizer Corporation of India Limited (FCIL) at Talcher Unit, Angul district, in the state of Odisha, India.

1.2 GAIL (India) Limited is a Public Sector Unit under the Ministry of Petroleum & Natural Gas and Rashtriya Chemicals & Fertilizers Limited (RCF) & Fertilizer Corporation of India Limited (FCIL) are two Public Sector Units under the Ministry of Chemicals & Fertilizers and Coal India Limited (CIL) is a Public Sector Unit under the Ministry of Coal, Govt. of India.

1.3 GAIL (India) Limited (GAIL), is India’s flagship Natural Gas Company, integrating all aspects of the Natural Gas value chain (including Exploration & Production, Processing, Transmission, Distribution and Marketing) and its related services. In a rapidly changing scenario, GAIL is spearheading the move to a new era of clean fuel industrialization, creating a quadrilateral of green energy corridors that connect major consumption centers in India with major gas fields, LNG terminals and other cross border gas sourcing points. GAIL is also expanding its business to become a player in the International Market.

1.4 Rashtriya Chemicals & Fertilizers Limited (RCF), a leading Public Sector Undertaking in the field of fertilizers, is engaged in manufacture and marketing of Fertilizers and Industrial chemicals. The company was carved out of the erstwhile Fertilizer Corporation of India Ltd at the time of reorganisation way back in the year 1978. Presently, Rashtriya Chemicals & Fertilizers Ltd. (RCF) is a leading fertilizer manufacturer in India having two production facilities, one at Trombay in Mumbai and the other at Thal in Alibag city which is 100 kilometers from Mumbai. Thal unit of RCF comprises Ammonia and Urea Plants and Trombay unit comprises Ammonia Urea Plants along with chemical plants like Methanol, Nitric Acid, Sulphuric Acid, Phosphoric Acid and Nitro Phosphate fertilizers of different composition.
1.5 **Coal India limited (CIL)** was formed in November, 1975 as a holding company to manage the coal mines nationalized in between 1971 to 1973. The company, with 78.86% of its equity owned by Government of India, is world’s largest hard coal producing company. It has core competence across the entire gamut of the coal business value chain. The business domain includes exploration, planning and design of mines, coal mining operations, coal beneficiation and marketing. CIL meets 42% of the nation’s primary energy demand and caters 81% of the nation’s coal requirement.

1.6 **Fertilizer Corporation of India Limited (FCIL)** is a Central Government undertaking under the administrative control of Ministry of Chemicals and Fertilizers. Due to non-viability of the operation of fertilizer unit, Government of India has decided to close the fertilizer plants. The net worth of the company has become negative and the corporation was referred to BIFR in April 1992 under the sick Industrial Companies (Special provision under Act 1985).

1.7 Projects and Development India Limited (PDIL), hereinafter referred to as CONSULTANT on behalf of M/s Talcher Fertilizers Ltd. (TFL), hereinafter referred as OWNER, has the pleasure of inviting eligible bidders to submit Bid ONLINE through Central Public Procurement (CPP) Portal in Single Stage Two Bid System, for the subject Project.

SECTION-II

BID EVALUATION CRITERIA

&

EVALUATION METHODOLOGY
SECTION-II

A. **BID EVALUATION CRITERIA (BEC)**

Bids are hereby invited from competent domestic bidders meeting the technical and financial criteria of respective BEC stated hereunder.

Evaluation of Techno-Commercial offers shall be carried out for only those Bidders who shall meet the BEC.

Silent features of BEC and other terms and conditions are as given below:

1.0 **Technical Criteria:**

1.1. The Bidder should possess experience of having successfully executed the job of Design & Engineering, Procurement, Supply, Construction & Erection, Testing, Pre-commissioning, Commissioning Circulating Fluidized Bed combustion (CFBC) or Pulverized Coal (PC) type coal fired boiler of installed total capacity of minimum 280 TPH under single stream or multiple streams of minimum 140 TPH capacity each on Turnkey/ EPC basis, with steam parameters of minimum 107 Kg/cm²(g) pressure and 515°C Temperature at battery limit of Boiler, in the last 10 years reckoned from the bid due date. Further, the said plant should have been in satisfactory operation for a minimum period of one year from the date of Acceptance.

**Note:**

(a) **Eligibility criteria in case bid is submitted on the basis of technical experience of FOREIGN BASED ANOTHER COMPANY (SUPPORTING COMPANY) which holds more than fifty percent of the paid up share capital of the bidder company or vice versa:**

Offers of those bidders (not under consortium arrangement) who themselves do not meet the technical experience criteria as stipulated in the BEC and are quoting based on the experience of Foreign based another company (Supporting Company) can also be considered. In such case the supporting company should hold more than fifty percent of the paid up share capital of the bidding company or vice versa.

However, the supporting company should on its own meet the technical experience as stipulated in the BEC and should not rely on any other company or through any other arrangement like Technical collaboration agreement.

In that case as the bidding company is dependent upon the technical experience of another company with a view to ensure commitment and involvement of the companies involved for successful execution of the contract, the participating bidder should enclose the following Agreements/ Guarantees/ Undertakings along with the techno-commercial bid:

i. An Agreement (as per format enclosed at F-23) between the bidder and the supporting company.
ii. Guarantee (as per format enclosed at F-24) by the supporting company to TFL/PDIL for fulfilling the obligation under the Agreement.

iii. Undertaking by Supporting Company to provide a Performance Bank Guarantee (as per format and instructions enclosed at F-26), equivalent to 50% of the value of the PBG which is to be submitted by the bidding company, in case of being the successful bidder.

In cases where foreign based supporting company does not have Permanent Establishment in India as per Indian Income Tax Act, the bidding company can furnish Performance Bank Guarantee for an amount which is sum of PBG amount to be submitted by the bidder and additional PBG amount required to be submitted by the supporting company subject to the condition that supporting company have 100% paid up equity share capital of the bidder either directly or through intermediate subsidiaries or vice versa.

In such case bidding company shall furnish an undertaking that their foreign based supporting company is not having any Permanent Establishment in India in terms of Income Tax Act of India.

In case Supporting company fails to submit Bank Guarantee as per (c) above, EMD/SD submitted by the bidder shall be forfeited.

iv. Undertaking from the supporting company to the effect that in addition to invoking the PBG submitted by the bidding company, the PBG provided by supporting company shall be invoked by TFL due to non-performance of the bidding company.

Note: In case Supporting Company fails to submit Bank Guarantee as per (iii) above, EMD/ SD submitted by the bidder shall be forfeited.

However, the Financial BEC of tender is to be met by bidder on their own.

(b) Job executed by a Bidder for its own plant/ project cannot be considered as experience for the purpose of meeting BEC of the tender. However, jobs executed for Subsidiary/ Fellow subsidiary/ Holding company will be considered as experience for the purpose of meeting BEC subject to submission of tax paid invoice(s) duly certified by Statutory Auditor of the Bidder towards payments of statutory tax in support of the job executed for Subsidiary/ Fellow subsidiary/ Holding company. Such Bidders to submit these documents in addition to the documents specified to meet BEC.

(c) The bidder must submit the completion certificate/acceptance certificate issued by end user/ owner (or their consultant who has been duly authorized by them to issue such certificate) only after completion of work/ supply in all aspects.

(d) Only documents (Work order, completion certificate, execution certificate etc.) which have been referred /specified in the bid shall be considered in reply to the queries during evaluation of bids.

(e) In case more than one contract/order/agreement/DLOA are emanating against same tender, these contracts are to be considered as single contract for evaluation of credentials of a bidder for meeting their experience criteria.
2.0 Financial Criteria:

2.1 The Annual Turnover in any one of the last three (03) preceding financial years i.e. FY 2018-19/FY 2017-18/FY 2016-17 or calendar years 2018/2017/2016 of the bidder should be at least INR 243 Crore.

2.2 Net Worth of the Company should be positive as per last audited financial year (F.Y 2018-19 or calendar year 2018).

2.3 The Bidder should have minimum working capital equal to INR 48.60 Crore as per last audited financial year (F.Y. 2018-2019 or Calendar year 2018). However, if the bidder’s working capital is negative or inadequate, the bidder shall submit a letter from their Bank having Net worth of the bank not less than Rs. 100.0 Crores (or equivalent USD), confirming the availability of line of credit for INR 48.60 Crore. The line of credit from bank shall be submitted strictly as per prescribed format.

3.0 BEC for START-UPS:

The Technical and Financial BEC as stipulated above shall also be applicable for start-ups. However, the Startups are exempted from submission of EMD. For availing the relaxation of EMD, bidder is required to submit requisite certificate towards Startup enterprise registration issued by Department of Industrial Policy and Promotion, Ministry of Commerce & Industry and the certificate should be certified by the Chartered Accountant (not being an employee or a Director or not having any interest in the bidder’s company/firm) and notary public with legible stamp.

4.0 DOCUMENTS TO BE SUBMITTED FOR COMPLIANCE TO ‘BEC’

(i) Technical Criteria of BEC:

To meet the criteria (1.1) above, Bidder must submit Copy of Detailed Letter of Acceptance (DLOA) / Work Order /relevant extract of work Order/ Contract Agreement alongwith Detailed scope of work, Completion / Acceptance Certificate and a certificate in respect of minimum one year successful operation of the Plant issued by the Owner/End user. The Detailed Letter of Acceptance (DLOA) / Work Order / Contract Agreement must clearly indicate nature of Work, period, and contract value. Similarly, the Completion Certificate/ Acceptance Certificate must clearly indicate reference of relevant work order/DLOA/Contract Agreement, Name of Work, Contract Value, Executed order value and date of completion.

(ii) Financial Criteria of BEC:

(a) To meet the criteria for Sr. No. 2.1, Bidder shall submit the Audited Financial Statements of the company for any one of the preceding three (03) financial years/Calendar years (i.e. FY 2018-19 / FY 2017-18 / FY 2016-17 or calendar years 2018/2017/2016) whichever meets the annual turnover criteria.

(b) To meet the criteria for Sr. No. 2.2, Bidder shall submit the last Audited Financial Statements (FY 2018-19 or calendar year 2018) alongwith “Details of Financial Capability of the Bidder” in prescribed format duly signed and stamped by Chartered Accountant.
(c) To meet the criteria for Sr. No. 2.3, Bidder shall submit the last Audited Financial Statements (FY 2018-19 or calendar year 2018) along with (i) Bank’s Letter (if applicable) and (ii) “Details of Financial Capability of the Bidder” in prescribed format duly signed and stamped by Chartered Accountant along with Bank’s letter for 2.3 (if applicable).

(d) If the bidder’s working capital is negative or inadequate, the bidder shall submit a letter from their bank having net worth not less than Rs.100 Crores (or equivalent USD), confirming the availability of line of credit for working capital amount mentioned herein above. The line of credit letter from bank to be submitted strictly as per format.

5.0 AUTHENTICATION OF DOCUMENTS SUBMITTED AGAINST BEC

5.1 All documents in support of Technical Criteria of Bid Evaluation Criteria (BEC) furnished by the bidders shall be verified and certified by any one of the following independent third party inspection agency (as per prescribed format at Appendix-I):

1. Société Générale de Surveillance (SGS)
2. Gulf Lloyds Industrial Services (India) Pvt. Ltd (GLISPL)
3. International Certification Services (ICS)
4. Bureau Veritas (Ind.) Pvt. Ltd (BVIS)
5. DNV GL
6. TUV Rheinland (India) Pvt. Ltd.
7. TÜV SÜD South Asia Pvt. Ltd.
8. TUV India Pvt. Ltd. (TÜV Nord Group)
9. Intertek India Pvt. Ltd.
10. Moody International (India) Pvt. Ltd.
11. RINA India Pvt. Ltd.
12. Tata Projects Ltd.
13. Competent Inspectorate and Consultants LLP
14. ABS Industrial Verification (India) Pvt. Ltd

All charges of the Third party for verification and certification shall be borne by the Bidder. TPIA will provide in addition a certificate towards verification and certification of documents pertaining to Technical PQC as per the prescribed format at Appendix-I given below.

If any above mentioned agency themselves are participating in bidding, then they shall authenticate the document by a different agency from the list given above.

5.2 For authentication of document submitted in support of Financial Criteria of Bid Evaluation criteria (BEC), copy of audited annual financial statements submitted with bid shall be duly certified / attested by Notary Public with legible stamp. Further, bidder shall submit “Details of financial capability of Bidder” in prescribed format duly signed and stamped by a Chartered Accountant/ Certified Public Accountant (CPA).

Note: In case, bidder submits ‘Details of financial capability of bidder’ in prescribed format in support of financial criteria of PQC duly signed and stamped by its **Statutory Auditor**, authentication of audited financial statements as mentioned above may not be necessary.

B. EVALUATION METHODOLOGY

The subject work is indivisible and complete work shall be awarded to successful overall lowest bidder as per evaluation methodology described below. In other words, evaluation of bids shall be done on overall L-1 basis considering all applicable taxes & duties including GST as under:

The Evaluation methodology shall be based on NPV arrived as per the following:

(a) **NPV OF TOTAL LUMPSUM TURNKEY (LSTK) PRICE/ TOTAL CONTRACT PRICE**

The TOTAL LSTK PRICE / TOTAL CONTRACT PRICE (Including all taxes, duties, levies and GST) as derived from the SCHEDULE OF PRICES will be discounted at the rate of 10.0% p.a., as per the cumulative monthly payment schedule / “S” curve submitted by the Bidder for the implementation period.

The Bidder shall furnish, the cumulative monthly payment schedule of its CONTRACT PRICE for 26 months project schedule in a tabular form as per prescribed format. The month-wise phasing of expenditure indicated by Bidder will be used for evaluation and form part of the CONTRACT for capping the monthly payment based on the actual progress of work. The cumulative monthly payment schedule / “S” curve has to be given by the bidders considering payment schedule given elsewhere in the tender.

(b) **NPV OF WORKS COST**

Bidder shall furnish the Guaranteed Consumption Figures of Raw Materials, Utilities and Condensate as per prescribed format (Annexure A of BOQ/Schedule of Price). The differential Works cost (in comparison to Bidder quoting the lowest Works Cost) considering 330 stream days per year will be calculated and will be discounted at discount rate of 10.0% p.a. for a period of 25 years of operation starting from Preliminary Acceptance.

The NPV of differential works cost so obtained on achieving Commissioning (26 months) shall be further discounted at the rate of 10.0% p.a to arrive at present value i.e. month zero

For Bid evaluation purpose, work cost shall be calculated for Guarantee Test run clause.

To summarize the above, the evaluated cost shall be ascertained as per following:

(a) NPV of quoted TOTAL CONTRACT PRICE

Plus (+)

(b) NPV of Works cost

(c) Optional prices quoted in the Schedule of Prices/BOQ shall not be considered in the evaluation

[A] – GENERAL

1 SCOPE OF BID
1.1 The Employer as defined in the "General Conditions of Contract [GCC]", wishes to receive Bids as described in the Tender document issued by Employer. Employer/Owner/TFL occurring herein under shall be considered synonymous.

1.2 SCOPE OF BID: The scope of work/ Services shall be as defined in the Tender documents.

1.3 The successful bidder will be expected to complete the scope of Bid within the period stated in Special Conditions of Contract.

1.4 Throughout the Tender documents, the terms 'Bid', 'Tender' & 'Offer' and their derivatives [Bidder/Tenderer, Bid/Tender/Offer etc.] are synonymous. Further, 'Day' means 'Calendar Day' and 'Singular' also means 'Plural'.

1.5 BRIEF SCOPE OF WORK:

There shall be three (03) Coal fired Boilers (2W+1S) either Circulating Fluidized Bed Combustion (CFBC) or Pulverized Coal (PC) type of identical capacity with total installed capacity (to be decided by bidder considering internal consumption within their B.L) based on net HP steam export figure of 564 TPH HP steam plus superheating of 74 TPH saturated HP steam. To meet the above requirement the bidder shall supply Basic Design and Detailed Engineering, HAZOP Study, Procurement, Supply, Fabrication, Third Party Inspection (TPI) as applicable, Expediting, Site Survey and Condition Assessment, Route Survey for ODCS, Insurance, Transportation of all Equipment / Materials to Work Site, Storage & Materials Management, Construction and Erection of all Civil, Mechanical, Electrical and Instrumentation Works, Assembly and Installation of Equipments, Packages, Obtaining all necessary Statutory Approvals, Testing, Mechanical Completion, Pre-Commissioning, Commissioning, Performance Guarantee Test Run including Complete Project Management and Handing Over of 'Steam Generation Plant' Comprising of Boilers with Steam Superheating Facility and all other associated Plant Auxiliaries like De-aeration System, Coal Processing, Transfer & Handling System, Ash Handling System etc. on a Lump-Sum Turnkey Basis under Single Point Responsibility Basis, at Talcher, Angul district, Odisha for Talcher Fertilizers Limited.

2 ELIGIBLE BIDDERS

2.1 The Bidder shall not be under a declaration of ineligibility by Employer for Corrupt/ Fraudulent/ Collusive/ Coercive practices, as defined in "Instructions to Bidders [ITB], Clause No. 39" (Action in case Corrupt/ Fraudulent/ Collusive/ Coercive Practices).

2.2 The Bidder is not put on ‘Holiday' by TFL or any of the JV partner of OWNER (viz. GAIL, RCF, CIL, FCIL) or Public-Sector Project Management Consultant (like PDIL only due to “poor performance” or “corrupt and fraudulent practices”) or banned/blacklisted by Government department/ Public Sector on due date of submission of bid or during the process of evaluation of bids. Further, neither bidder nor their allied agency/(ies) (as defined in the Procedure for Action in case of Corrupt/Fraudulent/Collusive/ Coercive Practices) are on banning list of TFL or any of the JV partner of OWNER viz. GAIL, RCF, CIL, FCIL.
If the Tender documents were issued inadvertently/ downloaded from website, offers submitted by such bidders shall not be considered for opening/ evaluation/Award and will be returned immediately to such bidders.

In case there is any change in status of the declaration prior to award of contract, the same has to be promptly informed to TFL/PDIL by the bidder.

It shall be the sole responsibility of the bidder to inform about their status regarding para 1 of clause 2.2 herein above on due date of submission of bid and during the course of finalization of the tender. Concealment of the facts shall tantamount to misrepresentation of facts and shall lead to action against such Bidders as per clause 39 of ITB.

2.3 The Bidder should not be under any liquidation court receivership or similar proceedings on due date of submission of bid. In case there is any change in status of the declaration prior to award of contract, the same has to be promptly informed to TFL/PDIL by the bidder.

It shall be the sole responsibility of the bidder to inform TFL there status on above on due date of submission of bid and during the course of finalization of the tender. Concealment of the facts shall tantamount to misrepresentation of facts and shall lead to action against such Bidders as per clause no. 39 of ITB.

2.4 Bidder shall not be affiliated with a firm or entity:

(i) that has provided consulting services related to the work to the Employer during the preparatory stages of the work or of the project of which the works/services forms a part of or
(ii) that has been hired (proposed to be hired) by the Employer as an Engineer/ Consultant for the contract.

2.5 Deleted.

2.6 Pursuant to qualification criteria set forth in the Tender document, the Bidder shall furnish all necessary supporting documentary evidence to establish Bidder’s claim of meeting qualification criteria.

2.7 **Power of Attorney:**

Power of Attorney to be issued by the bidder in favour of the authorised employee(s),in respect of the particular tender, for purpose of signing the documents including bid, all subsequent communications, agreements, documents etc. pertaining to the tender and act and take any and all decision on behalf of the bidder (including Consortium). Any consequence resulting due to such signing shall be binding on the Bidder (including Consortium).

(I) In case of a single Bidder, the power of Attorney shall be issued as per the constitution of the bidder as below:

a) **In case of Proprietorship:** By Proprietor
b) **In case of Partnership:** by all Partners or Managing Partner.
c) **In case of Limited Liability Partnership:** by any bidder’s employee authorized in terms of Deed of LLP.
d) **In case of Public /Limited Company:** POA in favour of authorized employee(s) by Board of Directors through Board Resolution or by the
designated officer authorized by Board to do so. Such Board Resolution should be duly countersigned by Company Secretary / MD / CMD / CEO.

The Power of Attorney should be valid till award of contract/order to successful bidder.

3 BIDS FROM "JOINT VENTURE"/"CONSORTIUM"
NOT APPLICABLE.

4 ONE BID PER BIDDER

4.1 A Bidder shall submit only 'one [01] Bid' in the same Bidding Process either as single entity or as a member of any consortium (wherever consortium bid is allowed). A Bidder who submits or participates in more than 'one [01] Bid' will cause all the proposals in which the Bidder has participated to be disqualified.

4.2 More than one bid means bid(s) by bidder(s) having same Proprietor / Partners / Limited Liability Partner in any other Bidder (s). Further, more than one bids shall also include two or more bidders having common power of attorney holder.

Failure to comply this clause during tendering process will disqualify all such bidders from process of evaluation of bids.

4.3 Alternative Bids shall not be considered.

4.4 The provisions mentioned at sl. no. (i) and (ii) shall not be applicable wherein bidders are quoting for different Items / Sections / Parts / Groups/ SOR items of the same tender which specifies evaluation on Items / Sections / Parts / Groups/ SOR items basis.

5 COST OF BIDDING
The Bidder shall bear all costs associated with the preparation and submission of the Bid including but not limited to Bank charges all courier charges including taxes & duties etc. incurred thereof. Further, TFL/PDIL will in no case, be responsible or liable for these costs, regardless of the outcome of the bidding process.

6 SITE VISIT
6.1 The Bidder is advised to visit and examine the site of works and its surroundings and obtain for itself on its own responsibility all information that may be necessary for preparing the Bid and entering into a Contract for the required job. The costs of visiting the site shall be borne by the Bidder.

6.2 The Bidder or any of its personnel or agents shall be granted permission by the Employer to enter upon its premises and land for the purpose of such visits, but only upon the express conditions that the Bidder, its personnel and agents will release and indemnify the Employer and its personnel, agents from and against all liabilities in respect thereof, and will be responsible for death or injury, loss or damage to property, and any other loss, damage, costs, and expenses incurred as a result of inspection.

6.3 The Bidder shall not be entitled to hold any claim against TALCHER FERTILIZERS LIMITED for non-compliance due to lack of any kind of pre-requisite information as it is the sole responsibility of the Bidder to obtain all the necessary information with regard to site, surrounding, working conditions, weather etc. on its own before submission of the bid.
7 CONTENTS OF TENDER DOCUMENTS

7.1 The contents of Tender documents / Tender Documents are those stated below, and should be read in conjunction with any 'Addendum / Corrigendum' issued in accordance with "ITB: Clause-9":

- Section-I : Invitation for Bid [IFB]
- Section-II : Bid Evaluation Criteria [BEC] & Evaluation Methodology
- Section-III : Instructions to Bidders [ITB], Annexures, Forms & Format
- Section-IV : General Conditions of Contract [GCC]
- Section-V : Special Conditions of Contract [SCC]
- Section-VI : Scope of Work & Specifications
- Section-VII : Price Schedule/ Schedule of Rates

*"Request for Quotation", wherever applicable, shall also form part of the Tender document.

7.2 The Bidder is expected to examine all instructions, forms, terms & conditions in the Tender documents. The "Request for Quotation [RFQ] & Invitation for Bid (IFB)" together with all its attachments thereto, shall be considered to be read, understood and accepted by the Bidders. Failure to furnish all information required by the Tender documents or submission of a Bid not substantially responsive to the Tender documents in every respect will be at Bidder's risk and may result in the rejection of his Bid.

8 CLARIFICATION OF TENDER DOCUMENTS

8.1 A prospective Bidder requiring any clarification(s) of the Tender documents may notify TFL in writing or through CPP Portal (https://etenders.gov.in/eprocure/app) or email at PDIL's mailing address indicated in the BDS no later than 02 (two) days prior to pre-bid meeting (in cases where pre-bid meeting is scheduled) or 05 (five) days prior to the due date of submission of bid in cases where pre-bid meeting is not scheduled. TFL/PDIL reserves the right to ignore the bidders request for clarification if received after the aforesaid period. TFL/PDIL may respond in writing to the request for clarification. TFL/PDIL's response including an explanation of the query, but without identifying the source of the query will be uploaded on the websites at Clause No. 2.0 (G) of IFB and communicated to prospective bidders by e-mail.

8.2 Any clarification or information required by the Bidder but same not received by the Employer at clause 8.1 (refer BDS for address) above is liable to be considered as "no clarification / information required".

9 AMENDMENT OF TENDER DOCUMENTS

9.1 At any time prior to the 'Bid Due Date', Owner may, for any reason, whether at its own initiative or in response to a clarification requested by a prospective Bidder, modify the Tender documents by amendment / corrigendum.

9.2 Any corrigendum thus issued shall be integral part of the Tender Document and shall be hosted on the websites as provided at clause no. 2.0 (G) of IFB /communicated to prospective bidders by e-mail. Bidders have to take into account all such amendment / corrigendum before submitting their Bid.
9.3 The Employer, if it considers necessary, may extend the date of submissions of Bid in order to allow the Bidders a reasonable time to furnish their most competitive bid taking into account the amendment / corrigendum issued thereof.

[C] – PREPARATION OF BIDS

10 **LANGUAGE OF BID:**
The bid prepared by the Bidder and all correspondence, document(s), certificate(s) etc. relating to the Bid exchanged by Bidder and TFL shall be written in English language only. In case a document, certificate, printed literature etc. furnished by the Bidder in a language other than English, the same should be accompanied by an English translation duly authenticated by the Chamber of Commerce of Bidders Country, in which case, for the purpose of interpretation of the Bid, the English translation shall govern.

11. **DOCUMENTS COMPRISING THE BID**
11.1 Bidders are requested to refer instructions for participating in E-Tendering and the ready reckoner for bidders available at [https://etenders.gov.in/eprocure/app](https://etenders.gov.in/eprocure/app). Bids submitted manually shall be rejected.

The bids must be submitted on E-tendering website of CPP portal ([https://etenders.gov.in/eprocure/app](https://etenders.gov.in/eprocure/app)) comprising following documents:-

11.1.1 **PART-I: "TECHNO-COMMERCIAL / UN-PRICED BID”** shall contain the following:

(a) 'Covering Letter' on Bidder's 'Letterhead' clearly specifying the enclosed contents.
(b) Duly attested documents in accordance with the "BID EVALUATION CRITERIA [BEC]" establishing the qualification.
(c) 'Bidder's General Information', as per 'Form F-1'.
(d) Copies of documents, as specified in tender document.
(e) As a confirmation that the prices are quoted in requisite format complying with the requirements copy of Schedule of Rate (SOR) with prices blanked out mentioning quoted / not quoted (as applicable) written against each item.
(f) 'Letter of Authority' on the Letter Head, as per 'Form F-3'.
(g) 'Agreed Terms and Conditions', as per 'Form F-5'.
(h) 'Acknowledgement cum Consent Letter', as per 'Form F-6'.
(i) Copy of Power of Attorney as per 'F-10' /copy of Board Resolution, in favour of the authorized signatory of the Bid, as per clause no.2.7 of ITB (Original to be submitted physically).
(j) Copy of EMD in original as per Clause 16 of ITB (Original to be submitted physically).
(k) All forms and Formats including Annexures.
(l) ‘Integrity Pact’ as per ‘Form F-14’
(m) ‘Indemnity Bond’ as per ‘Form F-15’
(n) Tender Document duly signed/ digitally signed by the Authorized Signatory.
(o) Additional document specified in Bidding Data Sheet (BDS).
(p) Any other information/details required as per Tender Document.

Note:

1. All the pages of the Bid must be signed/ digitally signed by the "Authorized Signatory" of the Bidder.

2. Forms F-4 and F-14 are not to be filled up at this stage as these will be executed only with successful bidder. However, bidders to be participated in this tender.
shall produce an acknowledgement regarding acceptance of prescribed format without any deviations at Sr. No. 22 of ‘Agreed Terms & Conditions as per F-5’ & same shall be produced in case they emerge as successful bidder.

11.1.2 PART-II: Price Bid
i) The Prices are to be submitted strictly as per the Schedule of Rate of the Tender documents. TFL/PDIL shall not be responsible for any failure on the part of the bidder to follow the instructions.

ii) Bidders are advised NOT to mention Rebate/Discount separately, either in the SOR format or anywhere else in the offer. In case Bidder(s) intend to offer any Rebate/Discount, they should include the same in the item rate(s) itself under the “Schedule of Rates (SOR)” and indicate the discounted unit rate(s) only.

iii) If any unconditional rebate has been offered in the quoted rate the same shall be considered in arriving at evaluated price. However no cognizance shall be taken for any conditional discount for the purpose of evaluation of the bids.

iv) In case, it is observed that any of the bidder(s) has/have offered suo-moto Discount/Rebate after opening of unpriced bid but before opening of price bids such discount /rebate(s) shall not be considered for evaluation. However, in the event of the bidder emerging as the lowest evaluated bidder without considering the discount/rebate(s), then such discount/rebate(s) offered by the bidder shall be considered for Award of Work and the same will be conclusive and binding on the bidder.

v) In the event as a result of techno-commercial discussions or pursuant to seeking clarifications / confirmations from bidders, while evaluating the un-priced part of the bid, any of the bidders submits a sealed envelope stating that it contains revised prices; such bidder(s) will be requested to withdraw the revised prices failing which the bid will not be considered for further evaluation.

vi) In case any bidder does not quote for any item(s) of “Schedule of Rates” and the estimated price impact is more than 10% of the quoted price, then the bid will be rejected. If such price impact of unquoted items is 10% or less of his quoted price, then the unquoted item(s) shall be loaded highest of the price quoted by the other bidders. If such bidder happens to be lowest evaluated bidder, price of unquoted items shall be considered as included in the quoted bid price.

11.2 Bidders must submit the original "EMD, Power of Attorney, Integrity Pact and TPI letter as specified in the Tender Document to the address mentioned in IFB, in a sealed envelope, superscribing the details of Tender Document (i.e. tender number & tender for) within 7 days from the date of un-priced bid opening.

Bidders are required to submit the EMD in original by Due Date and Time of Bid Submission or upload a scanned copy of the same in the Part-I of the Bid. If the Bidder is unable to submit EMD in original by Due Date and Time of Bid Submission, the Bidder is required to upload a scanned copy of the EMD in Part-I of Bid, provided the original EMD, copy of which has been uploaded, is received within 7 days from the Due Date of Bid Opening, failing which the Bid will be rejected irrespective of their status/ranking in tendering process and notwithstanding the fact that a copy of EMD was earlier uploaded by the Bidder.

11.3 The Prices are to be filled strictly in the Schedule of Rate of the bidding documents and provision mentioned at para 11.1.2 hereinabove and to be uploaded in CPP portal.
12 **SCHEDULE OF RATES / BID PRICES**

12.1 Unless stated otherwise in the Tender documents, the Contract shall be for the whole works as described in Tender documents, based on the rates and prices submitted by the Bidder and accepted by the Employer.

12.2 Prices must be filled in format for "Schedule of Rates [SOR]"/"BOQ" enclosed as part of Tender document. If there is any variation in item description, unit or quantity vis-à-vis SOR format of Tender Document; the Bid is liable to be rejected.

12.3 Bidder shall quote for all the items of "SOR" after careful analysis of cost involved for the performance of the completed item considering all parts of the Tender document. In case any activity though specifically not covered in description of item under "SOR" but is required to complete the works as per Specifications, Scope of Work / Service, Standards, General Conditions of Contract ("GCC"), Special Conditions of Contract ("SCC") or any other part of Tender document, the prices quoted shall deemed to be inclusive of cost incurred for such activity.

12.4 All duties, taxes and other levies [if any] payable by the Contractor under the Contract, or for any other cause except final GST (CGST & SGST/ UTGST or IGST) shall be included in the rates / prices and the total bid-price submitted by the Bidder. Applicable rate of GST (CGST & SGST/ UTGST or IGST) on the contract value shall be indicated in Agreed Terms & Conditions (Format-F5) and SOR.

12.5 Prices quoted by the Bidder, shall remain firm and fixed and valid until completion of the Contract and will not be subject to variation on any account. Any new taxes & Duties, if imposed by the State/ Govt. of India after due date of bid submission but before the expiry of contract period, shall be reimbursed to the contractor on submission of documentary evidence for proof of payment to State/ Govt. Authorities and after ascertaining it's applicability with respect to the contract.

12.6 Further, Bidder shall also mention the Service Accounting Codes (SAC) / Harmonized System of Nomenclature (HSN) at the designated place in SOR.

13 **GST (CGST & SGST/ UTGST or IGST)**

13.1 Bidders are required to mention the GST Registration number in bids wherever GST (CGST & SGST/UTGST or IGST) is applicable.

13.2 Please note that the responsibility of payment of GST (CGST & SGST or IGST or UTGST) lies with the Service Provider only. Service Provider providing taxable service shall issue tax Invoice/ Bill, as the case may be as per rules/ regulation of GST. Further, returns and details required to be filled under GST laws & rules should be timely filed by Service Provider with requisite details.

Payments to Service Provider for claiming GST (CGST & SGST/UTGST or IGST) amount will be made provided the above formalities are fulfilled. Further, TFL may seek copies of challan and certificate from Chartered Accountant for deposit of GST (CGST & SGST/UTGST or IGST) collected from Owner.

13.3 In case CBIC (Central Board of Indirect Taxes and Customs)/ any equivalent Central Government agency/ State Government agency brings to the notice of TFL that the Supplier of Goods / Services (Service Provider) has not remitted the amount towards GST (CGST & SGST/UTGST or IGST) collected from TFL to the government exchequer, then, that Contractor shall be put under Holiday list of TFL.
for a period of six months after following the due procedure. This action will be in addition to the right of recovery of financial implication arising on TFL.

13.4 For statutory variation in GST (CGST & SGST/UTGST or IGST), please refer clause no. 13.0 of SCC (Section V of NIT)

13.5 TFL will reimburse GST (CGST & SGST/UTGST or IGST) to the Contractor at actuals against submission of Tax Invoices as per format specified in rules/ regulation of GST, subject to any statutory variations.

The bids will be evaluated based on total price including applicable GST (CGST & SGST/UTGST or IGST).

13.6 TFL will prefer to deal with registered contractors under GST. Therefore, bidders are requested to get themselves registered under GST, if not registered yet.

However, in case any unregistered bidder is submitting their bid, their prices will be loaded with applicable GST (CGST & SGST/UTGST or IGST) while evaluation of bid.

13.7 In case TFL is required to pay entire/certain portion of applicable GST (CGST & SGST/UTGST or IGST) and remaining portion, if any, is to be deposited by Bidder directly as per GST (CGST & SGST/UTGST or IGST) laws, entire applicable rate/amount of GST (CGST & SGST/UTGST or IGST) to be indicated by bidder in the SOR.

Where TFL has the obligation to discharge GST (CGST & SGST/UTGST or IGST) liability under reverse charge mechanism and TFL has paid or is liable to pay GST (CGST & SGST/UTGST or IGST) to the Government on which interest or penalties becomes payable as per GST laws for any reason which is not attributable to TFL or ITC with respect to such payments is not available to TFL for any reason which is not attributable to TFL, then TFL shall be entitled to deduct/ setoff / recover such amounts against any amounts paid or payable by TFL to Contractor.

13.8 Contractor shall ensure timely submission of correct Tax invoice(s) as per rules/ regulations of GST with all required supporting document(s) within a period specified in Contracts/ DLOA to enable TFL to avail input tax credit. Further, returns and details required to be filled under GST laws & rules should be timely filed by Contractor with requisite details.

13.9 Anti-profiteering clause
As per Clause 171 of GST Act it is mandatory to pass on the benefit due to reduction in rate of tax or from input tax credit to the consumer by way of commensurate reduction in prices. The Contractor may note the above and quote their prices accordingly.

13.10 In case the GST rating of vendor on the GST portal / Govt. official website is negative / black listed, then the bids may be rejected by TFL. Further, in case rating of bidder is negative / black listed after award of work, then TFL shall not be obligated or liable to pay or reimburse GST to such vendor and shall also be entitled to deduct / recover such GST along with all penalties / interest, if any, incurred by TFL.

13.11 The Contractor shall mention the particulars of Talcher Fertilizers Limited, (place specified in BDS) on the Invoice. Besides, if any other particulars of Talcher Fertilizers Limited are required to be mentioned, under GST rules/ regulations, the same shall also be mentioned on the Invoice.
13.12 The rate of GST as quoted in Price Schedule/SOR shall be considered as the prevailing present applicable rates on the Bid due date and same shall be considered for price comparison as well as for ordering. Any error of judgment on part of the Bidder in identifying the present applicable rates shall not be admitted. The applicable rate of GST as indicated by the bidders in Price Schedule/SOR shall be considered as the maximum payable in the event when no statutory variations take place and any remainder/balance GST, if payable, beyond that quoted rates shall be borne by the Bidder. However, in the event of any statutory variations in the rate of GST, if the quoted rates are found erroneous then the base rates for calculation of statutory variations for the purpose of reimbursement of GST shall take into account either the rates actually prevalent on the due date of submission of bid or the erroneous rates quoted by the Bidders whichever is beneficial to TFL. Consequently, any difference in GST if it becomes payable to the tax authorities shall be borne by the Bidder.

13.13 The CONTRACTOR confirms that it has included all taxes, duties, levies etc., as applicable at prevailing rates, in its SCHEDULE OF RATES. In case, CONTRACTOR has not included any such taxes, duties, levies etc., at all and/or at prevailing rates and CONTRACTOR has to pay such taxes, duties, levies etc., OWNER shall not be liable for payment of such liabilities and/or OWNER shall not reimburse such taxes, duties, levies etc. to CONTRACTOR.

13.14 Wherever TDS under GST Laws has been deducted from the Tax invoices raised / payments made to the vendors, as per the provisions of the GST law / Rules, Vendors should accept the corresponding GST-TDS amount populated in the relevant screen on GST common portal (www.gst.gov.in). Further, Vendors should also download the GST TDS certificate from GST common portal (reference path: Services>User Services> View/Download Certificates option).

13.15 **Deduction of TDS on GST**

As per notification no. 50/2018-Central Tax dated 13.09.2018, deduction of tax under GST became effective w.e.f. 01.10.2018 and accordingly applicable TDS under GST shall be deducted from Contractor’s Invoice.

14 **BID CURRENCIES:**

Bidders must submit bid in Indian Rupees only.

15 **BID VALIDITY**

15.1 Bids shall be kept valid for period specified in BDS from the final due date of submission of bid’. A Bid valid for a shorter period may be rejected by TFL as 'non-responsive'.

15.2 In exceptional circumstances, prior to expiry of the original 'Bid Validity Period', the Employer may request the Bidders to extend the 'Period of Bid Validity' for a specified additional period. The request and the responses thereto shall be made in writing or by email. A Bidder may refuse the request without forfeiture of his EMD. A Bidder agreeing to the request will not be required or permitted to modify his Bid but will be required to extend the validity of its EMD for the period of the extension and in accordance with "ITB: Clause-16" in all respects.
16 **EARNEST MONEY DEPOSIT**

16.1 Bid must be accompanied with earnest money (i.e Earnest Money Deposit (EMD) also known as *Bid Security*) in the form of ‘Demand Draft’ / ‘Banker’s Cheque’[in favour of *Talcher Fertilizers Limited* payable at place mentioned in BDS] or ‘Bank Guarantee’ strictly as per the format given in form F-2 (as the case may be) of the Tender Document. Bidder shall ensure that EMD submitted in the form of ‘Bank Guarantee’ should have a validity of at least two [02] months beyond the validity of the Bid. EMD submitted in the form of ‘Demand Draft’ or ‘Banker’s Cheque’ should be valid for three months.

Bid not accompanied with EMD, or EMD not in requisite format shall be liable for rejection. The EMD shall be submitted in Indian Rupees only.

16.2 EMD shall not be accepted in case the same has reference of ‘remitter’ / ‘financer’ other than bidder on the aforementioned financial instrument of EMD submitted by the bidder and bid of such bidder will be summarily rejected.

16.3 OWNER shall not be liable to pay any documentation charges, Bank charges, commission, interest etc. on the amount of EMD. In case EMD is in the form of a ‘Bank Guarantee’, the same shall be from any Indian scheduled Bank or a branch of an International Bank situated in India and registered with ‘Reserve Bank of India’ as Scheduled Foreign Bank. However, in case of ‘Bank Guarantee’ from Banks other than the Nationalized Indian Banks, the Bank must be commercial Bank having net worth in excess of Rs. 100 Crores [Rupees One Hundred Crores] and a declaration to this effect should be made by such commercial Bank either in the ‘Bank Guarantee’ itself or separately on its letterhead.

16.4 Any Bid not secured in accordance with “ITB: Clause-16.1 & Clause-16.3” may be rejected by TFL as non-responsive.

16.5 Unsuccessful Bidder’s EMD will be discharged/ returned as promptly as possible, but not later than ‘thirty [30] days’ after finalization of tendering process.

16.6 The successful Bidder’s EMD will be discharged upon the Bidder’s acknowledging the ‘Award’ and signing the ‘Agreement’ (if applicable) and furnishing the ‘Contract Performance Security (CPS)/ Security Deposit’ pursuant to clause no. 38 of ITB.

16.7 Notwithstanding anything contained herein, the EMD may also be forfeited in any of the following cases:
   (a) If a Bidder withdraws his Bid during the ‘Period of Bid Validity’
   (b) If a Bidder has indulged in corrupt/fraudulent /collusive/coercive practice
   (c) If the Bidder modifies Bid during the period of bid validity (after Due Date and Time for Bid Submission).
   (d) Violates any other condition, mentioned elsewhere in the Tender Document, which may lead to forfeiture of EMD.
   (e) In case of Cartelization of bid
   (f) In the case of a successful Bidder, if the Bidder fails to:
      (i) to acknowledge receipt of the “Notification of Award” / Fax of Acceptance[FOA] / Detailed Letter of Acceptance [DLOA]”,
      (ii) to furnish “Contract Performance Security / Security Deposit”, in accordance with “ITB: Clause-38”

16.8 In case EMD is in the form of ‘Bank Guarantee’, the same must indicate the Tender Document No. and the name of Tender Document for which the Bidder is quoting. This is essential to have proper correlation at a later date.
16.9 MSEs (Micro & Small Enterprises) are exempted from submission of EMD in accordance with the provisions of PPP-2012 and Clause 40 of ITB. However, Traders/Dealers/ Distributors /Stockiest /Wholesaler are not entitled for exemption of EMD. The Government Departments/PSUs are also exempted from the payment of EMD. Further, Startups are also exempted from the payment of EMD.

16.10 In case of forfeiture of EMD/ Bid Security, the forfeited amount will be considered inclusive of tax and tax invoice will be issued by TFL. The forfeiture amount will be subject to final decision of TFL based on other terms and conditions of order/contract.

17 **PRE-BID MEETING**

17.1 The Bidder(s) or his designated representative are invited to attend a "Pre-Bid Meeting" which will be held at address specified in IFB. It is expected that a bidder shall not depute more than 02 representatives for the meeting.

17.2 Purpose of the meeting will be to clarify issues and to answer questions on any matter that may be raised at that stage and give hands-on e-tendering.

17.3 Text of the questions raised and the responses given, together with any responses prepared after the meeting, will be uploaded on websites as mentioned at Clause No. 2.0 (G) of IFB. Any modification of the Contents of Tender documents listed in "ITB: Clause-7.1", that may become necessary as a result of the Pre-Bid Meeting shall be made by the Employer exclusively through the issue of a Corrigendum pursuant to "ITB: Clause-9", and not through the minutes of the Pre-Bid Meeting.

17.4 Non-attendance of the Pre-Bid Meeting will not be a cause for disqualification of Bidder.

18 **FORMAT AND SIGNING OF BID**

18.1 The original and all copies of the Bid shall be typed or written in indelible ink [in the case of copies, photocopies are also acceptable] and shall be signed by a person or persons duly authorized to sign on behalf of the Bidder (as per POA). The name and position held by each person signing, must be typed or printed below the signature.

18.2 The Bid shall contain no alterations, omissions, or additions, unless such corrections are initialed by the person or persons signing the Bid.

18.3 Digitally signed documents to be uploaded as detailed in addendum to ITB.

19 **ZERO DEVIATION AND REJECTION CRITERIA**

19.1 ZERO DEVIATION: Deviation to terms and conditions of "Tender documents" may lead to rejection of bid. TFL will accept bids based on terms & conditions of "Tender documents" only. Bidder may note TFL will determine the substantial responsiveness of each bid to the Tender documents pursuant to provision contained in clause 29 of ITB. For purpose of this, a substantially responsive bid is one which conforms to all terms and conditions of the Tender documents without deviations or reservations. TFL’s determination of a bid’s responsiveness is based on the content of the bid itself without recourse to extrinsic evidence. TFL reserves the right to raise technical and/or commercial query(s), if required, may be raised on the bidder(s). The
response(s) to the same shall be in writing, and no change in the price(s) or substance of the bids shall be sought, offered or permitted. The substance of the bid includes but not limited to prices, completion, scope, technical specifications, etc. Bidders are requested to not to take any deviation/exception to the terms and conditions laid down in this "Tender Documents", and submit all requisite documents as mentioned in this "Tender Documents", failing which their offer will be liable for rejection. If a bidder does not reply to the queries in the permitted time frame, then its bid shall be evaluated based on the documents available in the bid.

19.2 **REJECTION CRITERIA:** Notwithstanding the above, deviation to the following clauses of Tender document shall lead to summarily rejection of Bid:

(a) Firm Price 
(b) Earnest Money Deposit / Bid Security 
(c) Specifications & Scope of Work 
(d) Schedule of Rates / Price Schedule / Price Basis 
(e) Duration / Period of Contract/ Completion Period 
(f) Payment Terms 
(g) Period of Validity of Bid 
(h) Integrity Pact 
(i) Mutually Agreed Damages 
(j) Overall ceiling on total liability 
(k) Contract Performance Security 
(l) Guarantee / Defect Liability Period 
(m) Patent Infringement and Indemnifications 
(n) Arbitration / Settlement of Dispute 
(o) Governing laws, language & measures 
(p) Force Majeure 
(q) Any other condition specifically mentioned in the tender document elsewhere that non-compliance of the clause lead to rejection of bid

Note: Further, it is once again reminded not to mention any condition in the Bid which is contradictory to the terms and conditions of Tender document.

20 **PAYMENT**

OWNER has initiated payments to Suppliers and Contractors through RTGS / NEFT. The successful bidder should give the details of his bank account as per the E-Banking Mandate Form (F-12).

[D] – **SUBMISSION OF BIDS**

21 **SUBMISSION, SEALING AND MARKING OF BIDS**

21.1 Bids shall be submitted through e-tender mode on CPP portal ([https://etenders.gov.in/eprocure/app](https://etenders.gov.in/eprocure/app)) in the manner specified elsewhere in tender document.

21.2 All the original/hard/physical copy of bids shall be addressed to the Consultant at address specified in IFB.

21.3 Bids submitted under the name of AGENT/ CONSULTANT/ REPRESENTATIVE/ RETAINER/ ASSOCIATE etc. on behalf of a bidder/affiliate shall not be accepted.
22 **DEADLINE FOR SUBMISSION OF BIDS**

22.1 Bids must be submitted through e-tender mode on CPP portal not later than the date and time specified in the BDS (Bidding Data Sheet).

22.2 **DELETED**

22.3 OWNER may, in exceptional circumstances and at its discretion, extend the deadline for submission of Bids (clause 9 of ITB refers). In which case all rights and obligations of OWNER and the Bidders, previously subject to the original deadline will thereafter be subject to the deadline as extended. Notice for extension of due date of submission of bid will be uploaded on website as mentioned in Clause No. 2.0(G) of IFB / communicated to the bidders.

23 **LATE BIDS**

E-tendering system shall close immediately after the due date for submission of bid and no bids can be submitted thereafter until unless the due date extended further. The bid bond/physical documents have been received but the bid is not submitted by the bidder on CPP portal (https://etenders.gov.in/eprocure/app), such bid bond/physical documents shall be returned immediately.

24 **MODIFICATION AND WITHDRAWAL OF BIDS**

The bidder may withdraw or modify its bid after bid submission but before the due date and time for submission as per tender document.

25 **EMPLOYER’S RIGHT TO ACCEPT ANY BID AND TO REJECT ANY OR ALL BIDS**

TFL reserves the right to accept or reject any Bid, and to annul the Bidding process and reject all Bids, at any time prior to award of Contract, without thereby incurring any liability to the affected Bidder or Bidders or any obligations to inform the affected Bidder or Bidders of the ground for TFL's action. However, Bidder if so desire may seek the reason (in writing) for rejection of their Bid to which TFL shall respond quickly.

[E] – **BID OPENING AND EVALUATION**

26 **BID OPENING**

26.1 **Unpriced Bid Opening:**

TFL will open bids, in the presence of bidders’ designated representatives who choose to attend, at date, time and location stipulated in the BDS. The bidders’ representatives, who are present, shall sign a bid opening register evidencing their attendance.

26.2 **Priced Bid Opening:**

26.2.1 TFL will open the price bids of those bidders who meet the qualification requirement and whose bids are determined to be technically and commercially responsive. Bidders selected for opening of their price bids shall be informed about the date of price bid opening. Bidders may depute their authorized representative to attend the bid opening. The bidders’ representatives, who are present shall sign a register
evidencing their attendance and may be required to be present on a short notice.

26.2.2 The price bids of those Bidders who were not found to be techno-commercially responsive shall not be opened. The Price bids for acceptable bidder shall be opened by OWNER/PMC.

26.2.3 The Price Evaluation of the Bids shall be carried by OWNER offline, as per Evaluation Methodology as specified under Section II of the tender document. Subsequently, Reverse Auction shall be carried out by OWNER/PMC on a separate Reverse Auction portal. The details of which shall be intimidated to the bidders.

26.3 Reverse Auction

26.3.1 OWNER shall finalize tender after conducting reverse auction except in those cases where less than four techno-commercially acceptable offers are available.

In case, after techno-commercial evaluation, number of technically & commercially acceptable offers are less than 04 (four), then no reverse auction will be conducted (but the OWNER/CONSULTANT shall take appropriate decision regarding conducting offline price negotiation, if required).

Accordingly, the decision to conduct reverse auction shall be communicated to shortlisted bidders prior to opening of price bid. The due date and time of conducting the event of Reverse Auction (if conducted) shall be intimated well in advance to the techno-commercially acceptable bidders, through email.

26.3.2 Types of Reverse Auction

(i) “Rank with L-1 Price” bid format:

In “Rank with L-1 Price” bid format, during the process of Reverse Auction, the short-listed bidders will be able to see only the current lowest price and their respective ranks/position during the online bidding process in the system, based on which they can reduce their prices. This type of auction shall be adopted in those tenders where Purchase preferences are not applicable.

At no point of time will any bidder see names of other bidders, or prices of bidders other than the lowest bid.

(ii) “Rank Only” bid format:

In “Rank Only” bid format, during the process of Reverse Auction, short-listed bidders will be able to see only their respective ranks/position during the online bidding process in the system, based on which they can reduce their prices. This type of auction is adopted in case of tenders, where purchase preference (for CPSU's/MSEs / PP-LC/DMEP/ PP for Telecom Goods, Works and Services etc.) is applicable, so as to take care of Purchase Preference at the end of the Reverse Auction.

The choice of the type of auction i.e. “Rank with L-1 price” or “Rank Only” shall be decided by the TFL at the time of short-listing of the bidders depending on the bidders at that stage who are eligible for Purchase Preference.
26.3.3 Reverse Auction shall be conducted with the evaluated price of various bidders as the bid opening price of the respective bidders.

26.3.4 The evaluated price (as per evaluation criteria defined in tender document) of the shortlisted bidders shall be automatically populated immediately on start of the Reverse Auction. Further, the start price of bidders will be automatically populated by system at the time of start of Reverse Auction. The same will be considered as participation by bidder in online Reverse Auction process.

26.3.5 During Reverse Auction, a bidder can reduce his prices repeatedly. The minimum percentage reduction in each step namely, ‘the bid decrement’ shall not be less than 0.5% of the last bid of the respective bidder. Bidders are allowed to submit/accept first price without decrement amount but afterwards participation in reverse auction is allowed only with minimum decrement amount/percentage.

26.3.6 During the Reverse Auction, bidders shall be allowed to decrease only the “TOTAL CONTRACT PRICE (excluding GST)” quoted by the bidder. The Monthly Payment Schedule and the work cost figures submitted by the bidder shall remain unchanged. However, the system shall automatically calculate the evaluated price as per the tender conditions and calculate the evaluated L-1 price. The acceptable bidders shall be informed about their respective loading factors before start of the Reverse Auction process.

26.3.8 In case any bidder emerges lowest bidder after RA based on their start price (s), the same will be considered as their final price (s) for award of contract/order irrespective of whether bidder had actually logged in RA portal or not. In case bidder does not accept the same, such bidder will be considered as errant bidder and action will be taken against bidder as per provision in this regard.

26.3.9 Bidders in their own interest should ensure uninterrupted internet connectivity at their end during the reverse auction with necessary backups to take care of any connectivity problem. However, in case of failure in connectivity of any of the bidders, the reverse auction time shall be extended against the request of bidders provided such request is received within the auction time. Such extensions shall each be of 10 minutes and no more than two requests per bidder for such extensions shall be entertained in the auction. The extension of auction time shall be communicated to all the bidders through system broadcast message and intimated telephonically to the bidders who are disconnected from reverse auction at that point of time.

If TFL/CONSULTANT is unable to extend the auction time due to some unavoidable reason and the auction happens to end before such extension, TFL/CONSULTANT reserves the right to launch a fresh auction immediately with the last bid price of the respective bidder during earlier auction as starting price.

26.3.10 All timings of the online bid shall be based on the time indicated by the Server hosting the Auction Engine which would reflect as closely as possible the Indian Standard Time (IST) i.e. GMT+0530 hrs. However, in the event of any deviations between the Server Time and the Indian Standard Time, the functioning of the Auction Engine (launch, operation and closure) would be guided by the Server time. Bidders should be advised to refresh the window of the Auction module and check the exact Server Time.
26.3.11 The process of Online Reverse Auction shall initially be held for a period of 30 minutes. In the event of a bid received in the last 5 minutes resulting in a change of prevailing L1 price, the period of the auction shall get extended automatically by 8 minutes (for “Rank with L-1 price” option) and 10 minutes (for “Rank Only” option) from the time of submission of such bid. This process will continue till no change in L-1 price takes place in last 5 minutes. Then the auction will close.

26.3.12 All bidders regardless of their previous position can submit their bid during the extended period also.

26.3.13 In case of a tie during auction i.e. two bidders entering same lowest price, the bidder who enters the prices first in the system would be taken as L-1 and the other bidder would see their ranking as L-2.

26.3.14 In case, no conclusion can be drawn from reverse auction from best bid history or where reverse auction is inconclusive on account of system malfunctioning or break in internet connectivity at TFL/CONSULTANT system end, reverse auction shall be re-conducted.

26.3.15 Detailed methodology of Reverse Auction shall be intimated to techno-commercially acceptable bidders before conduction of reverse auction.

With the assistance of RA system provider, training to all eligible bidders on the Online Reverse Auction process shall be facilitated prior to conduct of Online Reverse Auction.

26.3.16 Preferences: Purchase Preference shall be applicable as defined in tender document.

27 **CONFIDENTIALITY**

Information relating to the examination, clarification, evaluation and comparison of Bids, and recommendations for the award of a Contract, shall not be disclosed to Bidder(s) or any other persons not officially concerned with such process.

28 **CONTACTING THE EMPLOYER**

28.1 From the time of Bid opening to the time of award of Contract, if any Bidder wishes to contact the Employer on any matter related to the Bid, it should do so in writing. Information relating to the examination, clarification, evaluation & recommendation for award shall not be disclosed.

28.2 Any effort by the Bidder to influence the Employer in the Employer's 'Bid Evaluation', 'Bid Comparison', or 'Contract Award' decisions may result in the rejection of the Bidder's Bid and action shall be initiated as per procedure in this regard.

29 **EXAMINATION OF BIDS AND DETERMINATION OF RESPONSIVENESS**

29.1 The owner’s determination of a bid’s responsiveness is based on the content of the bid only. Prior to the detailed evaluation of Bids, the Employer will determine whether each Bid:

(a) Meets the "Bid Evaluation Criteria" of the Tender documents;
(b) Has been properly signed;
(c) Is accompanied by the required 'Earnest Money / Bid Security';
(d) Is substantially responsive to the requirements of the Tender documents; and
(e) Provides any clarification and/or substantiation that the Employer may require to determine responsiveness pursuant to "ITB: Clause-29.2"

29.2 A substantially responsive Bid is one which conforms to all the terms, conditions and specifications of the Tender documents without material deviations or reservations or omissions for this purpose employer defines the foregoing terms below:

a) “Deviation” is departure from the requirement specified in the tender documents.

b) “Reservation” is the setting of limiting conditions or withholding from complete acceptance of the requirement in the tender documents.

c) “Omission” is the failure to submit part or all of the information or documentation required in the tender document.

29.3 A material deviation, reservation or omission is one that,

a) If accepted would,

i) Affect in any substantial way the scope, quality, or performance of the job as specified in tender documents.

ii) Limit, in any substantial way, inconsistent with the Tender Document, the Employer’s rights or the tenderer’s obligations under the proposed Contract.

b) If rectified, would unfairly affect the competitive position of other bidders presenting substantially responsive bids.

29.4 The employer shall examine all aspects of the bid to confirm that all requirements have been met without any material deviation, reservation or omission.

29.5 If a Bid is not substantially responsive, it may be rejected by the Employer and may not subsequently be made responsive by correction or withdrawal of the of material deviation, reservation or omission.

30 DELETED.

31 CONVERSION TO SINGLE CURRENCY FOR COMPARISON OF BIDS

Not Applicable. All bids submitted must be in the currency specified at clause 14 of ITB.

32 EVALUATION AND COMPARISON OF BIDS

Bid shall be evaluated as per Evaluation Methodology mentioned under Section-II of Tender documents.

33 DELETED

34 PURCHASE PREFERENCE

Purchase preference to Central government public sector Undertaking, Local Content (PP-LC) bidders and Micro and Small Enterprises (MSEs) shall be allowed as per Government instructions in vogue.
**[F] – AWARD OF CONTRACT**

**35 **AWARD

Subject to "ITB: Clause-29", Owner will award the Contract to the successful Bidder whose Bid has been determined to be substantially responsive and has been determined as the lowest provided that bidder, is determined to be qualified to satisfactorily perform the Contract.

**36 **NOTIFICATION OF AWARD / FAX OF ACCEPTANCE

36.1 Prior to the expiry of 'Period of Bid Validity', Notification of Award for acceptance of the Bid will be intimated to the successful Bidder by OWNER either by E-mail /Letter or like means defined as the "Fax of Acceptance (FOA)". The Contract shall enter into force on the date of FOA and the same shall be binding on OWNER and successful Bidder (i.e. Contractor/Service Provider). The Notification of Award/FOA will constitute the formation of a Contract. The Detailed Letter of Acceptance shall be issued thereafter incorporating terms & conditions of Tender Document, Corrigendum, Clarification(s), Bid and agreed variation(s)/acceptable deviation(s), if any. OWNER may choose to issue Notification of Award in form of Detailed Letter of Acceptance without issuing FOA and in such case the Contract shall enter into force on the date of Detailed Letter of Acceptance only.

36.2 Contract period shall commence from the date of "Notification of Award" or as mentioned in the Notification of Award. The "Notification of Award" will constitute the formation of a Contract, until the Contract has been affected pursuant to signing of Contract as per "ITB: Clause-37".

Upon the successful Bidder's / Contractor's furnishing of 'Contract Performance Security / Security Deposit', pursuant to "ITB: Clause-38", TFL will promptly discharge his 'Earnest Money / Bid Security', pursuant to "ITB: Clause-16"

36.3 The Order/ contract value mentioned above is subject to Mutually Agreed Damages clause.

**37 **SIGNING OF AGREEMENT

37.1 OWNER will award the Contract to the successful Bidder, who, within 'fifteen [15] days' of issuance of the same, shall sign and return the acknowledged copy to OWNER.

37.2 The successful Bidder/Contractor shall be required to execute 'Contract Agreement' in the prescribed format given in this Tender Document (Form F-11) on a 'non-judicial stamp paper' of appropriate value [cost of the 'stamp-paper' shall be borne by the successful Bidder/Contractor] and of 'state' specified in Bidding Data Sheet (BDS) only, within 'fifteen [15] days' of issuance of "Notification of Award i.e. Fax of Acceptance (FOA)" of the Tender by the successful Bidder/Contractor. Failure on the part of the successful Bidder/Contractor to sign the 'Agreement' within the above stipulated period, shall constitute sufficient grounds for forfeiture of EMD/Security Deposit.

**38 **CONTRACT PERFORMANCE SECURITY / SECURITY DEPOSIT

38.1 Within 30 days of the issuance of Notification of Award i.e. Fax of Acceptance (FOA) by OWNER, the successful bidder shall furnish the Contract Performance Security
(CPS). The CPS shall be in the form of either Banker’s Cheque or Demand Draft or Bank Guarantee as per Format “F-4” and shall be in the currency of the Contract.

38.2 The CONTRACT PERFORMANCE SECURITY shall be for an amount equal to 10% of total contract value towards faithful performance of the contractual obligations and performance of equipment. For the purpose of CPS, Contract/order value shall be exclusive of GST (CGST & SGST/UTGST or IGST) to be reimbursed by the Owner.

Bank Guarantee towards CPS shall be from any Indian scheduled bank or a branch of an International bank situated in India and registered with Reserve Bank of India as scheduled foreign bank in case of Indian bidder as well as foreign bidder. However, in case of bank guarantees from banks other than the Nationalized Indian banks, the bank must be a commercial bank having net worth in excess of Rs 100 crores and a declaration to this effect should be made by such commercial bank either in the Bank Guarantee itself or separately on its letterhead. This bank guarantee shall be valid for a period as three months beyond the DLP (Defect Liability Period) specified in Special Conditions of Contract (SCC).

38.3 Failure of the successful bidder to comply with the requirements of this article shall constitute sufficient grounds for the annulment of the award and forfeiture of the EMD.

38.4 CPBG/Security Deposit will not be accepted in case the same has reference of ‘remitter’ / ‘financer’ other than bidder on the aforementioned financial instrument of CPBG/ Security.

38.5 The CPS has to cover the entire contract value including extra works also. As long as the CPS submitted at the time of award takes cares the extra works executed and total executed value are within the awarded contract price, there is no need for additional CPS. As soon as the total executed value is likely to burst the ceiling of awarded contract price, the contractor should furnish additional CPS.

38.6 In case of forfeiture of Contract Performance Security/ Security Deposit, the forfeited amount will be considered inclusive of tax and tax invoice will be issued by TFL. The forfeiture amount will be subject to final decision of TFL based on other terms and conditions of order/ contract.

38.7 Please also refer 8.0 of GCC of NIT

39 PROCEDURE FOR ACTION IN CASE CORRUPT/FRAUDULENT/COLLUSIVE/ COERCIVE PRACTICES

39.1 Procedure for action in case Corrupt/ Fraudulent/Collusive/Coercive Practices is provided at Annexure-I

39.2 NON-APPLICABILITY OF ARBITRATION CLAUSE IN CASE OF BANNING OF VENDORS/ SUPPLIERS / CONTRACTORS/ BIDDERS/ CONSULTANTS INDULGED IN FRAUDULENT/ COERCIVE PRACTICES

Notwithstanding anything contained contrary in GCC and other "CONTRACT DOCUMENTS", in case it is found that the Vendors/ Suppliers / Contractors/ Bidders/ Consultants indulged in fraudulent/ coercive practices at the time of bidding, during execution of the contract etc. and/or on other grounds as mentioned in OWNER’s "Procedure for action in case Corrupt/Fraudulent/Collusive/Coercive Practices" (Annexure-I), the contractor/bidder shall be banned (in terms of aforesaid procedure) from the date of issuance of such order by OWNER, to such Vendors/ Suppliers / Contractors/Bidders/ Consultants.
The Vendor/Supplier/Contractor/Bidder/Consultant understands and agrees that in such cases where Vendor/Supplier/Contractor/Bidder/Consultant has been banned (in terms of aforesaid procedure) from the date of issuance of such order by OWNER, such decision of OWNER shall be final and binding on such Vendor/Supplier/Contractor/Bidder/Consultant and the ‘Arbitration clause’ in the GCC and other “CONTRACT DOCUMENTS” shall not be applicable for any consequential issue/dispute arising in the matter.

40 **PUBLIC PROCUREMENT POLICY FOR MICRO AND SMALL ENTERPRISES**

40.1 Following provision has been incorporated in tender for MSEs, in line with notification of Government of India, vide Gazette of India No. 503 dated 26.03.2012 proclaiming the Public Procurement Policy on procurement of goods and services from Micro and Small Enterprises (MSEs)

i) Issue of tender document to MSEs free of cost.
ii) Exemption to MSEs from payment of EMD/Bid Security.

40.2 In case bidder is a Micro or Small Enterprise under the Micro, Small and Medium Enterprises Development Act, 2006, the bidder shall submit the following:

- Documentary evidence that the bidder is a Micro or Small Enterprises registered with District Industries Centers or Khadi and Village Industries National Small Industries Corporation or Directorate of Handicrafts and Handloom or any other body specified by Ministry of Micro, Small and Medium Enterprises or Udyog Aadhaar Memorandum.

The above documents submitted by the bidder shall be duly certified by the Chartered Accountant (not being an employee or a Director or not having any interest in the bidder’s company/firm) and notary public with legible stamp.

If the bidder does not provide the above confirmation or appropriate document or any evidence, then it will be presumed that they do not qualify for any preference admissible in the Public Procurement Policy (PPP) 2012.

Further, MSEs who are availing the benefits of the Public Procurement Policy (PPP) 2012 get themselves registered with MSME Data Bank being operated by NSIC, under SME Division, M/o MSME, in order to create proper data base of MSEs which are making supplies to CPSUs.

40.3 If against an order placed by OWNER, successful bidder(s) (other than Micro/Small Enterprise) is procuring material/services from their sub-vendor who is a Micro or Small Enterprise registered with District Industries Centers or Khadi and Village Industries Commission or Khadi and Village Industries Board or Coir Board or National Small Industries Corporation or Directorate of Handicrafts and Handloom or any other body specified by Ministry of Micro, Small and Medium Enterprises with prior consent in writing of the purchasing authority/Engineer-in-charge, the details like Name, Registration No., Address, Contact No. details of material & value of procurement made, etc. of such Enterprises shall be furnished by the successful bidder at the time of submission of invoice/Bill.

40.4 The benefit of policy are not extended to the traders/dealers/Distributors/Stockiest/Wholesalers.
40.5 NSIC has initiated a scheme of “Consortia and Tender Marketing Scheme” under which they are assisting the Micro & Small enterprises to market their products and services through tender participation on behalf of the individual unit or through consortia.

Accordingly, if the MSEs or the consortia, on whose behalf the bid is submitted by NSIC, is meeting the BEC and other terms and conditions of tender their bid will be considered for further evaluation.

Further, in such cases a declaration is to be submitted by MSE/ consortia on their letter head(s) that all the terms and conditions of tender document shall be acceptable to them.

41 DELETED

42 VENDOR PERFORMANCE EVALUATION

Shall be as stipulated Annexure II to ITB herewith.

43 INCOME TAX & CORPORATE TAX

43.1 Income tax deduction shall be made from all payments made to the contractor as per the rules and regulations in force and in accordance with the Income Tax Act prevailing from time to time.

43.2 Corporate Tax liability, if any, shall be to the contractor’s account.

43.3 TDS, wherever applicable, shall be deducted as per applicable act/law/rule.

43.4 MENTIONING OF PAN NO. IN INVOICE/BILL

As per CBDT Notification No. 95/2015 dated 30.12.2015, mentioning of PAN no. is mandatory for procurement of goods / services/works/consultancy services exceeding Rs. 2 Lacs per transaction.

Accordingly, supplier/ contractor/ service provider/ consultant should mention their PAN no. in their invoice/ bill for any transaction exceeding Rs. 2 lakhs. As provided in the notification, in case supplier/ contractor/ service provider/ consultant do not have PAN no., they have to submit declaration in Form 60 along with invoice/ bill for each transaction.

Payment of supplier/ contractor / service provider/ consultant shall be processed only after fulfilment of above requirement

44. SETTLEMENT OF COMMERCIAL DISPUTES BETWEEN PUBLIC SECTOR ENTERPRISE(S) INTER SE AND PUBLIC SECTOR ENTERPRISE(S) AND GOVERNMENT DEPARTMENT(S) THROUGH ADMINISTRATIVE MECHANISM FOR RESOLUTION OF CPSES DISPUTES (AMRCD) IN THE DEPARTMENT OF PUBLIC ENTERPRISES

In the event of any dispute or difference relating to the interpretation and application of the provisions of commercial contract(s)between Central Public Sector Enterprises (CPSEs) inter se and also between CPSEs and Government Departments / Organizations (excluding disputes concerning Railways, Income Tax, Customs & Excise Departments), such dispute or difference shall be taken up by either party for
45. **DISPUTE RESOLUTION MECHANISM**

1.0 **CONCILIATION**

Where invitation for Conciliation has been accepted by the other party, the Parties shall attempt to settle such dispute(s) amicably under Part-III of the Arbitration and Conciliation Act, 1996. It would be only after exhausting the option of Conciliation as an Alternate Dispute Resolution Mechanism that the Parties hereto shall invoke Arbitration Clause. For the purpose of this clause, the option of ‘Conciliation’ shall be deemed to have been exhausted, even in case of rejection of ‘Conciliation’ by any of the Parties.

2.0 **ARBITRATION**

All issue(s)/dispute(s) excluding the matters that have been specified as excepted matters and listed at clause no. 2.6 and which cannot be resolved through Conciliation, such issue(s)/dispute(s) shall be referred to arbitration for adjudication by Sole Arbitrator.

The party invoking the Arbitration shall have the option to either opt for Ad-hoc Arbitration as provided at Clause 2.1 below or Institutionalized Arbitration as provided at Clause 2.2 below, the remaining clauses from 2.3 to 2.7 shall apply to both Ad-hoc and Institutional Arbitration:-

2.1 On invocation of the Arbitration clause by either party, TFL shall suggest a panel of three independent and distinguished persons (Retd Supreme Court & High Court Judges only) to the other party from the Panel of Arbitrators maintained by ‘Delhi International Arbitration Centre (DIAC) to select any one among them to act as the Sole Arbitrator. In the event of failure of the other party to select the Sole Arbitrator within 30 days from the receipt of the communication from TFL suggesting the panel of arbitrators, the right of selection of the sole arbitrator by the other party shall stand forfeited and TFL shall appoint the Sole Arbitrator from the suggested panel of three Arbitrators for adjudication of dispute(s). The decision of TFL on the appointment of the sole arbitrator shall be final and binding on the other party. The fees payable to Sole Arbitrator shall be governed by the fee Schedule of “Delhi International Arbitration Centre”.

OR

2.2 If a dispute arises out of or in connection with this contract, the party invoking the Arbitration shall submit that dispute to any one of the Arbitral Institutions i.e ICADR/ICA/DIAC/SFCA and that dispute shall be adjudicated in accordance with their respective Arbitration Rules. The matter shall be adjudicated by a Sole Arbitrator who shall necessarily be a Retd Supreme Court/High Court Judge to be appointed/nominated by the respective institution. The cost/expenses pertaining to the said Arbitration shall also be governed in accordance with the Rules of the respective Arbitral Institution. The decision of the party invoking the Arbitration for reference of dispute to a specific Arbitral institution for adjudication of that dispute shall be final and binding on both the parties and shall not be subject to any change thereafter. The institution once selected at the time of invocation of dispute shall remain unchanged.
2.3 The cost of arbitration proceedings shall be shared equally by the parties.

2.4 The Arbitration proceedings shall be in English language and the seat, venue and place of Arbitration shall be New Delhi, India only.

2.5 Subject to the above, the provisions of Arbitration & Conciliation Act 1996 and any amendment thereof shall be applicable. All matter relating to this Contract and arising out of invocation of Arbitration clause are subject to the exclusive jurisdiction of the Court(s) situated at New Delhi.

2.6 List of Excepted matters:
   a) Dispute(s)/issue(s) involving claims below Rs 25 lakhs and above Rs 25 crores.
   b) Dispute(s)/issue(s) relating to indulgence of Contractor/Vendor/Bidder in corrupt/fraudulent/collusive/coercive practices and/or the same is under investigation by CBI or Vigilance or any other investigating agency or Government.
   c) Dispute(s)/issue(s) wherein the decision of Engineer-In-Charge/owner/TFL has been made final and binding in terms of the Contract.

2.7. Disputes involving claims below Rs 25 Lakhs and above Rs. 25 crores:- Parties mutually agree that dispute(s)/issue(s) involving claims below Rs 25 Lakhs and above Rs 25 crores shall not be subject matter of Arbitration and are subject to the exclusive jurisdiction of the Court(s) situated at New Delhi.

3.0 GOVERNING LAW AND JURISDICTION:

The Contract shall be governed by and construed in accordance with the laws in force in India. The Parties hereby submit to the exclusive jurisdiction of the Courts situated at New Delhi for adjudication of disputes, injunctive reliefs, actions and proceedings, if any, arising out of this Contract.

4.0 DISPUTES BETWEEN CPSE’S/ GOVERNMENT DEPARTMENT’S/ORGANIZATIONS

Subject to conciliation as provided above, in the event of any dispute or difference relating to the interpretation and application of the provisions of commercial contract(s) between Central Public Sector Enterprises (CPSEs)/ Port Trusts inter se and also between CPSEs and Government Departments /Organizations (excluding disputes concerning Railways, Income Tax, Customs & Excise Departments), such dispute or difference shall be taken up by either party for resolution through AMRCD as mentioned in OPE OM No. 4(1)/2013-DPE(GM)/FTS-1835 dated 22-05-2018.

Any party aggrieved with the decision of the Committee at the First level (tier) may prefer an appeal before the Cabinet Secretary at the Second level (tier) within 15 days from the date of receipt of decision of the Committee at First level, through it's administrative Ministry/Department, whose decision will be final and binding on all concerned.

The above provisions mentioned at clause no. 45 shall supersede provisions relating to Conciliation, Arbitration, Governing Law & Jurisdiction and Disputes between CPSE’s/ Government Department’s/ Organizations mentioned in General Conditions of Contract (GCC) and elsewhere in tender document.
PROMOTION OF PAYMENT THROUGH CARDS AND DIGITAL MEANS
To promote cashless transactions, the onward payments by Contractors to their employees, service providers, sub-contractors and suppliers may be made through Cards and Digital means to the extent possible.

CONTRACTOR TO ENGAGE CONTRACT MANPOWER BELONGING TO SCHEDULED CASTES AND WEAKER SECTIONS OF THE SOCIETY
While engaging the contractual manpower, Contractors are required to make efforts to provide opportunity of employment to the people belonging to Scheduled Castes and weaker sections of the society also in order to have a fair representation of these sections.

QUARTERLY CLOSURE OF THE CONTRACT [FOR APPLICABILITY OF THIS CLAUSE REFER BDS]-
During execution of contracts/orders, various issues may arise. In order to timely detect and to address the contractual issue(s) during the execution of contracts, OWNER has introduced a mechanism of quarterly closure of the contract, under which all the issues related to the contract execution will be monitored on quarterly basis for resolution.

Vendors/Contractors are required to co-operate with EIC for proper implementation of this mechanism for smooth execution of the contract.

PROVISIONS FOR STARTUPS (AS DEFINED IN GAZETTE NOTIFICATION NO. D.L-33004/99 DATED 18.02.2016 AND 23.05.2017 OF MINISTRY OF COMMERCE AND INDUSTRY AND AS AMENDED FROM TIME TO TIME) [FOR APPLICABILITY REFER BDS]
As mentioned in Section-II, Prior turnover and prior experience shall be required for all Startups [whether Micro & Small Enterprises (MSEs) or otherwise] subject to their meeting the quality and technical specifications specified in tender document.

Further, the Startups are also exempted from submission of EMDs.

If a Startup emerge lowest bidder, the DLOA on such Startup shall be placed for entire tendered quantity/group/item/part (as the case may be). However, during the Kick of Meeting monthly milestones/ check points would be drawn. Further, the performance of such contractor/ service provider will be reviewed more carefully and action to be taken as per provision of contract in case of failure/ poor performance.

PROVISION REGARDING INVOICE FOR REDUCED VALUE OR CREDIT NOTE TOWARDS MAD (MUTUALLY AGREED DAMAGES)
As mentioned in GCC, MAD is the reduction in the consideration / contract value for the goods / services covered under this contract. In case of delay in supply/ execution of contract, supplier/ contractor/ service provider should raise invoice for reduced value as per MAD clause. If supplier/ contractor/ service provider has raised the invoice for full value, then supplier/ contractor/ service provider should issue Credit Note towards the applicable MAD amount with applicable taxes.
In such cases if supplier/ contractor/ service provider fails to submit the invoice with reduced value or does not issue credit note as mentioned above, OWNER will release the payment to supplier/ contractor/ service provider after giving effect of the MAD clause with corresponding reduction of taxes charged on vendor’s invoice, to avoid delay in delivery/collection of material."

In case any financial implication arises on OWNER due to issuance of invoice without reduction in price or non-issuance of Credit Note, the same shall be to the account of supplier/ contractor/ service provider. OWNER shall be entitled to deduct / setoff / recover such GST amount (CGST & SGST/UTGST or IGST) together with penalties and interest, if any, against any amounts paid or becomes payable by OWNER in future to the Supplier/Contractor under this contract or under any other contract.

52 POLICY TO PROVIDE PURCHASE PREFERENCE (LINKED WITH LOCAL CONTENT) (PP-LC)

The policy for providing purchase preference (linked with Local content) is enclosed as Annexure V to ITB herewith.
Annexure-I

PROCEDURE FOR ACTION IN CASE CORRUPT/FRAUDULENT/COLLUSIVE/COERCIVE PRACTICES

A Definitions:

A.1 “Corrupt Practice” means the offering, giving, receiving or soliciting, directly or indirectly, anything of value to improperly influence the actions in selection process or in contract execution.

“Corrupt Practice” also includes any omission for misrepresentation that may mislead or attempt to mislead so that financial or other benefit may be obtained or an obligation avoided.

A2 “Fraudulent Practice” means and include any act or omission committed by an agent or with his connivance or by his agent by misrepresenting/submitting false documents and/or false information or concealment of facts or to deceive in order to influence a selection process or during execution of contract/order.

A3 “Collusive Practice amongst bidders (prior to or after bid submission)” means a scheme or arrangement designed to establish bid prices at artificial non-competitive levels and to deprive the Employer of the benefits of free and open competition.

A4 “Coercive practice” means impairing or harming or threatening to impair or harm directly or indirectly, any agency or its property to influence the improperly actions of an agency, obstruction of any investigation or auditing of a procurement process.

A5 “Vendor/Supplier/Contractor/Consultant/Bidder” is herein after referred as “Agency”

A.6 “Appellate Authority” shall mean Committee of Directors consisting of Director (Finance) and Director (BD) for works centers under Director (Projects). For all other cases committee of Directors shall consist of Director (Finance) & Director (Projects).

A.7 “Competent Authority” shall mean the authority, who is competent to take final decision for Suspension of business dealing with an Agency/ies and Banning of business dealings with Agency/ies and shall be the “Director” concerned.

A.8 “Allied Agency” shall mean all the concerns within the sphere of effective influence of banned/suspended agencies. In determining this, the following factors may be taken into consideration:

(a) Whether the management is common;
(b) Majority interest in the management is held by the partners or directors of banned/suspended firm.
(c) Substantial or majority shares are owned by banned/suspended agency and by virtue of this it has a controlling voice.

A.9 “Investigating Agency” shall mean any department or unit of TFL investigating into the conduct of Agency/party and shall include the Vigilance Department of the TFL, Central Bureau of Investigation, State Police or any other agency set up by the Central or state government having power to investigate.

B Actions against bidder(s) indulging in corrupt/fraudulent/collusive/coercive practice
B.1 Irregularities noticed during the evaluation of the bids:

If it is observed during bidding process/bids evaluation stage that a bidder has indulged in corrupt/fraudulent/collusive/coercive practice, the bid of such Bidder(s) shall be rejected and its Earnest Money Deposit (EMD) shall be forfeited.

Further, such agency shall be banned for future business with TFL for a period specified in para B.2.2 below from the date of issue of banning order.

B.2 Irregularities noticed after award of contract

(i) During execution of contract:

If an agency, is found to have indulged in corrupt/fraudulent/collusive/coercive practices, during execution of contract, the agency shall be banned for future business with TFL for a period specified in para B.2.2 below from the date of issue of banning order.

The concerned order(s)/contract(s) where corrupt/fraudulent/collusive practices is observed, shall be suspended with immediate effect by Engineer-in-Charge (EIC)/Employer whereby the supply/work/service and payment etc. will be suspended. The action shall be initiated for putting the agency on banning.

After conclusion of process, the order(s)/contract(s) where it is concluded that such irregularities have been committed shall be terminated and Contract cum Performance Bank Guarantee (CPBG)/Contract Performance Security (CPS) submitted by agency against such order(s)/contract(s) shall also be forfeited. The amount that may have become due to the contractor on account of work already executed by him shall be payable to the contractor and this amount shall be subject to adjustment against any amounts due from the contractor under the terms of the contract.

No risk and cost provision will be enforced in such cases.

(ii) After execution of contract and during Defect liability period (DLP)/Warranty/Guarantee Period:

If an agency is found to have indulged in corrupt/fraudulent/collusive/coercive practices, after execution of contract and during DLP/Warranty/Guarantee Period, the agency shall be banned for future business with TFL for a period specified in para B.2.2 below from the date of issue of banning order.

Further, the Contract cum Performance Bank Guarantee (CPBG)/Contract Performance Security (CPS) submitted by agency against such order(s)/contract(s) shall be forfeited.

(iii) After expiry of Defect liability period (DLP)/Warranty/Guarantee Period:

If an agency is found to have indulged in corrupt/fraudulent/collusive/coercive practices, after expiry of Defect liability period (DLP)/Warranty/Guarantee Period, the agency shall be banned for future business with TFL for a period specified in para B.2.2 below from the date of issue of banning order.

B.2.2 Period of Banning
The period of banning of agencies indulged in Corrupt/ Fraudulent/ Collusive/Coercive Practices shall be as under and to be reckoned from the date of banning order:

<table>
<thead>
<tr>
<th>S. No.</th>
<th>Description</th>
<th>Period of banning from the date of issuance of Banning order</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Misrepresentation/False information other than pertaining to BEC of tender but having impact on the selection process. For example, if an agency confirms not being in holiday/ banning list of PSUs/ Govt. Dept., liquidation, bankruptcy &amp; etc. and subsequently it is found otherwise, such acts shall be considered in this category.</td>
<td>02 years</td>
</tr>
<tr>
<td>2</td>
<td>Corrupt/Fraudulent (pertaining to BEC of tender) /Collusive/Coercive Practices</td>
<td>03 years</td>
</tr>
<tr>
<td>2.1</td>
<td>If an agency again commits Corrupt/Fraudulent (pertaining to BEC of tender) /Collusive/ Coercive Practices in subsequent cases after their banning, such situation of repeated offense to be dealt with more severity and following shall be the period of banning: (i) Repeated once (ii) Repeated twice or more</td>
<td>7 years (in addition to the period already served) 15 years (in addition to the period already served)</td>

</tbody>
</table>

C Effect of banning on other ongoing contracts/ tenders

C.1 If an agency is put on Banning, such agency should not be considered in ongoing tenders/future tenders.

C.2 However, if such an agency is already executing other order (s)/ contract (s) where no corrupt/fraudulent/ collusive/coercive practice is found, the agency should be allowed to continue till its completion without any further increase in scope except those incidental to original scope mentioned in the contract.

C.3 If an agency is put on the Banning List during tendering and no irregularity is found in the case under process:

C.3.1 after issue of the enquiry /bid/tender but before opening of Technical bid, the bid submitted by the agency shall be ignored.

C.3.2 after opening Technical bid but before opening the Price bid, the Price bid of the agency shall not be opened and BG/EMD submitted by the agency shall be returned to the agency.
C.3.3 after opening of price, BG/EMD made by the agency shall be returned; the offer of the agency shall be ignored & will not be further evaluated. If the agency is put on banning list for fraud/ mis-appropriation of facts committed in the same tender/other tender where errant agency emerges as the lowest (L1), then such tender shall also be cancelled and re-invited.

D. Procedure for Suspension of Bidder

D.1 Initiation of Suspension

Action for suspension business dealing with any agency(ies) shall be initiated by Corporate C&P Department when

(i) Corporate Vigilance Department based on the fact of the case gathered during investigation by them recommend for specific immediate action against the agency.

(ii) Corporate Vigilance Department based on the input from Investigating agency, forward for specific immediate action against the agency.

(iii) Non performance of Vendor/Supplier/Contractor/Consultant leading to termination of Contract/Order.

D.2 Suspension Procedure:

D.2.1 The order of suspension would operate initially for a period not more than six months and is to be communicated to the agency and also to Corporate Vigilance Department. Period of suspension can be extended with the approval of the Competent Authority by one month at a time with a ceiling of six months pending a conclusive decision to put the agency on banning list.

D.2.2 During the period of suspension, no new business dealing may be held with the agency.

D.2.3 Period of suspension shall be accounted for in the final order passed for banning of business with the agency.

D.2.4 The decision regarding suspension of business dealings should also be communicated to the agency.

D.2.5 If a prima-facie, case is made out that the agency is guilty on the grounds which can result in banning of business dealings, proposal for issuance of suspension order and show cause notice shall be put up to the Competent Authority. The suspension order and show cause notice must include that (i) the agency is put on suspension list and (ii) why action should not be taken for banning the agency for future business from TFL.

The competent authority to approve the suspension will be same as that for according approval for banning.

D 3 Effect of Suspension of business:

Effect of suspension on other on-going/future tenders will be as under:
D.3.1 No enquiry/bid/tender shall be entertained from an agency as long as the name of agency appears in the Suspension List.

D.3.2 If an agency is put on the Suspension List during tendering:

D.3.2.1 after issue of the enquiry /bid/tender but before opening of Technical bid, the bid submitted by the agency shall be ignored.

D.3.2.2 after opening Technical bid but before opening the Price bid, the Price bid of the agency shall not be opened and BG/EMD submitted by the agency shall be returned to the agency.

D.3.2.3 after opening of price, BG/EMD made by the agency shall be returned; the offer of the agency shall be ignored & will not be further evaluated. If the agency is put on Suspension list for fraud/ mis-appropriation of facts conducted in the same tender/other tender where errant agency emerges as the lowest (L1), then such tender shall also be cancelled and re-invited.

D.3.3 The existing contract (s)/ order (s) under execution shall continue.

D.3.4 Tenders invited for procurement of goods, works and services shall have provision that the bidder shall submit a undertaking to the effect that (i) neither the bidder themselves nor their allied agency/(ies) are on banning list of TFL and (ii) bidder is not banned by any Government department/ Public Sector.

F. Appeal against the Decision of the Competent Authority:

F.1 The agency may file an appeal against the order of the Competent Authority for putting the agency on banning list. The appeal shall be filed to Appellate Authority. Such an appeal shall be preferred within one month from the of receipt of banning order.

F.2 Appellate Authority would consider the appeal and pass appropriate order which shall be communicated to the party as well as the Competent Authority.

F.3 Appeal process may be completed within 45 days of filing of appeal with the Appellate Authority.

G. Wherever there is contradiction with respect to terms of ‘Integrity pact’ , GCC and ‘Procedure for action in case of Corrupt/Fraudulent/ Collusive/Coercive Practice’, the provisions of ‘Procedure for action in case of Corrupt/Fraudulent/ Collusive/Coercive Practice’ shall prevail.
PROCEDURE FOR EVALUATION OF PERFORMANCE OF VENDORS/ SUPPLIERS/ CONTRACTORS/ CONSULTANTS

1.0 OBJECTIVE

The objective of Evaluation of Performance aims to recognize, and develop reliable Vendors/ Suppliers/Contractors/ Consultants so that they consistently meet or exceed expectations and requirements.

The purpose of this procedure is to put in place a system to monitor performance of Vendors/ Suppliers/Contractors/ Consultants to ensure timely completion of various projects, timely receipt of supplies including completion of works & services for operation and maintenance of operating plants and quality standards in all respects.

2.0 METHODOLOGY

i) Preparation of Performance Rating Data Sheet

Performance rating data Sheet for each and every Vendor/ Supplier/Contractor/Consultant for all orders/Contracts with a value of Rs. 50 Lakhs and above is recommended to be drawn up. Further, Performance rating data Sheet for orders/contracts of Vendor/Supplier/Contractor/ Consultant who are on watch list/holiday list/ banning list shall be prepared irrespective of order/ contract value. These data sheets are to be separately prepared for orders/ contracts related to Projects and O&M. Format, Parameters, Process, responsibility for preparation of Performance Rating Data Sheet are separately mentioned.

ii) Measurement of Performance

Based on the parameters defined in Data Sheet, Performance of concerned Vendor/ Supplier/Contractor/ Consultant would be computed and graded accordingly. The measurement of the performance of the Party would be its ability to achieve the minimum scoring of 60% points in the given parameters.

iii) Initiation of Measures:

Depending upon the Grading of Performance, corrective measures would be initiated by taking up the matter with concerned Vendor/ Supplier/Contractor/ Consultant. Response of Vendor/ Supplier/Contractor/ Consultant would be considered before deciding further course of action.

iv) Implementation of Corrective Measures:

Based on the response of Vendor/ Supplier/Contractor/ Consultant, concerned Engineer-in-Charge would recommend for continuation or discontinuation of such party from the business of TFL.

v) Orders/contracts placed on Proprietary/OEM basis for O&M will be evaluated and, if required, corrective action will be taken for improvement in future.
3.0 **PROCESS OF EVALUATION OF PERFORMANCE OF VENDORS/ SUPPLIERS/ CONTRACTORS/ CONSULTANTS**

3.1 **FOR PROJECTS**

i) Evaluation of performance of Vendors/ Suppliers/Contractors/ Consultants in case of PROJECTS shall be done immediately with commissioning of any Project.

ii) On commissioning of any Project, EIC (Engineer-in-charge)/ Project-in-charge shall prepare a Performance Rating Data Sheet (Format at Annexure-1) for all Orders and Contracts.

iii) Depending upon the Performance Rating, following action need to be initiated by Engineer-in-charge/Project-in-charge:

<table>
<thead>
<tr>
<th>Sl.No.</th>
<th>Performance Rating</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>POOR</td>
<td>Seek explanation for Poor performance</td>
</tr>
<tr>
<td>2</td>
<td>FAIR</td>
<td>Seek explanation for Fair performance</td>
</tr>
<tr>
<td>3</td>
<td>GOOD</td>
<td>Letter to the concerned for improving performance in future</td>
</tr>
<tr>
<td>4</td>
<td>VERY GOOD</td>
<td>No further action</td>
</tr>
</tbody>
</table>

iv) Reply from concerned Vendor/ Supplier/Contractor/ Consultant shall be examined. In case of satisfactory reply, Performance Rating data Sheet to be closed with a letter to the concerned for improving performance in future.

v) When no reply is received or reasons indicated are unsatisfactory, the following actions need to be taken:

A) Where performance rating is “POOR” (as per Performance Rating carried out after execution of Order/ Contract and where no reply/ unsatisfactory reply is received from party against the letter seeking the explanation from Vendor/Supplier/Contractor/ Consultant along with sharing the performance rating)

Recommend such defaulting Vendor/Supplier/Contractor/ Consultant for the following action:

(a) **First such instance: Advisory notice (Yellow Card)** shall be issued and Vendor/Supplier/Contractor/ Consultant shall be put on watch list for a period of Three (3) Years. Such vendor will be allowed to participate in all other tenders and to execute other ongoing order/ contract (s) or new contract/ order (s).

The Yellow card will be automatically revoked after a period of three years unless the same is converted into Red Card due to subsequence instances of poor/ non-performance in other ongoing order (s)/ contract (s) or new order (s) /contract (s) on such Vendor/ Supplier/ Contractor/ Consultant.
(b) **Second such instance in other ongoing order (s)/ contract (s) or new order (s) /contact (s) on such Vendor/ Supplier/ Contractor/ Consultant**

(i) Poor Performance due to reasons other than Quality:  
**Putting on Holiday for a period of One Year**

(ii) Poor Performance on account of Quality (if any mark obtained against Quality parameter is less than 30):  
**Putting on Holiday for a period of Two Years**

(c) **Subsequent instances (more than two) in other ongoing order (s)/ contract (s) or new order (s) /contact (s) on such Vendor/ Supplier/ Contractor/ Consultant:**  
**Putting on Holiday for a period of Three Years**

B) Where Poor/Non-Performance leading to termination of contract or Offloading of contract due to poor performance attributable to Vendor/Supplier/ Contractor/Consultant (under Clause no.3.16.1 of GCC- Consultancy)

(a) **First instance:** **Advisory notice (Yellow Card) shall be issued and Vendor/Supplier/Contractor /Consultant shall be put on watch list for a period of Three (3) Years.** Further such vendor will not be allowed to participate in the re-tender of the same supply/work/services of that location which has terminated / offloaded. Moreover, it will be ensured that all other action as per provision of contract including forfeiture of Contract Performance Security (CPS) etc. are undertaken. However, such vendor will be allowed to participate in all other tenders and to execute other ongoing order/ contract (s) or new contract/ order (s).

The Yellow card will be automatically revoked after a period of three years unless the same is converted into Red Card due to subsequent instances of poor/ non-performance in other ongoing order (s)/ contract (s) or new order (s) /contact (s) on such Vendor/ Supplier/ Contractor/ Consultant.

(b) **Second instances** in other ongoing order (s)/ contract (s) or new order (s) /contact (s) on such Vendor/ Supplier/ Contractor/ Consultant: **Holiday (Red Card)** for period of One Year and they shall also to be considered for Suspension.

(c) **Subsequent instances (more than two) in other ongoing order (s)/ contract (s) or new order (s) /contact (s) on such Vendor/ Supplier/ Contractor/ Consultant:** **Holiday (Red Card)** for period of Three Years and they shall also to be considered for Suspension.

(C) **Where Performance rating is “FAIR”:**  
Issuance of warning to such defaulting Vendor/ Supplier/Contractor/ Consultant to improve their performance.

3.2 **FOR CONSULTANCY JOBS**

Monitoring and Evaluation of consultancy jobs will be carried out in the same way as described in para 3.1 for Projects.
3.3 FOR OPERATION & MAINTENANCE

ii) After execution of orders a Performance Rating Data Sheet (Format at Annexure-2) shall be prepared for Orders by C&P and for Contracts/Services by respective Engineer-In-Charge.

iii) Depending upon Performance Rating, following action need to be initiated by C&P:

<table>
<thead>
<tr>
<th>Sl. No.</th>
<th>Performance Rating</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>POOR</td>
<td>Seek explanation for Poor performance</td>
</tr>
<tr>
<td>2</td>
<td>FAIR</td>
<td>Seek explanation for Fair performance</td>
</tr>
<tr>
<td>3</td>
<td>GOOD</td>
<td>Letter to the concerned for improving performance in future.</td>
</tr>
<tr>
<td>4</td>
<td>VERY GOOD</td>
<td>No further action</td>
</tr>
</tbody>
</table>

iv) Reply from concerned Vendor/ Supplier/Contractor/ Consultant shall be examined. In case of satisfactory reply, Performance Rating data Sheet to be closed with a letter to the concerned for improving performance in future.

v) When no reply is received or reasons indicated are unsatisfactory, the following actions need to be taken:

A) Where performance rating is “POOR” (as per Performance Rating carried out after execution of Order/ Contract and where no reply/ unsatisfactory reply is received from party against the letter seeking the explanation from Vendor/Supplier/Contractor/ Consultant along with sharing the performance rating)

Recommend such defaulting Vendor/Supplier/Contractor/ Consultant for the following action:

(b) First such instance: Advisory notice (Yellow Card) shall be issued and Vendor/Supplier/Contractor/ Consultant shall be put on watch list for a period of Three (3) Years.
Such vendor will be allowed to participate in all other tenders and to execute other ongoing order/ contract (s) or new contract/ order (s).

The Yellow card will be automatically revoked after a period of three years unless the same is converted into Red Card due to subsequence instances of poor/ non-performance in other ongoing order (s)/ contract (s) or new order (s)/contract (s) on such Vendor/ Supplier/ Contractor/ Consultant.

(b) Second such instance in other ongoing order (s)/ contract (s) or new order (s)/contract (s) on such Vendor/ Supplier/ Contractor/ Consultant
(i) Poor Performance due to reasons other than Quality: Putting on Holiday for a period of One Year
(ii) Poor Performance on account of Quality (if any mark obtained against Quality parameter is less than 30):

**Putting on Holiday for a period of Two Years**

(c) Subsequent instances (more than two) in other ongoing order (s)/ contract (s) or new order (s) /contact (s) on such Vendor/ Supplier/ Contractor/ Consultant: **Putting on Holiday for a period of Three Years**

B) Where Poor/Non-Performance leading to termination of contract or Offloading of contract due to poor performance attributable to Vendor/Supplier/ Contractor/Consultant (under Clause no.3.16.1 of GCC- Consultancy)

(d) First instance: Advisory notice (Yellow Card) shall be issued and Vendor/Supplier/Contractor /Consultant shall be put on watch list for a period of Three (3) Years. Further such vendor will not be allowed to participate in the re-tender of the same supply/work/services of that location which has terminated / offloaded. Moreover, it will be ensured that all other action as per provision of contract including forfeiture of Contract Performance Security (CPS) etc. are undertaken. However, such vendor will be allowed to participate in all other tenders and to execute other ongoing order/ contract (s) or new contract/ order (s). The Yellow card will be automatically revoked after a period of three years unless the same is converted into Red Card due to subsequence instances of poor/ non-performance in other ongoing order (s)/ contract (s) or new order (s) /contact (s) on such Vendor/ Supplier/ Contractor/ Consultant.

(e) Second instances in other ongoing order (s)/ contract (s) or new order (s) /contact (s) on such Vendor/ Supplier/ Contractor/ Consultant: **Holiday (Red Card)** for period of One Year and they shall also to be considered for Suspension.

(f) Subsequent instances (more than two) in other ongoing order (s)/ contract (s) or new order (s) /contact (s) on such Vendor/ Supplier/ Contractor/ Consultant: **Holiday (Red Card)** for period of Three Years and they shall also to be considered for Suspension.

(C) Where Performance rating is “FAIR”:

Issuance of warning to such defaulting Vendor/ Supplier/Contractor/ Consultant to improve their performance.

4.0 **EXCLUSIONS:**

The following would be excluded from the scope of evaluation of performance of Vendors/ Suppliers/Contractors/ Consultants:

i) Orders/Contracts below the value of Rs. 50 Lakhs if Vendor/ Supplier/Contractor/ Consultant is not on watch list/ holiday list/ banning list.

ii) Orders for Misc./Administrative items/ Non stock Non valuated items (PO with material code ending with 9).

However, concerned Engineer-in-Charge /OICs will continue to monitor such cases so as to minimize the impact on Projects/O&M plants due to non performance of Vendors/ Suppliers/Contractors/ Consultants in all such cases.
5.0 REVIEW & RESTORATION OF PARTIES PUT ON HOLIDAY

5.1 An order for Holiday passed for a certain specified period shall be deemed to have been automatically revoked on the expiry of that specified period and it will not be necessary to issue a specific formal order of revocation.

Further, in case Vendor/Supplier/Contractor/Consultant is put on holiday due to quality, and new order is placed on bidder after restoration of Vendor/Supplier/Contractor/Consultant, such order will be properly monitored during execution stage by the concerned site.

6.0 EFFECT OF HOLIDAY

6.1 If a Vendor/Supplier/Contractor/Consultant is put on Holiday, such Vendor/Supplier/Contractor/Consultant should not be considered in ongoing tenders/future tenders.

6.2 However, if such Vendor/Supplier/Contractor/Consultant is already executing any other order/contract and their performance is satisfactory in terms of the relevant contract, should be allowed to continue till its completion without any further increase in scope except those incidental to original scope mentioned in the contract. In such a case CPBG will not be forfeited and payment will be made as per provisions of concerned contract. However, this would be without prejudice to other terms and conditions of the contract.

6.3. Effect on other ongoing tendering:

6.3.1 after issue of the enquiry/bid/tender but before opening of Technical bid, the bid submitted by the party shall be ignored.

6.3.2 after opening Technical bid but before opening the Price bid, the Price bid of the party shall not be opened and BG/EMD submitted by the party shall be returned to the party.

6.3.3 after opening of price, BG/EMD made by the party shall be returned; the offer of the party shall be ignored & will not be further evaluated. If errant party emerges as the lowest (L1), then such tender shall also be cancelled and re-invited.

7.0 While putting the Vendor/Supplier/Contractor/Consultant on holiday as per the procedure, the holding company, subsidiary, joint venture, sister concerns, group division of the errant Vendor/Supplier/Contractor/Consultant shall not be considered for putting on holiday list.

Any bidder, put on holiday, will not be allowed to bid through consortium route also in new tender during the period of holiday.

8.0 If an unsuccessful bidder makes any vexatious, frivolous or malicious complaint against the tender process with the intention of delaying or defeating any procurement or causing loss to TFL or any other bidder, such bidder will be put on holiday for a period of six months, if such complaint is proved to be vexatious, frivolous or malicious, after following the due procedure.
9. **APPEAL AGAINST THE DECISION OF THE COMPETENT AUTHORITY:**

(a) The party may file an appeal against the order of the Competent Authority for putting the party on Holiday list. The appeal shall be filed to Appellate Authority. Such an appeal shall be preferred within one month from the receipt of Holiday order.

(b) Appellate Authority would consider the appeal and pass appropriate order which shall be communicated to the party as well as the Competent Authority.

(c) Appeal process may be completed within 45 days of filing of appeal with the Appellate Authority.

(d) “Appellate Authority” shall mean Committee of Directors consisting of Director (Finance) and Director (BD) for works centers under Director (Projects). For all other cases committee of Directors shall consist of Director (Finance) & Director (Projects).

10. **ERRANT BIDDER**

In case after price bid opening the overall lowest evaluated bidder is not awarded the job for any mistake committed by him in bidding or withdrawal of bid or modification of bid or varying any term in regard thereof leading to re-tendering, such bidders shall be debarred from participation in re-tendering of the same job(s)/item(s).

Further, such bidder will be put on holiday for a period of six months after following the due procedure.

11. In case CBIC (Central Board of Indirect Taxes and Customs)/ any tax authority / any equivalent government agency brings to the notice of TFL that the Consultant has not remitted the amount towards GST (CGST & SGST/UTGST or IGST) collected from TFL to the government exchequer, then, that Contactor shall be put under Holiday list of TFL for period of six months after following the due procedure. This action will be in addition to the right of recovery of financial implication arising on TFL.

ADDENDUM TO INSTRUCTIONS TO BIDDERS
INSTRUCTIONS FOR SUBMISSION OF BID ONLINE THROUGH CPP PORTAL

1. The bidders are required to submit soft copies of their bids electronically on the CPP Portal, using valid Digital Signature Certificates. The instructions given below are meant to assist the bidders in registering on the CPP Portal, prepare their bids in accordance with the requirements and submitting their bids online on the CPP Portal. More information useful for submitting online bids on the CPP Portal may be obtained at: https://etenders.gov.in/eprocure/app.

2. REGISTRATION
   i. Bidders are required to enroll on the e-Procurement module of the Central Public Procurement Portal (URL: https://etenders.gov.in/eprocure/app) by clicking on the link “Online bidder Enrollment” on the CPP Portal which is free of charge.
   ii. As part of the enrollment process, the bidders will be required to choose a unique username and assign a password for their accounts.
   iii. Bidders are advised to register their valid email address and mobile numbers as part of the registration process. These would be used for any communication from the CPP Portal.
   iv. Bidders are advised to make ensure the accessibility & availability of java software in their system (PC) either download & install the latest version of java software or click on the below link to install the java in their system prior to proceed further. https://www.oracle.com/technetwork/java/javase/downloads/index.html
   v. Upon enrollment, the bidders will be required to register their valid Digital Signature Certificate (Class III Certificates with signing key usage) issued by any Certifying Authority recognized by CCA India (e.g. Sify / nCode / eMudhra etc.), with their profile.
   vi. Only one valid DSC should be registered by a bidder. Please note that the bidders are responsible to ensure that they do not lend their DSC’s to others which may lead to misuse.
   vii. Bidder then logs in to the site through the secured log-in by entering their user ID / password and the password of the DSC / e-Token.

3. SEARCHING FOR TENDER DOCUMENTS
   i. There are various search options built in the CPP Portal, to facilitate bidders to search active tenders by several parameters. These parameters could include Tender ID, Organization Name, Location, Date, Value, etc. There is also an option of advanced search for tenders, wherein the bidders may combine a number of search parameters such as Organization Name, Form of Contract, Location, Date, Other keywords etc. to search for a tender published on the CPP Portal.
   ii. Once the bidders have selected the tenders they are interested in, they may download the required documents / tender schedules. These tenders can be moved to the respective ‘My Tenders’ folder. This would enable the CPP
Portal to intimate the bidders through SMS / email in case there is any corrigendum issued to the tender document.

iii. The bidder should make a note of the unique Tender ID assigned to each tender, in case they want to obtain any clarification / help from the Helpdesk.

4. PREPARATION OF BIDS
   i. Bidder should take into account any corrigendum published on the tender document before submitting their bids.
   
   ii. Please go through the tender advertisement and the tender document carefully to understand the documents required to be submitted as part of the bid. Please note the number of covers in which the bid documents have to be submitted, the number of documents - including the names and content of each of the document that need to be submitted. Any deviations from these may lead to rejection of the bid.
   
   iii. Bidder, in advance, should get ready the bid documents to be submitted as indicated in the tender document / schedule and generally, they can be in PDF / XLS / RAR / DWF/JPG formats. Bid documents may be scanned with 100 dpi with black and white option which helps in reducing size of the scanned document.
   
   iv. To avoid the time and effort required in uploading the same set of standard documents which are required to be submitted as a part of every bid, a provision of uploading such standard documents (e.g. PAN card copy, annual reports, auditor certificates etc.) has been provided to the bidders. Bidders can use “My Space” or “Other Important Documents" area available to them to upload such documents. These documents may be directly submitted from the “My Space” area while submitting a bid, and need not be uploaded again and again. This will lead to a reduction in the time required for bid submission process.

Note: My Documents space is only a repository given to the Bidders to ease the uploading process. If Bidder has uploaded his Documents in My Documents space, this does not automatically ensure these Documents being part of Technical Bid.

5. SUBMISSION OF BIDS
   i. Bidder should log into the site well in advance for bid submission so that they can upload the bid in time i.e. on or before the bid submission time. Bidder will be responsible for any delay due to other issues.
   
   ii. The bidder has to digitally sign and upload the required bid documents one by one as indicated in the tender document.
   
   iii. Bidders are requested to note that they should necessarily submit their financial bids in the format provided and no other format is acceptable. If the price bid has been given as a standard SOR format with the tender document, then the same is to be downloaded and to be filled by all the bidders. Bidders are required to download the SOR file, open it and complete the white coloured (unprotected) cells with their respective financial quotes and other details (such as name of the bidder). No other cells should be changed. Once the details have been completed, the bidder should save it
and submit it online, without changing the filename. If the SOR file is found to be modified by the bidder, the bid will be rejected.

iv. The server time (which is displayed on the bidders’ dashboard) will be considered as the standard time for referencing the deadlines for submission of the bids by the bidders, opening of bids etc. The bidders should follow this time during bid submission.

v. All the documents being submitted by the bidders would be encrypted using PKI encryption techniques to ensure the secrecy of the data. The data entered cannot be viewed by unauthorized persons until the time of bid opening. The confidentiality of the bids is maintained using the secured Socket Layer 128 bit encryption technology. Data storage encryption of sensitive fields is done. Any bid document that is uploaded to the server is subjected to symmetric encryption using a system generated symmetric key. Further this key is subjected to asymmetric encryption using buyers/bid opener’s public keys. Overall, the uploaded tender documents become readable only after the tender opening by the authorized bid openers.

vi. The uploaded tender documents become readable only after the tender opening by the authorized bid openers.

vii. Upon the successful and timely submission of bids (i.e. after Clicking “Freeze Bid Submission” in the portal), the portal will give a successful bid submission message & a bid summary will be displayed with the bid no. and the date & time of submission of the bid with all other relevant details.

viii. The bid summary has to be printed and kept as an acknowledgement of the submission of the bid. This acknowledgement may be used as an entry pass for any bid opening meetings.

6. ASSISTANCE TO BIDDERS

i. Any queries relating to the tender document and the terms and conditions contained therein should be addressed to the Tender Inviting Authority for a tender or the relevant contact person indicated in the tender.

ii. Any queries relating to the process of online bid submission or queries relating to CPP Portal in general may be directed to the 24x7 CPP Portal Helpdesk.

iii. Further if at all the issues could not resolved, then bidder may click & follow the link mentioned below for any queries relating to the searching, filling, submission of tender document on CPP portal; https://etenders.gov.in/eprocure/app?page=HelpForContractors&service=page

<td>Public Procurement (Preference To Make In India) Policy or Purchase Preference under Public Procurement Policy For MSEs (MICRO &amp; SMALL ENTERPRISES) Order 2012</td>
<td></td>
</tr>
</tbody>
</table>

**Note:**

i. Please indicate your preference against only one policy.

ii. The above preference shall be extended only after submission of requisite documents (as mentioned in the tender documents).

iii. In case a bidder eligible to seek benefit under Public Procurement (Preference to Make in India) Policy as well as PPP for MSE 2012, than the bidder should categorically seek benefits against only one of the two policies i.e. either Public Procurement (Preference to make in India) Policy or MSE policy.

iv. In case MSEs bidder opts for purchase Preference based on Public Procurement (Preference to Make in India) Policy, he shall not be entitle to claim purchase preference benefit available to MSE Bidders under PPP for MSE 2012. However, the exemptions from furnishing EMD shall continue to be available to MSE Bidders.

v. The option once exercised cannot be modified subsequently.

PROFORMA OF "BANK GUARANTEE" FOR "CONTRACT PERFORMANCE SECURITY / SECURITY DEPOSIT" (ON NON-JUDICIAL STAMP PAPER OF APPROPRIATE VALUE)

Ref................... Bank Guarantee No..........  
Date..................

To,  
M/s TALCHER FERTILIZERS LIMITED 
NOIDA 

Dear Sir(s),

M/s. ____________________________________________________________________________ (herein after called the “contractor/supplier” which expression shall wherever the context so require include its successors and assignees) have been placed/ awarded the job/work of ___________________________________________ vide PO/LOA/FOA No. __________________________________________________________________________________________ dated ______ for Talcher Fertilizers Limited having registered office at Plot 2/H, Kalpana Area, BJB Nagar, Khordha, Bhubaneswar – 751014 (herein after called the “TFL” which expression shall wherever the context so require include its successors and assignees).

The Contract conditions provide that the SUPPLIER/CONTRACTOR shall pay a sum of Rs. ___________________________________________________________________ (Rupees ____________________________) as full Contract Performance Guarantee in the form therein mentioned. The form of payment of Contract Performance Guarantee includes guarantee executed by Nationalized Bank/Scheduled Commercial Bank, undertaking full responsibility to indemnify TALCHER FERTILIZERS LIMITED, in case of default.

The said M/s. _____________________________________________________________________________ has approached us and at their request and in consideration of the premises we having our office at ____________________________________________________________________________ have agreed to give such guarantee as hereinafter mentioned.

1. We hereby undertake to give the irrevocable & unconditional guarantee to you that if default shall be made by M/s. __________________________________________________________________ in performing any of the terms and conditions of the tender/order/contract or in payment of any money payable to TALCHER FERTILIZERS LIMITED (TFL) we shall on first demand pay without demur, contest, protest and/ or without any recourse to the contractor to TFL in such manner as TFL may direct the said amount of Rupees ___________________________ only or such portion thereof not exceeding the said sum as you may require from time to time.

2. You will have the full liberty without reference to us and without affecting this guarantee, postpone for any time or from time to time the exercise of any of the powers and rights conferred on you under the order/contract with the said M/s. __________________________________________________________________ and to enforce or to forbear from endorsing any powers or rights or by reason of time being given to the said M/s. __________________________________________________________________ and such postponement forbearance would not have the effect of releasing the bank from its obligation under this debt.
3. Your right to recover the said sum of Rs. __________________________ (Rupees ______________________________________) from us in manner aforesaid is absolute & unequivocal and will not be affected or suspended by reason of the fact that any dispute or disputes have been raised by the said M/s. _________________ and/or that any dispute or disputes are pending before any officer, tribunal or court or arbitrator or any other authority/forum and any demand made by you in the bank shall be conclusive and binding. The bank shall not be released of its obligations under these presents by any exercise by you of its liberty with reference to matter aforesaid or any of their or by reason or any other act of omission or commission on your part or any other indulgence shown by you or by any other matter or changed what so ever which under law would, but for this provision, have the effect of releasing the bank.

4. The guarantee herein contained shall not be determined or affected by the liquidation or winding up dissolution or changes of constitution or insolvency of the said supplier/contractor but shall in all respects and for all purposes be binding and operative until payment of all money due to you in respect of such liabilities is paid.

5. This guarantee shall be irrevocable and shall remain valid up to ___________________ (this date should be 90 days after the expiry of defect liability period/ Guarantee period) _______________. The bank undertakes not to revoke this guarantee during its currency without your previous consent and further agrees that the guarantee shall continue to be enforceable until it is discharged by TFL in writing. However, if for any reason, the supplier/contractor is unable to complete the supply/work within the period stipulated in the order/contract and in case of extension of the date of delivery/completion resulting extension of defect liability period/guarantee period of the supplier/contractor fails to perform the supply/work fully, the bank hereby agrees to further extend this guarantee at the instance of the supplier/contractor till such time as may be determined by TFL. If any further extension of this guarantee is required, the same shall be extended to such required period on receiving instruction from M/s. ___________________________(contractor) on whose behalf this guarantee is issued.

6. Bank also agrees that TFL at its option shall be entitled to enforce this Guarantee against the bank (as principal debtor) in the first instant, without proceeding against the supplier/contractor and notwithstanding any security or other guarantee that TFL may have in relation to the supplier's/contractor's liabilities.

7. The amount under the Bank Guarantee is payable forthwith without any delay by Bank upon the written demand raised by TFL. Any dispute arising out of or in relation to the said Bank Guarantee shall be subject to the exclusive jurisdiction of courts at New Delhi.

8. Therefore, we hereby affirm that we are guarantors and responsible to you on behalf of the Supplier/Contractor up to a total amount of __________(amount of guarantees in words and figures) and we undertake to pay you, upon your first written demand declaring the Supplier/Contractor to be in default under the order/contract and without caveat or argument, any sum or sums within the limits of (amounts of guarantee) as aforesaid, without your needing to prove or show grounds or reasons for your demand or the sum specified therein.

9. We have power to issue this guarantee in your favor under Memorandum and Articles of Association and the undersigned has full power to do under the Power of Attorney, dated ___________ granted to him by the Bank.

Yours faithfully,
_______________
INSTRUCTIONS FOR FURNISHING
"CONTRACT PERFORMANCE SECURITY / SECURITY DEPOSIT" BY "BANK GUARANTEE"

1. The Bank Guarantee by successful Bidder(s) will be given on non-judicial stamp paper as per 'stamp duty' applicable. The non-judicial stamp paper should be in name of the issuing bank. In case of foreign bank, the said Bank Guarantee to be issued by its correspondent bank in India on requisite non-judicial stamp paper and place of Bid to be considered as Delhi.

2. The Bank Guarantee by Bidders will be given from bank as specified in Tender.

3. A letter from the issuing bank of the requisite Bank Guarantee confirming that said Bank Guarantee and all future communication relating to the Bank Guarantee shall be forwarded to Employer.

4. If a Bank Guarantee is issued by a commercial bank, then a letter to Employer and copy to Consultant (if applicable) confirming its net worth is more than Rs. 100,00,00,000.00 [Rupees One Hundred Crores] or its equivalent in foreign currency along with documentary evidence.

PROFORMA FOR CONTRACT AGREEMENT  
(To be executed on non-judicial stamp paper of appropriate value)

DLOA No. ……………… dated ………..  

TFL’s PAN No. ……………..  

Contract Agreement for the work of ……………….. of TALCHER FERTILIZERS LIMITED made on …………. between (Name and Address)…………………. , hereinafter called the “CONTRACTOR” (which term shall unless excluded by or repugnant to the subject or context include its successors and permitted assignees) of the one part and TALCHER FERTILIZERS LIMITED hereinafter called the “EMPLOYER” (which term shall, unless excluded by or repugnant to the subject or context include its successors and assignees) of the other part.

WHEREAS

A. The EMPLOYER being desirous of having provided and executed certain work mentioned, enumerated or referred to in the Tender Documents including Letter Inviting Tender, General Tender Notice, General Conditions of Contract, Special Conditions of Contract, Specifications, Drawings, Plans, Time Schedule of completion of jobs, Schedule of Rates, Agreed Variations, other documents has called for Tender.

B. The CONTRACTOR has inspected the SITE and surroundings of WORK specified in the Tender Documents and has satisfied himself by careful examination before submitting his tender as to the nature of the surface, strata, soil, sub-soil and ground, the form and nature of site and local conditions, the quantities, nature and magnitude of the work, the availability of labour and materials necessary for the execution of work, the means of access to SITE, the supply of power and water thereto and the accommodation he may require and has made local and independent enquiries and obtained complete information as to the matters and thing referred to, or implied in the tender documents or having any connection therewith and has considered the nature and extent of all probable and possible situations, delays, hindrances or interferences to or with the execution and completion of the work to be carried out under the CONTRACT, and has examined and considered all other matters, conditions and things and probable and possible contingencies, and generally all matters incidental thereto and ancillary thereof affecting the execution and completion of the WORK and which might have influenced him in making his tender.

C. The Tender Documents including the Notice Letter Inviting Tender, General Conditions of Contract, Special Conditions of Contract, Schedule of Rates, General Obligations, SPECIFICATIONS, DRAWINGS, PLANS, Time Schedule for completion of Jobs, Letter of Acceptance of Tender and any statement of agreed variations with its enclosures copies of which are hereto annexed form part of this CONTRACT though separately set out herein and are included in the expression “CONTRACT” wherever herein used.

AND WHEREAS
The EMPLOYER accepted the Tender of the CONTRACTOR for the provision and the execution of the said WORK at the rates stated in the schedule of quantities of the work and finally approved by EMPLOYER (hereinafter called the "Schedule of Rates") upon the terms and subject to the conditions of CONTRACT.

NOW THIS AGREEMENT WITNESSETH AND IT IS HEREBY AGREED AND DECLARED AS FOLLOWS:-

1. In consideration of the payment to be made to the CONTRACTOR for the WORK to be executed by him, the CONTRACTOR hereby covenants with EMPLOYER that the CONTRACTOR shall and will duly provide, execute and complete the said work and shall do and perform all other acts and things in the CONTRACT mentioned or described or which are to be implied there from or may be reasonably necessary for the completion of the said WORK and at the said times and in the manner and subject to the terms and conditions or stipulations mentioned in the contract.

2. In consideration of the due provision execution and completion of the said WORK, EMPLOYER does hereby agree with the CONTRACTOR that the EMPLOYER will pay to the CONTRACTOR the respective amounts for the WORK actually done by him and approved by the EMPLOYER at the Schedule of Rates and such other sum payable to the CONTRACTOR under provision of CONTRACT, such payment to be made at such time in such manner as provided for in the CONTRACT.

A N D

3. In consideration of the due provision, execution and completion of the said WORK the CONTRACTOR does hereby agree to pay such sums as may be due to the EMPLOYER for the services rendered by the EMPLOYER to the CONTRACTOR, such as power supply, water supply and others as set for in the said CONTRACT and such other sums as may become payable to the EMPLOYER towards the controlled items of consumable materials or towards loss, damage to the EMPLOYER'S equipment, materials construction plant and machinery, such payments to be made at such time and in such manner as is provided in the CONTRACT.

It is specifically and distinctly understood and agreed between the EMPLOYER and the CONTRACTOR that the CONTRACTOR shall have no right, title or interest in the SITE made available by the EMPLOYER for execution of the works or in the building, structures or work executed on the said SITE by the CONTRACTOR or in the goods, articles, materials etc., brought on the said SITE (unless the same specifically belongs to the CONTRACTOR) and the CONTRACTOR shall not have or deemed to have any lien whatsoever charge for unpaid bills will not be entitled to assume or retain possession or control of the SITE or structures and the EMPLOYER shall have an absolute and unfettered right to take full possession of SITE and to remove the CONTRACTOR, their servants, agents and materials belonging to the CONTRACTOR and lying on the SITE.

The CONTRACTOR shall be allowed to enter upon the SITE for execution of the WORK only as a licensee simpliciter and shall not have any claim, right, title or interest in the SITE or the structures erected thereon and the EMPLOYER shall be entitled to terminate such license at any time without assigning any reason.
The materials including sand, gravel, stone, loose, earth, rock etc., dug up or excavated from the said SITE shall, unless otherwise expressly agreed under this CONTRACT, exclusively belong to the EMPLOYER and the CONTRACTOR shall have no right to claim over the same and such excavation and materials should be disposed off on account of the EMPLOYER according to the instruction in writing issued from time to time by the ENGINEER-IN-CHARGE.

In Witness whereof the parties have executed these presents in the day and the year first above written.

INTEGRITY PACT
INTEGRITY
PACT
INTEGRITY PACT

INTRODUCTION:

Talcher Fertilizers Limited (TFL) as one of its endeavour to maintain and foster most ethical and corruption free business environment, have decided to adopt the Integrity Pact, a tool developed by the Transparency International, to ensure that all activities and transactions between the Company (TFL) and its Counterparties (Bidders, Contractors, Vendors, Suppliers, Service Providers/Consultants etc.) are handled in a fair and transparent manner, completely free of corruption.

Considering the above, the details mentioned at attached Annexure-1 are applicable as stated in Instruction to Bidders of Tender Document in addition to the existing stipulation regarding Corrupt and Fraudulent Practices.

The attached copy of the Integrity Pact at Annexure- 2 shall be included in the Bid submitted by the bidder (to be executed by the bidder). In case a bidder does not sign the Integrity Pact, his bid shall be liable for rejection.
Bidder is required to sign the Integrity Pact with TFL as per format & terms and conditions enclosed with tender. In case a bidder does not sign the Integrity Pact, his bid shall be liable for rejection.

I COMMITMENTS AND OBLIGATIONS OF THE “COUNTERPARTY”

a) The Counterparty, directly or indirectly (through agent, consultant, advisor, etc.), shall not pay any bribe/ influence or give undue/ unlawful benefit to anyone to gain undue advantage in dealing with TFL.
b) The Counterparty will not engage in collusion of any kind including price fixation etc. with other Counterparts.
c) The counterparty will not pass TFL’s confidential information to any third party unless specifically authorized by TFL in writing.
d) The Counterparties shall promote and observe best ethical practices within their respective organizations.
e) The Counterparty shall inform the Independent External Monitor.
i) If it received any demand, directly or indirectly, for a bribe/ favour or any illegal gratification/ payment / benefit;
ii) If it comes to know of any unethical or illegal payment / benefit;
iii) If it makes any payment to any TFL associate.
f) The Counterparty shall not make any false or misleading allegations against TFL or its associates.

II VIOLATIONS & CONSEQUENCES:

a) If a Counterparty commits a violation of its Commitments and Obligations under the Integrity Pact Programme during bidding process, their entire Earnest Money Deposit/ Bid Security, would be forfeited and in addition, they would be banned from the TFL business in future as per Section 3.
b) In case of violation of the Integrity pact by Counterparty after award of the Contract, TFL shall be entitled to terminate the Contract. Further, TFL would forfeit the security deposits/ Contract Performance Bank Guarantee.
c) In case it is found that the Counterparty has made any frivolous, untrue and misleading allegations against TFL or its associates, TFL reserves its right to initiate criminal proceedings against the violating Counterparty and may also impose exemplary cost for the same.
INDEPENDENT EXTERNAL MONITORS (IEMS)

Presently the panel consisting of the following Independent External Monitors (IEMs) have been appointed by TFL, in terms of Integrity Pact (IP) which forms part of TFL Tenders/Contracts.

i) Shri Anjan Kumar Banerjee (Email ID: anjan.banerjee@gov.in)
ii) Shri Atul Sobti (Email ID: sobtiatul@gmail.com)

This panel is authorised to examine/consider all references made to it under this tender. The bidder(s), in case of any dispute(s)/complaint(s) pertaining to this tender may raise the issue either with the designated tender issuing officer or Nodal Officer (presently Sh. S. Dasgupta, DGM (C&P) – Email: sdasgupta@gmail.co.in) in TFL or directly with the IEMs on the panel or IEM c/o Chief Vigilance Officer, Rashtriya Chemicals and Fertilizers Ltd., Priyadarshini Building, Eastern Express Highway, Sion, Mumbai Maharashtra, 400022.
INTEGRITY PACT

(To be executed on plain paper)

Between Talcher Fertilizers Limited (TFL) (here-in-after referred to as “Principal”).

AND

_________________________ (here-in-after referred to as “The Bidder/Contractor”).

(Principal and the Bidder / Contractor are here-in-after are referred to individually as “Party” or collectively as “Parties”).

PREAMBLE

The Principal intends to award under laid down organizational procedures, contract/s for

The Principal values full compliance with all relevant laws and regulations, and the principles of economic use of resources, and of fairness and transparency in its relations with its Bidder/s and Contractor/s.

In order to achieve these goals, the Principal will appoint Independent External Monitor (s) (in consultation with Central Vigilance Commission) who will monitor the tender process, the execution of the contract etc. for compliance with the principles mentioned above.

Section 1 – Commitments of the Principal

1. The Principal commits itself to take all measures necessary to prevent corruption and to observe the following Principles in this regard:-

   i) No employee of the Principal, either in person or through family members, including relatives, will in connection with the tender for or the execution of a contract, demand or accept a promise for or accept for him/herself or for a third person, any material or immaterial benefit to which he/she is not legally entitled.

   ii) The Principal shall, during the tender process treat all Bidders with equity. The Principal undertakes and ensures that before and during the tender process shall provide and share the same information to all Bidders and will not provide to any Bidder confidential / additional information through which one particular Bidder could take an advantage in relation to the tender process or the contract execution.

   iii) In case, any misconduct on the part of any official (s) is reported by the BIDDER to the PRINCIPAL with full and verifiable facts and the same is prima facie found to be correct by the PRINCIPAL, necessary disciplinary proceedings, or any other action as deemed fit, including criminal proceedings may be initiated by the PRINCIPAL and such person shall be debarred from further dealings related to the contract process. In such a case, while an enquiry is being conducted by the PRINCIPAL the proceedings under the contract would not be stalled.
2. If the Principal obtains information on the conduct of any of its employees which is a criminal offence under the Anti-Corruption Laws of India, or if there be a substantive suspicion in this regard, the Principal will inform its Vigilance Office and in addition can initiate disciplinary actions.

**Section 2 – Commitments and Undertakings by the Bidder/Contractor**

1. The Bidder / Contractor commits and undertakes to take all measures necessary to prevent malpractices & corruption. He commits himself to observe the following principles during his participation in the tender process and during the contract execution till the validity of Integrity Pact:

i) The Bidder / Contractor undertakes not to, directly or through any other person or firm offer, promise or give or influence to any employee of the Principal associated with the tender process or the execution of the contract or to any other person on their behalf any material or immaterial benefit to which he / she is not legally entitled in order to obtain in exchange any advantage of any kind whatsoever during the tender process or during the execution of the contract till the validity of Integrity Pact.

ii) The Bidder / Contractor undertakes not to enter into any undisclosed agreement or understanding, whether formal or informal with other Bidders. This applies in particular to prices, specifications, certifications, subsidiary contracts, submission or non-submission of bids or any other action to restrict competitiveness or to introduce cartelization in the bidding process.

iii) The Bidder / Contractor undertakes not to commit any offence under the relevant Anti-corruption Laws of India. Further, the Bidder / Contractor will not use improperly any information or document provided by the Principal as part of the business relationship regarding plans, technical proposals and business details, including information contained or transmitted electronically for the purposes of competition or personal gain and will not pass the information/document so acquired on to others.

iv) The Bidder / Contractor will, when presenting his bid undertakes to disclose any and all payments made, is committed to or intends to make to agents, brokers or any other intermediaries in connection with the award of the contract.

v) The bidder (s)/ Contractor (s) of foreign origin shall disclose the name and address of the Agents/ representatives in India, if any. Similarly, the bidder (s)/ contractor (s) of Indian Nationality shall furnish the name and address of the foreign principals, if any.

vi) Bidder(s) / Contractor(s) who have signed the Integrity Pact shall not approach the Courts while representing the matter to IEMs and shall wait for their decision in the matter.

2. The Bidder/ Contractor shall not instigate or cause to instigate any third person to commit any of the actions mentioned above.

The Bidder/Contractor commits to refrain from giving any complaint directly or through any other manner without supporting it with full and verifiable facts.
4. The Bidder/Contractor shall not lend to or borrow any money from or enter into any monetary dealing or transactions, directly or indirectly, with any employee of the Principal.

5. In case of any allegation of violation of any provision(s) of this pact or payment of commission, the Principal or its agencies shall be entitled to examine all the documents including the book of accounts of the Bidder and the Bidder shall provide necessary information and documents in English and shall extend all possible help for the purpose of such examination.

6. The Bidder/ Contractor will not collude with other parties interested in the contract to impair the transparency, fairness and progress of the bidding process, bid evaluation, contracting and implementation of contract.

7. The Bidder/ Contractor will not accept any advantage in exchange for any corrupt practice, unfair means and illegal activities.

Section 3 – Disqualification from tender process and exclusion from future contracts

1. If it is found that the Bidder / Contractor or any one employed by it has committed a transgression through a violation of any provisions of Section 2 so as to put his reliability or credibility into question, the Principal shall be entitled to disqualify such Bidder / Contractor from the tender including banning such Bidder / Contractor from entering into any TFL’s future contract/ tender processes for a period as decided by TFL and also to terminate the contract, if already signed, on that ground. Further, the period of banning shall be as per TFL’s decision and the decision of the Principal in this regard will be final and binding on the Bidder/ Contractor.

2. A transgression is considered to have occurred if the Principal after due consideration of the available evidence, concludes that there is a transgression of the provisions of the Pact.

3. The Bidder with its free consent and without any influence agrees and undertakes to respect and uphold the Principal’s absolute rights to resort to and impose such exclusion and further accepts and undertakes not to challenge or question such exclusion on any ground, including the lack of any hearing before the decision to resort to such exclusion is taken. This undertaking is given freely and after obtaining independent legal advice.

4. Principal is entitled to recover all sums paid by Bidder/ contractor to any middleman or agent or broker with a view to securing the contract.

In cases where irrevocable Letters of credit has to be established in respect of any contract signed by the Principal with the Bidder, the same shall not be opened.

Principal is entitled to forfeit the Performance Bond clearly assigning reason in case Bidder/ Contractor violates this Pact.

Section 4 – Forfeiture of EMD / Security Deposits

1. If due to transgression as per the provisions of the Pact, the Principal has disqualified the Bidder from the tender process prior to the award in terms of Section 3, the Principal is entitled to forfeit earnest money deposit / bid security money. In addition to this, such Bidder/Contractor shall also be
banned from the future business with Principal with consequential actions as decided by TFL.

**Section 5 – Previous transgression**

1. The Bidder declares that no previous transgression has occurred during the last three years immediately before signing of this Integrity Pact, with any other Company in any country in respect of any corrupt practices envisaged hereunder or with any other Public Sector Enterprise / Undertaking or any Government Department in India that could justify Bidder's exclusion from the tender process.

2. If the Bidder makes incorrect statement on this subject, he shall be disqualified from the tender process or the contract, if already awarded, could be liable to be terminated on this ground and other actions can be taken by TFL.

In case of any transgression in the last three years from the date of signing of Integrity Pact, Bidder to provide the details of same in their bid.

**Section 6 – Equal treatment to all Bidders / Contractors / Subcontractors**

1. The Bidder / Contractor undertakes to demand from all its sub-contractors, if any, an undertaking and commitment in conformity with this Integrity Pact, and to submit it to the Principal before signing of the contract.

In case of Sub-Contracting, the Principal Contractor shall take the responsibility of the adoption of Integrity Pact by the Sub-contractor.

2. The Principal will enter into agreements with similar conditions, as stipulated herein, with all Bidders, Contractors and Subcontractors.

3. The Principal shall disqualify from the tender process all Bidders who do not sign this Pact or violate any of its provisions.

**Section 7 – Criminal charges against violating Bidders / Contractors / Sub-contractors**

If the Principal obtains knowledge of conduct of a Bidder, Contractor or Subcontractor, or of an employee or a representative or an associate of a Bidder, Contractor or Subcontractor which constitutes corruption of an offence as defined in Chapter IX of the Indian Penal Code 1860 or prevention of corruption Act 1988 and amendments thereof or any other enacted statute for prevention of corruption, or if the Principal has substantive suspicion in this regard, the Principal will inform the same to the Vigilance Office / Department for initiating appropriate action for above.

**Section 8 – Independent External Monitor / Monitors**

1. The Principal appoints competent and credible external independent Monitor for this Pact. The task of the Monitor is to review independently and objectively, whether and to what extent the parties comply with the obligations under this agreement.

2. The Monitor is not subject to any instructions by the representatives of the parties and performs his functions neutrally and independently. He reports to the Chairperson of the Board of the Principal.
3. The Bidder/Contractor accepts that the Monitor has the right to access without restriction to all Project documentation of the Principal including that provided by the Contractor. The Contractor will also grant the Monitor, upon his request and demonstration of a valid interest, unrestricted and unconditional access to his project documentation. The same is applicable to Sub-contractors. The Monitor is under contractual obligation to treat the information and documents of the Bidder / Contractor / Sub-contractor with confidentiality.

4. The Principal will provide to the Monitor sufficient information about all meetings among the parties related to the Project provided such meetings could have an impact on the contractual relations between the Principal and the Contractor. The parties offer to the Monitor the option to participate in such meetings.

5. As soon as the Monitor notices, or believes to notice, a violation of this Pact he will so inform the Management of the Principal and request the Management to discontinue or heal the violation or to take other relevant action. The monitor can in this regard submit non-binding recommendations. Beyond this, the Monitor has no right to demand from the parties that they act in a specific manner, refrain from action or tolerate action. However, the Independent External Monitor shall give an opportunity to the bidder / contractor to present its case before making its recommendations to the Principal.

6. The Monitor will submit a written report to the Chairperson of the Board of the Principal within 10 days from the date of reference or intimation to him by the ‘Principal’ and should the occasion arise, submit proposals for taking corrective measures.

7. Remuneration payable to Monitor(s) shall be borne by Principal.

8. If the Monitor has reported to the Chairperson of the Board a substantiated suspicion of an offence under relevant Anti-Corruption laws of India, and the Chairperson has not, within reasonable time, taken visible action to proceed against such offence or reported it to the Vigilance Office, the Monitor may also transmit this information directly to the Central Vigilance Commissioner, Government of India.

9. The word ‘Monitor’ would include both singular and plural.

10. Independent External Monitor shall be required to maintain confidentiality of the information acquired and gathered during their tenure / role as Independent Monitor. Any breach in this regard would be subject to the legal judicial system of India.

11. The Independent External Monitors shall be responsible to oversee the implementation of Integrity Pact Program to prevent corruption, bribes or any other unethical practices in the TFL.

12. The monitor has also signed declarations on ‘Non-Disclosure of Confidential Information’ and of ‘Absence of Conflict of Interest’. In case of any conflict of interest arising at a later date, the IEM shall inform Chairperson of the Principal and recuse himself / herself from that case.

In case of any complaints referred under IP Program, the role of IEMs is advisory and would not be legally binding and it is restricted to resolving the
issues raised by an intending bidder regarding any aspect of the tender which allegedly restricts competition on bias towards some bidder.

14. Issues like warranty / guarantee, etc. shall be outside the purview of IEMs.

Section 9 – Pact Duration

The provisions of this Pact shall come into effect from the date of signing of this Pact by the both parties. It expires for the Contractor 12 months after the last payment under the respective contract, and for all other Bidders 6 months after the contract has been awarded.

If any claim is made / lodged by either party during this time, the same shall be binding and continue to be valid despite the lapse of this pact as specified above, unless it is discharged/determined by the Chairperson of the Principal.

Section 10 – Miscellaneous provisions

1. This agreement is subject to Indian Law. Place of performance and exclusive jurisdiction is the Registered Office of the Principal, i.e. New Delhi. The Arbitration clause provided in main tender document / contract shall not be applicable for any issue / dispute arising under Integrity Pact.

2. Changes and supplements as well as termination notices, if any, need to be made in writing. Side agreements have not been made.

3. If the Contractor / Bidder is a partnership concern or a consortium, this agreement must be signed by all partners or consortium members.

4. In case any or several of the provisions of this agreement turn out to be void, the remainder of this pact shall remain valid. The parties to this pact however, shall strive to come to an agreement to their original intentions in such a case.

5. The actions stipulated in this Integrity Pact are without prejudice to any other legal action that may follow in accordance with the provision of the extant law in force relating to any civil or criminal proceeding.

PROFORMA OF CONSORTIUM AGREEMENT

DELETED
Ref................
Bank Guarantee No.-------- Date................

To,
M/s Talcher Fertilizers Limited

Dear Sir(s),

In consideration of the Talcher Fertilizers Limited, hereinafter called the "Owner" which expression shall unless repugnant to the context or meaning thereof include its successors, executors, administrators and assignees, having awarded to M/s........................ having its registered office at ................................... hereinafter referred as the 'CONTRACTOR', which expression shall unless repugnant to the context or meaning thereof, include its successors, administrators, executors and assignees, a contract hereinafter referred to as the 'Contract' for related works.............. referred to as the 'WORK' on terms and conditions set out, inter-alia in the Owner's Contract / DLOA / FOA No..........dated.......... valued at........................................ (in words & figures) and as the Owner having agreed to make an advance payment (herein after referred as Mobilization advance) for the performance of the above contract to the CONTRACTOR amounting to.............................(in words & figures) as an advance against Bank Guarantee to be furnished by the CONTRACTOR.

We........................................... hereinafter referred to as the BANK which expression shall, unless repugnant to the context or meaning thereof, include its successors, administrators, executors and assignees having our office at......................... do hereby undertake to give the irrevocable and unconditional guarantee and do hereby undertake to pay the OWNER on first demand without any demur, reservation, contest, recourse, protest and without reference to the CONTRACTOR any and all monies payable by the CONTRACTOR by reason of any breach by the said CONTRACTOR of any of the terms and conditions of the said Contract to the extent of.............. till the said advance is adjusted as aforesaid at any time upto......................... We agree that the guarantee herein contained shall continue to be enforceable till the sum due to the Owner on account of the said advance is adjusted/recovered in full as aforesaid or till the Owner discharges this guarantee in writing.

The OWNER shall have the fullest liberty without affecting in any way the liability of the BANK under this guarantee, from time to time to vary the advance or to extend the time for performance of the works by the CONTRACTOR. The BANK shall not
be released from its liability under these presents by any exercise of the Owner of the liberty with reference to the matter aforesaid.

The Owner shall have the fullest liberty, without reference to CONTRACTOR and without affecting this guarantee to postpone for any time or from time to time the exercise of any powers vested in them or of any right which they might have against the CONTRACTOR, and to exercise the same at any time in any manner, and either to enforce or to forebear to enforce any power, covenants contained or implied in the Contract between the OWNER and the CONTRACTOR or any other course or remedy or security available to the OWNER and the BANK shall not be released of its obligations under these presents by any exercise by the OWNER of its liberty with reference to matters aforesaid or other acts of omission or commission on the part of the OWNER or any other law would, but for this provision, have the effect of releasing the BANK.

The right of the OWNER to recover the outstanding sum of advance upto Rs.______________ from the BANK in the manner aforesaid is absolute and unequivocal and will not be affected or suspended by reason of the fact that any dispute or disputes has or have been raised by the CONTRACTOR and/or that any dispute or disputes is or are pending before any officer, tribunal or court or arbitrator or any other authority/forum and any demand made by OWNER on the BANK shall be conclusive and binding.

The BANK further undertakes not to revoke this guarantee during its currency without previous consent of the OWNER and further agrees that the guarantee contained shall continue to be enforceable until it is discharged by TFL in writing.

The BANK also agrees that the OWNER shall at its option be entitled to enforce this guarantee against the BANK as a principal debtor, in the first instance, notwithstanding any other security or guarantee that OWNER may have in relation to the CONTRACTOR's liabilities towards the said advance.

The amount under the Bank Guarantee is payable forthwith without any delay by Bank upon the written demand raised by TFL. Any dispute arising out of or in relation to the said Bank Guarantee shall be subject to the exclusive jurisdiction of courts at New Delhi.

Therefore, we hereby affirm that we are guarantors and responsible to you on behalf of the Contractor up to a total amount of ______________(amount of guarantees in words and figures) and we undertake to pay you, upon your first written demand declaring the Contractor to be in default under the contract and without caveat or argument, any sum or sums within the limits of ____________(amount of guarantee) as aforesaid, without your needing to prove or show grounds or reasons for your demand or the sum specified therein.

Notwithstanding anything contained hereinabove, our liability under this guarantee is restricted to _________ and it will remain in force upto and including ______________.
and shall be extended from time to time for such periods as may be advised by M/s_______ on whose behalf this guarantee has been given.

We have power to issue this guarantee in your favour under Memorandum and Articles of Association and the undersigned has full power to do so under the Power of Attorney/ resolution of the Board of Directors dated............... accorded to him by the BANK.

Dear Sir,

We hereby confirm that we have not been banned or blacklisted or de-listed or put on Holiday by any Government / Quasi-Government / Public Sector Undertaking on due date of submission of bid.

We also confirm that we are not under any liquidation, court receivership or similar proceedings or 'bankruptcy'.

If it is found at a later date that the Contractor has secured the contract by furnishing wrong information or by suppressing facts in the bid submitted, Talcher Fertilizers Limited (TFL) reserves the right to cancel the contract and forfeit the EMD/ Security cum Performance Guarantee and put the CONTRACOR on Holiday / Banned / Blacklist list of TFL and of it’s JV partners.

Further, we also confirm that in case there is any change in status of the declaration prior to award of contract, the same will be promptly informed to TFL by us.

Place: [Signature of Authorized Signatory of Bidder] Date: Name: Designatio n: Seal:
This agreement made this ___ day of ____ month ____ year by and between M/s. ______________ (Fill in Bidder’s full name, constitution and registered office address) ___________ hereinafter referred to as bidder on the first part and M/s. ______________ (Fill in full name, constitution and registered office address company which hold more than fifty percent of the paid up share capital of the bidding company or vice versa) hereinafter referred to as “Supporting Company” of the second part.

Whereas

M/s. Talcher Fertilizers Limited (hereinafter referred to as TFL) has invited offers vide their tender No. _____________ for _______________ and M/s. ________________ (Bidder) intends to bid against the said tender and desires to have technical support of M/s. ________________ [Supporting Company]

And whereas Supporting Company represents that they have gone through and understood the requirements of the subject tender and are capable and committed to provide the services as required by the bidder for successful execution of the contract, if awarded to the bidder.

Now, it is hereby agreed to by and between the parties as follows:

a) M/s. ____________ (Bidder) will submit an offer to TFL for the full scope of work as envisaged in the tender document as a main bidder and liaise TFL directly for any clarifications etc. in this context.

b) M/s. ________ [Supporting Company] undertakes to provide technical support and expertise, expert manpower and project management including financial support, if so required, to the bidder to discharge its obligations as per the Scope of Work of the tender / Contract for which offer has been made by the bidder and accepted the TFL.

c) The Bidder/ Supporting Company holds more than 50% paid up equity capital of the Supporting Company/ Bidder.
d) This agreement will remain valid till validity of bidder’s offer to TFL including extension if any and till satisfactory performance of the contract, the same is awarded by TFL to the bidder.

e) Supporting Company undertakes that this agreement shall remain enforceable even if their stake in Bidder is diminished during the execution of works under the contract between the Bidder and TFL.

f) The bidder shall have the overall responsibility of satisfactory execution of the contract awarded by TFL, however without prejudice to any rights that TFL might have against the Supporting Company

g) It is further agreed that, if contract pursuant to Supporting Company shall be jointly and severely responsible to TFL for the performance of works during contract period and for the satisfactory execution of the contract, and for all the consequences for non-performance thereof.

In witness whereof the parties hereto have executed this agreement on the date mentioned above.

GUARANTEE BY THE FOREIGN BASED SUPPORTING COMPANY/ GUARANTOR

THIS DEED OF GUARANTEE executed at ........... this ........ day of ........ by M/s ........................................ (mention complete name) a company duly established and existing under the laws of ...................... (insert country), having its Registered Office at .......................................................... hereinafter called “the Guarantor and/ or the Supporting Company” which expression shall, unless excluded by or repugnant to the subject or context thereof, be deemed to include its successors and permitted assignees.

FOR

M/s ........................................ (bidder) a company duly established and existing under the laws of ...................... (insert country), having its Registered Office at .......................................................... hereinafter called the “Bidder” which expression shall, unless excluded by or repugnant to the subject or context thereof, be deemed to include its successors and permitted assignees.

TOWARDS

M/s Talcher Fertilizers Limited, a company duly registered under the law of India having its Registered Office at Plot 2/H, Kalpana Area, BJB Nagar, Khurda, Bhubneshwar-751014, Odisha, India, and having Purchase center at .................... hereinafter called “TFL” which expression shall unless excluded by or repugnant to the context thereof, be deemed to include its successor and assignees.

WHEREAS TFL has invited tender number ....................... for ........ on ............... , and the bidder has submitted it bid number ..................... in response to the above mentioned tender invited by TFL.

AND WHEREAS the bidder/ Guarantor Company holds more than 50% paid up equity capital of the Supporting Company/ Bidder .

AND WHEREAS one of the condition for acceptance of Bidder’s bid against said tender is that in case the bidder is seeking to qualify upon the technical credentials of its Guarantor Company, then the bidder shall arrange a guarantee from its Guarantor Company guaranteeing due and satisfactory performance of the work covered under the said tender including any change therein as may be deemed appropriate by the TFL at any stage.

The Guarantor represents that they have gone through and understood the requirement of the above said tender and are capable of and committed to provide technical and such other supports as may be required by the Bidder for successful execution of the same.

The Bidder and the Guarantor have entered into an agreement dated ........ as per which the Guarantor shall be providing technical, financial and such other supports as may be
necessary for performance of the work under the tender, if the contract is awarded to the Bidder.

Accordingly, at the request of the Bidder and in consideration of and as a requirement for the TFL to enter into agreement(s) with the Bidder, the Guarantor hereby guarantees and undertakes that upon award of Contract to Bidder against bid number .............., made by the Bidder under tender number................:

1. The Guarantor unconditionally agrees that in case of non-performance by the Bidder of any of its obligations in any respect, the Guarantor shall, immediately on receipt of notice of demand by the TFL, take up the job without any demur or objection, in continuation and without loss of time and without any cost to the TFL and duly perform the obligations of the Bidder to the satisfaction of the TFL.

2. The Guarantor agrees that the Guarantee contained herein shall remain valid till the satisfactory execution and completion of the work (including discharge of the warranty obligations) awarded to the Bidder.

3. The Guarantor shall be jointly and severally responsible to TFL for satisfactory performance of works during contract period and for the satisfactory execution of the contract, and for all consequences for non-performance thereof.

4. The liability of the Guarantor, under the Guarantee, is limited of the Bidder for non-performance under the contract entered between TFL and the Bidder. This will, however, be in addition to the forfeiture of the Performance and Advance Guarantees furnished by the Bidder.

5. The Guarantor agrees to execute a Corporate Guarantee in favour of TFL, guaranteeing the performance of obligations by the Bidder, in case the Contract is awarded to the Bidder by TFL.

6. The Guarantor represents that this Guarantee has been issued after due observance of the appropriate laws in force in India. The Guarantor hereby undertakes that the Guarantor shall obtain and maintain in full force and effect all the governmental and other approvals and consents that are necessary and do all other acts and things necessary or desirable in connection therewith or for the due performance of the Guarantor's obligations towards TFL.

7. Any dispute arising out of or in connection with this contract, including any question regarding its existence, validity or termination, shall be referred to and finally resolved by arbitration. It is further agreed that Claims by and against the Guarantor, the Bidder and TFL under the different contract to be entered pursuant to their relationship can be brought under a single reference and there shall be no bar on the consolidation of such proceedings before the same arbitral tribunal. The governing law shall be the laws of India and seat of arbitration shall be New Delhi, India. The language of arbitration shall be English.
8. The Guarantor hereby declares and represents that this Guarantee has been given without any undue influence or coercion, and that the Guarantor has fully understood the implications of the same.

9. In case of award of contract to the bidder, the Guarantor shall provide Performance Bank Security to TFL, equivalent to 50% of the value of Performance Bank Security to be submitted by the bidding company, in the prescribed format within 15 days from the date of Fax of Acceptance, as guarantee for performance by the bidder/contractor. The Guarantor hereby expressly agrees that if in the opinion of TFL, the Bidder / Contractor has failed to perform its obligations under the contract in any manner, TFL shall have unfettered right to invoke the said Bank guarantee. The guarantor hereby agrees that decision of TFL about performance of the bidder / contractor shall be final and shall not be questioned by the Guarantor. Guarantor shall have no objection to invocation of the Performance Bank Guarantee submitted by the Guarantor

OR

(applicable, subject to meeting the conditions stipulated in BEC in respect of additional Performance Bank Security)

In case of award of contract to the bidder, the bidder on behalf of the Guarantor shall provide additional Performance Bank Security to TFL, equivalent to 50% of the value of Performance Bank Security to be submitted by the bidding company, in the prescribed format within 15 days from the date of Fax of Acceptance, as guarantee for performance by the bidder/contractor. The Guarantor hereby expressly agrees that if in the opinion of TFL, the Bidder / Contractor has failed to perform its obligations under the contract in any manner, TFL shall have unfettered right to invoke the said Bank guarantee. The Guarantor hereby agrees that decision of TFL about performance of the bidder / contractor shall be final and shall not be questioned by the Guarantor. Guarantor shall have no objection to invocation of the Performance Bank Security submitted by the Guarantor. The Guarantor represents and confirms that the Guarantor has the legal capacity, power and authority to issue this Guarantee and that giving of this Guarantee and the performance and observations of the obligations hereunder do not contravene any existing laws.

(Strike through the clause whichever is not applicable)
10. The Guarantor represents and confirms that the Guarantor has the legal capacity, power and authority to issue this Guarantee and that giving of this Guarantee and the performance and observations of the obligations hereunder do not contravene any existing laws.

To,
M/s TALCHER FERTILIZERS LIMITED

Dear Sir(s),

M/s. _____________________________________________ (herein after called the "CONTRACTOR/ SUPPLIER/SERVICE PROVIDER" which expression shall wherever the context so require include its successors and assignees) have been placed/ awarded the job/work of _______________________________ vide PO/LOA /FOA No. _______________________________ dated______ (herein after called CONTRACT/ ORDER) for Talcher Fertilizer Limited having registered office at Plot 2/H, Kalpana Area, BJB Nagar, Khurda, Bhubneshwar-751014, Odisha, India (herein after called the “TFL” which expression shall wherever the context so require include its successors and assignees).

Further, M/s __________________ (Name of the Supporting company) having its registered/head office at __________________ based on whose experience/technical strength, the CONTRACTOR/SUPPLIER/SERVICE PROVIDER has qualified for award of contract (hereinafter referred to as the "SUPPORTING COMPANY") which expression shall, unless repugnant to the context or meaning thereof include all its successors, administrators, executors and assignees) has agreed to provide complete technical and other support to the CONTRACTOR/SUPPLIER/SERVICE PROVIDER for successful completion of the contract/order as mentioned above, entered between TFL and the CONTRACTOR/SUPPLIER/SERVICE PROVIDER and TFL having agreed that the "SUPPORTING COMPANY" shall furnish to TFL a performance guarantee for Indian Rupees/US$ ............. towards providing complete financial and other support to the CONTRACTOR/SUPPLIER/SERVICE PROVIDER for successful completion of the contract/order as mentioned above,
The said M/s. ___________________________________________ (Supporting Company) has approached us and at their request and in consideration of the premises we having our office at ______________________________ have agreed to give such guarantee as hereinafter mentioned.

2. We (name of the bank) ______________________________ registered under the laws of _______ having head/registered office at __________________________ (hereinafter referred to as "the Bank", which expression shall, unless repugnant to the context or meaning thereof, include all its successors, administrators, executors and permitted assignees) do hereby guarantee and undertake to pay immediately on first demand in writing any/all moneys to the extent of Indian Rs./US$ (in figures) __________ (Indian Rupees/US Dollars (in words) _______________________) without any demur, reservation, contest or protest and/or without any reference to the 'SUPPORTING COMPANY'. Any such demand made by TFL on the Bank by serving a written notice shall be conclusive and binding, without any proof, on the bank as regards the amount due and payable, notwithstanding any dispute(s) pending before any Court, Tribunal, Arbitrator or any other authority and/or any other matter or thing whatsoever, as liability under these presents being absolute and unequivocal. We agree that the guarantee herein contained shall be irrevocable and shall continue to be enforceable until it is discharged by TFL in writing. This guarantee shall not be determined, discharged or affected by the liquidation, winding up, dissolution or insolvency of the 'SUPPORTING COMPANY' and shall remain valid, binding and operative against the bank.

3. The Bank also agrees that TFL at its option shall be entitled to enforce this Guarantee against the Bank as a principal debtor, in the first instance, without proceeding against the 'SUPPORTING COMPANY' and notwithstanding any security or other guarantee that TFL may have in relation to the 'SUPPORTING COMPANY's liabilities.

4. The Bank further agrees that TFL shall have the fullest liberty without our consent and without affecting in any manner our obligations hereunder to vary any of the terms and conditions of the said CONTRACT/ORDER or to extend time of performance by the said CONTRACTOR/SUPPLIER/SERVICE PROVIDER from time to time or to postpone for any time or from time to time exercise of any of the powers vested in TFL against the said CONTRACTOR/SUPPLIER/SERVICE PROVIDER and to forbear or enforce any of the terms and conditions relating to the said agreement and we shall not be relieved from our liability by reason of any such variation, or extension being granted to the said CONTRACTOR/SUPPLIER/SERVICE PROVIDER or for any forbearance, act or omission on the part of TFL or any indulgence by TFL to the said CONTRACTOR(s) or any such matter or thing whatsoever which under the law relating to sureties would, but for this provision, have effect of so relieving us.
5. The Bank further agrees that the Guarantee herein contained shall remain in full force during the period that is taken for the performance of the CONTRACT/ORDER and all dues of TFL under or by virtue of this CONTRACT/ORDER have been fully paid and its claim satisfied or discharged or till TFL discharges this guarantee in writing, whichever is earlier.

6. This Guarantee shall not be discharged by any change in our constitution, in the constitution of TFL or that of the 'SUPPORTING COMPANY'.

7. The Bank confirms that this guarantee has been issued with observance of appropriate laws of the country of issue.

8. The Bank also agrees that this guarantee shall be governed and construed in accordance with Indian Laws and subject to the exclusive jurisdiction of Indian Courts of the place from where the purchase CONTRACT/ORDER has been placed.

9. Notwithstanding anything contained hereinabove, our liability under this Guarantee is limited to Indian Rs./US$ (in figures) _________________ (Indian Rupees/US Dollars in words) ________________ only) and our guarantee shall remain in force until (indicate the date of expiry of bank guarantee) ________.

8. We have power to issue this guarantee in your favor under Memorandum and Articles of Association and the undersigned has full power to do under the Power of Attorney, dated ___________ granted to him by the Bank.

   Yours faithfully,

   ________________________

   Bank by its Constituted Attorney

   Signature of a person duly Authorized to sign on behalf of the Bank
INSTRUCTIONS FOR FURNISHING
"CONTRACT PERFORMANCE SECURITY / SECURITY DEPOSIT" BY "BANK GUARANTEE"

1. The Bank Guarantee by successful Bidder(s) will be given on non-judicial stamp paper as per 'stamp duty' applicable. The non-judicial stamp paper should be in name of the issuing bank. In case of foreign bank, the said Bank Guarantee to be issued by its correspondent bank in India on requisite non-judicial stamp paper and place of Bid to be considered as Delhi.

2. The Bank Guarantee by Bidders will be given from bank as specified in Tender.

3. A letter from the issuing bank of the requisite Bank Guarantee confirming that said Bank Guarantee and all future communication relating to the Bank Guarantee shall be forwarded to Purchaser.

4. If a Bank Guarantee is issued by a commercial bank, then a letter to Purchaser and copy to Consultant (if applicable) confirming its net worth is more than Rs. 100,00,00,000.00 [Rupees One Hundred Crores] or its equivalent in foreign currency alongwith documentary evidence.

1.0 **SCOPE OF CONTRACT** shall be as per Section VI- 3.0 and Section V of NIT.

2.0 **CONTRACT DOCUMENTS**

The term 'Contract Documents' shall mean and include the following documents which shall constitute the Contract and shall be deemed to form an integral part of the Contract:

a) Contract Agreement  
b) Detailed Letter of Acceptance (DLOA) and all Annexures  
c) FAX OF ACCEPTANCE (FOA)  
d) Post bid Clarification and replies exchanged between Owner and the Contractor  
e) Schedule of Rates  
f) Reply to Pre Bid Queries  
g) Original Tender Document and subsequent amendments, if any  
h) Integrity Pact (IP) signed between the Owner and the Bidder/Contractor

The above documents are intended to be correlative, complementary and mutually explanatory. The Contract shall be read as a whole.

2.1 **INTERPRETATION OF CONTRACT DOCUMENTS**

2.1.1 Notwithstanding the sub-division of the CONTRACT document into these separate documents and/or volumes and/or heads, every part of each separate section/volume/head shall be deemed to be supplementary of every other part and shall be read with and into the CONTRACT so far as it may be practicable to do so.

2.1.2 If in respect of any commercial term or condition, if any provision in the GENERAL CONDITIONS OF CONTRACT is repugnant to or at variance with any provision(s) of the SPECIAL CONDITIONS OF CONTRACT, the provision(s) of the SPECIAL CONDITIONS OF CONTRACT shall be deemed to override the provision(s) of GENERAL CONDITIONS OF CONTRACT, but only to the extent that such repugnancy in the GENERAL CONDITIONS OF CONTRACT cannot be reconciled with the SPECIAL CONDITIONS OF CONTRACT.

2.1.3 Without prejudice to the provisions of the GENERAL CONDITIONS OF CONTRACT, whenever in the Bidding documents it is mentioned or stated that the CONTRACTOR shall perform certain work or provide certain facilities, it is understood that the CONTRACTOR shall do so at his own cost and the Lumpsum Price shall be deemed to have included the cost of such performance and/or provision, as the case may be.

2.1.4 The MATERIALS, design and workmanship shall satisfy the applicable relevant Indian standards, the job specifications contained herein and the codes referred to by expression or implication. Where the job specifications stipulate requirements in addition to those contained in the standard codes and specifications, these additional requirements shall also be satisfied. In the absence of any standard/specification/code of practice for detailed specifications covering any part of the work covered in this tender, the instructions/directions agreed between OWNER and CONTRACTOR based on good international engineering practice shall be binding on the CONTRACTOR.
2.1.5 In the event of any ambiguity or conflict between the Contract Documents listed in clause 2.0 above, the order of precedence shall be the order in which the Contract Documents are listed in Clause 2.0 (CONTRACT DOCUMENTS) above.

2.1.6 Should there be any doubt or ambiguity in the interpretation of the CONTRACT documents or contradiction therein or should there be any discernable error or omission in any CONTRACT document, the CONTRACTOR shall, prior to commencing the relative work or supply, as the case may be, apply in writing to the Engineer-In-Charge for his decision for resolution of the doubt, ambiguity or contradiction or correction of the error or making good the omission, as the case may be. Should the CONTRACTOR fail to apply to the ENGINEER-IN-CHARGE for his decision as aforesaid prior to commencing the relative work or supply, the CONTRACTOR shall perform the said work or make the said supply, as the case may be, at his own risk, and the provisions of Clause 2.1.9 hereof shall apply to any such work performed or supply made by the CONTRACTOR.

2.1.7 Notwithstanding anything provided in Clause 2.1.6 hereof above, either the CONTRACTOR or any representative of the OWNER or CONSULTANT may, at any time prior to or during the execution of the work or supply of any material or any part thereof (if the CONTRACTOR has failed to make an application as provided for in Clause 2.1.6), apply to the ENGINEER-IN-CHARGE in writing for his decision in resolution of any doubt, ambiguity or contradiction or for the correction of any error or for making good the omission as the case may be.

2.1.8 The decision of the ENGINEER-IN-CHARGE on any application under Clause 2.1.6 or Clause 2.1.7 hereof shall be in writing and shall be final and binding upon the CONTRACTOR and shall form part of the CONTRACT documents, with the intent that the CONTRACT documents shall be read as though the said decision is and was at all times incorporated therein. It is clarified that in case the Contractor disagrees with the decision of the ENGINEER-IN-CHARGE, the dispute shall be settled as per the provisions of Clause 39.0 of GCC.

2.2 Any work or supply shown, indicated or included in any description of the work, plans, drawings, Specifications and/or Price Schedule or other Contract or Bid documents shall be deemed to form part of the WORK and/or supply contracted for, as the case may be, notwithstanding failure to show, indicate or include such work or supply in any other or others among the documents aforesaid with the intent that the indication or inclusion of the work or supply within any one of the said documents shall be deemed to be a sufficient indication or inclusion of the work or supply, as the case may be, within the work and supply covered by the CONTRACT.

2.3 No verbal agreement, assurance, representation or understanding given by any employee or officer of the OWNER or so understood by the CONTRACTOR, whether given or understood before or after the execution of the contract, shall any-wise bind the OWNER or alter the CONTRACT documents unless specifically given in writing and signed by the OWNER or by the ENGINEER-IN-CHARGE on behalf of the OWNER and issue the amendment of the relative term(s).

2.4 Clause headings given in this or any other contract documents are intended only as a general guide for convenience in reading and segregating the general subject of the various Clauses, but do not form part of the contract documents, with the intent that the Clause headings shall not govern the meaning or import of the Clauses there under appearing or confine or otherwise affect the interpretation thereof.
3.0 DEFINITION OF TERMS AND INTERPRETATION

In the CONTRACT, unless the context otherwise requires, the following expressions shall have the following meanings. The singular shall include the plural and the plural include the singular except where the context otherwise requires and the words ‘he’, ‘him’, and ‘his’ shall be taken to mean ‘she’, ‘her’ and ‘hers’ where appropriate.

1. ‘APPROVAL’ shall mean and include the written approval by the OWNER of a documents, drawing or other particulars in relation to this CONTRACT.

2. 'BATTERY LIMIT’ shall mean the outer limits of boundaries of the areas within which the Plants and associated facilities shall be located.

3. ‘BID’ shall mean the proposal/document that the BIDDER submits in the requested and specified form in the specification in response to this NIT.

4. 'BIDDER' shall mean the Sole Bidder who shall submit or who have submitted the Bid.

5. ‘CHANGE ORDER’ means an order by which a change is ordered or other notification made to the Contractor in accordance with the CONTRACT.

6. ‘CODES’ shall mean the following, including the latest amendments, and/or replacements, if any:
   a) All relevant Indian Acts, and Rules and Regulations made there under;
   b) ASME Codes
   c) IBR Codes
   d) AIEE Codes
   e) American Society of Testing of Materials (ASTM) Codes
   f) Other internationally applicable standards and/or Regulations the subject matter of the CONTRACT.
   g) Indian Employees Provident Fund Act,
   h) Pollution Control norms of INDIA
   i) Contract Labour
   j) Minimum Wages Act
   k) Any other labour laws of INDIA applicable during execution of contract.
   l) Any other codes/standards specified in the contract documents.

7. 'COMMERCIAL OPERATION' shall mean the condition of operation in which the complete PLANT covered under the CONTRACT is officially declared by the OWNER to be available for continuous operation at different loads upto and including rated capacity after completion of commissioning as per CONTRACT. Such declaration by the OWNER however, shall not relieve
or prejudice the CONTRACTOR any of his obligations under the CONTRACT.

8. ‘COMMERCIAL USE’ shall mean that use of the PLANT which the CONTRACT contemplates or of which it is commercially capable.

9. ‘COMMISSIONING’ shall mean the putting into operation of PLANT by CONTRACTOR including Sustained Load Test as defined under Section-VI of NIT.

10. Deleted

11. ‘CONSULTANT/PROJECT MANAGEMENT CONSULTANT (PMC)’ shall mean the agency nominated/appointed by the OWNER for this project/job/WORKS.

12. 'CONTRACT' shall mean the Agreement between the OWNER and the CONTRACTOR for the execution of the works including therein all contract documents.

13. 'CONTRACTOR’ shall mean the successful Bidder whose bid has been accepted by the OWNER and who has been selected by the OWNER for the award of Works and shall include his heirs, legal representatives, successors and permitted assigns.

14. ‘COMPLETION PERIOD / GURANTEED COMPLETION DATE’ shall mean the time period / date (or as may be extended by the OWNER from time to time) during which the CONTRACT shall be executed.

15. ‘CONTRACTOR’S EQUIPMENT’ means all equipment, construction plant, vehicles, temporary facilities, material, tools or things brought on to the Site by or on behalf of the Contractor for carrying out the Works but not for permanent incorporation in the Plant.

16. ‘CONTRACTOR’S SOFTWARE’ means standard Software owned by the CONTRACTOR.

17. 'CONTRACTOR'S WORKS' OR 'MANUFACTURER'S WORKS' shall mean the place or places of work used by the CONTRACTOR/SUB-CONTRACTOR/SUB-VENDOR or their collaborator(s) for the manufacture of EQUIPMENT or performance of WORKS.

18. ‘COST’ means the cost incurred by the Contractor in carrying out any of his obligations under the Contract, and ‘Costs’ shall be construed accordingly.

19. 'DAY' shall mean a day of 24 hours from midnight to midnight irrespective of the number of hours worked in that day.

"WORKING DAY" means any day which is not declared to be holiday or rest day by the OWNER.
20. ‘DEEMED ACCEPTANCE’ shall mean as defined in Clause 16.0 of SPECIAL CONDITIONS OF CONTRACT.

21. ‘DEFECT’ means any work done or any Material or the Plant or any part of it which does not comply with the CONTRACT.

22. ‘DEFECT/DEFECTS LIABILITY PERIOD’ shall mean a period of 12 months commencing from the date of PRELIMINARY ACCEPTANCE. CONTRACTOR shall warrant that the equipment and material supplied under the CONTRACT shall be new and free from any defect or deficiency with respect to design, material and workmanship. In the event of any defect or deficiency arising during the DEFECT LIABILITY PERIOD, CONTRACTOR shall repair or replace the defective or deficient equipment and materials at its own cost. In such event the defect liability period for the particular equipment shall be another 12 months from the date of acceptance by OWNER of such replaced/repaired equipment/material. However, extended DEFECT LIABILITY PERIOD shall have an upper limit of 24 months for extended DEFECT LIABILITY PERIOD, starting from the Preliminary Acceptance.

23. ‘DOCUMENT(S)/DOCUMENTATION’ means any relevant documents in paper or electronic form, including drawings, technical software, images, designs, manuals or records.

24. 'DRAWINGS' or 'PLAN' shall mean all:
   a) Drawings furnished by the OWNER as a basis for proposals;
   b) Supplementary drawings furnished by the OWNER to clarify and to define in greater detail the intent of the CONTRACT;
   c) DRAWINGS submitted by the CONTRACTOR with his proposal provided such drawings are acceptable to the OWNER.
   d) DRAWING furnished by the OWNER to the CONTRACTOR during the progress of the works; and
   e) Engineering data and DRAWINGS submitted by the CONTRACTOR during the progress of the work provided such drawings are acceptable to the OWNER.

25. DLOA shall mean DETAILED LETTER OF ACCEPTANCE which shall be issued to successful bidder after issuance of FAX OF ACCEPTANCE (FOA).

26. 'ENGINEER'S INSTRUCTIONS' shall mean any drawings and/or instructions in writing, details, directions and explanations issued by the OWNER from time to time during the COMPLETION PERIOD to the CONTRACTOR/ SUB-CONTRACTOR for carrying out the WORK.

27. ENGINEER IN CHARGE" shall mean the person designated from time to time by the OWNER and shall include those who are expressly authorized by him to act
for and on his behalf for operation of this CONTRACT.

28. ‘EQUIPMENT’ OR ‘STORES’ shall mean the equipment, machinery and structure of any kind which the CONTRACTOR is obliged to design, supply, deliver, unload, store at site, erect, set to work and test under the CONTRACT.

29. ‘FINAL ACCEPTANCE’ shall mean that date when all of the conditions set forth in Clause 19 of SPECIAL CONDITIONS OF CONTRACT have been satisfied, all liabilities and obligations under this CONTRACT have been discharged, except those specially to be continued or performed after FINAL ACCEPTANCE.

30. ‘FINAL ACCEPTANCE CERTIFICATE’ shall mean that certificate issued by the ENGINEER-IN-CHARGE or OWNER to the CONTRACTOR subject to clause 19 of SPECIAL CONDITIONS OF CONTRACT at the end of the DEFECTS LIABILITY PERIOD.

31. ‘FINAL COMPLETION’ shall mean the completion of guarantee tests and handing over of the PLANTS and facilities to OWNER.

32. FINAL PROPOSAL means the Offer submitted by the Bidder and its subsequent clarification/revision during techno-commercial queries.

33. ‘FORCE MAJEURE’ has the meaning stated in Sub-clause 35.0 of GCC.

34. ‘FOA’ means Fax of Acceptance.

35. GCC or GENERAL CONDITIONS OF THE CONTRACT shall mean all the terms and conditions forming part of this agreement as defined in the Section IV.

36. Deleted

37. 'INITIAL OPERATION' shall mean the first integral operation of the complete EQUIPMENT covered under the CONTRACT with sub-systems and supporting equipment in service or available for service and shall be undertaken as part of COMMISSIONING after completion of start up activities.

38. 'INSPECTOR' shall mean the duly authorised representative of the OWNER for stage wise or final inspection of WORKS or of EQUIPMENT or MATERIALS to be supplied under the CONTRACT.

39. ‘LEGISLATION’ means all applicable laws, directives, codes, statutes, rules, ordinances, approvals, licences, decrees, authorizations, by-laws, regulations, standards and any other requirement of any governmental authority or agency whether international national, state, municipal, local or other government subdivision, having the force of law in any place where the WORKS or any part of the WORKS are being carried out.

40. ‘MANUFACTURER’ shall mean a person or firm who is the producer and supplier of material and/or designer and/or fabricator of equipment to either the
OWNER, the CONTRACTOR or both under the CONTRACT.

41. ‘MATERIALS’ means machinery, plant and other items of equipment and materials intended to form part of the PLANT and other things needed for its operation, to be supplied by the CONTRACTOR.

42. "MECHANICAL COMPLETION" shall mean completion of erection to such an extent that the PLANT is ready for commissioning. This shall happen when:

A. The EQUIPMENT capable of producing to rated capacities are installed, aligned and grouted (wherever applicable) in accordance with drawings, specifications as per finally approved P&I Diagrams after HAZOP Studies and in accordance with all applicable codes, and laws.

B. All pressure EQUIPMENT are hydrostatically or pneumatically tested once either in CONTRACTOR'S shop or in the field in accordance with Technical Specifications.

C. Fired Heater and Boilers are hydrostatically or pneumatically tested. All non-operating preferring checks are made in accordance with the manufacturer's instructions.

D. Compressor, Turbine, Generator Pumps, Machinery etc. are cold aligned. Couplings are assembled and guards installed.

E. Instruments, control system, instrument cable, safety interlock are installed, inspected and such non-operating checks are made as to ensure operability in the manner required for the process application. Instrument air lines are checked for correct hook up. Air lines are leak tested.

F. Relief valves are installed prior to this, they will have been checked by the CONTRACTOR in the CONTRACTOR's shop.

G. Piping is hydrostatically or pneumatically tested in accordance with the specifications. Special treatment such as chemical cleaning is done as required by drawing or specifications. Suction screens are installed and test blinds are removed. Spring support anchors and guide are checked for removal of all shipping locks.

H. The electric system is installed and tested in accordance with and to the extent required by electrical specifications. All wiring is checked for correct hook up. Motor rotation is checked. All power system protective devices are set.

I. Insulation and drying out are completed to the extent necessary to permit start of commissioning and start up.
J. Pipe support system installed as per drawings.

K. Painting is completed. EQUIPMENT /MACHINERY, piping duly marked and labelled.

L. Safety equipments, systems are installed and checked for operations. Effluent management and treatment systems are installed and operational.

M. All Emergency & Instrument power system are checked and operating.

N. All chemical & lubricants are charged into the system.

O. PRECOMMISSIONING has been completed.

P. The PLANT is ready to take feed

Q. All packing and bed support materials are installed.

R. Liquidation of all punch list applicable for achieving MECHANICAL COMPLETION. Balance items of punch list, if any, shall be liquidated as mutually agreed

S. Temporary constructions facilities are removed to extent necessary to permit start of commissioning of Plant.

43. 'MONTH' shall mean the calendar month.

44. 'NOTIFICATION OF AWARD OF THE CONTRACT'/FAX OF ACCEPTANCE' refer Clause No. 36 of ITB.

45. 'NOTICE IN WRITING', 'WRITTEN NOTICE' shall mean a notice in written, typed or printed characters sent (unless delivered personally or otherwise proved to have been received) by registered post/ Speed Post to the last known private or business address or registered office of the addressee and shall be deemed to have been received when in the ordinary course of post it would have been delivered. Fax with Post copy confirmation.

46. ‘OTHER CONTRACTOR/OTHERS' shall mean any person(s) having a contract with the OWNER to design, supply, erect, set to work, or do any other thing to or in connection with any other plant and shall include their, heirs, legal representatives, successors and permitted assigns.

47. ‘OWNER’ shall mean M/s Talcher Fertilisers Limited having its registered office at Plot 2/H, Kalpana Area Nagar, Khordha, Bhubaneshwar – 751014 and shall include their, heirs, legal representatives, successors and permitted
assigns.

48. 'PERFORMANCE & GUARANTEE TESTS RUN (PGTR)' shall mean all operational checks and tests required to determine and demonstrate capacity, efficiency and operating characteristics and proving guarantees for work cost as specified in the CONTRACT documents.

49. ‘PLANT’ shall mean the Steam Generation Plant as defined in Section VI-1.0 of NIT.

50. ‘PRELIMINARY ACCEPTANCE’ shall mean that following milestones have been achieved (i) MECHANICAL COMPLETION has occurred, (ii) PRE-COMMISSIONING and COMMISSIONING of the PLANT have been accomplished, (iii) the Sustained Load Test has been passed successfully, (iv) PGTR has been conducted by LSTK Contractor and accepted by OWNER (v) All statutory approvals in the scope of Contractor, required to operate and maintain the PLANT have been obtained (vi) OWNER has received all DOCUMENTS required hereunder to start up, operate and maintain the PLANT (vii) OWNER has received all operations, maintenance, and spare parts manuals and instruction book necessary to operate and maintain the PLANT in a safe, efficient and effective manner (viii) all special tools and spare parts purchased by CONTRACTOR as provided herein have been delivered to OWNER; and (ix) CONTRACTOR has completed the training program of OWNERS personnel as required under this CONTRACT (x) All demonstration runs have successfully completed

51. ‘PRELIMINARY ACCEPTANCE CERTIFICATE’ shall mean that certificate issued by the ENGINEER-IN-CHARGE or OWNER to the CONTRACTOR following satisfaction of conditions under PRELIMINARY ACCEPTANCE, the acceptance of which commences the DEFECT LIABILITY PERIOD.

52. "PRE-COMMISSIONING" shall mean preparation of PLANT so that it is capable of operating on a continuous basis at or near rated capacity for carrying out COMMISSIONING activities.

53. 'PROJECT’ shall mean the Project specified in the Technical specification.

54. Deleted.

55. Deleted

56. Deleted

57. ‘SCC’ or SPECIAL CONDITIONS OF THE CONTRACT shall mean all the terms and conditions forming part of this agreement as defined in the Section V

58. 'SITE' shall mean and include the land and other places on, into or through which the EQUIPMENT and related facilities shall be erected and any adjacent land, paths, streets or reservoirs which may be allocated or used by the OWNER
or CONTRACTOR in the performance of the CONTRACT.

59. ‘SOFTWARE’ means all forms of software and firmware and their documentation.

60. 'SPECIFICATION' shall mean collectively all the terms and stipulations in Conditions of the CONTRACT, the Technical Specifications, schedules, detailed descriptions, statement of Technical Data, performance characteristics, standards & codes etc., and subsequent addenda issued thereto before the date of closing of bid and all written agreements made or to be made pertaining to the method and manner of performing the Work or to the quantities and the qualities of the materials to be furnished under this CONTRACT.

61. 'START UP' shall mean bringing the equipment covered under the CONTRACT from an inactive condition, when construction is essentially complete, to the state ready for initial operation. The start up shall include preliminary inspection and checkout of EQUIPMENT and supporting sub-systems; perform calibration and corrective action and chemical cleaning of the plant/system/equipment covered under the CONTRACT.

62. 'SUB-CONTRACTOR/SUB-VENDOR' shall mean any person or persons, or firm(s) including his/their, heirs, legal representatives, successors and permitted assigns selected by the CONTRACTOR with prior written approval of the OWNER for undertaking any part of the Works under the CONTRACT or to whom any part of the CONTRACT is sublet by the CONTRACTOR with the consent in writing of the OWNER.

63. ‘TAKING OVER’ AND ‘TAKEN OVER’ shall mean OWNER taking possession of and use of the PLANT following issue of PRELIMINARY ACCEPTANCE CERTIFICATE.

64. ‘TEMPORARY WORKS’ means all temporary works and structures of every kind constructed at the Site and required for the provision and construction of the PLANT.

65. 'TEST ON COMPLETION', shall mean all such tests as prescribed in NIT Documents to be performed by the CONTRACTOR have been carried out satisfactorily.

66. ‘THIRD PARTY SOFTWARE’ means standard Software which is owned by a third party.

67. ‘TOTAL CONTRACT PRICE” shall mean the sum accepted or the sum calculated in accordance with the prices accepted in tender and/or the CONTRACT rates as payable to the CONTRACTOR for the entire execution and full completion of the work, including change order.

68. Deleted

69. 'WEEK' shall mean continuous period of 7 (Seven) DAYS.
70. 'WORK' OR 'WORKS' means the design, engineering and other services to be provided by the Contractor including, but not limited to, the provision and construction of the PLANT and any Temporary Works and the subsequent dismantling or removal of the Temporary Works when no longer required, and any other works to be carried out by the CONTRACTOR in accordance with the CONTRACT.

71. 'WRITING' shall include any manuscript, typewritten or printed statement, under or over signature and/or seal as the case may be.

72. ‘NOTICE INVITING TENDER (NIT)/ BIDDING DOCUMENT’ means Complete Bidding Document as originally issued and any Addendum /Corrigendum/ Amendment(s) issued thereafter.

73. ‘MUTUALLY AGREED DAMAGES' (MAD) means the pre-defined mutually agreed rates between OWNER and CONTRACTOR as detailed in NIT representing the ‘CONTRACTOR’s liability (without possibility to recourse at Law) for the delay in achieving GUARANTEED COMPLETION DATE and / or for the failure to meet Works Cost Guarantee provided under Article 31 of GCC for reasons attributable to the CONTRACTOR.

4.0 CONTRACT CONFIRMATION

4.1 On acceptance of the bid of the successful bidder by the OWNER, such bidder shall be issued FAX OF ACCEPTANCE (FOA). The successful bidder will be required to give his unconditional acceptance in writing of FOA within 15 (fifteen) days. Thereafter a CONTRACT AGREEMENT as per format F-14 shall be executed between the OWNER and the BIDDER within fifteen (15) days from date of acceptance of FOA. CONTRACTOR shall sign the CONTRACT AGREEMENT and return it to the OWNER. The copy of the CONTRACT AGREEMENT shall be signed by an authorised officer of the CONTRACTOR in whose name Power of Attorney has been issued.

4.2 A 'DETAILED LETTER OF ACCEPTANCE (DLOA)' shall thereafter be issued by the OWNER.

4.3 If after issuance of FOA, CONTRACTOR fails to deposit the SECURITY CUM PERFORMANCE BANK GUARANTEE within the time period specified in the CONTRACT, the OWNER reserves the right to cancel the CONTRACT and forfeit the EMD without prejudice to various rights and remedies the OWNER may be entitled to as per terms and conditions of CONTRACT and without being liable in any manner whatsoever to the CONTRACTOR.

4.4 The DLOA and CONTRACT AGREEMENT will be signed in duplicate, one copy each for CONTRACTOR and OWNER.

5.0 MODIFICATIONS IN CONTRACT

5.1 All modifications leading to changes in the CONTRACT with respect to technical or commercial aspects including terms of completion period shall be considered valid only when accepted in writing by OWNER and CONTRACTOR by issuing amendment to the
CONTRACT. Issuance of acceptance or otherwise in such cases shall not be any ground for extension of agreed completion date (except in cases where completion period itself is revised by OWNER) and also shall not affect the performance of CONTRACT in any manner except to the extent mutually agreed to, through a modification to CONTRACT. The PARTIES shall have the right to modify or amend the CONTRACT subject to an adjustment in the CONTRACT PRICE and/ or COMPLETION DATE in accordance with the applicable provision of the CONTRACT, if any, and subject to mutual agreement.

5.2 OWNER shall not be bound by any printed conditions or provisions in the CONTRACT-OR's bid forms or acknowledgement of CONTRACT, packing list and other documents which support to impose any condition at variance with or supplemental to CONTRACT.

6.0 USE OF CONTRACT DOCUMENTS AND INFORMATION

6.1 The CONTRACTOR shall not, without the OWNER's prior written consent, disclose the CONTRACT or any provision thereof, or any specification, plan, drawing, pattern, sample or information furnished by or on behalf of the OWNER in connection therewith, to any person other than a person employed by the CONTRACTOR in the performance of the CONTRACT. Disclosure to any such employed person shall be made in confidence and shall extend only so far as may be necessary for purpose of such performance.

6.2 The CONTRACTOR shall not without the OWNER's prior written consent, make use of any document or information enumerated in Clause 6.1 except for purpose of performing the CONTRACT.

6.3 Any document other than CONTRACT, itself, enumerated in Clause 6.1 shall remain the property of the OWNER and shall be returned (all copies) to the OWNER on completion of the CONTRACTOR's performance under the CONTRACT if so required by the OWNER.

7.0 PATENT INFRINGEMENT AND INDEMNIFICATION

7.1 PATENT INFRINGEMENT

7.1.1 CONTRACTOR shall at all times, indemnify and keep indemnified OWNER against all claims or suits and defend, at its own cost, any suit or action brought against OWNER and hold OWNER free and harmless against all costs of such claims or suits which may be made against OWNER in respect of any infringement of any rights protected by patent, copyright, trademarks, and trade secrets to the extent that such claim, suit, or action is a result of the use of CONTRACTOR's Technical Information for the construction, maintenance, and operation of PLANT and the use of CONTRACTOR's and/or any other process licenser's processes used in PLANT. OWNER shall pass on all claims made against it to CONTRACTOR for settlement.

7.1.2 CONTRACTOR declares that to the best of its knowledge and belief the use of CONTRACTOR's Technical Information for the construction, maintenance, and operation of PLANT and the use of CONTRACTOR's processes used in PLANT will not infringe any valid patent rights of a third party. However, if at any time such infringement arises, CONTRACTOR agrees to keep OWNER indemnified and harmless against such claims and costs thereof and make arrangements that will allow OWNER to continue the operation of PLANT.
OWNER shall promptly advise CONTRACTOR in writing of any claim of infringement or any action for infringement of patents brought against it by a third party and based upon the use of CONTRACTOR's Technical Information. If such use is in accordance with instructions given in writing by CONTRACTOR, CONTRACTOR shall undertake the defence, or assist OWNER in the defence, of the claim or suit up to final judgment or settlement.

CONTRACTOR shall undertake the defence on behalf of OWNER and shall have sole charge and direction of the defence, and shall bear all costs related thereto. CONTRACTOR shall further hold OWNER harmless from any damages or other sums that may become payable by OWNER under a final judgment or settlement. However, OWNER shall render to CONTRACTOR all reasonable assistance that may be required by CONTRACTOR in the defence, and shall have the right to be represented therein by advisory counsel of its own selection and at its own expense.

In addition to the measures specified in Clause-7.1.4, CONTRACTOR may further, at its option, however, in reasonable consultation with OWNER, seek to abate the alleged infringement by modification of PLANT or its operation without adversely affecting the performance and/or secure for OWNER immunity from suit for infringement. In such case, CONTRACTOR shall bear/ reimburse OWNER for all costs related to said modification and to said immunity.

In the event that OWNER is legally restrained from operating PLANT on account of any infringement action or suit, CONTRACTOR shall take all possible actions to allow OWNER to operate and use PLANT.

Neither CONTRACTOR nor OWNER shall settle or compromise any suit or action without the written consent of the other if settlement or compromise obliges the other to make any payment or part with any property or assume any obligations or surrender any rights or to be subjected to any injunction by reason of such settlement or compromise.

INDEMNITIES

INDEMNIFICATION FOR LIABILITIES

CONTRACTOR Indemnification for Liabilities

To the fullest extent permitted by Law, CONTRACTOR assumes liability for and agrees to indemnify, protect, save and hold harmless OWNER from and against any and all Liabilities (including, any strict liability), arising out of acts or omissions of CONTRACTOR or its personnel or its agents in the performance of its obligations under the CONTRACT causing bodily injury, sickness, disease or death, damage to or loss of any property, and whether or not involving damage to WORKS or SITE that may be imposed on, suffered or incurred by or asserted against OWNER and in any way relating to or arising out of (i) WORK, any EQUIPMENT (ii) the presence, discharge, treatment, storage, transportation, disposal, escape or release of any Hazardous Substance, or the threat thereof, at, to or from SITE after commencement of work (any hazardous substance already existing at SITE before commencement of WORK excluded) (iii) The performance of WORK, or as a result of personal injuries (including wrongful death); (iv) the violation by CONTRACTOR or any SUB-CONTRACTOR/VENDOR of any Government Approval or applicable Law relating to WORK (v) any breach of CONTRACT with any SUB-CONTRACTOR/VENDOR, provided, however, that CONTRACTOR shall not be required
under this Clause to indemnify OWNER for any liability arising out of or resulting from events or circumstances occurring or existing after PRELIMINARY ACCEPTANCE OF PLANT except where the liability arises from an act or omission of CONTRACTOR or any SUB-CONTRACTOR/VENDOR or any other Person directly or indirectly employed by either of them or anyone for whose acts either of them may be liable that was a contributory cause of such liability.

7.2.2 **CONTRACTOR Indemnification for Taxes**

It is specifically understood that CONTRACTOR hereby accepts and assumes exclusive liability for and save and hold OWNER harmless from and against all Taxes arising from the performance of WORK, and all such Taxes shall be deemed to be included in CONTRACT PRICE.

7.2.3 **Indemnification by SUB-CONTRACTOR/VENDOR**

CONTRACTOR shall obtain from each SUB-CONTRACTOR/VENDOR, which is an affiliate, and shall use all reasonable efforts to obtain from each SUB-CONTRACTOR/VENDOR, an indemnification materially similar in form and substance to Clause-7.1 and Clause-7.2.2 of which the OWNER shall be named as beneficiary.

7.2.4 **Payment of Amounts under this Clause**

Except to the extent covered by insurance, all amounts payable and due by CONTRACTOR to OWNER under this Clause shall be deducted from CONTRACT PRICE or any other amounts owed by OWNER to CONTRACTOR here under. If such amounts payable by OWNER to CONTRACTOR are less than the amounts payable and due by CONTRACTOR under this Clause, CONTRACTOR shall be liable to OWNER for such excess and shall pay such amount to OWNER immediately upon demand.

7.2.5 **Permits and Certificates**

CONTRACTOR shall procure, at its expense, all necessary permits, certificates and licences required by virtue of all applicable laws, regulations, ordinances and other rules in force at the place where any of the works is to be performed, and CONTRACTOR further agrees to hold OWNER harmless from liability or penalty which might be imposed by reason of any asserted or established violation of such laws, regulations, ordinances or other rule. OWNER shall provide the necessary permits for CONTRACTOR's personnel to undertake any work in India in connection with CONTRACT.

7.2.6 **Mechanics Lien**

CONTRACTOR agrees to indemnify and hold harmless OWNER against all labourer's material, man's and/or mechanic's liens arising from its work, and shall keep the premises of OWNER free from all such claims, liens and encumbrances.

8.0 **CONTRACT PERFORMANCE SECURITY (CPS)**

8.1 The proceeds of **CPS** shall be appropriated by the OWNER as compensation for any loss resulting from the CONTRACTOR's failure to complete their obligations under the
CONTRACT without prejudice to any of the rights or remedies the OWNER may be entitled to as per terms and conditions of the CONTRACT.

8.2 The CPS shall be valid upto DEFECT LIABILITY PERIOD plus three months. The CONTRACTOR shall extend the validity of the CPS suitably if it is required due to delay in PRELIMINARY ACCEPTANCE of the PLANT at its own cost. The CPS shall be suitably extended in event of repair/replacement of equipment or any part thereof during DEFECT LIABILITY PERIOD to take care of extended warranty period of repair/replacement. The proforma for this bank guarantee is enclosed as F-4. The Bank Guarantee will be discharged by the OWNER after the CONTRACTOR's performance obligation including any warranty obligation under the CONTRACT. For any component replaced during DEFECT LIABILITY PERIOD, the component should work satisfactorily for a period of 12 months from the date of replacement.

The CPS shall be retained by OWNER during the currency of CONTRACT as indicated above, or till settlement of all the accounts thereof whichever is later. In case of any dispute or differences not settled within the validity of CPS, contractor shall arrange to get the CPS extended for the period asked for by OWNER. In case CPS is not extended as asked, OWNER shall have the sole discretion to 'call in' the bank to pay the whole or part of the amount of bank guarantee/CPS. The above deposit shall be deemed to be security for the faithful performance of the CONTRACT and for the purpose of section 74 of the Indian Contract Act, 1872 and for the extension of that section, the CPS shall deemed to be the bond given by the CONTRACTOR for the performance of essential duty. In the event of breach of any of the terms and conditions of the contract, OWNER shall have the right to draw from the CPS whole or part of the value of CPS. The amount so drawn shall not in any way affect any remedy to which OWNER may otherwise be entitled or any liability incurred by contractor under the contract or any law for the time being in force relating thereto or bearing here upon. This CPS shall be refunded 3 months after expiry of Defect Liability Period. It shall be lawful for OWNER if any differences or dispute is likely to arise to defer payment of the CPS or any portion thereof which may be due for release until such differences and dispute has been finally settled or adjusted. CPS amount shall not bear any interest.

NOTE:

In case CPS is submitted by way of Bank Guarantee, the non-judicial Stamp paper of appropriate value only or equivalent document value shall have to be purchased in the name of the bank executing the bank guarantee and not in the name of the CONTRACTOR.

8.3 Rights of the OWNER to forfeit CPS:

i) Whenever any claim against the CONTRACTOR for the payment of a sum of money arises out or under the CONTRACT, the OWNER shall be entitled to recover such sum by appropriating in part or whole the CPS of the CONTRACTOR. In the event of the security being insufficient or if no security has been taken from the CONTRACTOR, then the balance or the total sum recoverable, as the case may be shall be deducted from any sum then due or which at any time thereafter may become due to the CONTRACTOR. The CONTRACTOR shall pay to the OWNER on demand any balance remaining due.
ii) All compensation or other sums of money payable by the CONTRACTOR to the OWNER under terms of this CONTRACT may be deducted from or paid by the encashment or sale of a sufficient part of his CPS or from any sums which may be due or may become due to the CONTRACTOR by the OWNER of any account whatsoever and in the event of his Rights of the OWNER to forfeit CPS.

9.0 DELETED

10.0 MANNER OF EXECUTION OF CONTRACT

10.1 All documents as per Clause 2.0 of GCC shall be included in the DLOA.

10.2 Every page of the CONTRACT agreement shall be initialled by the authorised representatives of OWNER and CONTRACTOR under the Seal of their respective Companies.

10.3 The CONTRACT agreement shall be prepared on Non-Judicial stamp paper of appropriate value as per specified Form of Contract as per format F-14. Cost of Non-Judicial stamp paper shall be borne by CONTRACTOR.

10.4 The CONTRACTOR shall present the above CONTRACT AGREEMENT so prepared in two Sets along with proper Power of Attorney and other requisite material on the day of signing the agreement.

10.5 Notwithstanding anything mentioned in any other clause, any conditions imposed from time to time by Government of India shall be followed by the CONTRACTOR.

11.0 Deleted

12.0 ASSIGNMENT OR SUBLETTING OF CONTRACT AND SUB-CONTRACTING

12.1 Neither CONTRACTOR nor OWNER shall assign CONTRACT or any part of it or any share of interest therein, without the prior written consent of the other party. This consent shall not be unreasonably denied.

12.2 CONTRACTOR shall not subcontract the whole or any part of WORK without the prior written consent of OWNER provided always that CONTRACTOR may subcontract any part of WORK to any of its affiliates or subsidiaries in which event CONTRACTOR shall remain fully responsible to OWNER for the work performed by such affiliates.

12.3 Sub-Contracts and Purchase Orders

12.3.1 General
All vendors, suppliers, consultants and SUB-CONTRACTORS/ SUB-VENDORS providing equipment, materials, construction equipment, or services to CONTRACTOR under a
SUBCONTRACT, purchase order or similar purchase form or arrangement with CONTRACTOR for the performance of the WORK under this CONTRACT are herein referred as "SUB-CONTRACTORS"/ "SUB-VENDORS", and any such SUB-CONTRACTS, purchase orders and similar purchase forms and arrangement entered into by or on behalf of CONTRACTOR with SUB CONTRACTORS/SUB-VENDORS are herein referred to as "SUB-CONTRACTS" provided that none of OWNER's CONTRACTOR'S or SUB-CONTRACTOR'S/ SUB-VENDOR'S shall be deemed to be a SUB-CONTRACTOR/ SUB-VENDOR under the CONTRACTOR. The CONTRACTOR shall be obligated to select SUB-CONTRACTORS/ SUB-VENDORS it retains in connection with the performance by CONTRACTOR of the WORK from the SUB-CONTRACTOR'S/ SUB-VENDOR'S list which would be finalised and approved by the OWNER. OWNER and CONTRACTOR may by mutual agreement add to or delete from such list from time to time and approve any successor or replacement of any person listed on such list or any other vendor, supplier, material-man, consultant or SUB-CONTRACTOR/ SUB-VENDOR.

12.3.2 Approval of Major SUB-CONTRACTOR/SUB-VENDOR

12.3.2.1 The vendor list for procurement of EQUIPMENT and the list of SUB-CONTRACTOR/ SUB-VENDOR shall be as attached in the Section VI of NIT. Any changes to such list of SUB-CONTRACTOR/SUB-VENDOR shall require the prior approval of OWNER. CONTRACTOR shall provide name, address, fax number and name of contact person of major SUB-CONTRACTORS/SUB-VENDORS for use in future, to OWNER. SUB-CONTRACTOR/SUB-VENDOR as per agreed Vendor list are not subject to approval.

12.3.2.1.1 Under normal circumstance a bidder shall not be allowed to source any equipment/machinery from the vendors other than the Owners approved vendor list. However, in exceptional circumstance the bidder may suggest additional vendors meeting the following requirement for the approval of Owner.

   a. The BIDDER should specify, while pre-qualifying the Vendors, that during the past 7 years the Vendor should have supplied at least two similar plant equipments or machinery. The BIDDER should satisfy themselves that sufficient documentary proof is submitted by the Vendors in support of this criterion. However, in case of critical equipment, in addition to above criterion, the Vendor should also be prequalified by Process Licensor.

   b. The Bidder would be ultimately responsible for verifying the credentials, the quality of the equipment, machinery and timely supply.

12.3.2.2 The review, approval and consent by OWNER as to the agreed SUB-CONTRACTOR's/SUB-VENDOR List or as to CONTRACTOR's entering into any SUB-CONTRACT / PURCHASE ORDER shall not relieve CONTRACTOR of any of its duties, liabilities or obligations under this CONTRACT and CONTRACTOR shall be liable hereunder to the same extent as if any such Subcontract had not been entered into.

12.3.2.3 (a) CONTRACTOR shall provide to OWNER such information concerning the SUB-CONTRACTORS as OWNER may from time to time reasonably request and shall ensure that each SUBCONTRACT contains provisions in all material respects not less stringent than the provisions of the CONTRACT and shall include terms and provisions required to be included...
pursuant to the CONTRACT. In the event of termination of the CONTRACT under Clause 34.0 herein, CONTRACTOR shall forthwith deliver to OWNER a copy of each SUBCONTRACT.

(b) CONTRACTOR shall supervise and direct the work of all SUBCONTRACTORS/SUB-VENDORS and shall be responsible for all design, engineering, procurement, manufacturing, transportation, delivery, fabrication, construction, commissioning, start-up and testing means, erection, operation, maintenance, repair, methods, techniques, sequences and procedures of, and for co-coordinating the work of SUB-CONTRACTORS/ SUB-VENDORS.

(c) If CONTRACTOR fails to correct, or commence to correct and execute the correction with due diligence of deficient or defective work performed by any SUB-CONTRACTOR/SUB-VENDORS within reasonable time (provided it doesn’t materially impact safe operation of plant), after receipt by CONTRACTOR of a notice from OWNER with respect thereto, OWNER may (but shall not be obligated to), after seven days following receipt by CONTRACTOR of an additional notice, and without prejudice to any other right or remedy take all reasonable steps to remedy such defective or deficient work at risk and cost of CONTRACTOR.

(d) CONTRACTOR shall require all SUB-CONTRACTORS/SUB-VENDORS to perform the SUB-CONTRACTS in accordance with the relevant requirements of the CONTRACT including FINAL PROPOSAL, all APPLICABLE LAWS and APPLICABLE PERMITS, Prudent Utility Practice, Good Engineering Practices, the requirements of the NIT, and all Warranties of SUB-CONTRACTORS/SUB-VENDORS and Manufacturers and all insurance policies relating to the PLANT or the WORK.

(e) CONTRACTOR shall be solely responsible for paying each SUB-CONTRACTOR/SUB-VENDOR and any other person to whom any amount is due from CONTRACTOR for services, equipment, construction equipment, materials or supplies otherwise related to the PLANT or the WORK. CONTRACTOR shall take all reasonable steps and actions to ensure that such services, equipment, construction equipment materials and supplies and the like have been or will be received, inspected and approved and that such services have been or will be properly performed.

(f) In performing the duties incidental to its responsibilities hereunder, CONTRACTOR shall issue to the SUB-CONTRACTORS/SUB-VENDORS such directives and impose such restrictions as may be required to obtain such compliance herewith and with the terms of the SUB-CONTRACTS.

12.3.2.4 SUB-CONTRACTOR/VENDOR AND MANUFACTURER WARRANTIES

(a) CONTRACTOR shall ensure that all equipment and other items used in connection with the performance of the WORK or incorporated in the PLANT (other than minor items) will be purchased in compliance with CONTRACT Technical Specifications and requirements in order to allow the Plant to achieve the Guarantee and Warrantee as provided for in the CONTRACT, unless otherwise agreed with OWNER. Any residual warranty from subcontractor/vendor shall be passed to the OWNER after expiry of DEFECT LIABILITY PERIOD.

(b) Neither CONTRACTOR nor its SUB-CONTRACTORS/SUB-VENDORS nor any
person under the control of either thereof, shall take any action which could release, void, impair or waive any Guarantee or Warranty on EQUIPMENT or services relating to the PROJECT or the WORK. Any residual warranty from sub-contractor/sub-vendor shall be passed to the OWNER after expiry of DEFECT LIABILITY PERIOD.

(c) Nothing in this clause shall derogate from the obligations of CONTRACTOR to provide the Guarantees and Warranties described in and to comply with the provisions hereinabove.

(d) CONTRACTOR shall, based on its past professional judgement enforce all guarantees and warranties provided hereunder to the fullest extent thereof till such time they are transferred to the OWNER pursuant to sub-clause (g) below.

(e) Upon the expiration or termination of any of the guarantees or warranties provided by CONTRACTOR pursuant to the CONTRACT, the CONTRACTOR shall assign, and hereby assigns, effective as of such date, or otherwise make available, to OWNER all of CONTRACTOR's rights under all such SUBCONTRACTOR's residual Guarantees and Warranties as per 12.3.2.4(a) & (b) (except to the extent CONTRACTOR has thereof provided warranty services to OWNER and is enforcing CONTRACTOR's rights with respect to such services under the applicable guarantee or warranty) and shall deliver to OWNER copies of all contracts providing for such guarantees and warranties.

(f) CONTRACTOR, in accordance with the CONTRACT, shall require all SUBCONTRACTORS/SUB-VENDORS to be covered by the insurance covers specified in the CONTRACT, during the time in which they are engaged in performing WORK.

(g) CONTRACTOR shall require all SUB-CONTRACTORS/SUB-VENDORS to release and waive any and all rights of recovery against OWNER including its affiliates, subsidiaries, employees, successors, permitted assigns, insurers and underwriters) and against CONTRACTOR and all other SUB-CONTRACTORS/ VENDORS which the releasing SUB-CONTRACTOR/ VENDOR may otherwise have or acquire, in or from or in any way connected with any loss covered by policies of insurance maintained or required to be maintained pursuant to this the CONTRACT (other than third party liability insurance policies) or because of deductible clauses in or inadequacy of limits of any such policies of insurance. CONTRACTOR shall further require all SUB-CONTRACTORS/VENDORS to include in all policies of insurance maintained by the SUB-CONTRACTORS/VENDORS clauses providing that each underwriter shall release and waive all of its rights of recovery, under subrogation or otherwise, against OWNER, its promoters, affiliates, subsidiaries, employees, successors, permitted assigns, insurers and underwriters, and against CONTRACTOR and all other SUB-CONTRACTORS/VENDORS.

(h) OWNER shall not be deemed by virtue of the CONTRACT to have any contractual obligation to or relationship with any SUB-CONTRACTOR/VENDOR.
12.3.2.5 CONTRACTOR's LIABILITY FOR APPROVED SUB CONTRACTOR:

The review by and approval and consent of OWNER as to the approved SUB-CONTRACTORS list or as to CONTRACTOR entering into any SUB-CONTRACT with any approved SUB-CONTRACTOR or as to any WORK done or supply made or services provided by any such approved SUB-CONTRACTOR/ SUB-VENDOR shall not relieve CONTRACTOR of any of his duties, liabilities or obligations under this CONTRACT, and CONTRACTOR shall be liable hereunder to the same extent as if any such SUB-CONTRACT had not been entered into. Any inspection review or approval by OWNER permitted under this CONTRACT of any portion of the work or of any work in progress by CONTRACTOR or SUB-CONTRACTORS/ SUB-VENDORS shall not relieve CONTRACTOR of any duties, liabilities or obligations under this CONTRACT.

12.3.3 All WORK performed or EQUIPMENT supplied by SUB-CONTRACTOR/ SUB-VENDOR shall be pursuant to an appropriate SUB-CONTRACT, PURCHASE ORDER or similar agreement which shall, as appropriate, contain provisions that:

12.3.3.1 Preserve and protect all the rights of OWNER here under for WORK to be performed or EQUIPMENT to be supplied under PURCHASE ORDER or SUB-CONTRACT.

12.3.3.2 Require that such WORK be performed or EQUIPMENT be fabricated, supplied and installed in strict accordance with the applicable requirements of this CONTRACT.

12.3.3.3 Obligate such SUB-CONTRACTOR/SUB-VENDOR to consent to and be bound by those obligations under this CONTRACT which by their terms are intended to also obligate such SUB-CONTRACTOR/VENDOR, including the provisions of this Clause.

12.3.3.4 Require such SUB-CONTRACTOR/ SUB-VENDOR to provide and maintain adequate insurance consistent with requirements for companies of similar size and performing similar services. Permit the assignment of such SUB-CONTRACT/PURCHASE ORDER by CONTRACTOR to OWNER.

12.3.4 CONTRACTOR RESPONSIBLE FOR WORK

12.3.4.1 CONTRACTOR is responsible for WORK, and that the performance thereof conforms in all respects to the requirements of this CONTRACT, regardless of any failure of any SUB-CONTRACTOR/VENDOR to perform or any disagreement between any SUB-CONTRACTOR/VENDOR or between any SUB-CONTRACTOR/VENDOR and CONTRACTOR. CONTRACTOR shall furnish such information relative to its SUB-CONTRACTOR/VENDOR (including copies of unpaid SUB-CONTRACT or PURCHASE ORDER) as OWNER may request.

12.3.5 DAMAGES

12.3.5.1 It is within the discretion of Contractor, that CONTRACTOR shall agree to hold all SUB-CONTRACTOR/VENDOR, including all persons directly or indirectly employed by them, responsible for any damages due to breach of CONTRACT caused by them or any negligent act and to diligently endeavour to effect recoveries in such damages.
13.0 STANDARDS

The goods and services supplied under this CONTRACT shall conform to the standards mentioned in the technical specifications and when no applicable standard is mentioned, CONTRACTOR to follow best engineering practices.

14.0 INSTRUCTIONS, DIRECTIONS

14.1 The materials described in CONTRACT are to be supplied according to the standards, data sheets, tables, specifications and drawings attached hereto and/or enclosed with the CONTRACT itself and according to all conditions both general and specific enclosed with the CONTRACT, unless any or all of them shall have been modified or cancelled in writing as a whole or in part.

A) All instructions and orders to CONTRACTOR shall, excepting what is herein provided, be given by OWNER/ CONSULTANT.

B) All the work shall be carried out under the direction of OWNER and according to the CONTRACT requirements.

C) All communications including technical / commercial clarifications and / or comments shall bear reference to the CONTRACT.

D) Invoice for payment against CONTRACT shall be addressed to OWNER.

E) The CONTRACT/DLOA number shall be shown on all invoices, communications, packing lists, containers and bills of lading etc.

15.0 INSPECTION, TESTING AND EXPEDITING

15.1 The OWNER or his representatives shall have their right to inspect and/or to test the goods to conform to the specifications laid down in the CONTRACT. The SPECIAL CONDITIONS OF CONTRACT and/ or the TECHNICAL SPECIFICATIONS shall specify what inspections and test the OWNER require and where they are to be conducted. The OWNER shall notify the CONTRACTOR in writing of the identity of any other representatives retained for this purpose. Expediting by OWNER's representative in no way relieves the CONTRACTOR of his obligation under the terms and conditions of this CONTRACT.

15.2 The inspections and tests may be conducted on the premises of the CONTRACTOR or his SUB-CONTRACTOR at point of completion and/or at the good's final destination. When conducted on the premises of the CONTRACTOR or his SUBCONTRACTOR, all reasonable facilities and assistances including access to drawings and production data shall be furnished to the inspector at no charge to the OWNER.

15.3 CONTRACTOR shall be held responsible for any possible delay in the approval or testing phase as well as for any possible delay in the remittance of necessary certificates. Delay on the part of the Inspection institutions will not be considered a case of 'Force Majeure'.

15.4 Participation or presence of OWNER or their representatives at any tests or their failure to be present at or to witness any tests to be undertaken pursuant here to shall not in any way or manner relieve or release the CONTRACTOR from any of its warranties, guarantees or other obligations under the CONTRACT.
15.5 Copies of all test results/report of the tests shall be furnished promptly by the CONTRACTOR to the OWNER.

16.0 TIME SCHEDULE AND PROGRESS REPORTING

16.1 Time Schedule Network/Bar Chart

16.1.1 Together with the CONTRACT confirmation, CONTRACTOR shall submit to OWNER, his time schedule regarding the documentation, supply and manufacture of equipment and materials as well as information of his SUBCONTRACTS to be placed with third parties, including the dates on which CONTRACTOR intends to issue such SUB CONTRACTS. A complete activity-wise time schedule shall be furnished by the CONTRACTOR within 30 days from the date of issuance of FOA.

16.1.2 The time schedule will be in the form of a network or a bar chart clearly indicating all main or key events regarding documentation, supply of raw materials, manufacturing, testing, delivery, erection & commissioning.

16.1.3 The original issue and subsequent revisions of CONTRACTOR's time schedule and/or SUB-CONTRACTORS' time schedules shall be sent in two copies to OWNER.

16.1.4 The time schedule network/bar chart shall be updated at least every month using the latest ‘Project Management software’, i.e. Primavera (latest version), acceptable to the OWNER.

16.2 PROGRESS TREND CHART/MONTHLY REPORT

16.2.1 CONTRACTOR shall report fortnightly to OWNER, the progress of the execution of CONTRACT and achievement of targets set out in time bar chart.

16.2.2 The progress will be expressed in percentages shown in the progress trend chart.

16.2.3 The first issue of the progress trend chart will be forwarded together with the time bar chart along with CONTRACT confirmation.

16.2.4 The monthly reporting will bear the updating of the progress trend chart.

16.2.5 OWNER or his representatives shall have the right to inspect CONTRACTOR's premises to evaluate the actual progress of work on the basis of CONTRACTOR's time schedule documentation.

16.2.6 Irrespective of such inspection, CONTRACTOR shall advise OWNER at the earliest possible date of any anticipated delay in the programme indicating the reasons thereof and corrective measures proposed thereto.

16.2.7 The time for completion and phased time schedule shall be subject to and in accordance with the provision of Sub-Clauses 16.2.8 and 16.2.9 below.

16.2.8 Neither OWNER nor CONTRACTOR shall be considered in default in performance of their obligations if such performance is prevented or delayed by FORCE MAJEURE conditions as stated in Clause 35.0.

16.2.9 Should the CONTRACTOR's preparation for the commencement of the work or any portion of it or its subsequent rate of progress be from any cause whatsoever, so slow and reasons for delay solely attributed to the contractor, the CONTRACTOR will not be able to complete the work or any portion thereof within the stipulated time for completion, the provisions of Clause 34 of GCC shall apply.
17.0 CONTRACTOR TO INFORM HIMSELF FULLY

The CONTRACTOR in fixing his rate shall for all purpose whatsoever reason may be, deemed to have himself independently obtained all necessary information for the purpose of preparing his tender and his tender as accepted shall be deemed to have taken into account all contingencies as may arise due to such information or lack of same. The correctness of the details, given in the Tender Document to help the CONTRACTOR to make up the tender is not guaranteed.

The CONTRACTOR shall be deemed to have examined the CONTRACT DOCUMENTS, to have generally obtained his own information in all matters whatsoever that might affect the carrying out of the works at the schedules rates and to have satisfied himself to the sufficiency of his tender. Any error in description of quantity or omission there from shall not vitiate the CONTRACT or release the CONTRACTOR from executing the work comprised in the CONTRACT according to DRAWINGS and SPECIFICATIONS at the scheduled rates. He is deemed to have known the scope, nature and magnitude of the WORKS and the requirements of materials and labour involved etc., and as to what all works he has to complete in accordance with the CONTRACT documents whatever be the defects, omissions or errors that may be found in the DOCUMENTS. The CONTRACTOR shall be deemed to have visited surroundings, to have satisfied himself to the nature of all existing structures, if any, and also as to the nature and the conditions of the Railways, Roads, Bridges and Culverts, means of transport and communication, whether by land, water or air, and as to possible interruptions thereto and the access and egress from the site, to have made enquiries, examined and satisfied himself as to the sites for obtaining sand, stones, bricks and other materials, the sites for disposal of surplus materials, the available accommodation as to whatever required, depots and such other buildings as may be necessary for executing and completing the works, to have made local independent enquiries as to the sub-soil, subsoil water and variations thereof, storms, prevailing winds, climatic conditions and all other similar matters effecting these works. He is deemed to have acquainted himself as to his liability of payment of Government Taxes, Customs duty and other charges, levies etc.

Any neglect or omission or failure on the part of the CONTRACTOR in obtaining necessary and reliable information upon the foregoing or any other matters affecting the CONTRACT shall not relieve him from any risks or liabilities or the entire responsibility from completion of the works at the scheduled rates and times in strict accordance with the CONTRACT.

It is, therefore, expected that should the CONTRACTOR have any doubt as to the meaning of any portion of the CONTRACT DOCUMENT he shall set forth the particulars thereof in writing to OWNER in duplicate, before submission of tender. The OWNER may provide such clarification as may be necessary in writing to CONTRACT, such clarifications as provided by OWNER shall form part of CONTRACT DOCUMENTS.

No verbal agreement or inference from conversation with any effect or employee of the OWNER before, during or after the execution of the CONTRACT agreement shall in any way affect or modify and of the terms or obligations herein contained.
Any change in layout due to site conditions or technological requirement shall be binding on the CONTRACTOR and no extra claim on this account shall be entertained.

18.0 **SUITABILITY OF PLANT FOR INTENDED PURPOSE**

18.1 The CONTRACTOR warrants that the PLANT will be suitable in all respects for the purpose mentioned or inherent in the specification and as defined in the CONTRACT.

18.2 Without limiting the generality of the foregoing clause, the CONTRACTOR shall ensure before complying with any direction, that compliance by the CONTRACTOR with that direction will not render the plant unsuitable in any respect for the aforesaid purposes or otherwise prevent the CONTRACTOR from carrying out the CONTRACT in accordance with the terms thereof.

18.3 The CONTRACTOR shall give notice to the OWNER within Twenty one (21) days after receipt of any requirement or direction which he considers will render the plant unsuitable in any respect or is not in accordance with the meaning and intent of the CONTRACT otherwise prevent the CONTRACTOR from carrying out the CONTRACT or as aforesaid and submit to the OWNER a proposal or proposals for modifying the requirement or direction. Failure to file an objection within the allotted time will be considered as acceptance of the OWNER decision and the decision shall become final and binding.

19.0 **FEES FOR ROYALTIES AND PATENT RIGHTS**

19.1 **Payment Due to be Included in CONTRACT PRICE**

19.1.1 All payments for royalties, patent rights and fees due to or payable for or in connection with any matter or thing used or required to be used in performance of the CONTRACT or to be supplied under the CONTRACT, whether payable in one sum or by instalments or otherwise, shall be included by the CONTRACTOR in the prices named in the CONTRACT and shall be paid by CONTRACTOR to whom such payments may be due or payable.

19.1.2 The CONTRACTOR, if licensed under any patent covering equipment, machinery, materials or compositions of matter to be used or supplied or methods and process to be practiced or employed in the performance of this CONTRACT, agrees to pay all royalties and license fees which may be due with respect thereto. If any equipment, machinery, materials, composition of matters, be used or supplied or methods and processes to be practiced or employed in the performance of this CONTRACT, is covered by a patent under which the CONTRACTOR is not licensed then the CONTRACTOR before supplying or using the equipment, machinery materials, composition method or processes shall obtain such licenses and pay such royalties and license fees as may be necessary for performance of this CONTRACT. In the event the CONTRACTOR fails to pay any such royalty or obtain any such license, any suit for infringement of such patents which is brought against the CONTRACTOR or the OWNER as a result such failure will be defended by the CONTRACTOR at his own expense and the CONTRACTOR will pay any damages and costs awarded in such suit.
The CONTRACTOR shall promptly notify the OWNER if the CONTRACTOR has acquired the knowledge of any plant under which a suit for infringement could be reasonably brought because of the use by the OWNER of any equipment, machinery, materials, process, methods to be supplied hereunder. The CONTRACTOR agrees to and does hereby grant to OWNER, together with the right to extend the same to any of the subsidiaries of the OWNER as irrevocable, royalty free license to use in any country, any invention made by the CONTRACTOR or his employee in or as result of the performance of the WORK under the CONTRACT.

19.2 Payment to the CONTRACTOR by OWNER

19.2.1 Final payment to the CONTRACTOR by the OWNER will not be made while any such suit or claim remains unsettled. In the event any apparatus or equipment or any part thereof furnished by the CONTRACTOR is in such suit or proceedings, held to constitute infringement, and its use is enjoined, the CONTRACTOR shall, at his option, and at his own expense, either procure for the OWNER the right to continue use of the said apparatus, equipment or part thereof, replace it with non-infringing apparatus or equipment or modify it, so that it becomes non-infringing.

20.0 ACTS OF PARLIAMENT, LOCAL AND OTHER AUTHORITIES REGULATIONS AND BYE-LAWS

20.1 Complying With Regulations

20.1.1 Throughout the execution of the WORK, the CONTRACTOR shall comply with the requirements of all applicable laws and regulations, bye-laws or orders made there under and to the requirements of public, municipal and other authorities in any way affecting or applicable to the work. The OWNER shall, when requested by the CONTRACTOR, give all reasonable assistance to the CONTRACTOR in obtaining information concerning local conditions.

20.1.2 Before making any departure from the specification or drawings which may be necessary to conform to such requirements, the CONTRACTOR shall give the OWNER written notice specifying the departure proposed to be made and the reason for making it and applying for instructions thereon. If the CONTRACTOR does not receive such instructions within thirty (30) days, he shall conform to those requirements and inform the OWNER accordingly.

20.2 Notices and Fees

The CONTRACTOR shall give all notices required to be given by the Acts, regulations, bye-laws, orders and requirements referred to in sub-clause 20.1 of this clause and shall pay all fees payable in connection herewith.

Any additional fee becoming applicable due to any change of Acts, regulations, by-laws, orders and requirements after date of submission of FINAL PROPOSAL shall be borne by OWNER in accordance with SCC clause 3.0.
21.0 TIME- PROJECT SCHEDULE

21.1 Without prejudice to anything contained in the CONTRACT, the time and the date of completion of the works as stipulated in the CONTRACT shall be deemed to be of the utmost importance. The CONTRACTOR shall so organise his resources and perform his work so as to complete it within the completion period.

21.2 The contractor shall submit the Primavera Level 4 schedule within thirty (30) days from date of issuance of FOA.

The Primavera Level 4 schedule shall be for OWNER’s review and be based on a level 2 schedule as attachment to the CONTRACT. Such level 2 schedule shall show the execution periods for (i) engineering, (ii) procurement & delivery of equipment and materials, (iii) civil & erection (iv) Mechanical Completion and (v) commissioning, testing.

Bidder shall be contractually obliged to issue a Primavera Level 4 schedule provided that such schedule shall not (i) accelerate the OWNER obligations (to be agreed upon prior to Contract award) (ii) change the GUARANTEED COMPLETION DATE.

21.3 The above Primavera Level 4 schedule shall be periodically reviewed and reports shall be submitted by the CONTRACTOR as directed by the OWNER.

22.0 CONTRACT PRICE

22.1 CONTRACT PRICE is inclusive of the cost/fees of CONTRACTOR’s obligations as given below briefly but not limited to the following:

a. Detailed Engineering
b. Basic Engineering
c. Supply of all Plant, Equipment, Bulk Materials, Chemicals & Lubricants and consumables
d. 6 months supervisory assistance
e. Supply of spares and consumables, lubricants, chemicals for commissioning
f. all applicable taxes and duties under GST, Indian Income Tax, etc.
g. Civil and Structural works,
h. Forwarding charges, if applicable,
i. Freight up to SITE including taxes,
j. Unloading, storage at Site, Site Assembly, Erection, Pre-Commissioning and Commissioning until Preliminary Acceptance of Plant.
k. Insurance
l. All taxes as applicable in India and outside India for execution of work under CONTRACT.
m. Inspection and expediting charges
n. Project management and overheads,
o. Guarantee test runs and handing over of PLANT to OWNER.

p. All other costs, expenses and outgoings of the CONTRACTOR not otherwise expressly set forth herein necessary, required or incidental to the full, complete and proper performance and discharge of the CONTRACTOR’s obligations under and in accordance with the CONTRACT including completion of the PLANT in all respects and overheads of the CONTRACTOR.

22.2 OWNER shall pay to CONTRACTOR a lump-sum fixed CONTRACT PRICE, for the due and faithful performance of CONTRACTOR's obligations under the CONTRACT. CONTRACT PRICE provided for in this Clause covers entire consideration payable to CONTRACTOR for all obligations of CONTRACTOR.

22.3 CONTRACT PRICE is inclusive of cost of all travel, accommodation, living costs and all other expenses of management and personnel of CONTRACTOR, SUB-CONTRACTOR, VENDOR and their agents for travelling to and from plant SITE and other places/countries as may be necessary for the proper performance of CONTRACTOR's responsibilities under CONTRACT and shall also include all costs and expenses incurred in attending such meetings in connection with CONTRACT as OWNER may reasonably require.

22.4 CONTRACT PRICE is inclusive of cost of all CONTRACTOR’s EQUIPMENT, materials, services, etc. required to complete WORK under CONTRACT.

22.5 Deleted

22.6 All taxes, duties, licence fees and other such levies as may be applied to the CONTRACT both in CONTRACTOR's country and in India, including Custom Duty, all applicable taxes & duties under GST. Corporate income tax in respect of the performance of the CONTRACT as well as income tax on the personnel deputed by the CONTRACTOR to India in connection with the CONTRACT shall be to the account of the CONTRACTOR.

23.0 DEDUCTIONS FROM CONTRACT PRICE

All costs, damages or expenses which the OWNER may have paid for which, under the CONTRACT, the CONTRACTOR is liable, will be claimed by the OWNER. All such claims shall be billed by the OWNER to the CONTRACTOR regularly as and when they fall due. Such claims shall be paid by the CONTRACTOR within fifteen days of the receipt of the corresponding bills and if not paid by the CONTRACTOR within the said period, the OWNER may then deduct the amount from any bill due or becoming due by him to the CONTRACTOR under the CONTRACT or may be recovered by action of law or otherwise, if the CONTRACTOR fails to satisfy the OWNER of such claims.

24.0 Deleted
25.0 PAYMENT TERMS

25.1 The payment to CONTRACTOR for the performance of the WORKS under the CONTRACT will be made by OWNER as per the guidelines & conditions specified in Section V i.e. SPECIAL CONDITIONS OF CONTRACT.

25.2 Schedule of Payment

The CONTRACTOR shall submit billing schedule which is to be approved by the OWNER. The CONTRACTOR shall submit all invoices for a particular month under a single covering letter (once in a month) based on the billing schedule duly certified by OWNER with related documents.

25.3 Due Date for Payment

OWNER will make progressive payments as and when the payment becomes due as per the terms of payment set forth in the CONTRACT. Payment will become due and payable by OWNER within 30 days, except Final Payment, from the date of receipt of CONTRACTOR'S bill/invoice by OWNER provided the documents submitted are complete in all aspects and are submitted as per billing schedule.

25.4 Payment Methodology

Bidder shall enclose all documents as per check list issued by PMC/OWNER. After receipt of complete RA Bill as per terms and conditions of the contract and duly certified by Engineer-in-Charge (EIC) / PMC, on-account payment equivalent to seventy percent (70%) of the net payable certified amount of the RA Bill will be released to the Contractor within a period of seven (07) working days from submission of certified bill by PMC to TFL. The balance amount will be released within a period of 15 days from submission of certified bill by PMC to TFL.

26.0 TAXES APPLICABLE TO CONTRACTOR’S MANPOWER, TURNOVER, EQUIPMENT, ETC.

26.1 The CONTRACTOR shall be liable and pay all taxes, duties, levies, lawfully assessed against the OWNER or the CONTRACTOR in pursuance of the CONTRACT. The CONTRACTOR shall be solely responsible for all taxes that may be levied on the CONTRACTOR's turnover & profit or on the earnings of any of his employees or personnel engaged by him and shall hold the OWNER indemnified and harmless against any claims that may be made against the OWNER in this behalf. The OWNER does not undertake any responsibility whatsoever regarding any taxes levied on CONTRACTOR and/or his personnel by Centre/State/Local Authorities. The Taxes shall be deducted where the said provisions shall be applicable and/or obligatory on the part of the OWNER.

26.2 For CONTRACTORS who have to bring equipment and material from outside Odisha, will have to obtain necessary registrations and take appropriate steps as required under Odisha State Laws. Further, form 38 / E-Waybill / Road Permit shall be issued by the CONTRACTOR in such cases, wherever applicable. Necessary statutory registrations as required shall be done by CONTRACTOR in this regard.

26.3 CONTRACTOR is responsible for obtaining Customs clearance permit for temporary importation on re-export basis of CONTRACTOR’S EQUIPMENT, tools and tackles etc. If any duties, taxes and expenses are payable on this, the same will be to CONTRACTOR'S account.
27.0 PACKING, FORWARDING AND SHIPMENT

27.1 The CONTRACTOR shall give complete despatch information concerning the weight, size, content of each package including any other information the OWNER may require.

27.2 The CONTRACTOR, wherever applicable shall after proper painting, pack and crate all equipment in such a manner as to protect it from deterioration and damage during rail and road transportation to the site and storage at the site till the time of erection. The CONTRACTOR shall be held responsible for all damages due to improper packing.

27.3 The CONTRACTOR shall notify the OWNER of the date of each shipment from his works, and the expected date for arrival at the site for the information of the OWNER. The CONTRACTOR will be responsible for arranging any requirement of over-dimensional, special rail/road wagon/trailer for transporting.

27.4 The CONTRACTOR shall also give all shipping information concerning the weight, size and content of each package including any other information the OWNER may require. The size of the largest packages being considered as over dimensional consignments shall be as per the latest guidelines.

27.5 The CONTRACTOR shall prepare detailed packing lists of all packages and containers, bundles and loose materials forming each and every consignment despatched to the site. The CONTRACTOR shall further be responsible for making all necessary arrangements for loading, unloading and other handling, right from works till the SITE and also till the EQUIPMENT is erected, tested and commissioned. The CONTRACTOR shall be solely responsible for proper storage and preservation of all equipments & machineries etc.

28.0 INSURANCE

28.1 CONTRACTOR shall take in the joint name of CONTRACTOR and OWNER comprehensive transit insurance for imported and indigenous goods. Transit-cum-Storage-Erection insurance or its equivalents and third party liability insurance policies shall be taken with reputed underwriters to cover ALL RISK whatsoever during the whole period starting with dispatch of GOODS from CONTRACTOR’s warehouses/ Ex works in foreign country to CIF port of shipment for imported GOODS and EXW at Contractor’s works for indigenous GOODS and shall further cover for performing services in India for transportation, loading, unloading, assembly, erection, testing COMMISSIONING of PLANT till care and custody is transferred to OWNER.

28.1.1 Contractor shall take Public Liability (Third Party) Insurance cover of 10% of TOTAL CONTRACT PRICE.

28.1.2 Contractor shall ensure that in addition to “Erection All risk policy”, the coverage in respect of workmen compensation, ESI/Health Insurance, Professional Indemnity (with the amount of minimum excess) has been appropriately taken.
28.2 CONTRACTOR shall be fully responsible for pursuing and settling all claims under the underwriters. In the event of accident, injury, damage or loss likely to form a claim under the above insurance policies, CONTRACTOR shall, as quickly as possible submit the insurance claims by underwriters under intimation to OWNER. CONTRACTOR shall also keep OWNER fully informed about progress of each such case. CONTRACTOR shall undertake immediate repair and replacement of the equipment lost in transit, storage, assembly, erection and COMMISSIONING of PLANT pending settlement of claim thereafter by the underwriters.

28.3 The CONTRACTOR at his cost shall arrange, secure and maintain all insurance as may be pertinent to the works and obligatory in terms of law to protect his interest and interest of OWNER in the project, against all perils detailed herein. The Form and the limit of such insurance as defined herein together with the under-writer in each case shall be acceptable to the OWNER and OWNER’s acceptance shall not be unreasonably withheld. However, irrespective of such acceptance, the responsibility to maintain adequate insurance coverage at all times including third party liability during the period of contract shall be as of CONTRACTOR alone. The contractor’s failure in this regard shall not relieve him of any of his contractual responsibilities and obligations. The insurance covers to be taken by the CONTRACTOR shall be in the joint names of OWNER and the CONTRACTOR. The CONTRACTOR shall, however, be authorised to deal directly with insurance company or companies and shall be responsible in regard to maintenance of all insurance covers.

28.4 All insurance other than marine insurance for transportation outside India is to be covered from IRDA approved insurance company registered in India. There should be a single cover for marine cum inland transit, storage and erection up to PRELIMINARY ACCEPTANCE OF PLANT.

However adequacy, credibility and maintenance of Insurance policies is sole responsibility of CONTRACTOR and CONTRACTOR shall keep the OWNER indemnified against any such failure.

All insurance covers shall be taken by CONTRACTOR in joint name of CONTRACTOR and OWNER.

Alternatively, the CONTRACTOR has the option to take separate Insurances as

1. Marine Cargo Insurance for transit of all imported and indigenous goods from Ex-Works at CONTRACTOR’S/ SUB-CONTRACTOR’s works to Site.
2. Erection and All Risk (EAR) Insurance
3. Third Party Liability Insurance

Marine Cargo Insurance and Third Party Liability Insurance can be a part of Global Policy of the CONTRACTOR. However certificate of endorsement in favour of OWNER shall be provided by the CONTRACTOR from the insurance company. These two global policies of Marine Cargo Insurance and Third Party Liability Insurance shall be counter guaranteed by Indian Insurance Company. However, Erection and All Risk (EAR) is to be covered from Insurance Company registered in India and shall be separate dedicated policies for OWNER.

28.5 Any loss or damage to the equipment during handling, transportation, storage, erection, putting the equipment into satisfactory operation and all activities to be performed till the
successful completion of trial operation of the plant shall be to the account of the CONTRACTOR. The CONTRACTOR shall be responsible for reference of all claims and make good the damages or loss by way of repairs and/or replacement of the equipment, damaged or lost. The CONTRACTOR shall provide the OWNER with copies of all insurance policies and documents taken out by him in pursuance of the CONTRACT. Such copies of documents shall be submitted to the OWNER immediately after such insurance coverage. However, if Marine cargo insurance or Third party liability Insurance is a part of their global policies; insurer certificate (including the main terms of policy) shall be submitted by CONTRACTOR. The CONTRACTOR shall also inform the OWNER in the writing at least thirty (30) days in advance regarding the expiry/cancellation and/or change in any of such documents and ensure revalidation, renewal etc. as may be necessary well in time. However adequacy, credibility and maintenance of Insurance policies is the sole responsibility of CONTRACTOR and CONTRACTOR shall keep the OWNER indemnified against any such failure.

28.6 The perils required to be covered under the insurance shall include, but not be limited to fire and allied risks, miscellaneous accidents (erection risks) workman compensation risks, loss or damage in transit, theft, pilferage, riot and strikes and malicious damages, civil commotion, weather conditions, accidents of all kinds, war risks (during ocean transportation only) etc. The scope of such insurance shall be adequate to cover the replacement/reinstatement cost of the equipment for all risks till the equipment is taken over by the OWNER. The insurance policies to be taken should be on replacement value basis and/or incorporating escalation clause. Notwithstanding the extent of insurance cover and the amount of claim available from the underwriters, the CONTRACTOR shall be liable to make good the full replacement/rectification of all equipment/materials and to ensure their availability as per project requirements without additional financial liability to the OWNER.

The workman compensation policy taken by the SUB-CONTRACTOR of the CONTRACTOR shall be passed on to the OWNER.

28.7 CONTRACTOR shall at its own cost and initiative at all times upto the successful completion of PRELIMINARY ACCEPTANCE, take out and maintain all insurable liability, including but not limited to third Party insurance and liabilities under the Motor Vehicles Act, Worker’s Compensation Act, Fatal Accidents Act, Personal Injuries Insurance Act, Emergency Risk Insurance Act and/or other Industrial Legislation from time to time in force in India with Insurance Company(ies), such policy(ies) shall not be of lesser limits hereunder specified with reference to the matters hereunder specified, namely:

- Workmen’s Compensation Insurance to the limit to which compensation may be payable under Indian laws.

28.8 All cost on account of insurance liabilities covered under the CONTRACT will be to the CONTRACTOR’S account and will be included in the CONTRACT PRICE. The CONTRACTOR, while arranging the insurance, shall ensure to obtain all discounts on premium, which may be available for higher volume or for reason of financing arrangement of the project.

28.9 Irrespective of single or separate insurances, the CONTRACTOR shall take the same in the joint name of OWNER and CONTRACTOR, with OWNER as Primary Beneficiary and
CONTRACTOR as Joint Beneficiary, to cover all risk including marine cum erection insurance (MCE), workmen compensation / Employees State Insurance (ESI) under ESI Act 1948 for Contractor's personnel, fire risk policy etc. till handing over of PLANT to OWNER duly commissioned and tested. However, for CONTRACTOR’s EQUIPMENT, CONTRACTOR can be the sole beneficiary.

Further, OWNER shall have the first right over the claim amount for all insurance claims, where owner has made part or full payment to the contractor.

However, OWNER should have first right over the claim amount in case payment for the “equipment damaged” has already been paid to the CONTRACTOR

28.10 The CONTRACTOR shall be fully responsible for pursuing and settling all claims with the underwriters. In the event of accident, injury, damage or loss likely to form a claim under the above insurance policies, the CONTRACTOR shall as quickly as possible but not later than the claim period submit such details as are necessary for settling such claims by underwriters and shall also provide information and assistance necessary to settle the claim. The CONTRACTOR shall also keep OWNER fully informed about progress of each such case.

28.11 The charges quoted on account of insurance in the price bid shall be considered for the purpose of evaluation. However if owner opts to take policy, the contract price shall be adjusted to the extent of cost of insurance quoted in the price bid.

29.0 GUARANTEES

29.1 It shall be a condition of the CONTRACT and the CONTRACTOR shall guarantee that the plant shall achieve the requirement as set forth herein and as per the provisions of the Section VI-8.0 of Technical NIT.

29.2 The CONTRACTOR shall guarantee that the Plants, Equipment and machineries will be new and in accordance with the CONTRACT documents and free from defects in design, material and workmanship and shall give mechanical warranty for a period of Twelve (12) calendar months commencing immediately upon PRELIMINARY ACCEPTANCE as per Clause 17 SCC. The CONTRACTOR's liability shall be limited to the replacement of any defective parts in the equipment of his own manufacture or those of his SUB-CONTRACTOR under normal use and arising from faulty design, materials and/or workmanship provided always that such defective parts are not repairable at the site and are not in the meantime essential in the commercial use of the plant. Such replaced defective parts shall be returned to the CONTRACTOR unless otherwise arranged.

29.3 After the issue of the PRELIMINARY ACCEPTANCE CERTIFICATE, in the event of an emergency where, in the judgement of the OWNER, delay would cause serious loss or damage, repairs or adjustments may be made by the OWNER or a third party chosen by the OWNER without advance notice to the CONTRACTOR and the documented and direct cost of such work shall be paid by the CONTRACTOR but only to the extent that the repair or adjustment was due a defect attributable to CONTRACTOR.

29.4 Deleted.
29.5 Deleted.

29.6 The cost of any special or general overhaul rendered necessary during the guarantee period due to defects for which CONTRACTOR is liable under CONTRACT in the PLANT or defective work carried out by the CONTRACTOR shall be borne by the CONTRACTOR.

29.7 The acceptance of any equipment by the OWNER shall in no way relieve the CONTRACTOR of his obligation under this clause.

29.8 In the case of those defective parts which are not repairable at site but are essential for the commercial use of the equipment and machineries, the CONTRACTOR shall mutually agree to a programme of replacement or renewal which will minimise interruption to the maximum extent, in the operation of the equipment and machineries.

29.9 At the end of the DEFECT LIABILITY PERIOD or the extended DEFECT LIABILITY PERIOD, the CONTRACTOR's liability ceases. In respect of goods supplied by the SUB-CONTRACTORS to the CONTRACTOR where a long guarantee (more than 12 months) is provided by such SUBCONTRACTORS/SUB- VENDOR(s), the OWNER shall be entitled to the benefit of such longer guarantees.

29.10 During the GUARANTEE PERIOD, the CONTRACTOR shall provide if required by the OWNER, the services of operation engineers to advise the OWNER for such period and in such number as may be mutually agreed upon. The CONTRACTOR's operation engineers shall also train the OWNER's personnel, act as a liaison between the OWNER and the CONTRACTOR, assist the OWNER in ordering and obtaining spare parts, generally monitoring operation and maintenance and trouble shooting and supervising repair work under guarantee.

29.11 The provisions of Clause 48.0 of GCC including the cost of transport, insurance etc. shall be implemented at the CONTRACTOR's expenses.

29.12 The provisions contained in clause 48 of GCC will not be applicable if after handing over of the PLANT, the OWNER has not operated the equipment according to generally followed industrial practices and in accordance with the conditions of operation specified in accordance with operation and maintenance manuals.

29.13 Guarantees for Time of Completion

The CONTRACTOR shall guarantee the date of PRELIMINARY ACCEPTANCE of the WORK calculated from the date of issuance of FOA, for the purpose of determining predetermined MUTUALLY AGREED DAMAGES on account of delay in completion.

29.14 Performance Guarantees

CONTRACTOR shall guarantee the performance of PLANTS as well as works cost guarantee as specified in the Technical Documents. In general the Guarantees shall be demonstrated as per Section VI-8.0 of NIT.

29.15 Design and Vendors'/ Sub-Contractors' Guarantees
29.15.1 CONTRACTOR shall guarantee the design and engineering work carried out by him against mistakes, errors, defective specifications, inadequacy and other such items which lead to the supply of inadequate PLANTS and Facilities. In case of detection of such mistakes, errors, deficiencies etc. the CONTRACTOR shall redo the design and/or engineering work to overcome all such mistakes, errors, deficiencies etc. at no extra cost to OWNER.

29.15.2 CONTRACTOR shall be responsible for all the items of the EQUIPMENT procured by him from VENDORS/ SUB-CONTRACTORS. Further, CONTRACTOR shall replace or repair any item of EQUIPMENT which is demonstrated to be defective under normal operating conditions within DEFECT LIABILITY PERIOD.

30.0 LIABILITY FOR ACCIDENTS AND DAMAGES

30.1 Under the CONTRACT, the CONTRACTOR shall be responsible for loss or damage to the PLANT and provide new equipment and machineries in lieu of equipment/machineries lost/damaged beyond repairs, free of cost until the PLANT is handed over after successful completion of performance guarantee test run.

Notwithstanding the provisions in the CONTRACT, the CONTRACTOR shall not be responsible for any loss or damage to the PLANT or any part thereof if and to the extent that such loss or damage is not covered by insurance coverage such as War risk, provided the same is general exclusion of the policy of the EAR insurance. War Risks shall mean any of the following events occurring within India: War, hostilities, warlike operations (whether a state of war be declared or not), invasion, act of foreign enemy, civil war, rebellion, terrorism, revolution, insurrection, mutiny, usurpation of civil or military government, conspiracy, riot, civil commotion, mine, bomb, shell, grenade or other projectile, missile, munitions or explosive of war.

30.2 The CONTRACTOR shall indemnify the OWNER in respect of all damage or injury to any person or to any property (other than property forming part of the Work) and against all actions, suits, claims, demands, costs, charges and expenses arising in connection therewith which shall have been occasioned by the negligence of the CONTRACTOR or any SUB-CONTRACTOR, or by defective design (other than a design made, furnished or specified by the OWNER and which the CONTRACTOR has disclaimed responsibility in writing within a reasonable time after receipt of the OWNER's instructions) material or workmanship, any breach of the CONTRACTOR's obligations.

31.0 MUTUALLY AGREED DAMAGES (MAD)

31.1 For Delay in Completion

31.1.1 The CONTRACTOR agrees that the work shall be commenced and carried on at such points, and in the order of precedence and at such times and seasons as may be directed by the OWNER in accordance with the schedule for the completion of work as outlined in the CONTRACT. The CONTRACTOR declares that he has familiarised himself with the site and rights of way, ground conditions, with all the local conditions, and with all the circumstances which may or are likely to affect the performance and completion of the work and that he has allowed for such conditions in the preparation of this schedule. The progress of work shall be checked at regular monthly intervals and the percentage
progress achieved shall be commensurate with the time elapsed after the award of the CONTRACT.

31.1.2 However, it is not incumbent upon the ENGINEER-IN-CHARGE to notify the CONTRACTOR when to begin or to cease or to resume work, nor to give early notice of the rejection of a faulty work, nor in any way to superintend so as to relieve the CONTRACTOR of responsibility of any consequence of neglect or carelessness by him or his subordinates.

31.1.3 The time stipulated in the CONTRACT for the execution and completion of the works is shall be deemed to be of utmost importance of the CONTRACT. In the event the CONTRACTOR fails to attain the PRELIMINARY ACCEPTANCE within the GUARANTEED COMPLETION DATE due to the reasons for which CONTRACTOR is liable under CONTRACT then the CONTRACTOR shall pay to the OWNER as MAD at the rate of 0.5 % of the TOTAL CONTRACT PRICE (excluding taxes) per week of delay or part thereof subject to a maximum of 5% of the TOTAL CONTRACT PRICE (excluding taxes) . The OWNER may, without prejudice to any method of recovery, deduct the amount for such damages from any amount due or which may become due to the CONTRACTOR. In the event of extension of time being granted by the OWNER in writing for completion of the WORKS without levy of MAD (Mutually Agreed Damages), this clause will be applicable after expiry of such extended period. GST at the prevailing rate, if applicable on “MUTUALLY AGREED DAMAGES” shall be recovered extra from the CONTRACTOR on the amount of such MUTUALLY AGREED DAMAGES levied as per the Contractual terms.

OWNER shall raise separate Tax Invoice for recovery of MAD along with applicable GST.

Mutually Agreed Damages represent, without prejudice to the respect of the contractual obligation under the CONTRACT by CONTRACTOR, the sole and exclusive remedy of OWNER for such delay.

The decision of the OWNER on the applicability of MAD shall be final and binding on the CONTRACTOR.

31.1.4 Bonus for early completion

In the event, CONTRACTOR completes and delivers the WORKS and achieves PRELIMINARY ACCEPTANCE earlier than the time specified in the CONTRACT, then the CONTRACTOR shall be eligible for a bonus. The bonus shall be calculated @ 0.20% of the TOTAL CONTRACT PRICE (excluding taxes & duties) per completed week for earlier completion subject to a maximum of 1.0% of the TOTAL CONTRACT PRICE (excluding taxes & duties).

31.2 For Failing to Meet Works Cost Guarantee

LSTK bidder shall guarantee overall consumption/Generation of Raw Material and Utilities /Condensate for the production of Steam so as to guarantee the works cost for all the facilities provided by the CONTRACTOR as detailed in Technical Section VI-8.
In the event works cost is more than 100% but upto 102.5% of the Guaranteed Works Cost then the CONTRACTOR will pay Owner Mutually Agreed Damages as specified hereunder

For every 0.50% increase in Works cost above the guaranteed works cost or part thereof, CONTRACTOR will pay Mutually Agreed Damages equal to 1.0% of the TOTAL CONTRACT PRICE (excluding taxes).

If the Guaranteed Works cost as demonstrated during the performance test is more than 102.5% of the Guaranteed Works Cost, then CONTRACTOR at their own cost shall take corrective action irrespective of the cost involved. In case the Guaranteed Works Cost is more than 102.5% even after taking the corrective action, the same shall be considered as breach of Contract and necessary action as per clause 34 of GCC shall be taken by OWNER.

32.0 OVERALL CEILING ON TOTAL LIABILITY

32.1 The Maximum Overall Liability under the CONTRACT on account of (a) Delay in execution of project (b) Contractor failing to meet the Guaranteed Works Cost up to 102.5%, (c) Termination of CONTRACT (d) Carrying out balance work at the risk and cost of the CONTRACTOR, re-engineering, make good, mechanical warranty (e) Patent infringement and (f) any other liabilities (if any) defined in the NIT shall be capped to 100% of the TOTAL CONTRACT PRICE.

32.2 Except for criminal negligence or wilful misconduct, the Contractor shall not be liable to the Owner, whether in contract, tort, or otherwise, or any indirect or consequential loss or damage, loss of use, loss of production, or loss of profit or interest cost, provided that this exclusion shall not apply to any obligation of the Contactor to pay liabilities to the Owner, as defined in clause 32.1 above.

33.0 TIME EXTENSION OF CONTRACT

33.1 The CONTRACTOR shall promptly notify the ENGINEER-IN-CHARGE any event or conditions which might delay the completion of erection work in accordance with the approved schedule and the steps being taken to remedy such situation.

33.2 If the Work is delayed at any time in the commencement or during the progress of the WORK by any act, delay or neglect solely attributable to OWNER or his employees, or by any other contractor utilised by the OWNER or by FORCE MAJEURE conditions, the time of completion shall be extended by OWNER (without levy of Mutually Agreed Damages) in writing for a reasonable period as may be mutually agreed upon, at the time of closure of contract. The CONTRACTOR shall, immediately on occurrence of such special circumstances but not later than 14 working days, bring to the knowledge of OWNER through written application for any such delay as mentioned above.

33.3 OWNER shall have the right to suspend the WORK in whole or in part for such time as may be necessary in order that WORKS shall be well and properly executed. In such events, suitable extension of time shall be granted to CONTRACTOR. However, should the cumulative period of suspension exceed 45 days during the scheduled duration of CONTRACT, the CONTRACTOR shall be compensated as mutually agreed in addition
to extension of time, provided the suspension is caused due to reasons not attributable to CONTRACTOR.

### 34.0 TERMINATION OF CONTRACT

#### 34.1 Termination due to Legal Incapacity

If the CONTRACTOR goes into liquidation or has an administrator order made against him or carries on his business or any part of it under an administrator or receiver or manager for the benefit of the creditors or any of them, without prejudice to any other rights or remedies, the OWNER may forthwith by notice in writing terminate the CONTRACT.

#### 34.2 Termination due to Default by CONTRACTOR

##### 34.2.1 If the CONTRACTOR is in default in that he:

(a) Neglects to execute the work or part of the work; or

(b) without reasonable cause, suspends or abandons the carrying out the works, either partly or wholly, before their completion; or

(c) Fails to proceed regularly and diligently with the works; or

(d) Defaults in the performance or observance of any conditions or terms of the CONTRACT or neglects to carry out any order, instruction, direction or determination which the OWNER is empowered to give or make under the CONTRACT and which is given or made in writing to the CONTRACTOR,

then, without prejudice to any other rights or remedies which the OWNER may possess, the OWNER may, by notice in writing (which shall specify with reasonable particularity the neglect, default or refusal on the part of the CONTRACTOR) require the CONTRACTOR:

i) to put forward his proposals for

   a) Rectifying such neglect, default or refusal as the case may be and

   b) Commence and diligently pursue the rectification of the default.

##### 34.2.2 If within 30 days after the posting of the notice addressed to the CONTRACTOR, the CONTRACTOR fails to comply with the notice or if in the opinion of the OWNER, the CONTRACTOR's reasons or proposals are not satisfactory, then the OWNER, without prejudice to any other rights that he may have under the CONTRACT against the CONTRACTOR, may either:

a) DETERMINE THE CONTRACT in which event the CONTRACT shall stand terminated and shall cease to be in force and effect on and from the date appointed by the OWNER on that behalf, whereupon the CONTRACTOR shall stop forthwith any of the CONTRACTOR's work then in progress, except such WORK as the OWNER may, in writing, require to be done to safeguard any property or WORK, or installations from damage, and the OWNER, for its part, may take over the work
remaining unfinished by the CONTRACTOR and complete the same through a fresh contractor or by other means, at the risk and cost of the CONTRACTOR, and any of his sureties if any, shall be liable to the OWNER for any excess cost occasioned by such work having to be so taken over and completed by the OWNER over and above the cost at the rates specified in the schedule of quantities and rate/prices.

b) WITHOUT DETERMINING THE CONTRACT, take over the work of the CONTRACTOR or any part thereof and complete the same through a fresh contractor or by other means at the risk and cost of the CONTRACTOR. The CONTRACTOR and any of his sureties are liable to the OWNER for any excess cost over and above the cost at the rates specified in the Schedule of Quantities/ rates, occasioned by such works having been taken over and completed by the OWNER.

In such events of Clause 34.2.2 (a) or (b) above.

(i) The whole or part of the Contract Performance Security furnished by the CONTRACTOR is liable to be forfeited without prejudice to the right of the OWNER to recover from the CONTRACTOR the excess cost referred to in the sub-clause aforesaid, the OWNER shall also have the right of taking possession and utilising in completing the works or any part thereof, such as materials equipment and plants available at work site belonging to the CONTRACTOR as may be necessary and the CONTRACTOR shall not be entitled for any compensation for use or damage to such materials, equipment and plant.

(ii) The amount that may have become due to the CONTRACTOR on account of work already executed by him shall not be payable to him until after the expiry of Six (6) calendar months reckoned from the date of termination of CONTRACT or from the taking over of the WORK or part thereof by the OWNER as the case may be, during which period the responsibility for faulty materials or workmanship in respect of such work shall, under the CONTRACT, rest exclusively with the CONTRACTOR. This amount shall be subject to deduction of any amounts due from the CONTRACT to the OWNER under the terms of the CONTRACT authorised or required to be reserved or retained by the OWNER.

(iii) Before determining the CONTRACT as per Clause 34.2.2 (a) or (b) provided in the judgement of the OWNER, the default or defaults committed by the CONTRACTOR is/are curable and can be cured by the CONTRACTOR if an opportunity given to him, then the OWNER may issue Notice in writing calling the CONTRACTOR to cure the default within such time specified in the Notice.

(iv) The OWNER shall also have the right to proceed or take action as per 34.2.2 (a) or (b) above, in the event that the CONTRACTOR becomes bankrupt, insolvent, compounds with his creditors, assigns the CONTRACT in favour of his creditors or any other person or persons, or being a company or a corporation goes into voluntary liquidation, provided that in the said events it shall not be necessary for the OWNER to give any prior notice to the CONTRACTOR.

(v) Termination of the CONTRACT as provided for in sub-clause 34.2.2(a) above shall not prejudice or affect their rights of the OWNER which may have accrued up to the date of such termination.

34.2.3 In case of termination of CONTRACT herein set forth (under clause 34.2) except under conditions of Force Majeure and termination after expiry of contract, the
CONTRACTOR shall be put under holiday [i.e. neither any enquiry will be issued to the party by Talcher Fertilizers Limited (TFL) or any of it’s JV partners against any type of tender nor their offer will be considered by TFL or any of it’s JV partners against any ongoing tender (s) where contract between TFL/it’s JV partners and that particular CONTRACTOR (as a bidder) has not been finalized], for a period of three years from the date of termination by TFL to such CONTRACTOR.

34.3 Duration of suspension of payment due to CONTRACTOR:

34.3.1 Owner shall have right to suspend making any payments to the contractor for the portion of WORK having a bearing with CONTRACTOR's default during the period of rectification of the defaults.

34.4 Work taken out of the hands of the CONTRACTOR

34.4.1 Employment of other contractors:

If the OWNER takes action under sub-clause 34.2.2, he may complete the work or any part of it by contracting with or employing any other contractor to execute further and complete work or any part of it and to provide all equipment, materials and labour as may be necessary for such further execution and completion. If practicable the further execution and completion shall be carried out in accordance with the specification and at prices obtained under competitive conditions.

The OWNER may also take possession of and permit such person or persons to use for the purposes of the CONTRACT only such materials, tools and equipment and all other things on or about the SITE which are the property of the CONTRACTOR as are requisite and necessary for such further execution and completion, and the CONTRACTOR shall have no right to any compensation or allowance in respect thereof.

On the completion of such work, all tools and equipment and the surplus of the materials so taken possession of shall be handed over to the CONTRACTOR but without payment or allowance for the fair wear and tear they may have sustained in the meantime, provided that if there by a deficiency as referred to in sub clause 34.4.2 of this clause, and if the CONTRACTOR fails to make good such deficiency such of the tools, equipment and materials as are necessary to make good the deficiency may be sold and a sufficient part of the monies received retained by the OWNER and applied in payment of such deficiency.

In addition the OWNER shall be entitled:

a) To take possession of and remove from the CONTRACTOR's premises within a reasonable period anything (including but without limiting the generality thereof any design, drawings, specification, material or other goods) the property which is vested in the OWNER pursuant to the CONTRACT;

b) To full particulars of any sub-contract made by the CONTRACTOR with any person for the execution of any portion of the WORKS and to peruse and copy any instrument (including but without limiting the generality thereof any agreement, letter or other paper) relating to any such SUB-CONTRACT made by the CONTRACTOR with any person for the execution of any portion of the WORKS.
c) To pursue and copy any standard working drawing or other drawing or data necessary in the opinion of the OWNER for completion of the WORKS and the property which is not vested to the OWNER pursuant to the CONTRACT provided that the OWNER shall in no case make use of any copy made pursuant to sub paragraphs (b) or (c) hereof other than for the purpose of completing the WORKS and that on the fulfilment of the whole of the obligations of the CONTRACTOR under the CONTRACT the OWNER shall return to the CONTRACTOR any such copy.

The CONTRACTOR shall offer to the OWNER all rights of access and all reasonable facilities to enable the OWNER to remove any such thing or pursue or copy any such instrument, drawing or data and shall supply such particulars on request by the OWNER in that behalf.

For the purposes of sub-clause 34.4.2 the cost incurred by the OWNER in and about for such removal, perusal or copying or obtaining such particulars shall be deemed to be part of the cost of carrying out that portion of the work taken out of the CONTRACTOR's hands.

34.4.2 Extra cost to the OWNER of completing work for deduction:

On completing the terminated portion of WORK as provided under Article 34.4.1 the OWNER shall ascertain the reasonable and direct costs based on the documentary evidence of the cost incurred but such amount shall not include any extra cost due to departures from the specification unless such departures were necessitated by the CONTRACTOR's default. Should the amount so ascertained be greater than the CONTRACT PRICE which would have been paid to the CONTRACTOR, if the whole of the Work had been carried out by him, the difference between the two amounts shall be deducted from any monies which may then be or thereafter become due to the CONTRACTOR or which may have been deposited by him as security under the CONTRACT, and if such monies be less than the amounts to be deducted the deficiency shall be paid by the CONTRACTOR to the OWNER and which may be recovered as provided in subclause 34.4.1 of this clause or by way of arbitration, jurisdiction or both, such payment of excess amount shall be independent of penalty for delay if the completion of work is delayed.

34.5 Preservation of rights of the OWNER

No action taken by the OWNER under sub clause 34.3 and 34.4 of this clause shall vitiate the CONTRACT or shall operate to the prejudice of the right of the OWNER to recover from the CONTRACTOR or to deduct from any monies which may be or may become due to the CONTRACTOR all sums of money which may be or may become due to the OWNER under the CONTRACT as damages, penalties or otherwise.

34.6 Should the OWNER decide to terminate the CONTRACT under subclause 34.2.2(b) of this clause, he may do so under notice in writing as from the date of such notice, and the termination shall be without prejudice to any right that may have occurred to the OWNER or to the CONTRACTOR under the CONTRACT.
34.7 Termination of Contract on Account of OWNER's Convenience

34.7.1 The OWNER, may, by 30 days written notice send to the CONTRACTOR, terminate the CONTRACT, in whole or in part, at any time for his convenience. The notice of termination shall specify that termination is for the OWNER's convenience, the extent to which performance of work under the CONTRACT is terminated and the date upon which such termination becomes effective.

34.7.2 Upon receipt of the notice of termination under GCC Clause 34.7.1, the CONTRACTOR shall either immediately or upon the date specified in the notice of termination.

(a) cease all further work, except for such work as the OWNER may specify in the notice of termination for the sole purpose of protecting that part of the Facilities already executed, or any work required to leave the Site in a clean and safe condition.

(b) terminate all subcontracts, except those to be assigned to the OWNER pursuant to paragraph (d)(ii) below.

(c) remove all CONTRACTOR's Equipment from the Site, repatriate the CONTRACTOR's and its SUB-CONTRACTORs' personnel from the Site, remove from the Site any wreckage, rubbish and debris of any kind, and leave the whole of the Site in a clean and safe condition.

(d) In addition, the CONTRACTOR, subject to the payment specified in GCC Clause 34.7.2.1, shall

(i) deliver to the OWNER the parts of the PLANT executed by the CONTRACTOR up to the date of Termination.

(ii) to the extent legally possible, assign to the OWNER all right, title and benefit of the CONTRACTOR to the PLANT and Equipment as at the date of termination, and, as may be required by the OWNER, in any subcontracts concluded between the CONTRACTOR and its SUB-CONTRACTORs.

(iii) deliver to the OWNER all non-proprietary drawings, specifications and other documents prepared by the CONTRACTOR or its Sub-CONTRACTORs as at the date of termination in connection with the PLANT.

34.7.2.1 In the event of termination of the Contract under GCC Clause 34.7.1, the OWNER shall pay to the CONTRACTOR the following amounts:

(a) the Contract Price, properly attributable to the parts of the PLANT executed by the CONTRACTOR as of the date of termination

(b) the costs reasonably incurred by the CONTRACTOR in the removal of the CONTRACTOR's Equipment from the Site and in the repatriation of the CONTRACTOR's and its SUB-CONTRACTORs' personnel
(c) any amounts to be paid by the CONTRACTOR to its SUB-CONTRACTORs or Vendors in connection with the termination of any subcontracts or supply agreement, including any cancellation charges

(d) costs incurred by the CONTRACTOR in protecting the PLANT and leaving the Site in a clean and safe condition pursuant to paragraph (a) of GCC Clause 34.7.2

34.7.3 Termination for Insolvency

OWNER may at any time terminate CONTRACT giving written notice to CONTRACTOR, if CONTRACTOR becomes bankrupt or otherwise insolvent, provided that such termination will not prejudice or affect any right of action or remedy which has occurred or will accrue thereafter to OWNER.

If the Contract is terminated under GCC Sub-Clauses 34.7.3, the OWNER shall pay to the CONTRACTOR all payments specified in GCC Sub-Clause 34.7.2 as reasonable compensation for all loss or damage sustained by the CONTRACTOR arising out of, in connection with or in consequence of such termination.

34.7.4 Termination by CONTRACTOR due to default of OWNER

If the OWNER has failed to pay the CONTRACTOR any sum due under the Contract within the specified period or commits a substantial breach of the CONTRACT, the CONTRACTOR may give a notice to the OWNER that requires payment of such sum or specifies the breach and requires the OWNER to remedy the same, as the case may be. If the OWNER fails to pay such sum or fails to remedy the breach or take steps to remedy the breach within thirty (30) days after receipt of the CONTRACTOR’s notice then the CONTRACTOR may give a notice to the OWNER thereof, and if the OWNER has failed to pay the outstanding sum or to remedy the breach within thirty (30) days of such notice, the CONTRACTOR may by a further notice to the OWNER, terminate the CONTRACT.

If the CONTRACT is terminated under GCC Clause 34.7.4, the OWNER shall pay to the CONTRACTOR all payments specified in GCC Clause 34.7.2 as reasonable compensation for all loss or damage sustained by the CONTRACTOR arising out of, in connection with or in consequence of such termination.

34.8 Surviving Obligations

Termination of this CONTRACT (a) shall not relieve CONTRACTOR of its obligations with respect to the confidentiality as set forth in this CONTRACT, (b) shall not relieve CONTRACTOR of any obligation hereunder which expressly or by implication survives termination hereof, and (c) except as otherwise provided in any provision of this CONTRACT expressly limiting the liability of CONTRACTOR, shall not relieve CONTRACTOR of any obligations or liabilities for loss or damage to the other Party arising out of or caused by acts or omissions of CONTRACTOR prior to the effectiveness of such termination or arising out of such termination, and shall not relieve CONTRACTOR of its obligations as to portions of SERVICES already performed or of obligations assumed by CONTRACTOR prior to the date of termination, except as otherwise agreed by OWNER in writing.
Termination of this CONTRACT (a) shall not relieve OWNER of its obligations with respect to the confidentiality as set forth in this CONTRACT, (b) shall not relieve OWNER of any obligation hereunder which expressly or by implication survives termination hereof, and (c) shall not relieve OWNER of any obligations or liabilities for loss or damage to the other Party arising out of or caused by acts or omissions of OWNER prior to the effectiveness of such termination or arising out of such termination.

35.0  FORCE MAJEURE

35.1 CONDITIONS FOR FORCE MAJEURE: In the event of either party being rendered unable by Force Majeure to perform any obligations required to be performed by them under the CONTRACT the relative obligation of the party affected by such Force Majeures shall upon notification to the other party be suspended for the period during which Force Majeures conditions lasts. The cost and loss sustained by the either party shall be borne by the respective parties. The term "Force Majeures" as employed herein shall mean acts of God, earthquake, war (declared or undeclared), revolts, riots, fires, floods, rebellions, explosions, hurricane, sabotage, civil commotions and acts and regulations of respective Government of the two parties, namely the OWNER and the CONTRACTOR. Upon the occurrence of such cause(s) and upon its termination, the party alleging that it has been rendered unable as aforesaid thereby, shall notify the other party in writing immediately but not later than 120 (one hundred and twenty) hours of the alleged beginning and ending thereof giving full particulars and satisfactory evidence in support of its claim. Time for performance of the relative obligation suspended by the Force Majeure(s) shall then stand extended by the period for which such conditions lasts. If deliveries of bought out items and/or works to be executed by the CONTRACTOR are suspended by Force Majeure conditions lasting for more than 2 (two) months the OWNER shall have the option to terminate the CONTRACT or re-negotiate the contract provisions.

OUTBREAK OF WAR

(i) If during the currency of the CONTRACT there shall be an out-break of war whether declared or not, in that part of the World which whether financially or otherwise materially affect the execution of the WORK the CONTRACTOR shall unless and until the CONTRACT is terminated under the provisions in this clause continue to use his best endeavour to complete the execution of the WORK, provided always that the OWNER shall be entitled, at any time after such out-break of war to terminate or re-negotiate the CONTRACT by giving notice in writing to the CONTRACTOR and upon such notice being given the CONTRACT shall, save as to the rights of the parties under this clause and to the operation of the clauses entitled settlement of Disputes and Arbitration hereof, be terminated but without prejudice to the right of either party in respect of any antecedent breach thereof.

(ii) If the CONTRACT shall be terminated under the provisions of the above clause, the CONTRACTOR shall with all reasonable diligence remove from the SITE all the CONTRACTOR's equipment and shall give similar facilities to his SUB-CONTRACTORS to do so.

35.2 If the CONTRACTOR suffers delay in the due execution of the contractual obligations due to delays caused by force majeure as defined above, the agreed time of completion of job covered by this CONTRACT or the obligation of the CONTRACTOR shall be extended by a period of time on account of force majeure conditions, provided that on the occurrence of any such contingency, the CONTRACTOR within
120 hours reports to the OWNER in writing, the cause of delay and likely duration of cause of delay with requisite documentary evidence.

35.3 Should one or both the parties be prevented from fulfilling the contractual obligations by a state of FORCE MAJEURE lasting continuously for a period of 6 weeks, the two parties shall consult each other regarding the future implementation of the CONTRACT. The mere shortage of labour, materials or utilities shall not constitute FORCE MAJEURE unless caused by circumstances which are themselves FORCE MAJEURE.

35.4 CONTRACTOR and OWNER shall endeavour to prevent, overcome or remove the causes of FORCE MAJEURE.

35.5 No ground for exemption can be invoked if CONTRACTOR has failed to give timely notice by registered letter/ Speed-Post/Courier/Email/Fax/Hand Delivery and subsequently supported it by documentary evidence.

35.6 Delay or non-performance by a party hereto caused by the occurrence of any event of FORCE MAJEURE shall not:

(a) Constitute a default or breach of the CONTRACT,
   Or

(b) Give rise to any claim for damages or additional cost or expense occasioned thereby, if such delay or non-performance is caused by the occurrence of any event of FORCE MAJEURE. FORCE MAJEURE conditions are not payable under any circumstances.

35.7 Force Majeure is no one’s fault, therefore each party should bear its own cost and a provision to terminate the CONTRACT in case of Force Majeure extending beyond six (06) months is provided. Should OWNER wish the CONTRACTOR to continue further, both parties may sit together and mutually agree on the future course failing which Parties will have the right to terminate. Such termination shall not be considered as Termination for Owner’s Convenience. However, outstanding invoices, payment for supplies made and payment to the work already performed will be paid by OWNER on such termination and shall be detailed at the time of CONTRACT finalisation.

Contractor shall have the right to take action to mitigate the impact of the prolonged Force Majeure event in mutual consent with Owner; for instance Contractor shall have the right to demobilize Contractor’s equipment and personnel from the Plant.

36.0 NO WAIVER OF RIGHTS

Neither the inspection by the OWNER or any of their officials, employees, or agents nor any order by the OWNER for payment of money or any payment for or acceptance of, the whole or any part of the WORKS by the OWNER nor any extension of time, nor any possession taken by the OWNER shall operate as a waiver of any provision of the CONTRACT, or of any power herein reserved to the owner or any right to damages herein provided, nor shall any waiver of any breach in the CONTRACT be held to be a waiver of any other subsequent breach.
37.0 BANKRUPTCY AND LIQUIDATION OF CONTRACTOR OR BUSINESS UNDER RECEIVERSHIP

If the CONTRACTOR becomes insolvent or bankrupt, or has a receiving order made against him, or compound with his creditors, or being a corporation commence to be wound up not being a member's voluntary winding up for the purpose of reconstruction or carry on his business under a receiver for the benefit of his credit, the CONTRACTOR shall within fourteen (14) days notify the OWNER accordingly. On the occurrence of any of the happenings stated in the first sentence of this clause, the OWNER shall be at liberty to:

a) Determine the CONTRACT forthwith by notice in writing to the CONTRACTOR or to the receiver or liquidator or to any person in whom the CONTRACT may have become vested, and act in the manner provided in clause 34.1 (proceedings or default) or,

b) Give to such receiver liquidator or other person in writing the option for a period of one month of carrying out the WORK subject to his providing a guarantee for the due and faithful performance of the CONTRACT upto the CONTRACT value of the work for the time being remaining unexecuted and subject to his taking all reasonable steps to prevent stoppage of the work. In the event of stoppage of the work, the period of the option under this clause shall be fourteen (14) days only.

38.0 CERTIFICATE NOT TO AFFECT RIGHT OF OWNER AND LIABILITY OF CONTRACTOR.

No interim payment certificate of the OWNER nor any sum paid on account by the OWNER nor any extension of time for execution of the WORKS granted by the OWNER shall affect or prejudice the rights of the OWNER against the CONTRACTOR or relieve the CONTRACTOR of his obligations for the due performance of the CONTRACT or be interpreted as approval of the WORK done or of the equipment furnished and no certificate shall create liability on the OWNER to pay for alterations, amendments, variations, or additional works not ordered, in writing, by the OWNER or discharge the liability of the CONTRACTOR for the payment of damages whether due certified or not or any sum against the payment of which he is bound to indemnify the OWNER and the Consultant nor shall any such certificate nor the acceptance by him of any sum paid on account or otherwise affect or prejudice the rights of the CONTRACTOR against the OWNER.

39.0 SETTLEMENT OF DISPUTES

39.1 Except as otherwise specifically provided in the CONTRACT, all disputes concerning questions of fact arising under the CONTRACT shall be considered by the OWNER subject to a written appeal by CONTRACTOR to the OWNER.

39.2 Any disputes or differences including those considered as such by only of the parties arising out of or in connection with the CONTRACT shall be to be extent possible settled amicably between the parties.

39.3 If, after 60 DAYs from the commencement of such informal negotiations, OWNER and CONTRACTOR are unable to resolve amicably the dispute, either party may require that
the dispute be referred for resolution to the arbitration as described under clause 40 below.

40.0 ARBITRATION

40.1 Refer clause no 45 of Section-III of NIT

40.2 Continuation of Work and payments during Arbitration

WORK shall be continued by CONTRACTOR during the arbitration proceedings unless the matter itself is the subject of Arbitration or unless the matter itself is such that WORK cannot practically be continued until the decision of the arbitrator is obtained and CONTRACTOR shall remain liable and bound in all respects under the Contract. Except as otherwise expressly provided in CONTRACT, no payment due and payable by OWNER shall be withheld on account of such arbitration proceedings unless it is the subject matter or one of the subject matters.

40.3 FOR THE SETTLEMENT OF DISPUTES BETWEEN GOVERNMENT DEPARTMENT AND ANOTHER AND ONE GOVERNMENT DEPARTMENT AND PUBLIC ENTERPRISE AND ONE PUBLIC ENTERPRISE AND ANOTHER THE ARBITRATION SHALL BE AS FOLLOWS:

In the event of any dispute or difference between the parties hereto, such dispute or difference shall be resolved amicably by mutual consultation or through the good offices of empowered agencies of the Government. If such resolution is not possible, then, the unresolved dispute or difference shall be referred to arbitration of an arbitrator to be nominated by Secretary, Department of Legal Affairs ("Law Secretary") in terms of the Office Memorandum No.55/3/1/75 CF, dated the 19th December 1975 issued by the Cabinet Secretariat (Department of Cabinet Affairs), as modified from time to time. The Arbitration Act 1940 (10 of 1940) shall not be applicable to the arbitration under this clause. The award of the Arbitrator shall be binding upon parties to the dispute. Provided, however, any party aggrieved by such award may make a further reference for setting aside or revision of the award to Law Secretary whose decision shall bind the parties finally and conclusively.

41.0 GOVERNING LAWS, LANGUAGE AND MEASURES

41.1 CONTRACT shall be governed and construed according to the Indian Law as in force and shall be subject to the jurisdiction of the Court in Delhi. All disputes arising during the execution of the CONTRACT shall be resolved as per Clause no. 39.0 (Settlement of Dispute) & 40.0 (Arbitration) of GCC and thereafter in accordance with said law.

41.2 The governing language for all communication, notices, Technical Information, etc. pertaining to CONTRACT shall be English. Any literature, correspondence, documents, etc., shall be considered only if its accompanied by English translation. For the purpose of interpretation English translation shall govern and be binding on all parties.

41.3 The metric system of measurement shall be used exclusively in the CONTRACT.
42.0 RELEASE OF INFORMATION

The CONTRACTOR shall not communicate or use in advertising, publicity, sales releases or in any other medium, photographs or other reproduction of the WORKS under this CONTRACT or descriptions of the SITE, dimensions, quantity, quality or other information, concerning the work unless prior written permission has been obtained from the OWNER. Notwithstanding the above, CONTRACTOR is entitled, under intimation to OWNER, to make such public Announcements, as it may be bound to in compliance with the Law, the Rules and any Governmental Agency or Stock Exchange Regulation the CONTRACTOR is subjected to.

43.0 COMPLETION OF CONTRACT

Unless otherwise terminated under the provisions of any other relevant clause, this CONTRACT shall be deemed to have been completed at the expiry of the DEFECT LIABILITY PERIOD.

44.0 ENFORCEMENT OF TERMS

The failure of either party to enforce at any time any of the provisions of this CONTRACT or any rights in respect thereto or to exercise any option herein provided, shall in no way be construed to be a waiver of such provisions, rights or options or in any way affect the validity of the CONTRACT. The exercise by either party of any of its rights herein shall not preclude or prejudice either party from exercising the same or any other right provided in the contract.

45.0 OWNER’S DECISION

45.1 In respect of all matters which are left to the decision of the OWNER/ ENGINEER-IN-CHARGE including the granting or withholding of the certificates, the OWNER/ ENGINEER-IN-CHARGE shall, if required to do so, by the CONTRACTOR, give in writing a decision thereon.

45.2 In each case involving a financial commitment the written APPROVAL of the owner alone shall be binding.

45.3 In matters of difference of opinion on a decision passed by the OWNER/ ENGINEER-IN-CHARGE to the CONTRACTOR, stipulations of Clause 39.0 of GCC shall govern.
46.0 CO-OPERATION

46.1 CO-OPERATION WITH OWNER

The CONTRACTOR and OWNER shall co-operate with each other in the discharge of their respective obligation under the CONTRACT with the aim of satisfactorily completing the PLANT and the WORKS in accordance with the CONTRACT.

46.1.1 The parties shall deal fairly, openly and in good faith with each other. Subject to Clause 53 (Secrecy) of GCC, each party shall disclose information which the other might reasonably need in order to exercise its rights and to perform its obligations under the CONTRACT. In particular, each party shall promptly disclose full information to the other concerning any matter which will or may prevent the Plant and Works being completed in accordance with the CONTRACT. The parties shall work together in a manner consistent with their respective obligations under the CONTRACT to resolve or mitigate any such problem.

46.1.2 OWNER shall be at liberty to object with reasonably valid reasons to employment of any person at SITE and the objection shall be communicated in writing and CONTRACTOR shall make immediate arrangements for removal of such person.

46.2 COOPERATION WITH OTHER CONTRACTORS

The CONTRACTOR shall not object to the execution of the work by other contractors or tradesmen engaged by OWNER and offer them every facility for the execution of their several works simultaneously with CONTRACTOR’s work, provided however that CONTRACTOR’S WORK is not hampered by such co-operation. CONTRACTOR shall at all times provide sufficient fencing, notice boards, lighting and watchmen to protect and warn the public and guard the works and in default thereof, OWNER may provide such facilities at CONTRACTOR’s cost, if such failure is attributable to CONTRACTOR.

The CONTRACTOR shall agree to cooperate with the OWNER and OTHER CONTRACTORS and exchange with them such technical information, provided that such CONTRACTOR is bound towards CONTRACTOR on confidentiality and limited use obligations not less stringent than those accepted by OWNER under the CONTRACT and shall not be a competitor of CONTRACTOR as is necessary to obtain the most efficient and economical design and to avoid unnecessary duplication of efforts. The OWNER shall be provided with three (3) copies of all correspondence addressed by the CONTRACTOR to other SUB-CONTRACTORS in respect of such exchange of technical information.

47.0 SUSPENSION OF WORK

47.1 The OWNER reserves the right to suspend and reinstate execution of the whole or any part of the WORK without invalidating the provisions of the CONTRACT. Orders for suspension or reinstatement of the WORKS will be issued by the OWNER to the CONTRACTOR in writing. The time for completion of the WORKS will be extended for
a period equal to the duration of the suspension along with mutually agreed remobilization period.

47.2 If such suspension of WORK by OWNER delays or is likely to delay the progress of WORK or the carrying out of WORK under CONTRACT resulting in additional expenses or increased liability to CONTRACTOR, the OWNER shall pay to the CONTRACTOR all reasonable expenses, mutually agreed between OWNER and CONTRACTOR, arising from suspension of the work by an order in writing of the OWNER provided that such suspensions of work is more than a cumulative period of Sixty days (60) days and provided that such suspension is not due to some fault on the part of the CONTRACTOR or a SUB-CONTRACTOR.

47.3 If the OWNER has;
(i) failed to pay the CONTRACTOR any sum due under the CONTRACT within the period specified in the Contract; or (ii) failed to approve invoice or supporting document without just cause within the period specified in the Contract; or (iii) committed substantial breach of the Contract:
Then, CONTRACTOR may give a notice requesting OWNER to remedy aforesaid default within 30 days. If OWNER fails to remedy it within the said period, CONTRACTOR may suspend the performance of its obligations under the CONTRACT.

47.4 If the CONTRACTOR's performance of its obligations is suspended under the CONTRACT pursuant to clause 47.3 of GCC, then the GUARANTEED COMPLETION TIME shall be extended and all reasonable additional costs or expenses incurred by the CONTRACTOR and mutually agreed between OWNER and CONTRACTOR, as a result of such suspension shall be paid by the OWNER to the CONTRACTOR provided that such suspension is not due to fault on the part of CONTRACTOR or its SUB CONTRACTOR.

48.0 REPLACEMENT OF PARTS AND MATERIALS DEFECTIVE/DAMAGED/LOST DURING TRANSIT/ERECTION AND COMMISSIONING.

48.1 If during the progress of the WORK, the OWNER shall decide and inform in writing to the CONTRACTOR that the CONTRACTOR has manufactured any plant or part of the plant unsound or imperfect or has furnished any plant inferior to the quality specified, the CONTRACTOR on receiving details of such defects or deficiencies shall at his own expense, within seven (7) days of his receiving the notice or otherwise within such time as may be reasonably necessary for making it good, proceed to alter, reconstruct or remove such work and furnish fresh equipment upto the standards of the specifications. In case the CONTRACTOR fails to do so, the OWNER may, on giving the CONTRACTOR seven (7) days notice in writing of his intentions to do so, proceed to remove the portion of the works so complained of and at the risk & cost of the CONTRACTOR, perform all such work or furnish all such equipment provided that nothing in this clause shall be deemed to deprive the OWNER of or affect any rights under the CONTRACT which the OWNER may otherwise have in respect of such defects and deficiencies.
48.2 The CONTRACTOR's full and extreme liability under this clause shall be satisfied by the payments to the OWNER of the extra cost, of such replacement procured including erection as provided for in the CONTRACT, such extra cost being the ascertained difference between the price paid by the OWNER for such replacements and the CONTRACT price portion for such defective plants and repayments of any sum/ paid by the OWNER to the CONTRACTOR in respect of such defective plant.

48.3 If the material/ equipment or any portion thereof is damaged or lost during transit and handling, storage, erection, commissioning at site, the replacements of such material / equipment shall be effected by the CONTRACTOR within a reasonable time to avoid unnecessary delay in the COMMISSIONING of the EQUIPMENT and without waiting for realisation of cost of damages from the insurance company, appointed by him for this purpose. This will not alter the schedule of commissioning & guarantee tests in any way.

49.0 DEFENCE OF SUITS

49.1 If any action in Court is brought against the OWNER or an officer or agent of the OWNER for the failure omission or neglect on the part of the CONTRACTOR to perform any acts, matters, covenants or things under the CONTRACT, or for damage or injury caused by the alleged omission or negligence on the part of the CONTRACTOR, his agents representatives or his SUB-CONTRACTORS or in connection with any claim based on lawful demands of SUB-CONTRACTORs, workmen, suppliers or employees, the CONTRACTOR shall indemnify and keep the owner and/ or his representative harmless from all losses damages, expenses or decrees arising out of such action.

49.2 If any action in court referred to in Clause 49.1 of GCC above is brought against OWNER or an officer or agent of OWNER, OWNER shall promptly give the CONTRACTOR notice thereof and CONTRACTOR may at its own expense and in OWNER's name, conduct such proceedings or claim for the settlement of any such proceedings or claim. If CONTRACTOR fails to notify OWNER within twenty-eight (28) days after receipt of such notice that it intends to conduct any such proceedings or claim, then the OWNER shall have full power and right at his discretion to defend or comprise any suit or pay claim or demand brought or made against him as aforesaid whether pending or threatened as he may consider necessary or desirable and shall be entitled to recover from the CONTRACTOR all sums of money including the amount of damages and compensation and all legal costs, charges and expenses in connection with any compromise or award which shall not be called into question by the CONTRACTOR and shall be final and binding upon him provided however that, unless CONTRACTOR has so failed to notify OWNER within the twenty-eight (28) days period, OWNER shall make no admission which may be prejudicial to the defence of any such proceedings or claim.

50.0 CONTRACTOR’S RESPONSIBILITIES

50.1 In consideration of payment by the OWNER, the CONTRACTOR shall regularly and diligently carry out and complete the WORKS in accordance with the CONTRACT.
50.2 All work carried out by the CONTRACTOR shall be carried out with sound workmanship and materials, safety and in accordance with the Contract requirements.

50.3 The CONTRACTOR shall set out the PLANT by reference to points, lines and levels of reference as defined in the approved SPECIFICATION.

50.4 The PLANT/WORKS as completed by the CONTRACTOR shall in every respect comply with the requirements defined in the Specification or any other provision of the CONTRACT.

50.5 If any time during the performance of the CONTRACT the CONTRACTOR is of the opinion that a change to the WORKS or the design or method of operation of the PLANT
a. is necessary to eliminate a potential defect in the PLANT or a specific hazard to any person or party in the performance of the WORKS or in the operation of the PLANT which has occurred or would otherwise occur' or
b. would improve operating or life cycle costs of the PLANT; or
c. would otherwise be beneficial to the OWNER;
the CONTRACTOR shall bring the matter to the attention of the ENGINEER-IN-CHARGE stating the reasons for his opinion and where appropriate, submit his proposals for a Variation in accordance with Clause 3 of SPECIAL CONDITIONS OF CONTRACT.

50.6 The CONTRACTOR shall at all times have and maintain adequate resources available for the proper and timely execution of the WORKS, including financial resources, and competent, appropriately experienced and physically capable staff and labour whether employed by the CONTRACTOR, any SUB-CONTRACTOR or third parties.

50.7 The CONTRACTOR shall provide and maintain records as specified in the CONTRACT. Unless otherwise agreed, the CONTRACTOR shall, at intervals of not more than one calendar month, report to the ENGINEER-IN-CHARGE on the progress of the WORKS, supporting his reports with appropriate documentation including any revisions to the approved programme.

50.8 The CONTRACTOR shall maintain and cause SUB-CONTRACTORs to maintain, a quality assurance system as specified in the CONTRACT. The existence of such a quality assurance system shall not relieve the CONTRACTOR from any of his other duties, obligations or liabilities under the CONTRACT. The CONTRACTOR shall also prepare and implement a validation plan, if such a requirement is specified in the CONTRACT.

51.0 PROGRESS REPORTS AND PHOTOGRAPHS

51.1 The CONTRACTOR shall furnish soft copy of progress photographs of the work done in his shop/site. Photographs shall be taken when and where indicated by the ENGINEER-IN-CHARGE. Photographs, if required shall be approximately 8 inches by 10 inches in size, including a margin on one 10 inch side for binding. Each
51.2 Required number of monthly progress reports, in prescribed proforma, shall be submitted by the CONTRACTOR to the ENGINEER-IN-CHARGE for review. These shall detail the status of design, procurement of raw materials and bought outs, approval of the CONTRACTOR's drawings, manufacture of the equipment, statutory approvals taken, inspection of equipment/material, completed despatches, materials received at site, damages, if any, during transit, actions taken or replacement of damaged equipment, progress of erection work and programme of work for succeeding month and statement showing position of payment.

52.0 SPARES

All the necessary commissioning spares, Mandatory/Insurance spares shall be included in the scope of CONTRACT as listed in SectionVI-10.0 of NIT.

53.0 SECRECY

The technical information, drawings, specifications and other related documents forming part of the NIT or the CONTRACT or such of those materials prepared during the execution of the project including photographs, micro-films, design, calculations etc. are the property of the OWNER and shall not be used for any other purpose, except for execution of contract. All rights, including rights in the event of grant of a patent and registration of designs are reserved. The technical information, drawings, specifications, records and other documents shall not be copied, transcribed, traced or reproduced in any other form or otherwise in whole and/or duplicated, modified, divulged and / or disclosed to a third party nor misused in any other form whatsoever, without the OWNER's previous consent in writing except to the extent required for the execution of this CONTRACT. Such technical information, drawings specifications and other related documents furnished shall be returned to the OWNER with all approved copies and duplicates, if any, immediately after they have been used for the agreed purposes.

For avoidance of any doubt it may be clarified that this clause relate to documents prepared by OWNER.

In the event of any breach of this provision, the CONTRACTOR shall indemnify the OWNER from any loss, cost or damage or any other claim whatsoever from any parties claiming from or through them in respect of such breach.

All intellectual property rights in documents and calculations prepared by CONTRACTOR shall at all times exclusively vest with CONTRACTOR and be used by OWNER in accordance with the CONTRACT.

53.2 Records of Contract Documents

53.2.1 The CONTRACTOR shall at all times make and keep sufficient copies of the DRAWINGS, Specifications and CONTRACT documents for him to fulfil his duties under the CONTRACT.
53.2.2 The CONTRACTOR shall keep at site at least three copies of each and every Drawing, Specification and CONTRACT Document in excess of his own requirement and those copies shall be available at all times for use by the OWNER and EIC and by any other person authorized by the OWNER who have a need to know the same for the PROJECT, who shall be provided an adequately sized site office or offices, for the safekeeping and use of such documents, by the CONTRACTOR throughout the duration of the CONTRACT. Where one or more of CONTRACTOR’S yards/offices/offshore spreads are deployed in the WORKS, all requirements of the CONTRACT and CONTRACTOR’S obligation under the CONTRACT shall apply equally at each yard/office/offshore spread so deployed.

54.0 CORRESPONDENCE

54.1 All correspondence from the CONTRACTOR to the OWNER shall be as per the correspondence distribution schedule. All communications including technical-commercial clarification and/or comments shall be addressed to OWNER/PMC and shall always bear reference to CONTRACT.

54.1.1 Correspondence on technical and commercial matters shall be dealt with in separate letters and each copy of the letter shall be complete with all Annexure, if any.

54.2 Any notice to the CONTRACTOR under the terms of the CONTRACT shall be served by registered e-mail/Speed Post, fax or courier.

54.3 Any notice to the OWNER shall be served from the CONTRACTOR's Principal office in the same manner.

54.4 Any written order or instruction of OWNER or his duly authorised representative, communicated to authorised representative of the CONTRACTOR at site office shall be deemed to have been communicated to the CONTRACTOR at his legal address.

54.5 A notice shall be effective when delivered or on date of the notice, whichever is later.

55.0 MATERIALS AND EQUIPMENT

55.1 Materials

55.1.1 CONTRACTOR shall supply, to the OWNER, all materials required for incorporation in the permanent works as determined by the CONTRACTOR, within the scope of work, necessary to establish, commission and operate (so far as concerns mandatory/insurance spares) the PLANT/ Unit delivered on FOT Site basis.

55.1.2 INVOICES

CONTRACTOR’s invoices shall be raised as per approved Billing Schedule.

(a) The CONTRACTOR’s invoice shall be in the format with all the requisite information as prescribed under GST Laws.

(b) Before raising GST invoices, CONTRACTOR shall coordinate with the OWNER with respect to address and GSTIN number on which such invoices have to be raised.
55.1.3 The CONTRACTOR shall be responsible at his own cost and initiative within the scope of services, to take delivery of the materials from the port of delivery in India in respect of imported materials and from the factory or ware-house or other place(s) of delivery in respect of indigenous materials and to transport these to the CONTRACTOR's stockpiles, godowns or other places of storage approved by the ENGINEER-IN-CHARGE, and to transport the same from said godowns or place(s) of storage to the work site for installation in the permanent WORKS.

55.1.4 The work of delivery and transportation of materials shall include (but not be limited to) the following:

i) Clearance of the goods through custom and port clearance including filling and/or filing of all custom manifests, bills of entry, and custom declarations and other documents as may be required for the clearance of the goods from customs or port authorities, for which purpose the OWNER shall, from time to time, grant to the CONTRACTOR or the CONTRACTOR's designate(s), such authority(ies) as may be reasonably required by the CONTRACTOR in this behalf.

ii) Stevedoring, clearing, forwarding and handling services as required for clearing, forwarding and handling imported and indigenous materials and consignments including payment at CONTRACTOR's cost of any demurrage, wharfage, port charges, siding charges, retention charges, detention charges or other charges whatsoever and howsoever designated or levied by any railway, air-port, ship and/or other authorities for or in connection with the loading, unloading or detention of any materials or vessels or other means of transport beyond the free period or unloading, clearance, retention or detention or loading, as the case may be, provided by the relevant authority(ies) or carrier(s) in this behalf.

iii) All works and operations necessary to lift and to remove the material from port, ware-house, railway or other siding, factory or other places of delivery, loading, handling, transporting and unloading and safely stacking, placing or storing the same at approved godowns, yards or other place(s) of storage including lashing or otherwise securing or protecting the same in transit and during and in storage.

iv) Supply, procurement, mobilization, and deployment of all labour thereof, equipment & machinery necessary for lifting, loading, handling, removing, transporting, unloading, stacking or securing the materials.

v) Transit and storage insurance of all materials for the full replacement value thereof delivered at site.

vi) All acts, deeds, matters or things required to fulfil all local, municipal and other statutory authorities with respect to the transportation of any materials through or into any State, municipal, local or other barriers or limits or for the import of the materials or any of them within the limits of such barrier, including payment of octroi or other local toll, terminal and/or entry or other taxes payable on the passage or entry of the materials through or within any local limits, for which purpose the OWNER shall give the CONTRACTOR and/or CONTRACTOR's designate(s) any and all authority(ies) as may be reasonably required in this behalf.
vii) All other acts, deeds, matters and things whatsoever ancillary, auxiliary or incidental to the above including but not limited to the grading of the site and/or creation of temporary approaches and ramps etc. as may be required.

55.2 GENERAL PROVISION WITH REGARD TO MATERIALS

55.2.1 The CONTRACTOR shall, within the scope of work, undertake the following activities and responsibilities with respect to and in addition and without prejudice to the activities and responsibilities under Clause 55.1.0 and associated clauses thereunder in respect of materials:

i) The CONTRACTOR shall in taking delivery, ensure compliance of any condition for delivery applicable to deliveries from the concerned authority or carrier, and shall be exclusively responsible to pay and bear any detention, demurrage or penalty or other charges payable by virtue of any delay or failure by the CONTRACTOR in lifting the materials or in observing any of the conditions aforesaid, and shall keep the OWNER indemnified from and against all consequences thereof.

ii) The CONTRACTOR shall maintain a day-to-day account of all materials indicating the daily receipt(s), consumption(s) and balance of each material and category thereof. Such account shall be in the format, if any, prescribed by the ENGINEER-IN-CHARGE and shall be supported by all documents necessary to verify the correctness of the entries in the account. Such account shall be maintained at the CONTRACTOR MANAGER’s office and site(s) and shall be open for inspection and verification (by verification of documents in support of the entry as also by feasible verification of the stock) at all times by the ENGINEER-IN-CHARGE with authority at all times without obstruction to enter into or upon any godown or other place(s) or premise(s) where the materials or any part of them are lying or stored and to inspect the same himself and or through his representative(s).

iii) All materials shall be taken delivery of, held, stored and utilised by the CONTRACTOR as Trustee of the OWNER, and delivery of the material to the CONTRACTOR shall constitute an entrustment thereof to the CONTRACTOR, with the intent that any utilization, application or disposal thereof by the CONTRACTOR otherwise than for permanent incorporation in the contractual works in terms of the contract shall constitute a breach of trust by the CONTRACTOR.

iv) DELETED

v) The CONTRACTOR shall at all times be exclusively responsible for any and all losses, damages, deterioration, misuse, wastage, theft, or other application or misapplication or disposal of the materials or any of them contrary to the provisions hereof and shall keep the OWNER indemnified from and against the same and shall forthwith at its own cost and expenses replace any such material, lost, damaged, deteriorated, misused, wasted, stolen, applied, mis-applied and/or disposed as aforesaid with other material of equivalent quality and quantity delivered to site at the CONTRACTOR’s risks and costs in all respects.
vi) The CONTRACTOR shall take out, at his own cost and keep in force at all times, during transit, handling, storage, and erection up to completion in all respect of the work, policy (ies) with Insurance Company (ies) approved by the OWNER for the full replacement value of the materials at site against the risks specified in the CONTRACT. Such policies shall be in the joint names of the OWNER and the CONTRACTOR, with exclusive right in the OWNER to receive all monies due in respect of such policy (ies) and with right in the OWNER (but without obligation to do so) to take out and pay the premia for any such policy (ies) and deduct the premia and any other costs and expense in this behalf from the monies for the time being due or in future becoming due to the CONTRACTOR. In case of Insurance claim, the GST leviable on the transfer of the claim money from OWNER to CONTRACTOR shall be over and above the GST cap indicated in the CONTRACT and shall be borne by OWNER.

vii) Deleted

viii) If the CONTRACTOR shall default in replacing at the job SITE, without any additional cost to the OWNER, any material lost, damaged, deteriorated, misused, wasted, short, stolen, misapplied or disposed of within the provisions hereof above, the CONTRACTOR shall be liable to pay to the OWNER the cost of such materials.

a) Notwithstanding anything herein provided, the CONTRACTOR shall be and remain solely and exclusively liable to repair, restore or replace, as the case may be, the materials damaged or destroyed as a result of any act or omission, notwithstanding the existence or otherwise of any policy(ies) of insurance aforesaid, with the intent that any policy(ies) of insurance aforesaid taken out by the CONTRACTOR or by the OWNER, on default by the CONTRACTOR, shall not anywise absolve the CONTRACTOR from his full liability up to and until issue of the Preliminary Acceptance Certificate as provided for herein in respect of the works, the work(s) and all materials incorporated therein shall be and remain at the risks of the CONTRACTOR in all respects, including (but not limited to) accident, lightning, earth-quake, fire, storm, flood, tempest, riot, civil commotion and/or war or otherwise with respect to the materials, but shall constitute merely an additional security and not a substitution of liability.

b) It shall be the exclusive responsibility of the CONTRACTOR to lodge and pursue any or all claims in respect of the insurance aforesaid.

c) The CONTRACTOR shall, as a condition to the certification of any Running Account Bill, satisfy the OWNER/ Engineer-In-Charge of the existence of one or more policy(ies) of insurance, covering the materials as specified herein. The policy(ies) of insurance aforesaid shall cover all insurable risks, including but not limited to, any loss or damage commencing from the supplier’s ware house in handling, transit, storage and during erection, theft, pilferage, riot, civil commotion, force majeure (including earth quake, flood, storm, cyclone, tidal wave, lightening and other adverse weather conditions), accidents of kinds, fire, war risks and explosion.

ix) DELETE
55.3.0 **BILL OF MATERIALS**

55.3.1 The CONTRACTOR shall furnish to the OWNER a detailed Bill of Materials specifying the materials, which on preliminary determination made by the CONTRACTOR, will be required to be incorporated in the permanent works in order to establish the WORK/Unit and to operate the PLANT/Unit, including construction materials.

55.3.2 Each item entered in the Bill of Materials shall be priced. The Bill of Materials and said price break–up therein are intended only to form a basis for the purpose of calculating on account payments and for calculating payments due to the CONTRACTOR under Clause 34.0 of GCC upon cancellation of contract, and for no other purpose.

55.3.3 The OWNER shall review or cause to be reviewed the prima facie adequacy, sufficiency, validity and/or suitability of the materials listed in the Bill of Materials for the works for which they are intended, and of the prices indicated in the Bill of Materials in respect thereof. Such review shall be performed in conjunction with the design, engineering, specification and other technical reviews to be done by the OWNER and all provisions applicable thereto with reference to critical drawings shall be applicable to the review of the Bill of Materials.

55.3.3.1 The priced Bill of Materials as approved by the OWNER shall constitute the Bill of Materials envisaged in the contract documents. However, no such approval shall, in any manner, absolve the CONTRACTOR of his full responsibility under the CONTRACT to sell and supply to the OWNER all materials required for the permanent incorporation in the works and which are required to establish, commission and operate (to the extent of mandatory/insurance spares) the PLANT/Unit in accordance with the CONTRACT and the specifications, complete in all respects including spares, tools, tackles and testing equipment, so far as included within the scope of supply, whether or not any particular material is actually included within or omitted in the Bill of Materials and whether or not the price thereof is included in the price indicated in the Bill of Materials and whether or not the price thereof is in conformity with the price thereof indicated in the Bill of Materials. The review and approval of the Bill of Materials and the prices therein are intended only for the satisfaction of the OWNER that the priced Bill of Materials, prima facie covers the materials required to be supplied by the CONTRACTOR within the scope of supply.

55.3.4 The Bill of Materials shall be subject to amendment in both items and prices in so far as necessary consequent upon any amendment in any relevant related technical particulars, and upon any amendment, the amended Bill of Materials as approved by the OWNER, shall thereafter constitute the Bill of Materials as envisaged in the CONTRACT documents.

55.4 **SUPPLY OF MATERIALS**

55.4.1 The CONTRACTOR shall supply the materials required to be supplied within the Contractor’s scope of supply for incorporation in the permanent works in accordance with
and to meet the requirements in quality, quantity and other particulars of the descriptions, specifications, plans, drawings, designs and other documents applicable thereto, and the CONTRACTOR shall be deemed to have undertaken that all materials selected, procured and supplied by the CONTRACTOR within the scope of supply shall be of the best quality and workmanship and shall be capable of producing the designed desired results and to perform the designed and desired functions to meet the contractual requirements in all respects for the project.

55.4.2 The CONTRACTOR shall undertake and complete the supply of materials within the scope of supply to meet the scheduled progress and requirements of the WORK within the scope of work.

55.4.3 All materials shall be deemed to have been accepted only when the material is received at the project SITE and accepted by the ENGINEER-IN-CHARGE. Such acceptance shall however be subject to the terms and conditions of CONTRACT, including the right of rejection and/or replacement as elsewhere herein specified.

55.4.4 Without prejudice to any other terms of the contract, it is clarified that the mere agreement, acceptance or prescription of a Delivery or other Schedule containing an extended time of commencement or completion in respect of the entire delivery(ies) or any of them shall not anywise constitute an extension of time in a terms of the CONTRACT so as to bind the OWNER or relieve the CONTRACTOR of all or any of his liabilities under CONTRACT, nor shall constitute a promise on behalf of the OWNER or a waiver by the OWNER of any of its rights in terms of the contract relative to the performance of the CONTRACT within the time specified or otherwise, but shall be deemed only (at the most) to be a guidance to the CONTRACTOR for better organising his work on a recognition that the CONTRACTOR has failed to organise his supplies and/or make the same within the time specified in the Delivery Schedule.

55.4.5 If the CONTRACTOR fails to supply the materials in accordance with the dates in this behalf specified in the Delivery Schedule which has an impact on the critical path of the schedule, the CONTRACTOR shall provide the OWNER with a suitable plan to recover the delay, but without prejudice to any other rights, discount or remedy available to the OWNER in respect of such delay or failure.

55.4.6 MAKE OF MATERIALS

i) All equipment and materials to be supplied under this CONTRACT shall be from approved vendors as indicated in the Bidding Document or as otherwise approved by the ENGINEER-IN-CHARGE / OWNER.

ii) Where the makes of materials are not indicated in the Bidding document, the CONTRACTOR shall furnish details of proposed makes and supplies and supply the same after obtaining the OWNER's/ ENGINEER-IN-CHARGE's approval.

55.5.0 CERTIFICATE OF VERIFICATION AND GOOD CONDITION

55.5.1 The CONTRACTOR shall, before supply of material covered within the scope of supply, at his own risks, costs and initiative, undertake or cause to be undertaken all tests, analysis and inspections as shall be required to be undertaken with regard to the materials under the specifications and any codes, practices, orders and instructions with respect thereto and shall cause the results thereof to be recorded, reported or certified,
as the case may be, and shall not offer for delivery or deliver any material(s) which has/have not passed such tests/analysis or inspection and which are not accompanied by the tests results, reports and/or certificates in this behalf provided in the applicable specifications, code(s) and/or practices.

55.5.2 On arrival of the material at site the CONTRACTOR shall give written notice thereof to the ENGINEER-IN-CHARGE or Inspection Agency notified by the OWNER in this behalf, to inspect the materials, and shall keep in readiness for inspection, the materials and the relevant tests results, reports and certificates hereto.

55.5.3 Notwithstanding any other provisions in the contract documents for analysis or tests of materials and in addition thereto, the CONTRACTOR shall, if so required by the ENGINEER-IN-CHARGE or Inspection Agency in writing at his own risks and costs, analyse, test, prove and weigh all materials (including materials incorporated in the works) required to be analysed, tested, proved and/or weighed by the ENGINEER-IN-CHARGE or Inspection Agency in this behalf and shall have such analysis or tests conducted by the agency(ies), or authority(ies) if any specified by the ENGINEER-IN-CHARGE or Inspection Agency. The CONTRACTOR shall provide all equipment, labour, materials and other things whatsoever required for testing, preparation of the samples, measurement of work and/or proof of weighment of the materials as directed by the ENGINEER-IN-CHARGE or Inspection Agency.

55.5.4 If on Inspection or proof, analysis or tests as aforesaid the ENGINEER-IN-CHARGE or Inspection Agency nominated by the OWNER in this behalf is prima facie satisfied that the material received is in conformity with the material requirements of the Bill of Materials and description given in the shipping documents and in the CONTRACTOR’s invoices in this behalf and that the test reports/results/certificates given in respect thereof are prima facie in conformity with the relevant result/reports/certificates required in respect thereof in terms of the specifications and/or relevant codes and practices, and that the material appears to be prima facie in good order and condition, the ENGINEER-IN-CHARGE shall issue to CONTRACTOR, a Certificate of Verification and Good Condition in respect of such material, and this shall constitute the Certificate of Verification and Good Condition elsewhere envisaged in the CONTRACT documents. Should the ENGINEER-IN-CHARGE not issue said Certificate within 5 working days, following the conformity of the aforementioned requirements, the Certificate of Verification and Good Condition shall be deemed issued.

55.5.5 Such certificate is only intended to satisfy the OWNER that prima facie the material supplied by the CONTRACTOR is in order and shall not anywise absolve the CONTRACTOR of his/its full responsibility under the CONTRACT in relation thereto, including in relation to specification fulfilment and/or performance or other guarantees.

55.5.6 Notwithstanding that any area(s) or source(s) has/have been suggested by the OWNER to the CONTRACTOR from which any material for incorporation in the WORKS can be obtained, the CONTRACTOR shall independently satisfy himself of the suitability, accessibility and sufficiency of the source(s) of supply suggested by the OWNER and suitability of the material available from such source(s) with the intent that any suggestion as aforesaid shall not anywise relieve the CONTRACTOR of his full liability in respect of the suitability and quality of the material(s) obtained from said source(s) and the CONTRACTOR shall obtain material(s) there from and incorporate the same within the permanent works entirely at his own risks and costs in all respects, with the intent that any such suggestion by the OWNER shall only be by way of assistance to the CONTRACTOR and shall not entail any legal responsibility or liability upon the OWNER.
55.6.0 MATERIALS WITHIN THE CONTRACTOR’S SCOPE OF SUPPLY
55.6.1 The OWNER does not warrant or undertake the provisions of any materials and the CONTRACTOR shall not imply, by conduct, expression or assurance or by any other means, any promise or obligation on the part of the OWNER in his respect understood by the CONTRACTOR.

55.7.0 Deleted

55.8 PACKING AND FORWARDING

- The CONTRACTOR shall, wherever applicable, after proper painting, pack and crate all items in such a manner so as to protect them from deterioration and damage during rail and road transportation to the site and during storage at the site till the time of erection. Without prejudice to any other liabilities or obligations of the CONTRACTOR, the CONTRACTOR shall be responsible for all damage(s) due to improper packing.

- The CONTRACTOR shall notify OWNER/ ENGINEER-IN-CHARGE the expected date of arrival materials at the site for the information of OWNER/ ENGINEER-IN-CHARGE.

- The CONTRACTOR’s notification shall also give all shipping information concerning the weight, size and content of each packing and such other information as the OWNER/ ENGINEER-IN-CHARGE may require.

- The following documents shall be sent to the OWNER/ EIC in three copies:
  a) Signed Invoice(s)
  b) Delivery Challan
  c) Packing list.
  d) Manufacturer’s certificate of inspection for shipment duly approved by the CONTRACTOR in one original and one photocopy
  e) Third Party Inspection Release Note clearly indicating that material has been inspected and accepted as per QAP approved by OWNER, or waiver certificate issued by OWNER.
  f) Railway Receipt/LR
  g) Insurance Certificate/Intimation
  h) Guarantee certificate (wherever applicable)
  i) Operation & Maintenance manual (wherever applicable)

55.9 Deleted

55.10 Deleted

55.11 UTILITIES AND CONSUMABLES ETC.

55.11.1 Subject to any other provision to the contrary in the CONTRACT, the CONTRACTOR shall be and remain at all times exclusively responsible within the scope of work to
provide all utilities, consumables, permits, licenses, easements and facilities and other items and things whatsoever required for or in connection with the WORK, including but not limited to those indicated by expression or implication in the bid documents and/or other CONTRACT documents or howsoever otherwise as shall be or may from time to time be necessary for or in connection with the WORK.

56.0 MEASUREMENTS, CERTIFYING INSPECTIONS AND PAYMENTS

56.1 Final Measurements:

56.1.1 Within 15 (fifteen) days from the date of certification of works completed/milestone achieved in respect of the WORKS, or of any portion of the WORKS, section, group or job site, as the case may be, measurements for the works covered by such certification shall be jointly taken by the ENGINEER-IN-CHARGE and the CONTRACTOR as herein provided.

56.1.2 If the CONTRACTOR fails to apply to the ENGINEER-IN-CHARGE for measurements within 15 (fifteen) days from the date of certification of works completed/milestone achieved as specified in Clause 56.1.1, the ENGINEER-IN-CHARGE shall notify the CONTRACTOR in writing of the date(s) for measurements, and require the CONTRACTOR to be present on date(s) so notified.

56.2 Mode of Measurement:

56.2.1 All measurements shall be recorded in the metric system, and shall be taken in accordance with the procedures set forth or provided for in the Schedule of Rates, Specifications and other CONTRACT Documents.

56.2.2 Where the mode of measurement is not provided for in the Contract Documents in respect of any item of work, it shall be measured in accordance with the Indian Standard Specification No. 1200 (latest edition) and in the event of such item not being covered by Indian Standard Specifications, it shall be measured in accordance with the method of measurement in this behalf specified by the ENGINEER-IN-CHARGE, whose decision in this regard shall be final and binding upon the CONTRACTOR. If the Contractor disagrees with the decision of the ENGINEER-IN-CHARGE, the dispute shall be settled as per the provisions of Clause 39.0 of GCC.

56.2.3 All measurements shall be taken jointly by the ENGINEER-IN-CHARGE and the CONTRACTOR or their respective representatives. The CONTRACTOR or his authorized representative shall be entitled to remain present at all times when joint measurements are being taken.

56.2.4 Despite due intimation, if the CONTRACTOR omits or fails to be present to witness joint measurements, the measurements shall be taken in the presence of the ENGINEER-IN-CHARGE and the measurements so recorded and signed by the ENGINEER-IN-CHARGE as correct, shall be final and binding upon the Parties.

56.2.5 Except in cases covered by Clause 56.2.4, in all other cases measurements shall be signed and dated on each page by the CONTRACTOR / CONTRACT MANAGER and ENGINEER-IN-CHARGE or his representative. If the CONTRACTOR objects to any of the measurements recorded, including the mode of measurement, such objection shall be noted in the measurement book against the item objected to and such note shall be dated and authenticated by the CONTRACTOR / CONTRACT MANAGER and ENGINEER-IN-
56.2.6 All objections noted in the Measurement Book in terms of Clause 56.2.5 shall be considered and decided within 15 days by the ENGINEER-IN-CHARGE. The decision of the ENGINEER-IN-CHARGE relative thereto (whether on the correct measurement to be adopted or on the mode of measurement to be adopted) shall be final and binding upon the Parties. If the Contractor disagrees with the decision of the ENGINEER-IN-CHARGE, the dispute shall be settled as per the provisions of Clause 39.0 of GCC.

56.2.7 The measurement as finally recorded in terms of Clause 56.2.4 or Clause 56.2.5 or 56.2.6, as applicable, shall be the Final Measurement.

56.3 CERTIFYING INSPECTIONS

All provisions referred to in Clauses 56.1 to 56.2, in respect of Mode of Measurement, shall apply to all inspections required to be made in order to qualify the CONTRACTOR for any payment(s) under the CONTRACT and any reference in the said clauses to measurements shall, for the purpose of this clause, be deemed to be a reference to certifying inspections and any reference therein to the measurement book shall, for the purpose of this clause, be deemed to be a reference to the certifying inspection book.

56.4.0 FINAL BILL

56.4.1 On the basis of the LUMPSUM PRICE provided in the CONTRACT and subsequent Change Order(s)/Amendment(s), if any and the approved billing schedule, the CONTRACTOR shall prepare a Final Bill in the prescribed form. Additions claimed to the LUMPSUM PRICE or reductions thereof on account of CHANGE ORDER(s) shall be separately indicated in the Final Bill with reference to the relative CHANGE ORDERS(s).

56.4.2 The Final Bill shall, in addition to the payment entitlements arrived at according to the provisions of Clause 56.4.1 hereof shall separately state and include therein all claims of the CONTRACTOR, if any, with full particulars of the nature of such claim and grounds on which it is based and the amount claimed.

56.4.3 The Final Bill drawn in accordance with Clause 56.4.1 shall be submitted together with the PRELIMINARY ACCEPTANCE CERTIFICATE to the ENGINEER-IN-CHARGE for certification, who shall certify the Final Bill, if drawn in accordance with Clause 56.4.1. After certification of the ENGINEER-IN-CHARGE, the Final Bill shall be submitted in quadruplicate (or in such other number of copies as the OWNER may prescribe) accompanied by the PRELIMINARY ACCEPTANCE CERTIFICATE to the OWNER for payment.

56.4.4 All monies payable under the CONTRACT for WORKS to be performed and MATERIALS to be supplied up to and including successful completion and final tests and commissioning of the system and performance tests shall become due and payable to the CONTRACTOR only after submission to the OWNER of the Final Bill prepared in accordance with the provisions of Clause 56.4.1 hereof and associated provisions there under accompanied by the PRELIMINARY ACCEPTANCE CERTIFICATE in respect of the WORKS.
56.4.5 Payments of the amount(s) due on the Final Bill to the extent certified by the ENGINEER-IN-CHARGE, shall be made within 84 (Eighty Four) days from the due date as specified in Clause 56.4.4 hereof, subject to the deductions provided in Clause 56.4.5.1.

56.4.5.1 All payments due to the CONTRACTOR on the Final Bill shall be subject to, tax deductions as provided for in Clause 56.7.2 and associated clauses there under and any other deduction provided in the CONTRACT or required to be made under any law, rule or regulation having the force of law for the time being applicable, or elsewhere provided for in the CONTRACT documents.

56.5.0 PRICE SCHEDULE

56.5.1 The remuneration determined due to the CONTRACTOR as provided for in Clause 56.4.1 hereof shall constitute the entirety of the remuneration and entitlement of the CONTRACTOR in respect of the WORK under the CONTRACT, and no further or other payment whatsoever shall be or become due or payable to the CONTRACTOR under the CONTRACT.

56.5.2 Without prejudice to the generality of the provisions of Clause 56.5.1 hereof, the Price Schedule and LUMPSUM PRICE shall be deemed to include and cover (unless otherwise expressly specified to the contrary in any CONTRACT document(s)):

(i) All costs, expenses, outgoings and liabilities of every nature and description whatsoever and all risks whatsoever (foreseen or unforeseen, including force majeure) to be taken or which may occur in or relative to execution, completion, testing, commissioning and/or handling over the WORKS to the OWNER and/or in or relative to acquisition, loading, unloading, transportation, storing, working upon, using, converting fabricating, or erecting any item, equipment, system, material or component in or relative to the WORKS, and the CONTRACTOR shall be deemed to have known the nature, scope, magnitude and the extent of the works and items, MATERIALS, EQUIPMENT, and components required for the proper and complete execution of the Works though the CONTRACT documents may not fully and precisely set out, describe or specify them, and the generality hereof shall not be deemed to be anywise limited, restricted or abridged because in certain cases the CONTRACT documents or any of them shall or may and/or in other cases they shall or may not expressly state that the CONTRACTOR shall do or perform any particular labour or service or because in certain cases the CONTRACT documents state that a particular work, operation, supply, labour or service shall be performed/made by the CONTRACTOR at his own cost or without additional payment, compensation or charge or without entitlement of claim against the OWNER or words to similar effect, and in other cases they do not, or because in certain cases it is stated that the same are included in or covered by the Price Schedule and in other cases it is not so stated.

(ii) The cost of all construction and related vessels, craft, vehicles, movements, plant, equipment, distribution of water and power, construction of temporary roads and access, temporary works, pumps, wiring, pipes, scaffolding, piling, shuttering and other materials, supervision, labour, insurance, fuel, stores, spares, supplies, appliances and materials, items, articles and things whatsoever (foreseen of unforeseen) by expression or implication to be supplied, provided or arranged in or relative to or in connection with the performance and/or execution of the WORKS and/or related or incidental thereto, complete in every respect in
accordance with the CONTRACT document, and the plans, drawing, designs, orders and/or instructions;

(iii) The cost of mobilisation including but not limited to mobilisation of vehicles, movements, machinery, equipment, gear, tools, tackle, consumables and other items and goods and personnel necessary for or to perform the WORKS contemplated under the CONTRACT, preparation and erection of work yards and other work places and facilities necessary for or to perform the WORKS contemplated under the CONTRACT and/or to supply the material included within the scope of supplies including all work, labour, inputs, goods, EQUIPMENT, and other items and things whatsoever necessary for the performance of the WORKS, dismantling and/or removal of the same and restoration of the site, lifting the materials and transporting them to CONTRACTOR’s stock piles/work yard, job sites and loading, stacking and/or storing the same.

(iv) The costs and risks of all rents, royalties, licenses, permits, permission and other fees, duties, penalties, levies, and damages whatsoever payable for or in respect of any protected or patented goods, materials, equipment or processes employed in or relative to the works and of all rents, royalties, licenses, permits, permissions and any other fee, duty, penalty, levy, loss or damages payable on the excavation, removal or transportation of any material or acquisition or use of any right of way or other right, licenses, permit, privilege, permission or uses required for or relative to the performance of the WORK.

(v) The cost of all taxes and duties payable in India with regard to materials supplied by the CONTRACTOR within the scope of supplies, all customs and import duties, Indian Income Tax, applicable GST, quay, warfare, demurrage, detention and landing charges and all other duties, taxes, fees, charges, levies, and/or cesses whatsoever imposed or to be imposed by the Central Government or State Government or Municipal or Local Bodies or other Authorities whatsoever and payable on any materials supplied and/or on works performed without any entitlement to the CONTRACTOR for any exemption, remission, refund or reduction thereof.

(vi) The cost of all indemnities under the CONTRACT, and insurance primia on insurance required in terms of the CONTRACT documents or otherwise under any law, rule or regulation, and the cost of all risks whatsoever (foreseen and unforeseen) including but not limited to risks of delay or extension of time or reduction or increase in the work or scope of work and/or cancellation of CONTRACT, and/or accident, strike, civil commotion, war, strike, labour trouble, third party breach, fire, lighting, inclement weather, storm, tempest, flood, earthquake and other acts of God, Government regulation or imposition or restriction, dislocation of road, rail, sea, air and other transport, access or facility, flooding of site and/or access roads and approaches thereto, suspension of work, sabotage and other cause whatsoever.

(vii) The cost of all inspections, tests and certificates relative thereto including third party tests and/or inspections where necessary, and of items, instruments, plant and/or tools and appliances required to conduct such inspection and tests.

(viii) The cost of all materials supplied and/or intended for incorporation in the WORKS supplied within the scope of work, delivery thereof to the job site,
loading, transportation and unloading thereof, waste on materials, and return of empties and surpluses.

(ix) The cost of all escalations (foreseen and unforeseen) including but not limited to increase in Government taxes and duties (beyond contractual completion period and any extension hereof due to reasons attributable to CONTRACTOR), labor costs and material costs and other inputs whatsoever.

(x) All supervision charges, establishment's overheads, finance charges and other costs and expenses and charges to the CONTRACTOR, and the CONTRACTOR's profit of and relative to the WORK and/or supply.

(xi) The cost of all deductions, reductions, discounts, adjustments and withholdings whatsoever under or in connection with the CONTRACT.

(xii) The cost of all taxes & duties payable in India with regard to materials supplied by the CONTRACTOR within the scope of supplies, all customs and import duties, Indian Income Tax, applicable GST, quay, wharfage, demurrage, detention and landing charges and all other duties, taxes, fees, charges, levies, and/or cesses whatsoever imposed or to be imposed by the Central Government or State Government or Municipal or Local Bodies or other Authorities whatsoever and payable on any materials supplied and/or on works performed without any entitlement to the CONTRACTOR for any exemption, remission, refund or reduction thereof.

(xiii) The Schedule of Rates shall be deemed to include and cover the risk of all possibilities of delay and interference with the CONTRACTOR's conduct of WORK which occur from any causes including orders of the OWNER in the exercise of his power and on account of extension of time granted due to various reasons and for all other possible or probable causes of delay.

56.5.3 The rates stated in the Price Schedule and the lumpsum price(s) shall not be subject to escalation or increase for any reason whatsoever unless otherwise provided in the CONTRACT documents.

56.6.0 ADVANCE PAYMENT

56.6.1 Without prejudice to the provisions of Clause 56.4.4 hereof, the OWNER shall by way of assistance to the CONTRACTOR, make “advance” or “on account” payments to the CONTRACTOR during the progress of the work and/or supply on the basis of Running Account Bills or otherwise as elsewhere more specifically provided for in the CONTRACT documents. However, all payments shall be as per the payment terms agreed as per relevant clause.

56.6.2 The following provisions shall apply with respect to “advance” payments to the CONTRACTOR:

56.6.2.1 Advance(s), if any, paid to the CONTRACTOR shall carry interest at the rates specified in the SPECIAL CONDITIONS OF CONTRACT, and shall be adjustable (without prejudice to the any other mode of recovery) from the Running Account Bills of the CONTRACTOR as provided in the SPECIAL CONDITIONS OF CONTRACT.

56.6.2.2 The advances paid to the CONTRACTOR shall be used for execution of this contract only and the CONTRACTOR shall satisfy the OWNER in this regard whenever required. If it is found that an advance has been utilised by the CONTRACTOR in whole or part for any other purpose, the OWNER may at its discretion forthwith recall the entire advance and,
without prejudice to any other right or remedy available to the OWNER, recover the same by recourse to any Bank Guarantee(s).

56.6.3 Subject to the provisions of clause 34.0 of GCC, all advances made by the OWNER to the CONTRACTOR shall forthwith become repayable to the OWNER in the event of the CONTRACT being terminated for any cause.

56.7.0 MODE OF PAYMENT AND TAX DEDUCTIONS

56.7.1 All payments made under or in terms of the CONTRACT, shall be paid through Electronic Fund Transfer mechanism (EFT).

56.7.2 The CONTRACTOR shall be primarily responsible for the payment of all Indian Income tax.

56.8.0 CLAIMS BY THE CONTRACTOR

56.8.1 No claim(s) shall on any account be made by the CONTRACTOR after submission of the Final Bill, with the intent that the Final Bill prepared by the CONTRACTOR shall reflect any and all claims whatsoever of the CONTRACTOR against the OWNER arising out of or in connection with the CONTRACT or any supply made or work performed by the CONTRACTOR there under or in relation thereto, and notwithstanding any enabling provision in any law or CONTRACT and notwithstanding any claim that the CONTRACTOR could have with respect thereto, the CONTRACTOR hereby waives and relinquishes any and all such claims not included in the Final Bill and absolves and discharges the OWNER from and against the same, even if in not including the same as aforesaid, the CONTRACTOR shall have acted under a mistake of law or of fact, or shall claim to have acted under economic compulsion or necessity.

56.8.2 If required by the OWNER, the ENGINEER-IN-CHARGE shall be authorised to require the CONTRACTOR to furnish, and the CONTRACTOR shall, upon the request of the ENGINEER-IN-CHARGE /OWNER, furnish all invoices, vouchers and accounting records as may be deemed necessary by the ENGINEER-IN-CHARGE /OWNER for the purpose of verifying any CONTRACTOR’s claim.

56.9 DISCHARGE OF OWNER’S LIABILITY

56.9.1 The acceptance by the CONTRACTOR of any amount paid by the OWNER to CONTRACTOR in respect of the Final Bill of the CONTRACTOR in settlement of all said dues to the CONTRACTOR under the Final Bill shall, without prejudice to the claims of the CONTRACTOR included in the Final Bill in accordance with the provisions of clause 56.4.2 of GCC, be deemed to be in full and final settlement of all such dues to the CONTRACTOR notwithstanding any qualifying remarks, protest or condition imposed or purported to be imposed by the CONTRACTOR related to the acceptance of such payment, with the intent that upon acceptance by the CONTRACTOR of any payment made as aforesaid, the CONTRACT (including the arbitration clause) shall stand discharged and extinguished insofar as relates to and/or concerns the entitlements of the CONTRACTOR under the CONTRACT except for the CONTRACTOR’s right, if any, to receive payment in respect of his notified claims included in his Final Bill and the right to receive payment of the unadjusted balance of the Security Deposit in accordance with the provisions of Clause 56.10.3 on successful completion of the DEFECT LIABILITY
PERIOD. But nothing herein stated shall affect the CONTRACTOR’s undischarged liabilities and obligations under the CONTRACT.

56.9.2 The acceptance by the CONTRACTOR of any amount paid by the OWNER to the CONTRACTOR in respect of the notified claims of the CONTRACTOR included in the Final Bill, in settlement of the claims of the CONTRACTOR, shall be deemed to be in full and final settlement of all claims of the CONTRACTOR and, the CONTRACT shall stand discharged and extinguished insofar as relates to and/or concerns the claims of the CONTRACTOR except for the CONTRACTOR’s rights to receive payments of the unadjusted balance, if any, of the security deposit in accordance with clause 56.10.3.0 hereof on successful completion of the DEFECT LIABILITY PERIOD. But nothing herein stated shall affect the CONTRACTOR’s undischarged liabilities and obligations under the CONTRACT.

56.9.3 Notwithstanding anything provided in Clause 56.9.1 and/or Clause 56.9.2, the CONTRACTOR shall be and remain liable for defects in terms of DEFECT LIABILITY PERIOD and associated clause thereunder and for any indemnity to the OWNER in terms of Clause 56.10.2 and shall be and remain entitled to receive the unadjusted balance of the Security Deposit remaining in the hands of the OWNER in terms of Clause 56.10.3 and associated clauses thereunder.

56.10.0 FINAL ACCEPTANCE CERTIFICATE

56.10.1 Forthwith on the CONTRACTOR’s application made after the expiry of DEFECT LIABILITY PERIOD provided and associated clauses thereunder and satisfaction of all liabilities of the CONTRACTOR in respect thereof, the ENGINEER-IN-CHARGE shall issue a FINAL ACCEPTANCE CERTIFICATE to the CONTRACTOR Certifying that the CONTRACTOR has performed his obligations in respect of the DEFECT LIABILITY PERIOD and associated clauses thereunder, and until issue of such FINAL ACCEPTANCE CERTIFICATE, the CONTRACTOR shall be deemed not to have performed such liabilities notwithstanding issue of the PRELIMINARY ACCEPTANCE CERTIFICATE or payment of the Final Bill by the OWNER.

In the event that OWNER fails to issue the FINAL ACCEPTANCE CERTIFICATE, or fails to notify CONTRACTOR the reason for not issuing said certificate of acceptance, within a period of 60 days from CONTRACTOR’s application, the FINAL ACCEPTANCE CERTIFICATE shall be deemed as issued by OWNER for all contractual purposes.

56.10.2 Upon application for the FINAL ACCEPTANCE CERTIFICATE, the CONTRACTOR shall:

(i) Be deemed to have warranted that it had been fully paid and satisfied all claims for or arising out of the WORK, labour, MATERIALS, supplies and EQUIPMENT used in or connected with the CONTRACT and all other liabilities whatsoever touching or affecting the CONTRACT, or its performance, including in relation to SUB-CONTRACTORS and suppliers, and

(ii) To have undertaken to indemnify and keep indemnified the OWNER from and against all claims, demands, debts, liens, obligations and liabilities whatsoever arising there from or relating thereto.
56.10.2.1 Upon issue of the FINAL ACCEPTANCE CERTIFICATE, the CONTRACTOR shall be
deemed to have released, acquitted and discharged the OWNER from and against all
claims (known or unknown), liens, demands or causes of action of any kind whatsoever
arising out of or relating to the CONTRACT or otherwise howsoever touching or affecting
the same.

56.10.3 Forthwith on application made by the CONTRACTOR in this behalf accompanied by the
FINAL ACCEPTANCE CERTIFICATE, or within 84 (Eighty Four) days of the OWNER
passing the CONTRACTOR’s Final Bill, whichever shall be later, the OWNER shall
cancel and return to the CONTRACTOR all previous Bank Guarantees remaining
unutilised in the hands of the OWNER, and upon such cancellation and return, the
OWNER shall stand discharged of all obligations/ liabilities under the CONTRACT
provided that the cancellation and return of any Bank Guarantee(s) furnished by the
CONTRACTOR as and by way of security deposit shall be subject to the CONTRACTOR
replacing such Bank Guarantee(s) with a Bank Guarantee from OWNER’s approved list
of banks in a format acceptable to the OWNER covering 10% (ten percent) of the value
(or as determined by the OWNER) of equipments/works replaced or repaired during the
DEFECT LIABILITY PERIOD for the unexpired term of extended defect liability period in
respect thereof plus a 6 (six) months period. The claims or demands made during such
additional 6 months period shall refer to events which has occurred before the expiry of
the DEFECT LIABILITY PERIOD.

56.11 CLAIMS OF OWNER

56.11.1 The release/payment of any unadjusted balance of the Security Deposit (furnished in the
form of a Bank Guarantee or otherwise) by the OWNER to the CONTRACTOR as
aforesaid or otherwise shall not be deemed or treated as a waiver of any right(s) or
claim(s) of the OWNER existing before the issuance of the FINAL ACCEPTANCE
CERTIFICATE or shall not stop or prevent the OWNER from thereafter making or
enforcing any claim or any rights existing before the issuance of the FINAL
ACCEPTANCE CERTIFICATE against the CONTRACTOR with the intent that the claims
of the OWNER, against the CONTRACTOR shall continue to survive and shall not get
extinguished notwithstanding the issue of FINAL ACCEPTANCE CERTIFICATE and/or
the release of Security Deposit to the CONTRACTOR.

57.0 UNDERGROUND OBSTRUCTIONS

The soil investigation report furnished in the NIT is indicative only and is enclosed purely
for information/guidance purpose to the bidders. The contractor shall carry out its own
detailed soil investigation for the proposed plant. Design of the foundation system of the
plant shall be based, only on the site specific report. Nothing extra shall be paid in case of
any variation arising out of the soil report conducted report conducted by the bidders and
the data given in the tender. In the event, CONTRACTOR encounters any underground
obstructions, the same shall be removed by CONTRACTOR without any extra cost
implications to the OWNER.

In the event, CONTRACTOR encounters any underground obstruction which entails cost
implication to the CONTRACTOR, the OWNER shall consider to compensate the
CONTRACTOR reasonable cost compensation and/or time extension, depending on
merit of the case after mutual discussion. The decision of the ENGINEER-IN-CHARGE in this regard shall be in writing and shall be final and binding upon the CONTRACTOR. It is clarified that in case the CONTRACTOR disagrees with the decision of ENGINEER-IN-CHARGE, the dispute shall be settled as per the provision of clause 39 of GCC.

57.1 ARTICLES OF VALUE FOUND:

All gold, silver and other minerals of any description and all precious stones, coins, treasure relics, antiquities and other similar things which shall be found in, under or upon the SITE, shall be the property of the OWNER and the CONTRACTOR shall duly preserve the same to the satisfaction of the ENGINEER-IN-CHARGE and shall from time to time deliver the same to such person or persons indicated by the OWNER.

58.0 REGISTRATION OF THE CONTRACTOR WITH STATUTORY AUTHORITIES

58.1 Within 30 days of execution of the CONTRACT, the CONTRACTOR shall, insofar as necessary, register itself and the CONTRACT at their own cost with the Reserve Bank of India, Income Tax, Sales Tax and/or any other applicable statutory authorities as required under the rules and regulations governing in India. The CONTRACT PRICE shall be deemed to include all costs towards the same. A copy of all documents related to all such registration shall be submitted to OWNER for record.

58.2 Immediately after notification of the Acceptance of Bid, the foreign CONTRACTOR shall obtain permission for opening of their office(s) in India from the Reserve Bank of India, and shall obtain Income Tax clearance from Indian Income Tax authorities. Among other formalities, these will be required by the OWNER to release any payment due to the CONTRACTOR.

59.0 STATUTORY APPROVALS

59.1 Unless otherwise specified in Bidding Documents, it shall be the CONTRACTOR's sole responsibility to obtain all approvals from any authority (except for environment clearance and Consent to Establish/Operate, However the data and information required for the same shall be made available by the LSTK contractor) required under any statute, rule or regulation of the Central or State Government concerned with the performance of the CONTRACT and/or the contractual Work. The application on behalf of the OWNER for submission to relevant authorities along with copies of required certificates complete in all respects shall be prepared and submitted by the CONTRACTOR well ahead of time so that the actual construction/COMMISSIONING of the WORKS is not delayed for want of the APPROVAL/inspection by the concerned authorities. The CONTRACTOR shall arrange for the inspection of the works by the authorities and will undertake necessary coordination and liaison required and shall not be entitled to any extension of time for any delay in obtaining such approval. All statutory fees shall be paid by the CONTRACTOR and the same shall be reimbursed by the OWNER upon production of documentary evidence by the CONTRACTOR.

59.2 Any deficiency(ies) as pointed out by any such authority shall be rectified by the CONTRACTOR within the scope of relative supply and/or WORK at no extra cost to the OWNER. The inspection and acceptance of the WORKS by such authorities shall,
however, not absolve the CONTRACTOR from any of its responsibilities under this CONTRACT.

59.3 No extension of time shall be granted for meeting the requirement and/or obtaining APPROVAL of statutory authorities.

60.0 UTILISATION OF LOCAL RESOURCES

60.1 The CONTRACTOR shall ascertain the availability of local SUB-CONTRACTORS and skilled/unskilled manpower and engage them to the extent possible for performance of the WORKS.

60.2 The CONTRACTOR shall not recruit personnel of any category from among those who are already employed by the other agencies working at the site, but shall make maximum use of local labour available.

61.0 FUEL REQUIREMENT OF WORKERS

The CONTRACTOR shall be responsible to arrange for the fuel requirement of his workers and staff without resorting to cutting of trees and shrubs. Cutting of trees and shrubs is strictly prohibited for this purpose. The CONTRACTOR shall abide by the conditions put forth by the Environmental Clearance for the SITE as regards to construction workers.

62.0 SURPLUS MATERIAL

Notwithstanding anything provided elsewhere, all surplus materials shall be dealt as follows:

62.1 Any balance Indigenous/imported surplus MATERIALS including scrap shall belong to the CONTRACTOR upon completion of the WORKS and will be allowed to be taken back by CONTRACTOR after compliance of statutory formalities.

62.2 For taking out balance indigenous/imported surplus MATERIALS as mentioned above upon the completion of the project, the CONTRACTOR shall have to furnish proof of entry and ownership of such MATERIALS inside the SITE, certification of ENGINEER-IN-CHARGE and OWNER in this regard.

62.3 In case of applicability of concessional custom duty. All imported surplus materials other than CONSTRUCTION EQUIPMENT which is brought to the SITE shall be the OWNER's property and shall be returned by the CONTRACTOR to the OWNER's designated stores. All such materials shall be subject to reconciliation and a proper accounting procedure shall be developed and strictly followed by the CONTRACTOR recorded in the inspection reports, proforma of which will be approved by the ENGINEER-IN-CHARGE. These reports shall form part of the completion DOCUMENTS. Inspection and acceptance of the WORK shall not relieve the CONTRACTOR from any of his responsibilities under this CONTRACT. However, indigenous Surplus Material as certified by the OWNER will be allowed to be taken back by Contractor after compliance of statutory formalities.
63.0 COORDINATION WITH OTHER AGENCIES

63.1 CONTRACTOR shall be responsible for proper coordination with other agencies operating at the site so that WORK may be carried out concurrently, without any hindrance to others. The ENGINEER-IN-CHARGE shall resolve disputes, if any, in this regard, and his decision shall be final and binding on the CONTRACTOR.

63.2 If and when required for the coordination of the WORKS with other agencies involved at SITE, the CONTRACTOR shall within the scope of work, re-route and/or prepare approaches and working areas as may be necessary.

64.0 ERECTION OF EQUIPMENT

All erection shall be carried out by deploying a crane(s) of suitable capacity. Erection by derrick shall not be permissible. The CONTRACTOR shall submit erection schemes for erection of critical equipment to ENGINEER-IN-CHARGE for his APPROVAL. No EQUIPMENT shall be erected in the absence of an approved erection scheme for such EQUIPMENT.

The quoted rates of the CONTRACTOR shall be deemed to include load testing of the crane as required to establish the lifting capacity of the crane.

65.0 ELECTRICAL CONTRACTORS LICENCE

65.1 The CONTRACTOR or its nominated SUB-CONTRACTOR(s), as the case may be, shall have a valid electrical contractor's license for working in the State in which the job site is located. The CONTRACTOR shall furnish a copy of the same to ENGINEER-IN-CHARGE before commencement of any electrical work or work pertaining to Electrical System.

65.2 No electrical work or work pertaining to electrical system(s) shall be permitted to be executed without a valid Electrical Contractors License being produced by the CONTRACTOR or SUB-CONTRACTOR, as the case may be, intending to execute the WORK.

66.0 RENTS & ROYALTIES

Unless otherwise specified, the CONTRACTOR shall pay all tonnage and other royalties, rents and other payments or compensation (if any) for getting stone, sand, gravel, clay, bricks or other materials required for the WORKS or any temporary works.

67.0 GOVERNMENT OF INDIA NOT LIABLE

It is expressly understood and agreed by and between the CONTRACTOR and the OWNER that the OWNER is entering into this agreement solely on its own behalf and not on behalf of any other person or entity. In particular, it is expressly understood and agreed that the Government of India is not a party to this agreement and has no liabilities, obligations or rights thereunder. It is expressly understood and agreed that the OWNER is an independent legal entity with power and authority to enter into contracts, solely in its own behalf under the applicable laws of India and general principles of Contract. The CONTRACTOR expressly agrees, acknowledges and understands that the OWNER is not an agent, representative or delegate of the Government of India. It is further understood and agreed that the Government of India is not and shall not be liable for any
acts, omissions commissions, breaches or other wrongs arising out of the CONTRACT. Accordingly, CONTRACTOR hereby expressly waives, releases and foregoes any and all actions or claims, including cross claims or counter claims against the Government of India arising out of this CONTRACT and covenants not to sue the Government of India on any matter, claim, and cause of action or thing whatsoever arising of or under this CONTRACT.

68.0 SITE CLEANING

The CONTRACTOR shall take care to keep clean the job site at all times for easy access to the job site and also from the safety point of view in accordance with the CONTRACT requirements.

69.0 ACCESS TO SITE

69.1 The CONTRACTOR shall at his own cost and initiative arrange for and provide any access to the work area and stringing or other yards for labour, EQUIPMENT and MATERIAL as may be necessary for any cause in addition to the ingress and egress available. Any arrangements in respect thereof as may be entered into by the CONTRACTOR with any person interested in the land through which access is sought, shall be in writing and a copy of the writing (certified by or on behalf of the CONTRACTOR to be true copy thereof) shall forthwith be lodged with the OWNER. Such a writing shall specifically stipulate that the OWNER shall not be responsible for any claims under the CONTRACT or for any damage, loss or injury to the land or any material, item or thing thereon or in, and the CONTRACTOR shall keep the OWNER indemnified from and against any claim, action or proceedings in respect thereof.

69.2 The CONTRACTOR shall at his own cost and initiative arrange for and obtain all necessary permissions, permits, consents and licenses as may be necessary to transport the MATERIALS, tools, EQUIPMENT, machinery and labour along or across any highway, roadway, or other way, or railway, tramway, bridge, dyke, dam or embankment, or lake, pond, canal, river, state terminal toll octroi, or other line, border or barrier. Traffic study if required, shall be carried out by CONTRACTOR independently without any liability on OWNER.

70.0 INDEPENDENT CONTRACTOR

70.1 OWNER shall have the right to instruct and direct CONTRACTOR, as to the results to be obtained under the CONTRACT, and shall be entitled to ascertain whether the WORK is carried out in accordance with the requirements of the CONTRACT, including the right to inspect the WORK at all stages of its performance. Such instructions direction and/or inspection by OWNER shall not relieve CONTRACTOR of his obligation, duties or liabilities under the CONTRACT.

70.2 Neither CONTRACTOR nor any SUB-CONTRACTOR nor the employees, agents or representative of either shall be deemed to be employees, agents or representative of the OWNER in the performance of the CONTRACTOR obligations here under, unless otherwise specified in the CONTRACT.

71.0 CONTRACTOR shall indemnify and hold harmless OWNER for any claim brought by SUBCONTRACTOR against OWNER in relation to CONTRACTOR’s payment obligations.
for the relevant purchase orders and sub-contracts.

71.1 CONTRACTOR agrees that he shall furnish to OWNER, if requested, satisfactory evidence that all SUB-CONTRACTORS, including vendor to CONTRACTOR have been paid on the time and in full for work done or good supplies in connection with the performance of the WORK.

71.2 If such satisfactory evidence is not supplied then the OWNER shall not be bound to make any further payment to CONTRACTOR for that part of work until it is supplies.

71.3 CONTRACTOR shall notify OWNER of any dispute of any kind between CONTRACTOR and any of his SUB-CONTRACTOR or vendors stating the nature of dispute, the amount of any payment which is being withheld by CONTRACTOR, the reasons thereof and the CONTRACTOR plan settle the dispute.

72.0 ORDER OF WORKS / PERMISSION / RIGHT OF ENTRY / CARE OF EXISTING SERVICES

CONTRACTOR is required to submit to OWNER the various details with respect to their personnel(s) to be deputed for the execution of WORK such as name(s), nationality and passport details in case of Foreign Nationals (Passport No., Date of Issue, Date of Expiry etc.). These details are required for granting permission to enter and work in the existing fertilizer complex. The OWNER reserves the right to declare any person(s) as non grata. No claim whatsoever shall be entertained by OWNER on this account.

OWNER shall have the right to object to any Representative or personnel deputed to India by CONTRACTOR for execution of WORK or in connection with WORK, due to their misconduct or breach of law and regulation or who are found to be incompetent or negligent. CONTRACTOR shall remove such persons from SITE forthwith and take immediate action for replacement at no cost to OWNER.

73.0 GIFTS, COMMISSIONS, ETC.

Any gift, commission or advantage given, promised or offered by or on behalf of the CONTRACTOR or his partner, agent, officers, directors, employee or servant or anyone on his or their behalf in relation to the obtaining or to the execution of this or any other contract with the OWNER, shall in addition to any criminal liability which it may incur, subject the CONTRACTOR to the cancellation of this and all other contracts and also the payment of any loss or damage to the OWNER resulting from any cancellation. The OWNER shall then be entitled to deduct the amounts so payable from any monies otherwise due to the CONTRACTOR under the CONTRACT.

74.0 LABOUR LAWS- PF, EPF AND ESI

74.1 The CONTRACTOR shall obtain necessary license from the Licensing Authority under the Contract Labour (Regulation & Abolition) Act 1970 and the Central Rules framed thereunder and produce the same to the ENGINEER-IN-CHARGE before start of WORK.

74.2 The CONTRACTOR shall not undertake or execute or permit any other agency or SUB-CONTRACTOR to undertake or execute any work on the CONTRACTOR’S behalf
through contract labour except under and in accordance with the license issued in that behalf by the Licensing Officer or other authority prescribed under the Factories Act or the contract labour (Regulation & Abolition) Act 1970 or their applicable lay, rule or regulation, if applicable.

74.3 The provision of EPF & MP Act, 1952 and Rules scheme there under shall be applicable to the CONTRACTOR and the employees engaged by him for the WORK. The CONTRACTOR shall furnish the code number allotted by the RPFC Authority, to the ENGINEER-IN-CHARGE before commencing the WORK.

74.4 The CONTRACTOR shall be exclusively responsible for any delay in commencing the work on account of delay in obtaining a license under clause 74.1 above or in obtaining the code number under clause 74.3 above and the same shall not constitute a ground for extension of time for any purpose.

74.5 The CONTRACTOR shall enforce the provisions of ESI Act and Scheme framed from time to time there under with regard to all his employees involved in the performance of the CONTRACT and shall deduct employee's contribution from the wages of each of the employees and shall deposit the same together with employer's contribution of such total wages payable to the employees in the appropriate account.

74.6 All liabilities like salaries, wages and other statutory obligations in respect of the persons engaged by the CONTRACTOR shall be borne by the CONTRACTOR during the period of agreement. In view of the provisions of the ESI Act, PF and EPF Act and other Acts, as may be applicable to OWNER, the CONTRACTOR shall take necessary steps to cover its employees under the said enactments and shall submit proof of such compliance to ENGINEER-IN-CHARGE periodically or at any date upon such request, as may be made by ENGINEER-IN-CHARGE to the CONTRACTOR. In the event of non-compliance with the statute or the provisions thereof, referred to above, it shall be open to OWNER to withhold such amount as in its opinion is due and payable by the CONTRACTOR in respect of its employees from and out of dues, payable by OWNER to the CONTRACTOR and such due shall be held by OWNER with it until proof is submitted by the CONTRACTOR to OWNER indicating compliance with such statutes within reasonable time, failing which OWNER shall deposit such amounts with the authorities concerned on behalf of the CONTRACTOR and inform the CONTRACTOR of such deposit or deposits.

75.0 GENERAL PROVISIONS

75.1.0 Confidential Information

75.1.1 Non-disclosure

75.1.1.1 Each party agrees to hold in confidence any information imparted to it or in the case of CONTRACTOR, to any of its SUB-CONTRACTOR / VENDOR, by the other Party which pertains to that other party’s business activity in any manner, and which is not be subject of general public knowledge, including, without limitation, proprietary processes, technical information and know-how, information concerning other projects, management policies, economic policies, financial and other data and the like. The preceding non-disclosure requirements shall not apply to:
i) Information furnished without restriction by the other Party prior to the date hereof

ii) Information in the public domain; or

iii) Information obtained by a Party from a third Person not under obligation of non-disclosure to the other party.

(iv) Information required to be disclosed in pursuance of an order, judgment, decree of the Court, Tribunal or Statutory Authority.

75.1.2 Disclosure to Govt. Agency

75.1.2.1 Either Party may disclose any such information to the extent that such Party is required by any Government Agency to make such disclosure. In addition, OWNER may disclose such information to the extent that such disclosure is required by any Lender / Lender’s Representative, etc. provided that such Lenders signed a confidentiality agreement containing confidentiality and limited use obligations not less stringent than those accepted by OWNER under the CONTRACT and License Agreement and such parties are not competitor of CONTRACTOR or its Licensors.

75.1.3 Upon completion of the Works or in the event of termination pursuant to the provisions of the CONTRACT, CONTRACTOR shall immediately return to the OWNER all drawings, plans, specifications and other documents supplied to the CONTRACTOR by or on behalf of the OWNER or prepared by the CONTRACTOR solely for the purpose of the performance of the WORKS, including all copies made thereof by the CONTRACTOR.

75.1.4 This clause shall survive and remain in full force for a period of ten years following the issue of FINAL ACCEPTANCE CERTIFICATE.

75.2.0 Deleted

75.3.0 Recovery of Sums / Dues

75.3.1 All costs, damages or expenses which OWNER may have incurred, for which CONTRACTOR is liable under CONTRACT, shall be notified to CONTRACTOR and shall be recovered by OWNER from any payment due to or becoming due to CONTRACTOR under this CONTRACT or other CONTRACT and/or shall be recovered by action at law or otherwise. If the payment due to CONTRACTOR is not sufficient for recovery of the said sums/dues, CONTRACTOR shall pay immediately to OWNER such sums/dues or the balance sums/dues on demand.

75.3.2 All MUTUALLY AGREED DAMAGES applicable and to be recovered from CONTRACTOR under CONTRACT, shall be recovered by OWNER from any payment due to or becoming due to CONTRACTOR under this CONTRACT or other CONTRACT and/or shall be recovered by action at law or otherwise. If the payment due to CONTRACTOR is not sufficient for recovery of the said MUTUALLY AGREED
DAMAGES, CONTRACTOR shall pay immediately to OWNER such MUTUALLY AGREED DAMAGES, or the balance MAD on demand.

75.3.3 For avoidance of doubt all the rights and remedies of OWNER/ CONTRACTOR and liabilities of the CONTRACTOR/ OWNER as set out in the CONTRACT shall be to the exclusion of any other rights, remedies or liabilities available at law.

75.4.0 Payments etc. not to affect rights of OWNER

No sum paid on account by OWNER nor any extension of the date for completion granted by OWNER shall affect or prejudice the rights of OWNER against CONTRACTOR or relieve CONTRACTOR of its obligation for the faithful performance of CONTRACT.

75.5.0 Cut-Off Dates

No claims or correspondence on claims on this CONTRACT shall be entertained by either parties after 6 months after expiry of the Performance Bank Guarantee, unless specified otherwise in CONTRACT.

75.6.0 Paragraph Heading

The paragraph heading in those conditions shall not affect the construction thereof.

75.7.0 Site Working and Safety Conditions

CONTRACTOR shall follow the SITE working and safety conditions enclosed as Section VI-14.

75.8.0 Miscellaneous

75.8.1 No CONTRACT or understanding in any way modifying the conditions of CONTRACT shall be binding upon either parties hereto unless made in writing and approved by both parties.

75.8.2 Without prejudice to FORCE MAJEURE, CONTRACTOR shall, during inclement weather, carry out WORK in accordance with CONTRACT and CONTRACTOR shall not be entitled to any additional payment over and above the fees payable under CONTRACT by reason of its being unable to carry out WORK owing to inclement weather.

75.9.0 Member of OWNER not individually liable

No Director, or official or employee of the OWNER/ PMC shall in any way be personally bound or liable for the acts or obligations of the OWNER under the CONTRACT or answerable for any default or omission in the observance or performance of any of the acts, matters or things which are herein contained.

76.0 Implementation of Apprentices act 1961:
The CONTRACTOR shall comply with the provisions of the Apprentices Act, 1961 and the Rules and Orders issued thereunder from time to time. If he fails to do so, his failure will be a breach of the CONTRACT and the ENGINEER-IN-CHARGE may, at his discretion, cancel the CONTRACT. The CONTRACTOR shall also be liable for any pecuniary liability arising on account of any violation by him of the provisions, of the Act.

77.0 Change in constitution

Where the CONTRACTOR is a partnership firm, the prior approval of the OWNER shall be obtained in writing, before any change is made in the constitution of the firm. Where the CONTRACTOR is an individual or a Hindu undivided family business concern, such approval as aforesaid shall, likewise be obtained before such CONTRACTOR enters into any agreement with other parties, where under, the reconstituted firm would have the right to carry out the work hereby undertaken by the CONTRACTOR. In either case if prior approval as aforesaid is not obtained, the CONTRACT shall be deemed to have been allotted in contravention of clause 12 of GCC and the same action may be taken and the same consequence shall ensure as provided in the said clause.

78.0 Access by Road:

CONTRACTOR, if necessary, shall build other temporary access roads to the actual site of construction for his own work at his own cost. The CONTRACTOR shall be required to permit the use of the roads so constructed by him for vehicles of any other parties who may be engaged on the project site. The CONTRACTOR shall also facilitate the construction of the permanent roads should the construction there of start while he is engaged on this work. He shall make allowance in his tender for any inconvenience he anticipates on such account. Non-availability of access roads, railway siding and railway wagons for the use of the CONTRACTOR shall in no case condone any delay in the execution of WORK nor be the cause for any claim for compensation against the OWNER.

79.0 Members of the OWNER not individually liable:

No Director, or official or employee of the OWNER/ PMC shall in any way be personally bound or liable for the acts or obligations of the OWNER under the CONTRACT or answerable for any default or omission in the observance or performance of any of the acts, matters or things which are herein contained.

80.0 OWNER not bound by personal representations:

The CONTRACTOR shall not be entitled to any increase on the scheduled rates or any other right or claim whatsoever by reason of any representation, explanation statement or alleged representation, promise or guarantees given or alleged to have been given to him by any person.

81.0 Land for Contractor's Field Office, Godown and Workshop:

The OWNER will, at his own discretion and convenience and for the duration of the execution of the work make available near the site, land for construction of CONTRACTOR's Temporary Field Office, godowns workshops and assembly yard required for the execution of the CONTRACT. The CONTRACTOR shall at his own cost construct all these temporary buildings and provide suitable water supply and sanitary arrangement and get the same approved by the ENGINEER-IN-CHARGE. On completion of the works undertaken by the CONTRACTOR, he shall remove all temporary works erected by him and have the SITE cleaned as directed by ENGINEER-IN-CHARGE. If the
CONTRACTOR shall fail to comply with these requirements, the ENGINEER-IN-CHARGE may at the expenses of the CONTRACTOR remove such surplus, and rubbish materials and dispose-off the same as he deems fit and get the site cleared as aforesaid; and CONTRACTOR shall forthwith pay the amount of all expenses so incurred and shall have no claim in respect of any such surplus materials disposed off as aforesaid. But the OWNER reserves the right to ask the CONTRACTOR any time during the pendency of the CONTRACT to vacate the land by giving 7 days' notice on security reasons or on national interest or otherwise. Rent may be charged for the land so occupied from contractor by the OWNER. The CONTRACTOR shall put up temporary structures as required by them for their office, fabrication shop and construction stores only in the area allocated to them on the project site by the OWNER or his authorized representative. No tea stalls/canteens should be put up or allowed to be put up by any CONTRACTOR in the allotted land or complex area without written permission of the OWNER. Un-authorized buildings, constructions or structures should not be put up by the CONTRACTOR anywhere on the project site. For uninterrupted fabrication work, the CONTRACTOR shall put up temporary covered structures at his cost within Area in the location allocated to them in the project site by the OWNER or his authorised representative. No person except for authorized watchman shall be allowed to stay in the plant area/CONTRACTOR's area after completion of the day's job without prior written permission from ENGINEER-IN-CHARGE.

82.0 ROUNDOFF OF AMOUNTS:
In calculating the amount of each item due to the CONTRACTOR in every certificate prepared for payment, sum of less than 50 paise shall be omitted and the total amount on each certificate shall be rounded off to the nearest rupees, i.e., sum of less than 50 paise shall be omitted and sums of 50 paise and more upto one rupee shall be reckoned as one rupee.

83.0 ARTICLES OF VALUE FOUND:
All gold, silver and other minerals of any description and all precious stones, coins, treasure relics, antiquities and other similar things which shall be found in, under or upon the SITE, shall be the property of the OWNER and the CONTRACTOR shall duly preserve the same to the satisfaction of the ENGINEER-IN-CHARGE and shall from time to time deliver the same to such person or persons indicated by the OWNER.

84.0 WORK IN MONSOON AND DEWATERING
(i) Unless otherwise specified elsewhere in the tender, the execution of the WORK may entail working in the monsoon also. The CONTRACTOR must maintain a minimum labour force as may be required for the job and plan and execute the construction and erection according to the prescribed schedule. No extra rate will be considered for such work in monsoon.
(ii) During monsoon and other period, it shall be the responsibility of the CONTRACTOR to keep the construction work site free from water at his own cost

85.0 General conditions for construction and erection work:
(i) The working time at the site of work is 48 hours per week. Overtime work is permitted in cases of need and the OWNER will not compensate the same. Shift working at 2 or 3 shifts per day will become necessary and the CONTRACTOR should take this aspect into consideration for formulating his rates for quotation. No extra claims will be entertained by the OWNER on this account. No extra claims will be entertained by the OWNER on this account. For carrying out work beyond working hours the...
CONTRACTOR will approach the ENGINEER-IN-CHARGE or his authorized representative and obtain his prior written permission.

(ii) The CONTRACTOR must arrange for the placement of workers in such a way that the delayed completion of the WORK or any part thereof for any reason whatsoever will not affect their proper employment. The OWNER will not entertain any claim for idle time payment whatsoever.

(iii) The CONTRACTOR shall submit to the OWNER/ENGINEER-IN-CHARGE reports at regular intervals regarding the state and progress of WORK. The details and proforma of the report will mutually be agreed after the award of CONTRACT. The CONTRACTOR shall provide display board showing progress and labour strengths at worksite, as directed by the ENGINEER-IN-CHARGE.

86.0 **Action where no specification is issued:**

In case of any class of WORK for which there is no SPECIFICATION supplied by the OWNER as mentioned in the Tender Documents such WORK shall be carried out in accordance with Indian Standard Specifications and if the Indian Standard Specifications do not cover the same, the WORK should be carried out as per standard Engineering Practice subject to the approval of the ENGINEER-IN-CHARGE.

87.0 **Deleted**

88.0 **Deleted**

89.0 **CARE OF WORKS:**

i) From the commencement to completion of the WORK, the CONTRACTOR shall take full responsibility for the care for all works including all temporary works and in case any damages, loss or injury shall happen to the WORK or to any part thereof or to any temporary works from any cause whatsoever, shall at his own cost repair and make good the same so that at completion the WORK shall be in good order and in conformity in every respects with the requirement of the CONTRACT and the ENGINEER-IN-CHARGE’s instructions.

ii) **DEFECTS PRIOR TO TAKING OVER:** If at any time, before the WORK is taken over, the ENGINEER-IN-CHARGE shall: a) Claim that any works done or materials used by the CONTRACTOR or by any SUB-CONTRACTOR is defective or not in accordance with the CONTRACT, or that the works or any portion thereof are defective, or do not fulfill the requirements of CONTRACT (all such matters being hereinafter, called ‘Defects’ in this clause), and b) As soon as reasonably practicable, gives to the CONTRACTOR notice in writing of the said decision, specifying particulars of the defects alleged to exist or to have occurred, then the CONTRACTOR shall at his own expenses and with all speed make good the defects so specified. In case CONTRACTOR shall fail to do so, the OWNER may take, at the cost of the CONTRACTOR, such steps as may in all circumstances, be reasonable to make good such defects. The expenditure so incurred by the OWNER will be recovered from the amount due to the CONTRACTOR. The decision of the ENGINEER-IN-CHARGE with regard to the amount to be recovered from the CONTRACTOR will be final and binding on the CONTRACTOR. As soon as the WORK has been completed in accordance with the CONTRACT (except in minor respects that do not affect their use for the purpose for which they are intended and except for maintenance thereof provided in clause 3.0 (22) of General Conditions of
Contract) and have passed the tests on completion, the ENGINEER-IN-CHARGE shall issue a certificate (hereinafter called Completion Certificate) in which he shall certify the date on which the WORK have been so completed and have passed the said tests and the OWNER shall be deemed to have taken over the WORK on the date so certified. If the WORK has been divided into various groups in the CONTRACT, the OWNER shall be entitled to take over any group or groups before the other or others and there upon the ENGINEER-IN-CHARGE shall issue a Completion Certificate which will, however, be for such group or groups so taken over only. In such an event if the group /section/ part so taken over is related, to the integrated system of the work, notwithstanding date of grant of Completion Certificate for group/ section/ part.

iii) DEFECTS AFTER TAKING OVER: In order that the CONTRACTOR could obtain a COMPLETION CERTIFICATE he shall make good, with all possible speed, any defect arising from the defective materials supplied by the CONTRACTOR or workmanship or any act or omission of the CONTRACT or that may have been noticed or developed, after the works or groups of the works has been taken over, the period allowed for carrying out such WORK will be normally one month. If any defect be not remedied within a reasonable time, the OWNER may proceed to do the WORK at CONTRACTOR's risk and expense and deduct from the final bill such amount as may be decided by the OWNER. If by reason of any default on the part of the CONTRACTOR a COMPLETION CERTIFICATE has not been issued in respect of any portion of the WORK within one month after the date fixed by the CONTRACT for the completion of the WORK, the OWNER shall be at liberty to use the WORK or any portion thereof in respect of which a completion certificate has not been issued, provided that the WORK or the portion thereof so used as aforesaid shall be afforded reasonable opportunity for completing these works for the issue of Completion Certificate.

iv) COMPLETION CERTIFICATE’ wherever mentioned shall be read as ‘PRELIMINARY ACCEPTANCE CERTIFICATE’

90.0 Field Management & Controlling / Coordinating Authority:

i) The field management will be the responsibility of the ENGINEER-IN-CHARGE, who will be nominated by the OWNER. The ENGINEER-IN-CHARGE may also authorize his representatives to assist in performing his duties and functions.

ii) The ENGINEER-IN-CHARGE shall coordinate the works of various agencies engaged at site to ensure minimum disruption of work carried out by different agencies. It shall be the responsibility of the CONTRACTOR to plan and execute the work strictly in accordance with site instructions to avoid hindrance to the work being executed by other agencies.

91.0 Local Conditions:

i) It will be imperative on each tenderer to inform himself of all local conditions and factors which may have any effect on the execution of WORK covered under the Tender Document. In their own interest, the tenderer are requested to familiarize themselves with the Indian Income Tax Act 1961, Indian Companies Act 1956/2013, Indian Customs Act 1962 and other related Acts and Laws and Regulations of India with their latest amendments, as applicable. TFL shall not entertain any requests for clarifications from the tenderer regarding such local conditions.
ii) It must be understood and agreed that such factors have properly been investigated and considered while submitting the tender. No claim for financial or any other adjustments to VALUE OF CONTRACT, on lack of clarity of such factors shall be entertained.

92.0 Special Conditions of Contract:

i) Special Conditions of Contract (SCC) shall be read in conjunction with the General Conditions of Contract (GCC), specification of Work, Drawings and any other documents forming part of this CONTRACT wherever the context so requires.

ii) Notwithstanding the sub-division of the documents into these separate sections and volumes every part of each shall be deemed to be supplementary to and complementary of every other part and shall be read with and into the CONTRACT so far as it may be practicable to do so.

iii) Where any portion of the General Condition of Contract is repugnant to or at variance with any provisions of the Special Conditions of Contract, unless a different intention appears the provisions of the Special Conditions of Contract shall be deemed to over-ride the provisions of the General Conditions of Contract and shall to the extent of such repugnancy, or variations, prevail.

iv) Wherever it is mentioned in the specifications that the CONTRACTOR shall perform certain WORK or provide certain facilities, it is understood that the CONTRACTOR shall do so at his cost and the VALUE OF CONTRACT shall be deemed to have included cost of such performance and provisions, so mentioned.

v) The materials, design and workmanship shall satisfy the relevant INDIAN STANDARDS, the JOB SPECIFICATIONS contained herein and CODES referred to. Where the job specification stipulate requirements in addition to those contained in the standard codes and specifications, these additional requirements shall also be satisfied.

93.0 POWER OF ENTRY:

1) If the CONTRACTOR shall not commence the WORK in the manner previously described in the CONTRACT documents or if he shall at any time in the opinion of the ENGINEER-IN-CHARGE -

i) fail to carry out the WORK in conformity with the CONTRACT documents, or

ii) fail to carry out the WORK in accordance with the Time Schedule, or

iii) substantially suspend work or the WORK for a period of fourteen days without authority from the ENGINEER-IN-CHARGE, or

iv) fail to carry out and execute the WORK to the satisfaction of the ENGINEER-IN-CHARGE, or

v) fail to supply sufficient or suitable construction plant, temporary works, labour, materials or things, or

vi) Commit, suffer, or permit any other breach of any of the provisions of the CONTRACT on his part to be performed or observed or persist in any of the above mentioned breaches of the CONTRACT for fourteen days, after notice in writing shall have been given to the CONTRACTOR by the ENGINEER-IN-CHARGE requiring such breach to be remedied, or
vii) if the CONTRACTOR shall abandon the WORK, or

viii) if the CONTRACTOR during the continuance of the CONTRACT shall become bankrupt, make any arrangement or composition with his creditors, or permit any execution to be levied or go into liquidation whether compulsory or voluntary not being merely a voluntary liquidation for the purpose of amalgamation or reconstruction then in any such case, the OWNER shall have the power to enter upon the WORK and take possession thereof and of the materials, temporary WORK, construction plant, and stock thereon, and to revoke the CONTRACTOR's license to use the same, and to complete the WORK by his agents, other CONTRACTORS or workmen or to relate the same upon any terms and to such other person, firm or corporation as the OWNER in his absolute discretion may think proper to employ and for the purpose aforesaid to use or authorize the use of any materials, temporary work, CONSTRUCTION PLANT, and stock as aforesaid, without making payment or allowance to the CONTRACTOR for the said materials other than such as may be certified in writing by the ENGINEER-IN-CHARGE to be reasonable, and without making any payment or allowance to the CONTRACTOR for the use of the temporary said works, construction plant and stock or being liable for any loss or damage thereto, and if the OWNER shall by reason of his taking possession of the WORK or of the WORK being completed by other CONTRACTOR (due account being taken of any such extra work or works which may or be omitted) then the amount of such excess as certified by the ENGINEER-IN-CHARGE shall be deducted from any money which may be due for work done by the CONTRACTOR under the CONTRACT and not paid for. Any deficiency shall forthwith be made good and paid to the OWNER by the CONTRACTOR and the OWNER shall have power to sell in such manner and for such price as he may think fit all or any of the construction plant, materials etc. constructed by or belonging to and to recoup and retain the said deficiency or any part thereof out of proceeds of the sale.

94.0 LIENS:

1) If, at any time there should be evidence or any lien or claim for which the OWNER might have become liable and which is chargeable to the CONTRACTOR, the OWNER shall have the right to retain out of any payment then due or thereafter to become due an amount sufficient to completely indemnify the OWNER against such lien or claim and if such lien or claim be valid, the OWNER may pay and discharge the same and deduct the amount so paid from any money which may be or may become due and payable to the CONTRACTOR. If any lien or claim remain unsettled after all payments are made, the CONTRACTOR shall refund or pay to the OWNER all money that the latter may be compelled to pay in discharging such lien or claim including all costs and reasonable expenses. OWNER reserves the right to do the same.

2) The OWNER shall have lien on all materials, equipments including those brought by the CONTRACTOR for the purpose of erection, testing and commissioning of the WORK.

3) The final payment shall not become due until the CONTRACTOR delivers to the ENGINEER-IN-CHARGE a complete release or waiver of all liens arising or which may arise out of his agreement or receipt in full or certification by the CONTRACTOR in a form approved by ENGINEER-IN-CHARGE that all invoices for labour, materials, services have been paid in lien thereof and if required by the ENGINEER-IN-CHARGE in any case an affidavit that so far as the CONTRACTOR has knowledge
or information the releases and receipts include all the labour and material for which a lien could be filled.

4) CONTRACTOR will indemnify and hold the OWNER harmless, for a period of two years after the issue of FINAL ACCEPTANCE CERTIFICATE, from all liens and other encumbrances against the OWNER on account of debts or claims alleged to be due from the CONTRACTOR or his SUB-CONTRACTOR to any person including SUB-CONTRACTOR and on behalf of OWNER will defend at his own expense, any claim or litigation brought against the OWNER or the CONTRACTOR in connection therewith. CONTRACTOR shall defend or contest at his own expense any fresh claim or litigation by any person including his SUB-CONTRACTOR, till its satisfactory settlement even after the expiry of two years from the date of issue of FINAL CERTIFICATE.

The SPECIAL CONDITIONS OF CONTRACT shall be read in conjunction with the GENERAL CONDITIONS OF CONTRACT, specifications of work, DRAWINGS and any other document forming part of this CONTRACT wherever the context so requires.

Where any portion of the GENERAL CONDITIONS OF CONTRACT is repugnant to or at variance with any other provisions of the SPECIAL CONDITIONS OF CONTRACT, then unless a different intension appears, the SPECIAL CONDITIONS OF CONTRACT shall be deemed to over-ride the provisions of GENERAL CONDITIONS OF CONTRACT and shall prevail to the extent of such repugnancy or variations.

1.0 CONTRACTOR'S OBLIGATIONS
1.1.0 General Responsibility
1.1.1 The CONTRACTOR acknowledges that this CONTRACT is a Lumpsum turnkey contract and CONTRACTOR'S obligation hereunder, notwithstanding anything to the contrary contained herein, is to provide OWNER with fully operational PLANT, complete in all respects under and in accordance with the provision of CONTRACT, within the stipulated time and for the purpose designated herein by OWNER, and to do, furnish and provide everything necessary in connection therewith.

Without prejudice to the foregoing and except as otherwise expressly set forth in the CONTRACT as within the scope of OWNER's obligations under the CONTRACT, the CONTRACTOR shall perform or cause to be performed all WORK and services required in connection with the design, engineering, supply of equipment, procurement (including, without limitation, all transportation services in connection therewith), construction, erection, start-up, commissioning, testing including conducting of Performance Tests and other work and services upto the PRELIMINARY ACCEPTANCE OF PLANT by the OWNER including 6 months supervisory assistance after successful commissioning and in connection therewith provide all materials, equipment, machinery, tools, labour, transportation, administration and other services and items required to complete the PLANT in all respects upto the PRELIMINARY ACCEPTANCE OF PLANT and having the performance as guaranteed under the CONTRACT by the CONTRACTOR on a total, fixed price basis in accordance with this CONTRACT. The WORK shall, without prejudice to the generality of the foregoing or those enumerated in Clause 1.2.0 include but not be limited to the following:

(a) All engineering and design services including necessary investigation required for a completely engineered PLANT including necessary documentation;

(b) Provision of all equipment, systems, materials, processes, CONTRACTOR's EQUIPMENT, temporary works and all other items, whether of a temporary or permanent nature including those required for the design, erection, completion commissioning, conducting of PERFORMANCE GUARANTEE TEST RUN and remedying of DEFECTS during DEFECT LIABILITY PERIOD.
(c) Transportation from works, port of entry and import clearance and handling services in and into India and inland transportation from the relevant points of delivery of EQUIPMENT required in connection with the completion of the PLANT, and the performance of the other WORK.

(d) Project management.

(e) Receipt of EQUIPMENT at SITE including stores management.

(f) Construction infrastructure services, civil and structural construction; mechanical, electrical and instruments erection and installation services, inspection, testing and commissioning, and PERFORMANCE GUARANTEE TEST RUN before PRELIMINARY ACCEPTANCE of PLANT including all relevant applicable permits, with CONTRACTOR having responsibility for overall co-ordination of permits required by the OWNER and all training activities;

(g) Provision of all necessary superintendence, labour, construction fuels and construction chemicals, tools, supplies and other consumables and services;

Construction water (at one point within factory premises and CONTRACTOR to arrange the line upto their Battery Limit) and Construction Power (1 No. 11 kV feeder of 2 MVA at Existing Substation Near 132 kV Switchyard and CONTRACTOR to arrange tap off Power from this feeder) shall be provided within 6 months of issuance of FOA on chargeable basis (presently @ of Rs 4.50/m^3 for Construction Water and Rs 5.915/KWH for Construction Power. In case of any escalation by statutory authorities in the unit rates during execution of Contract, the same shall be borne by Contractor)

Raw Material and utilities as defined in Technical part of Section VI-2.0 of NIT and shall be made available to the LSTK CONTRACTOR at one point of Steam Generation Plant battery limit 2 months before scheduled Completion Period. However required utilities prior to this will be arranged by LSTK CONTRACTOR.

(h) Rectification of defects during DEFECT LIABILITY PERIOD.

1.1.2 CONTRACTOR shall provide services, for PLANT, in accordance with good engineering practice. CONTRACTOR shall provide services of engineers, designers, draftsmen, buyers, inspectors, expediters and other persons required for the performance of WORK pursuant to CONTRACT.

1.1.3 In the event that there is any item of EQUIPMENT or WORK of the type provided for in CONTRACT, which is not specifically mentioned in the specifications or drawings set out in FINAL PROPOSAL, but which is necessary (even though not mentioned in CONTRACT) for normal, safe and continuous operation of PLANT, , CONTRACTOR shall include such item of EQUIPMENT in the design and perform such items of WORK, for such EQUIPMENT or WORK free of cost to OWNER as if the same had been originally included in its Scope of Work/FINAL PROPOSAL.
1.1.4 Subject to prior consent of OWNER, CONTRACTOR may make use of the services of SUB-CONTRACTOR/ VENDOR (previously approved in writing by the OWNER) in accordance with the provisions in CONTRACT provided, however, the CONTRACTOR shall remain responsible and liable for the work done by such SUB-CONTRACTOR/vendor.

1.1.5 The CONTRACTOR shall be responsible for obtaining necessary approvals which are to be issued in the CONTRACTOR’S name from the various statutory authorities. All approvals/permissions other than Environment Clearance and Consent to Establish/Operate shall be obtained by the CONTRACTOR.

1.1.6 The CONTRACTOR shall provide necessary full technical assistance to OWNER including follow-up for obtaining the necessary approvals to be issued in the name of OWNER from the various statutory authorities.

1.1.7 The CONTRACTOR shall furnish CONTRACT SECURITY CUM PERFORMANCE BANK GUARANTEE as per the enclosed format in line with the provisions of bidding document.

1.1.8 The enumeration in subsequent Clauses of SPECIAL CONDITIONS OF CONTRACT, in GENERAL CONDITIONS OF CONTRACT and other documents of CONTRACT shall not in any manner limit the general scope of obligations and responsibilities of designing, engineering, procurement, supply, construction, commissioning and proving the performance guarantees of PLANT within the scope of CONTRACT.

1.2.0 CONTRACTOR’s Scope of Work

1.2.1 CONTRACTOR shall provide and be responsible for the tasks specified in this Clause under the following heads:

1.2.2 Deleted

1.2.3 Design & Engineering

1.2.3.1 CONTRACTOR shall provide all design and engineering services necessary for completion of the PLANTS in conformity with the CONTRACT and Good Engineering Practices and the NIT including but not limited to:

(a) Preparation of

- Project design book which shall form the basis of PLANT design;
- The conceptual design; and
- The engineering and design necessary to describe and detail the PLANT and the Project.
(b) Provision of criteria for the detailed design by other suppliers of equipment/system/structures for incorporation into the PLANTS.

(c) Preparation of design, engineering, drawings, plans, bill of material, schedule and estimates for the PLANT and the project and the performance by CONTRACTOR of its obligations hereunder so that the PLANT constructed and commissioned by the CONTRACTOR is capable of meeting the performance guarantees and will be such as could be legally, safely and reliably placed in commercial operation by the OWNER.

(d) CONTRACTOR shall perform the design and engineering for PLANT so that when constructed and commissioned, PLANT shall be capable of meeting the guarantees with respect to quality and quantity of products, consumption of raw materials and utilities, and Pollution Level as guaranteed under CONTRACT and shall be reliable and safe and operable in accordance with the sound engineering practice. CONTRACTOR shall ensure design capacity of all sections of PLANT in accordance with CONTRACTOR's experience vis-a-vis as indicated in this NIT and expertise for obtaining a full throughput under varying conditions within the limits specified in CONTRACT. PLANT shall be designed so as to be capable of producing at full plant capacity when operated as specified in CONTRACT. CONTRACTOR shall review the basic design conditions and other conditions furnished by OWNER in NIT. If CONTRACTOR observes any inconsistency or insufficiency in these data, CONTRACTOR shall bring to the notice of OWNER the same, before its use.

1.2.4 Deleted

1.2.5 Codes and Standards

1.2.5.1 The engineering shall be performed and EQUIPMENT shall be manufactured and supplied according to acceptable international standards, as specified in the Technical Specification/FINAL PROPOSAL, meeting safety and other requirements of various national/international Codes and Regulations being in force as on submission of the FINAL PROPOSAL. The design of PLANT shall be based on the criteria enumerated in CONTRACT. However, it shall be CONTRACTOR’s responsibility to follow all Indian Rules and Regulations as applicable.

CONTRACT shall comply with and shall cause the WORK and all components thereof (including, without limitation, the design and engineering of the PLANT) to comply with all APPLICABLE LAWS and APPLICABLE PERMITS as they may be in effect at the time of CONTRACTOR's performance under the CONTRACT.

The CONTRACTOR shall ensure that all actions on its behalf in connection with the WORKS shall be in compliance with applicable laws of India. The CONTRACTOR agrees to take all reasonable steps to ensure that Persons appointed by it in
connection with the WORK shall comply with the applicable laws/ regulations/ guidelines and obligations.

1.2.6 Drawings and Documents

1.2.6.1 CONTRACTOR shall prepare or secure and furnish to OWNER all data, specifications, drawings, plans and other documents as required/used for WORK as specified in Technical Specifications.

1.2.7 Owner's/PMC Review

1.2.7.1 ENGINEER-IN-CHARGE shall review all documents and give its comments to CONTRACTOR within 14 (Fourteen) working days from the date of receipt of the same. Review as aforesaid by OWNER/PMC and furnishing of comments by OWNER/PMC or the failure of OWNER/PMC to review or comment as aforesaid shall not relieve CONTRACTOR in any manner of its obligations including performance guarantees under this CONTRACT.

1.2.8 Procurement Services

1.2.8.1.1 As part of the WORK, CONTRACTOR shall procure and pay for, in CONTRACTOR's name as an independent contractor and not as agent for OWNER, all CONTRACTOR and SUB-CONTRACTOR'S labour, materials, equipment, supplies, soil, gravel and similar materials and manufacturing, fabrication and related services (whether on or off the PLANT Site) for construction and incorporation in the PLANT or which are otherwise required for completion of the WORK in accordance with the Specification and the CONTRACT and are not explicitly specified to be furnished by OWNER pursuant to the terms and provisions of the CONTRACT including FINAL PROPOSAL.

1.2.8.1.2 CONTRACTOR shall procure and provide all EQUIPMENT required for PLANT. EQUIPMENT procured shall be according to specifications as set forth in the CONTRACT, proven record of performance and with suitable delivery time to meet the COMPLETION PERIOD as given by CONTRACTOR. EQUIPMENT shall be procured from the vendor list agreed between CONTRACTOR and OWNER.

In connection with its procurement work, CONTRACTOR shall be responsible for the shipping, transportation and delivery of all items fabricated, manufactured, constructed or procured as set forth in the FINAL PROPOSAL and the CONTRACT. All such items and equipment, materials and supplies to be provided by the CONTRACTOR pursuant to the CONTRACT shall be new and of required quality, free from improper workmanship or defects and properly warranted or guaranteed in accordance with the CONTRACT. Any apparent omission or error in the equipment specifications will be corrected by the CONTRACTOR to the extent required by the CONTRACT including FINAL PROPOSAL.

1.2.8.2 Equipment
1.2.8.2.1 CONTRACTOR agrees that EQUIPMENT procured shall be strictly in accordance with the specifications as provided, however, that any apparent omission or error in the specifications will be corrected by CONTRACTOR if it is necessary for the functioning of EQUIPMENT. CONTRACTOR shall inform OWNER for such omission or error or ambiguity in the specifications and corrections made for the same.

1.2.8.2.2 Completeness of EQUIPMENT shall be the responsibility of CONTRACTOR. Any fittings, accessories, etc. which may not be specifically mentioned in Technical Specifications but which is required for the satisfactory functioning of EQUIPMENT and realization of PERFORMANCE GUARANTEES shall be provided by CONTRACTOR without any extra cost.

1.2.8.2.3 CONTRACTOR shall ensure that the modern practices in the manufacture of high grade EQUIPMENT are followed notwithstanding any omission in the specifications.

1.2.8.2.4 The supplies including fittings, accessories, etc. shall be in strict compliance to the applicable specifications/codes/standards. Components for which no relevant standards exist, the same shall be designed and manufactured as per good engineering practices.

1.2.8.2.5 The true intent and meaning of this Clause is that CONTRACTOR shall in all respects design, engineer, ensure quality of manufacture and supply EQUIPMENT in a thorough workman like manner, within prescribed time and in accordance with good engineering practice in order to enable proper operation of EQUIPMENT and PLANT.

1.2.8.2.6 CONTRACTOR shall furnish drawings and documents of EQUIPMENT as described in Technical part, Section VI. These documents shall include but not limited to technical documents, final drawings, preservation instructions, operation and maintenance manuals, test certificates, spare parts catalogues, etc. in a bound book for all rotating EQUIPMENT and in a folder for other EQUIPMENT, before despatch of EQUIPMENT under intimation to OWNER.

1.2.8.2.7 The documents, required for statutory approvals once submitted during construction period by CONTRACTOR shall be firm and final and not subject to subsequent changes unless such subsequent changes are approved by statutory agencies. CONTRACTOR shall be responsible for any payment of penalty as imposed by the Statutory Agencies consequent to furnishing of any incorrect data/drawings.

1.2.8.2.8 All dimensions and weights shall be in metric system.

1.2.8.2.9 EQUIPMENT to be supplied and WORK to be carried out under CONTRACT shall conform to and comply with the provision of relevant Regulations/Acts (or both) as may be applicable in the State of ODISHA and in India to the type of EQUIPMENT/ WORK carried out and necessary certificates shall be furnished.
1.2.8.2.10 CONTRACTOR shall provide cross sectional drawings wherever applicable to identify the spare part numbers and their location, e.g. the size of bearings/seals, their make and number shall be furnished.

1.2.8.3 CONTRACTOR shall furnish unpriced copy of Purchase Orders/Work Order/Contract for equipments and major items as per the list to be mutually agreed (including Priced copy of Purchase Orders/Work Order/Contract as required by the statutory authority) together with spares and special maintenance tools covering accurately all terms and conditions such as specifications requirements for quality, inspection, and test, warranties and guarantees, erection and commissioning assistance by vendor, delivery schedule, packing, transportation and insurance, and documentation.

1.2.8.4 CONTRACTOR shall arrange & furnish/provide to OWNER,

   a) Lubrication schedule from VENDOR,

   b) Mechanical specifications and equipment data sheets for review by OWNER for CRITICAL EQUIPMENT before manufacture is started,

   c) Shop fabrication drawings as made available by vendor,

   d) Characteristic curves for pumps and compressors, etc. as made available by vendor,

   e) Certified drawings including civil scope drawing and loading data, pertinent bulletin, installation, operation and maintenance manuals and test certificates as received from vendor,

   f) Final revised vendor’s drawings including one reproducible, as described in Technical Specifications, before PRILIMINARY ACCEPTANCE.

   g) Any other information as may be sought by OWNER.

Any changes necessary during commissioning period can be incorporated in the as-built drawing and will be submitted after PAC as per the mutually agreed schedule.

1.2.8.5 CONTRACTOR shall provide services of vendor’s specialist for installation and commissioning of EQUIPMENT whenever necessary.

1.2.8.6 Deleted

1.2.8.7 **Inspection, Expediting & Testing**

1.2.8.7.1 CONTRACTOR shall establish an inspection and expediting system and use its services for obtaining EQUIPMENT which conforms to the required technical and
quality specifications and delivery schedule according to Purchase Order. CONTRACTOR shall send copies of expediting and inspection reports regularly to OWNER. CONTRACTOR shall arrange Third Party Inspection and quality certification of EQUIPMENT, as described in FINAL PROPOSAL/CONTRACT.

Third party Inspection shall be carried by Llyods/BV/TUV/LRIS.

1.2.8.7.2 OWNER or its INSPECTOR shall have the right to inspect and/or to test EQUIPMENT to check its conformity to the specifications and as per approved QAP (Quality Assurance Plan). CONTRACTOR shall specify the inspections and tests to be carried out giving reference of applicable codes/standards and the location of inspection/test to OWNER. OWNER shall notify CONTRACTOR in writing the name of INSPECTOR retained for this purpose.

1.2.8.7.3 The inspection and tests may be conducted at the premises of CONTRACTOR or SUB-CONTRACTOR/vendor before delivery and/or at SITE. All reasonable facilities and assistance including access to all drawings and production data shall be furnished to INSPECTOR at no charge to OWNER.

1.2.8.7.4 Should any inspected or tested EQUIPMENT fail to conform to the specifications, OWNER may reject it and CONTRACTOR shall either replace the rejected EQUIPMENT or make all alterations necessary to meet specification requirements free of cost.

1.2.8.7.5 OWNER’s right to inspect and wherever necessary, comment about EQUIPMENT after its arrival at SITE or its participation in tests in respect of any EQUIPMENT shall in no way be limited or waived by reason of EQUIPMENT having previously been inspected, tested and passed by OWNER or INSPECTOR/representative prior to its shipment/despatch.

1.2.8.7.6 INSPECTOR shall follow the progress of the manufacture of EQUIPMENT under CONTRACT to ensure that the requirements outlined in CONTRACT are not being deviated from with respect to Schedule and Quality.

1.2.8.7.7 CONTRACTOR shall allow INSPECTOR to visit, during working hours, the workshops relevant to execution of CONTRACT during the contractual period and INSPECTOR will have the right to inspect EQUIPMENT at all stages of manufacture right from identification of material up to its shipment/despatch, to the extent that the delivery schedule shall not be delayed, with prior notice to CONTRACTOR in writing.

1.2.8.7.8 In order to enable INSPECTOR to obtain entry visa in time, CONTRACTOR shall notify OWNER two months before assembly, testing and packing of main EQUIPMENT and if requested assist INSPECTOR in getting visa in the shortest possible time.

1.2.8.7.9 CONTRACTOR shall place at the disposal of INSPECTOR free of charge all tools, instruments and other apparatus necessary for the inspection and/or testing of
EQUIPMENT. INSPECTOR is entitled to prohibit the use and despatch of EQUIPMENT that has failed to comply with the characteristics/specifications of EQUIPMENT during test and inspection.

1.2.8.7.10 CONTRACTOR shall ensure that the permission for inspection/test is granted by its SUB-CONTRACTOR/VENDOR.

1.2.8.7.11 In respect of the inspection, CONTRACTOR shall advise in writing of any delay in the programme at the earliest possible date, describing in detail what has caused the delay and the proposed corrective action.

1.2.8.7.12 All tests and trials in general of EQUIPMENT shall be witnessed by INSPECTOR. Therefore, CONTRACTOR shall confirm to OWNER by E-mail/fax about the exact date of inspection at least 15 DAYS in advance. CONTRACTOR shall specify the items and quantities ready for testing and indicate whether a Preliminary or Final Test is to be carried out.

1.2.8.7.13 On receipt of this notice, if OWNER decides to waive the right to witness the test, information shall be given to CONTRACTOR within 15 DAYS of receipt of the notice from CONTRACTOR and CONTRACTOR then shall have right to proceed with the inspection.

1.2.8.7.14 Any and all expenses incurred in connection with tests, preparation of reports and analysis made by qualified laboratories, necessary technical documents, testing documents and drawings shall be at CONTRACTOR's cost. Technical documents shall include the references and numbers of the standard used in the fabrication/construction and, wherever deemed practical by INSPECTOR. INSPECTOR shall attach importance to the views given by CONTRACTOR or its SUB-CONTRACTOR/VENDOR. Any and all expenses for boarding, lodging and airfare/rail fare incurred in connection with INSPECTOR shall be borne by OWNER.

1.2.8.7.15 Nothing in Clause -1.2.8.7.2 to 1.2.8.7.14 shall in any way relieve CONTRACTOR from any warranty or other obligations under this CONTRACT.

Not performing or failing to perform the inspection by OWNER hereunder shall not be a waiver of any of CONTRACTOR's obligations hereunder nor it be construed as an approval or acceptance of any of the WORK hereunder nor it shall absolve the CONTRACTOR in any way or manner of its liabilities, responsibilities and obligations under the CONTRACT.

1.2.8.7.16 Arrangements for all inspections required by Statutory Authorities and as specified in Technical Specifications shall be made by CONTRACTOR. Certain category of EQUIPMENT/piping fall under the jurisdiction of Indian Boiler Regulations (IBR), irrespective of the fact whether these are proprietary in nature or not, certification from an internationally recognised agency approved by IBR is considered necessary to enable local IBR authorities to allow their installation and operation. In such cases, inspection and certification from such authorities will also have to be arranged by
CONTRACTOR. CONTRACTOR shall also submit, as may be required by IBR authorities, necessary design calculations from respective fabricators and/or manufacturers of such EQUIPMENT.

1.2.8.7.17 Rejections, Removal of Rejected EQUIPMENT and Replacement

1.2.8.7.17.1 Preliminary inspection at SUB-CONTRACTOR’s / vendor’s works by INSPECTOR shall not prejudice OWNER for commenting on EQUIPMENT including its specifications on final inspection at SITE or claim under warranty provisions.

1.2.8.7.17.2 If EQUIPMENT is not of specification or fail to perform specified duties, OWNER shall be entitled to reject EQUIPMENT or part thereof and ask for modification, repair or free replacement within reasonable time subject to the relevant provisions in the CONTRACT.

1.2.8.7.17.3 In the event of such rejection, OWNER shall be entitled to use EQUIPMENT in a reasonable and proper manner for a time reasonably sufficient to enable it to obtain replacement, without any liability to CONTRACTOR. After free replacement of such rejected EQUIPMENT, the rejected equipment shall become the property of CONTRACTOR.

1.2.8.7.17.4 Nothing in this Clause shall be deemed to deprive OWNER and/or affect any of its rights under CONTRACT which it may otherwise have in respect of such defects or deficiencies or in any way relieve CONTRACTOR of its obligation under CONTRACT.

1.2.8.7.17.5 EQUIPMENT rejected by OWNER shall be removed by CONTRACTOR, within reasonable time, at its own cost after replacement of the said EQUIPMENT. OWNER shall in no way be responsible for any deterioration or damage to rejected EQUIPMENT under any circumstances whatsoever.

1.2.8.7.17.6 In case, the rejected EQUIPMENT is to be taken out of OWNER’s premises for repair, Owner shall have the right to withhold the payment for such cost of equipment to the extent of payment made by Owner towards the equipment until the equipment is returned / replaced.

1.2.8.8 Packing

1.2.8.8.1 CONTRACTOR shall ensure that packing of EQUIPMENT is as required to prevent their damage or deterioration during transit to its final destination.

1.2.8.8.2 The packing, markings and documentation within and outside the packages shall comply strictly with the provisions of CONTRACT.

1.2.8.8.3 CONTRACTOR shall be responsible for any eventual consequence occurred to EQUIPMENT due to improper packing of the same.

1.2.8.9 Delivery/Time Schedule and Documents
1.2.8.9.1 Time schedule shall include time for submission of documents/drawings for review/approval, incorporation of comments, if any, and final review of drawings by ENGINEER-IN-CHARGE. Within 14 (Fourteen) working days after receipt by ENGINEER-IN-CHARGE of any document requiring OWNER’s review, ENGINEER-IN-CHARGE shall either return one copy thereof to CONTRACTOR as it is, if ENGINEER-IN-CHARGE has no comments or with its comments and reasons thereof.

1.2.8.9.2 Special care shall be taken by CONTRACTOR to furnish Manufacturer’s Test Certificates, material of construction, make, type, pressure ratings wherever applicable and included in the scope of supply of EQUIPMENT.

1.2.8.9.3 In case of delayed delivery beyond the stipulated COMPLETION PERIOD, for reasons not attributable to OWNER, FORCE MAJEURE and suspension of WORK by OWNER, even though provisional extension of COMPLETION PERIOD time is allowed by OWNER, all extra costs on account of changes of statutory regulations/Acts or increase in price on any other account including price variation clause, shall not apply to CONTRACT PRICE and the same shall be borne by CONTRACTOR.

1.2.8.10 Despatch, Transportation/Shipping

1.2.8.10.1 CONTRACTOR shall be responsible for despatch of EQUIPMENT by sea/ rail/ road/air after proper packing and protection. The consignment shall be despatched after inspection by OWNER unless otherwise agreed to in writing however such inspection shall not constitute waiver of the CONTRACTOR’s obligations, responsibilities for the EQUIPMENT including care, safety and preservation in any way and manner and the CONTRACTOR’s responsibility and obligation in this behalf shall continue till PRELIMINARY ACCEPTANCE OF PLANT.

1.2.8.10.2 Generally, on-Deck shipment shall not be made without prior permission of OWNER. However, in case of towers, reactors, vessels and other large-sized EQUIPMENT, CONTRACTOR may, at its own discretion, make on-deck shipment, without OWNER’s prior permission. In case of damage to such EQUIPMENT, during delivery or at any stage before PRELIMINARY ACCEPTANCE OF PLANT, CONTRACTOR shall be responsible for repair/replacement of EQUIPMENT.

1.2.8.10.3 Clean onboard bill of lading for all offshore supplies shall be drawn as under:

For CIF/FOB/FAS/FCA shipments

<table>
<thead>
<tr>
<th>Shipper</th>
<th>= CONTRACTOR/Supplier</th>

</table>
1.2.8.10.4 Property in EQUIPMENT

1.2.8.10.4.1 In case of all EQUIPMENTS/MATERIALS (both imported and indigenous), the title of Ownership shall pass on to OWNER on PRELIMINARY ACCEPTANCE of Plant. However, the OWNER shall have Lien on all EQUIPMENTS/MATERIALS including those brought by the Contractor for the purpose of Erection, testing and commissioning of the WORK. However, in case of Termination of Contract the Transfer of Title shall pass automatically to OWNER.

1.2.8.10.4.8 CONSTRUCTION EQUIPMENT used by the CONTRACTOR and its SUB-CONTRACTORS in connection with the execution of works shall remain the property of CONTRACTOR or its SUB-CONTRACTORS. All duties, levies, taxes etc payable on account of CONSTRUCTION EQUIPMENT shall be borne by the CONTRACTOR. CONTRACTOR shall indemnify the OWNER on this count.

1.2.8.10.5 Assembly Marks and Name Plates

1.2.8.10.5.1 All component/parts of EQUIPMENT shall be indelibly hard marked with identification marks, comprising EQUIPMENT, part numbers, and CONTRACT number/PO number which shall also be shown on drawing to facilitate speedy identification, assembling or dismantling.

1.2.8.10.5.2 On each EQUIPMENT, a nameplate indicating basic details, pressure rating, wherever applicable, code number of EQUIPMENT, electrical characteristics in case of electrical EQUIPMENT, name of instrument with tag no., manufacturer’s name shall be fixed at proper place.

1.2.8.10.5.3 For packages where marking is not possible at least two metallic nameplates must be affixed. Marking on the plates will be by means of engraving or indelible paint and will include the information listed above.

1.2.8.10.6 Despatch/Shipping notice

1.2.8.10.6.1 CONTRACTOR shall notify OWNER by fax/E-mail for its information the expected date of delivery of a consignment, date of readiness of EQUIPMENT for shipment, total gross weight and total volume with dimensions.

1.2.8.10.7 Heavy Lift Consignment (HLC) or Over Dimensional Consignments (ODC).

1.2.8.10.7.1 CONTRACTOR shall follow the guidelines of Ministry of Road transport and Highways (MORTH) India, for the shipping/transportation of all packages/consignments. The CONTRACTOR shall be responsible to comply with rules relating to E-way Bills and other related provisions under the GST laws for movement of packages/consignments.
1.2.8.10.7.2 CONTRACTOR shall make his own arrangements for movement of all consignments including ODC.

1.2.8.10.7.3 CONTRACTOR confirms that it has surveyed the route for transportation of ODC items of EQUIPMENT and CONTRACTOR further confirms that it has included all cost of repairs of road, civil works, strengthening of bridges, culverts, widening of roads, etc. as required for transportation of ODC items of EQUIPMENT in its CONTRACT PRICE. OWNER shall not be responsible for repairs of road, civil works, strengthening of bridges, culverts, widening of roads, etc. as required for the transportation of ODC items of EQUIPMENT and shall not be liable to reimburse the cost of such repairs of road, civil works, strengthening of bridges, culverts, widening of roads, etc. to CONTRACTOR.

1.2.8.10.8 Marking

1.2.8.10.8.1 CONTRACTOR shall mark the following on packing three sides i.e. two sides faced and cover (Top) EQUIPMENT with indelible paint in conspicuous printed letters not less than 5 cm. in size in English:

A. For Imported EQUIPMENT

   Government of India  
   A/c TALCHER PROJECT, ODISHA, INDIA.

   a) CONTRACT /PO NO. : _____________________
   b) Equipment Description and Item Nos. : _____________________
   c) Package : _____ of _________
   d) Gross / Net Weight (Kgs.) : _____________________
   e) Dimension L x W x H cms. : _____________________
   f) WARNING MARKS (FRAGILE, ATTENTION, TOP, KEEP DRY ETC.)
   g) Forwarding No. : _____________________
   h) Part shipment/full shipment/final shipment : _________________
   i) Each package shall bear a symbol contained in the package as follows:

   ‘A’ Storage in a closed storehouse.
   ‘B’ Storage under a shed.
   ‘C’ Storage in the open.
1.2.8.10.8.2 Depending on the characteristics of the contents in the packages, the packages have to be marked with appropriate international marking ("HANDLE WITH CARE"; "THIS SIDE UP"; "SLING MARK"; ETC.) and other indications necessary for correct handling such as Centre of Gravity and points of slinging (in case of heavy loads).

1.2.8.10.8.3 For packages where marking is not possible, at least two metallic nameplates must be affixed. Marking on the plates will be by means of engraving or indelible paint and will include the information listed above.

1.2.8.10.8.4 All corners of the packages shall be painted with indelible ‘Blue’ paint at least 125 mm in depth for easy identification/location of the packages for clearance and handling at the port.

1.2.8.10.9 Packing List

1.2.8.10.9.1 CONTRACTOR will include in each package an item-wise packing List, Invoice No. and associated drawings.

1.2.8.10.9.2 The packing list and any other documents shall be put in a closed polyethylene envelope and included in each package.

1.2.8.10.9.3 A second copy of the packing list shall be placed in a polyethylene envelope on the outside of each package by means of metallic plate marked “Documents”. As regards columns, exchangers and similar equipment, the envelope shall be placed in a nozzle being identified by an arrow, in indelible paint, followed by the word “Document”.

1.2.8.10.9.4 Shipping documents must always be presented in the number of copies indicated in this CONTRACT.

1.2.8.10.11 Shipping Arrangements and Forwarding of Documents

CONTRACTOR shall avoid the use of over aged vessels for the shipment of the imported EQUIPMENT under this CONTRACT and if so used, the cost of additional insurance, if any, shall be borne by CONTRACTOR.

1.2.8.10.12 Despatch/Shipment Notice for Insurance.

1.2.8.10.12.1 CONTRACTOR shall send intimations of despatches indicating items despatched, quantity, value, weight and carrier particulars directly through fax to the insurance company fixed by CONTRACTOR. A copy of this letter/ intimation shall also be given to commercial negotiating bank for payment against Letter of Credit. Copies shall also be sent to OWNER.

1.2.8.10.12.2 Insurance for transit risks and other risks shall be covered by CONTRACTOR.

1.2.9 Spares, Special Maintenance Tools, Lubricants, Chemicals and Consumable
<table>
<thead>
<tr>
<th>Section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.2.9.1</td>
<td>CONTRACTOR shall procure and supply commissioning spares, special maintenance tools and fixtures for EQUIPMENT, lubricants, chemicals and consumable in sufficient quantity for COMMISSIONING and maintenance of PLANT, as described in FINAL PROPOSAL. The commissioning spares, special maintenance tools, lubricants, chemicals and consumable procured and supply shall be optimum, so as not to fall short during COMMISSIONING, Sustained Load Test and GTR. CONTRACTOR shall obtain for these items the appropriate guarantees and warranties. CONTRACTOR shall also ensure that the commissioning spares and special maintenance tools and fixtures are procured along with the related items of EQUIPMENT and form part of PURCHASE ORDER for the related items of EQUIPMENT.</td>
</tr>
</tbody>
</table>
| 1.2.9.2 | **Lubricants, Chemicals, Consumable etc.**  
CONTRACTOR shall supply Consumables, lubricants and chemicals required for 100% full load run for 6 months operation after successful commissioning (and include the cost in CONTRACT PRICE). Consumables, lubricants and chemicals to be supplied in phased manner shall be mutually agreed between OWNER and CONTRACTOR considering the consumption and storage capacity. |
| 1.2.9.3 | **Special Maintenance Tools**  
CONTRACTOR shall supply special devices or tools required for normal maintenance, special handling and lifting of EQUIPMENT with main EQUIPMENT. The cost of such special maintenance tools shall be included in CONTRACT PRICE. |
| 1.2.9.4 | **Bidder’s Recommended Operational Spares**  
CONTRACTOR shall provide Itemised Price List for Bidder's Recommended operational spares 6 months prior to Mechanical Completion with validity of 2 Years. The recommended spares shall be optimum so as not to cause any short fall or excessive inventory. The price of above shall NOT be included in CONTRACT PRICE. |
| 1.2.9.5 | **Special Tools & Tackles**  
CONTRACTOR shall supply special tools, tackles and fixture, required during normal operation & maintenance of PLANT. The cost of such special tools & tackles shall be included in CONTRACT PRICE. |
| 1.2.9.6 | **Chemicals**  
CONTRACTOR shall supply all chemicals for first filling and make-up required as indicated in Technical Section of NIT. The cost of these chemicals shall be included in the CONTRACT PRICE. |
| 1.2.9.7 | **Lubricants** |
1.2.9.7.1 CONTRACTOR shall supply lubricants in sufficient quantity for the first filling and make-up required as indicated in Technical Section of NIT. The cost of lubricants shall be included in the CONTRACT PRICE.

1.2.9.7.2 CONTRACTOR shall furnish the name of recommended lubricants indicating their commercial/trade name, quality and grade and equivalent quality lubricants (in case of imported lubricants) available in India to OWNER.

1.2.9.8 Commissioning spares and Consumables

CONTRACTOR shall supply spares and consumables required for construction, PRE COMMISSIONING, COMMISSIONING, start-up and testing of PLANT. The cost of such spares and consumables shall be included in TOTAL CONTRACT PRICE.

1.2.9.9 Mandatory Spares

CONTRACTOR shall provide Mandatory Spares as per Section VI-10.0, of Technical Document. Notwithstanding anything contained in this CONTRACT, the Prices for Mandatory Spares/Insurance Spares shall be included in TOTAL CONTRACT PRICE.

The Lumpsum price for “Mandatory Spares/Insurance Spares” shall be as included in the supply portion of Total Contract Price. However, details along with breakup for the above shall be submitted by successful bidder during execution.

1.2.9.10 General

1.2.9.10.1 CONTRACTOR shall furnish to OWNER, the blue prints, drawings and specifications of the spare parts.

1.2.9.10.2 CONTRACTOR shall provide to OWNER all addresses and particulars of its SUB-CONTRACTOR/VENDOR on whom PURCHASE ORDER for EQUIPMENT covered under CONTRACT has been placed and will further ensure with its SUB-CONTRACTOR/VENDOR that, OWNER if so desires, shall have the right to place order for two years spare parts directly on them on mutually agreed terms based on offers of such SUB-CONTRACTOR/ VENDOR.

1.2.9.10.3 Spare parts shall be new and as per engineering standards/codes, free of any defects (even concealed), deficiency in Design, Materials and Workmanship and also shall be completely interchangeable with the corresponding parts.

1.2.9.10.4 Type and sizes of bearing/seals and bearing number with make shall be clearly indicated.

1.2.9.10.5 Spare parts shall be packed for long storage under tropical climatic conditions in suitable cases, clearly marked as to their intended purpose.

1.2.10 Warrantees and Guarantees
1.2.10.1  Materials and Workmanship Warranty

1.2.10.1.1 CONTRACTOR warrants that EQUIPMENT supplied under CONTRACT are new, unused, of the recent or current models and incorporate all recent improvements in design and materials unless provided otherwise in CONTRACT. CONTRACTOR further warrants that EQUIPMENT supplied under this CONTRACT shall be according to specifications, have no defect (even concealed) arising from design, materials or workmanship or form any act or omission of CONTRACT that may develop under normal use of the supplied EQUIPMENT in the conditions prevailing in the country of final destination.

1.2.10.1.2 The warranty period for the EQUIPMENT supplied by CONTRACTOR shall be valid for minimum 12 months for all EQUIPMENT except for catalysts from the date of PRELIMINARY ACCEPTANCE. The warranty period for individual catalyst shall be up to its guaranteed life, as specified in FINAL PROPOSAL, from the date of PRELIMINARY ACCEPTANCE.

1.2.10.1.3 The warranty shall be valid for the period as described under Clause -1.2.10.1.2 from the date of PRELIMINARY ACCEPTANCE and shall be governed by Clause 17 of SPECIAL CONDITIONS OF CONTRACT. Should any DEFECTS be noticed in design, material and/or workmanship within the said warranty period, ENGINEER-IN-CHARGE shall inform CONTRACTOR and CONTRACTOR shall immediately on receipt of such intimation depute their personnel within 10 DAYS to investigate the causes of DEFECTS and arrange rectification / replacement / modification of the defective EQUIPMENT at SITE without any cost to OWNER, within a reasonable period. If CONTRACTOR fails to take proper corrective action to replace/ repair defective Equipment satisfactorily within a reasonable period, OWNER shall be free to take such corrective action as may be deemed necessary at CONTRACTOR’s risk and cost, after giving notice to CONTRACTOR. OWNER shall promptly notify CONTRACTOR in writing of any claims arising under this warranty.

1.2.10.1.4 In case defects are of such nature that EQUIPMENT shall have to be taken to CONTRACTOR’s/ SUB-CONTRACTOR’s/ vendor’s works for rectification etc., CONTRACTOR shall take EQUIPMENT at its cost after giving necessary undertaking or security as may be required by OWNER. OWNER shall, if so required by CONTRACTOR, despatch EQUIPMENT by quickest mode on freight to pay basis to CONTRACTOR’s / SUB-CONTRACTOR’s / vendor’s works. After repairs CONTRACTOR shall deliver EQUIPMENT at SITE on freight paid basis. All transit risks to and from site shall be borne by CONTRACTOR.

1.2.10.1.5 EQUIPMENT or part thereof so repaired or replaced shall have further warranty for a period of 12 months from the date of its acceptance after repair/replacement and the Performance Bank Guarantee shall be suitably extended for the same. The value of the Performance Bank Guarantee during the extended warranty period shall be 10 (Ten) percent of the cost of such repaired/replaced EQUIPMENT or its parts for which documentary evidence to be submitted.
However, extended DEFECTS LIABILITY PERIOD shall have an upper limit of 24 months for extended DEFECTS LIABILITY PERIOD, starting from the Preliminary Acceptance.

1.2.10.1.6 If the repairs, replacements or modifications referred to above are of such nature which may affect the efficiency of EQUIPMENT, OWNER shall have right to give notice in writing to CONTRACTOR within one month of such repair/ replacement/ modification to carry out tests as may be required for acceptance of EQUIPMENT.

1.2.10.1.7 If CONTRACTOR fails to meet its obligation to repair or replace defective EQUIPMENT and make it good within a reasonable period of time and or if CONTRACTOR refuses to carry out WORK under the guarantee clause and implied guarantee conditions and/or in case of severe urgency, OWNER shall be entitled to carry out repair/replacement/WORK or arrange to carry out repair/ replacement/WORK by a third party. The entire cost of such repair/ replacement/WORK including transit insurance, freight, taxes and duties etc. shall be borne by the CONTRACTOR. In case, the cost of such repair/replacement has been incurred by OWNER, CONTRACTOR shall reimburse the same immediately on demand by OWNER with a document substantiating such costs.

1.2.10.1.8 Damages to EQUIPMENT deriving from incomplete, erroneous instructions issued by CONTRACTOR will be considered CONTRACTOR’s fault and will be treated according to the provision of warranty clause. Normal wear and tear shall not come under purview of this clause.

1.2.11 Performance Guarantee of PLANT / EQUIPMENT

1.2.11.1 CONTRACTOR guarantees that the performance of PLANT supplied under CONTRACT shall be strictly in conformity with the specifications and shall perform the duties and have consumption, production and other guarantees set forth in CONTRACT.

1.2.11.2 If the performance of PLANT and/or any of EQUIPMENT fails as guaranteed and set forth in CONTRACT, CONTRACTOR shall investigate the causes and provide free of cost to OWNER, design, engineering, MATERIALS and services and EQUIPMENT within a reasonable period to prove guarantees. CONTRACTOR’s liability in this respect shall be limited as per the provisions of 32.0 of GCC except that the Works Cost Guarantee shall be governed by the provisions of Cl.No.31.2. of GCC.

1.2.12 Government Clearances, Permits and Certificates

1.2.12.1 CONTRACTOR shall procure at its expenses, all necessary APPLICABLE PERMITS, certificates and licenses required by virtue of all APPLICABLE LAWS, regulations, ordinances and other rules in effect at the place where any of WORK is to be performed, and CONTRACTOR shall further hold OWNER harmless from liability or
penalty which might be imposed by reason of any asserted or established violation of such laws, regulations, ordinances or other rules. OWNER will provide the necessary assistance to CONTRACTOR for obtaining PERMITS for CONTRACTOR’s personnel to undertake WORK in India in connection with CONTRACT.

1.2.12.2 CONTRACTOR shall furnish necessary technical information, data, drawing, etc. as and when required by OWNER for submission to Government/Statutory Agencies.

1.2.13 Network Schedule

1.2.13.1 OWNER would be using a computerized time and cost monitoring system and CONTRACTOR shall provide necessary input data for the same. CONTRACTOR shall prepare within 30 (thirty) days from date of FOA and provide to OWNER a PROJECT MASTER SCHEDULE indicating the important milestones of activities relating to WORK from date of FOA to the date of PRELIMINARY ACCEPTANCE. This PROJECT MASTER SCHEDULE shall be discussed with and approved by OWNER. Based on the approved PROJECT MASTER SCHEDULE, CONTRACTOR shall also prepare network schedules for activities relating to WORK. CONTRACTOR shall obtain the details of progress of various activities of WORK from SUB-CONTRACTOR and vendor wherever required and update the network schedules and PROJECT MASTER SCHEDULE incorporating the progress achieved by CONTRACTOR, SUB-CONTRACTOR and vendor and submit the same to ENGINEER-IN-CHARGE on monthly basis.

1.2.13.2 CONTRACTOR shall clearly indicate any delay in WORK in the above schedules and shall inform ENGINEER-IN-CHARGE the action taken to achieve the COMPLETION PERIOD.

1.2.13.3 Time Schedule Network/Bar Chart

1.2.13.3.1 Within 30 (thirty) DAYS from the date of FOA, CONTRACTOR shall submit to ENGINEER-IN-CHARGE its time schedule regarding delivery of documentation, supply and manufacture of EQUIPMENT, time schedule for placement of purchase order and SUB-CONTRACT, etc.

1.2.13.3.2 The time schedule will be in the form of a network and a bar chart clearly indicating all main or key events regarding documentation, supply of raw materials, manufacturing, testing and delivery of equipment, civil works, erection, commissioning, testing etc.

1.2.13.3.3 The original issue and subsequent revisions of such time schedule shall be sent to OWNER in two copies (of which one shall be a reproducible/soft copy). The time schedule network/bar chart shall be updated at least every month during the period of CONTRACT.

1.2.13.4 Progress of WORK
1.2.13.4.1 CONTRACTOR shall report monthly to OWNER of the execution of CONTRACT and achievement of targets set out in time bar chart, in a monthly progress report on 7th working day of every Month.

1.2.13.4.2 The progress shall be expressed in percentages for all activities.

1.2.13.4.3 The first issue of the progress report shall be forwarded together with the time bar chart.

1.2.13.4.4 OWNER shall also review the physical/actual progress of WORK on the basis of CONTRACTOR's time schedule documentation.

1.2.13.4.5 Irrespective of such review, CONTRACTOR shall advise OWNER at the earliest possible date of any anticipated delay in the progress.

1.2.13.4.6 In the event that the delay is caused by a delay in the delivery of a sub-contracted EQUIPMENT, CONTRACTOR shall be responsible for such delay and submit details together with copies of the appropriate orders and agreements with SUB-CONTRACTOR/vendor.

1.2.14 **Transportation and Storing of EQUIPMENT**

1.2.14.1 CONTRACTOR shall be responsible for proper packing, transportation from vendor's workshop to port or railway station (whether by road, rail, ship or aircraft), handling and clearances at port or railway station including loading and unloading, customs clearance, carriage to SITE, unloading at SITE, warehousing, coding and tagging, storage including proper preservation, etc. of EQUIPMENT. Any special clearance, lifting, handling, loading/unloading, and transport arrangements for over dimensional consignments shall also be done by CONTRACTOR. CONTRACTOR shall ensure timely delivery of EQUIPMENT. CONTRACTOR shall endeavor to have the consignments in the upper part of the hold to enable early discharge at the Port of disembarkment. The above arrangement shall be in accordance with the guidelines set forth in the Co-ordination Procedure. CONTRACTOR shall be responsible for inspection of EQUIPMENT on receipt at SITE and for maintenance and management of stores and warehousing of EQUIPMENT at SITE including all activities connected with the issue of EQUIPMENT, accounting and final reconciliation and handing over of stores to OWNER.

1.2.14.2 OWNER shall provide area at SITE for making shed/covered stores etc. for storing EQUIPMENT. CONTRACTOR shall be responsible for making shed/covered stores etc. for safe storage of EQUIPMENT.

1.2.15 **Construction**

1.2.15.1 CONTRACTOR shall be responsible for all civil and structural work, foundations, insulating & painting works, erection, site fabrication, piping, instrumentation, electrical installation, and other miscellaneous construction jobs of PLANT leading to
MECHANICAL COMPLETION and PRELIMINARY ACCEPTANCE of PLANT. CONTRACTOR shall organise these activities in appropriate sequence and use proper methods giving due regard to the requirements of safety, quality, sound engineering practice, compliance with relevant Codes and Regulations, and for achieving PRELIMINARY ACCEPTANCE of PLANT on or before COMPLETION PERIOD.

The CONTRACTOR shall within the scope of work observe in addition to specifications, all national and local laws, ordinances, rules and regulation and requirements pertaining to the WORK.

Various procedures and methods to be adopted by CONTRACTOR during the construction as required in the respective specifications shall be submitted to OWNER in due time and well in advance of the specific work for approval.

The CONTRACTOR shall carry out required supervision as per Quality Assurance Plan and furnish all assistance required by the OWNER in carrying out inspection work. The OWNER will have authorised representatives present who shall have free access to the work at all times. If an OWNER's representative notifies the CONTRACTOR's representative of any deficiency in any work or in the supervision thereof, the CONTRACTOR shall make every effort to carry out such instructions consistent with best industry practice.

The CONTRACTOR shall so far as reasonably feasible employ skilled workers who are Certified Tradesmen in the field(s) of their relative activities(s).

1.2.15.2 CONTRACTOR shall submit and adhere to the completion schedule of construction leading to PRELIMINARY ACCEPTANCE.

1.2.15.3 In case of delay in completion beyond the stipulated completion period as specified in Invitation For Bid (IFB) under clause 2 (E) for reasons attributable to Contractor, all extra costs on account of changes of statutory regulations / Acts, shall not apply to Contract price and the same shall be borne by Contractor.

1.2.15.4 Civil Work Warranty

1.2.15.4.1 CONTRACTOR shall certify that the all civil works, reinforced concrete, structures, permanent buildings and foundations has been designed in accordance with stipulations of relevant BIS Codes.

1.2.16 Safety and Plant Security

1.2.16.1 CONTRACTOR shall observe and also use its best efforts to ensure that all parts of WORK carried out at SITE is being done in a safe and satisfactory manner conforming
to the applicable Safety Rules and Regulations. Further, CONTRACTOR shall observe and make provisions in SUB-CONTRACT that employees working for PLANT observe all the Safety Rules as required under the Factories Act and Regulations and other Local Laws and SUB-CONTRACTOR to provide safety apparel and equipment to its employees. OWNER shall have the right to object to any unsafe practice followed by SUB-CONTRACTOR’s employees or any CONTRACTOR’s personnel and direct them to carry out the job in a manner considered safe by OWNER. CONTRACTOR shall further abide by all the Security Regulations imposed by OWNER.

1.2.16.2 CONTRACTOR shall observe all safety rules so that no harm is done to OWNER’s employees or property. If on account of CONTRACTOR, OWNER’s property or personnel are likely to suffer any damage, in such cases any directions issued by OWNER shall be carried out by CONTRACTOR.

1.2.17 PRE-COMMISSIONING Services of PLANT

1.2.17.1 CONTRACTOR shall render and be responsible for pre-commissioning activities leading to MECHANICAL COMPLETION. These activities will include relevant checking, adjustment, testing, calibration, running in and trial runs of individual items of EQUIPMENT, and other similar jobs. OWNER shall provide experienced/trained and suitable operating and maintenance personnel who will perform their tasks under the supervision and direction of CONTRACTOR.

1.2.17.2 CONTRACTOR shall provide experienced personnel as required for carrying out the PRE-COMMISSIONING activities with OWNER’s personnel.

1.2.17.3 CONTRACTOR shall provide SUB-CONTRACTOR’s/VENDOR’s specialists wherever required. Suitable provision for such services shall be made by CONTRACTOR in PURCHASE ORDER/CONTRACT with their Sub-Vendor/Sub-Contractor.

1.2.18 MECHANICAL COMPLETION

1.2.18.1 CONTRACTOR shall be responsible for completing the design, engineering, procurement, inspection and expediting, arranging for transportation of EQUIPMENT, construction and PRE-COMMISSIONING for making PLANT ready for acceptance of feed stock on declaration of MECHANICAL COMPLETION.

1.2.19 Commissioning Services of PLANT

1.2.19.1 CONTRACTOR shall be responsible for COMMISSIONING after PRE-COMMISSIONING activities have been completed giving due regard to safety of EQUIPMENT according to sound international practice. OWNER shall provide operating and maintenance personnel who shall work under the supervision and direction of CONTRACTOR. The COMMISSIONING activities shall include but not limited to the following:
a) Introduction of raw materials, utilities, lining-up of various sections of PLANT leading to production of Steam as per Section VI-4.0 of NIT

b) Stabilising PLANT and stepping up production to full plant capacity.

c) Demonstrating and Conducting sustained load test and Guarantee Test as per Section VI-8.0 of NIT

1.2.19.2 CONTRACTOR shall provide engineers as required to commission the PLANT. CONTRACTOR shall be responsible to provide supervision personnel for operation of PLANT for a period of 6 months from date of successful commissioning and OWNER will operate the PLANT under the supervision and instructions of CONTRACTOR.

During the sustained load test and the guarantee test, the range of operating conditions shall be within the limits of the design conditions and shall meet the requirements of safety and compliance with relevant Codes and Regulations.

1.2.20 Performance Guarantee Test Run

1.2.20.1 CONTRACTOR shall successfully complete PERFORMANCE TEST as early as possible after MECHANICAL COMPLETION as specified in Technical Section-VI, 8.0 of NIT.

1.2.20.2 CONTRACTOR shall, when PLANT is stabilized at full plant capacity to the satisfaction of OWNER, shall carry out PERFORMANCE TEST and prove Guarantees.

1.2.21 Deleted.

1.2.22 6 months Supervisory Assistance.

Owner requires six months supervisory assistance after successful Commissioning with designated selected manpower defined by Owner as per the requirement specified in Technical Section VI-3.0, of NIT. LSTK Contractor shall include the cost of above services in TOTAL CONTRACT PRICE.

1.2.23 Laws and Regulations

1.2.23.1 CONTRACTOR shall abide, while fulfilling its obligations, by all applicable codes and APPLICABLE LAWS from time to time in force in the State of ODISHA and in India. FINAL PROPOSAL shall be based on the codes, and regulations applicable on the date of submission of the FINAL PROPOSAL.

In the event of change in any codes, legislation, laws or regulation applicable to PLANT WORK or any part thereof after date of submission of FINAL PROPOSAL, which alters the scope of CONTRACTOR’s obligations under CONTRACT,
CONTRACTOR shall agree to make the necessary changes in scope of WORK. Such changes shall be governed by CHANGE IN WORK as per the provisions of Clause -3 of SCC. Any additional fee becoming applicable due to any change of Acts, regulations, by-laws, orders and requirements after date of submission of FINAL PROPOSAL shall be borne by OWNER in accordance with SCC clause 3.0.

1.2.24 Statutory Obligations

1.2.24.1 CONTRACTOR shall comply with the requirements of statutory provisions and shall be solely responsible for fulfilment of all legal obligations under Contract Labour (Regulation and Abolition) Act, Inter-state Migrant Workmen (Registration of Employment and Condition of Service) Act, Payment of Wages Act, Workmen Compensation Act, Factories Act, Employees Provident Fund and Misc. Provisions Act, Payment of Bonus Act, Payment of Gratuity Act, Industrial Disputes Act and all other applicable Industrial/Labour enactment and Rules made there under as applicable from time to time. In case OWNER incurs any liability towards payment of any kind whatsoever, due to non-fulfilment of statutory provisions under any industrial/labour law by CONTRACTOR, the same shall be made good by CONTRACTOR.

1.2.24.2 SUB-CONTRACTOR engaged by CONTRACTOR for performing civil and erection work/other jobs at SITE shall have PF Code No. in its name issued by Regional Provident Fund Commissioner (RPFC).

1.2.24.3 The CONTRACTOR shall ensure that the SUB-CONTRACTOR shall comply with the Statutory Requirements, as applicable, for the execution of this CONTRACT.

1.2.25 Progress Monitoring and Reporting

1.2.25.1 CONTRACTOR shall develop a suitable system for monitoring and reporting progress on the various activities up to PRELIMINARY ACCEPTANCE. CONTRACTOR shall submit PROJECT MASTER SCHEDULE and detailed Network Schedule covering the activities and milestones starting from date of FOA until PRELIMINARY ACCEPTANCE, as described under Clause -1.2.13 above. These schedules shall include the activities of CONTRACTOR, SUB-CONTRACTOR/Sub-Vendor. CONTRACTOR shall monitor progress continuously and submit to EIC monthly progress reports giving the status of the activities, indicating those delayed and action being taken, or required to be taken, to bring back those activities on schedule. These reports will also include progress at vendor’s workshops and shall be supplemented with photographs, wherever necessary. The Network Schedule shall be updated once in a month. CONTRACTOR shall also furnish information to ENGINEER-IN-CHARGE as may be required by any other Government Authority or any other agency such as Financing Institution etc.

1.2.26 Technical Information
1.2.26.1 CONTRACTOR shall furnish to OWNER, CONTRACTOR’s Technical Information and know-how as may be necessary for the operation of PLANT and relating to its process according to the provisions of Article 53 of General Conditions of Contract. CONTRACTOR shall grant or cause to be granted to OWNER an irrevocable right to use all such above technical information for PLANT and shall further advise OWNER for a period of five (5) years from date of PRELIMINARY ACCEPTANCE of any improvements in process, know-how, engineering, operation methods, and other conditions which will result in more efficient operation of PLANT that are developed by CONTRACTOR or process licensor or have come to the knowledge of CONTRACTOR, at no extra cost to OWNER. OWNER shall also grant to CONTRACTOR, at no extra cost to CONTRACTOR, to the benefit of process licensor the same right on OWNER’s improvements as per the provisions of this Clause. Notwithstanding the generality of the foregoing, ownership of data, technical information processes, technology or software proprietary to CONTRACTOR and/or SUBCONTRACTORS shall remain with CONTRACTOR and/or SUBCONTRACTOR. CONTRACTOR and/or SUBCONTRACTOR shall ensure that OWNER is legally entitled to use of such data, processes, technology and software in the form of a perpetual, non-terminable, non-exclusive, royalty-free License for the purpose of the operation and maintenance of the PLANT.

1.2.27 Work of SUB-CONTRACTOR and vendor

1.2.27.1 CONTRACTOR shall remain responsible for proper execution of such part of WORK as are carried out by its SUB-CONTRACTOR and vendor and any failure of SUB-CONTRACTOR/vendor shall not relieve CONTRACTOR of its obligations under CONTRACT. Furthermore, in the event of any default by SUB-CONTRACTOR/vendor, CONTRACTOR shall either take over SUB-CONTRACTOR/vendor’s part of WORK on mutually agreed terms or take remedial action as may be necessary in order to comply with COMPLETION PERIOD and any other activities leading to PRELIMINARY ACCEPTANCE.

1.2.28 Co-ordination

1.2.28.1 CONTRACTOR shall render all necessary assistance to ENGINEER-IN-CHARGE required for overall co-ordination of all activities connected with WORKS. For this purpose, CONTRACTOR and ENGINEER-IN-CHARGE shall agree on a meeting as soon as practicable after issuance of FOA, with SUBCONTRACTOR/vendor’s and such other parties as are necessary to settle the following:

- a) Review the basic design conditions set forth in FINAL PROPOSAL and where appropriate, review possibilities of standardisation.
- b) Assess the priorities and key dates required to be included in CONTRACTOR’s PROJECT MASTER SCHEDULE.
- c) Make an assessment of all items requiring co-ordination.
- d) Fix up a date and agenda of any subsequent meeting as may be required in association with OWNER.
e) Discuss with ENGINEER-IN-CHARGE and furnish all technical information about various effluents/emission and discharge points from different sources indicating the quality and quantity of gaseous and liquid emission of pollutants from PLANT. CONTRACTOR shall also supply ENGINEER-IN-CHARGE any additional information required on the above matter during the performance of process design and basic engineering design.

In the event, ENGINEER-IN-CHARGE pursuant to its responsibilities of overall co-ordination requests CONTRACTOR to make any alteration to the programme, scope of responsibility under CONTRACT, CONTRACTOR shall do the same, subject to the provisions of Clause 3.0.

1.2.29 Notices and Reports

1.2.29.1 CONTRACTOR shall submit the following copies of notices to ENGINEER-IN-CHARGE as part of the Scope of Work:

a) Immediate notification of safety incidents and accidents, including near misses, of any kind or type followed as soon as possible after such event by a full report.

b) Notices from any Government / Statutory Agency or any other Person for a violation of any Law or Government Approval, immediately upon receipt by CONTRACTOR and no later than twenty-four (24) hours after its receipt.

c) Inspection reports by any inspector whether relating to any accident, accepting any test reports or otherwise immediately upon receipt by CONTRACTOR and no later than two (2) working DAYS after its receipt.

d) Any other matter/issue that involves OWNER's interest.

1.2.30 CONTRACTOR's Representative and Key Personnel

1.2.30.1 CONTRACTOR shall with prior consent of ENGINEER-IN-CHARGE, appoint a CONTRACT MANAGER to manage the execution of WORK and to be nominated as CONTRACTOR's Representative. CONTRACTOR’s personnel stationed at SITE for providing services during the execution of WORK shall work under the supervision and guidance of CONTRACT MANAGER. The CONTRACT MANAGER shall have the full authority to make binding and enforceable decisions in the name of CONTRACTOR and shall receive all notices/correspondence that OWNER serves on CONTRACTOR.

1.2.30.2 CONTRACTOR shall be responsible for the work performed by CONTRACT MANAGER and CONTRACTOR’s personnel and shall under no circumstances be relieved of its responsibilities and obligations under CONTRACT on account of acts or omissions of CONTRACT MANAGER and personnel.
1.2.30.3 The Key Personnel shall hold the staff positions as indicated in CONTRACT. CONTRACTOR shall use reasonable efforts to ensure that such Key Personnel will be engaged in the execution of WORK continuously until their role is completed unless prior release is approved by OWNER, such approval not to be unreasonably withheld or delayed. Replacement of or addition to Key Personnel shall only be made with persons having qualifications and experience equal to or better than those replaced or added to, and shall be similarly subject to OWNER’s prior approval. In the event, any person identified in CONTRACT decides to leave the employment of CONTRACTOR, CONTRACTOR shall use reasonable efforts to retain the services of such person until his portion of WORK is complete. CONTRACTOR further agrees not to remove from WORK Key Personnel, which OWNER considers to be necessary for the proper performance of WORK without the prior written approval of OWNER.

1.2.31 General Warranties

a) CONTRACTOR shall perform WORK in full compliance with its FINAL PROPOSAL and all other terms and conditions set forth herein.

b) WORK shall be performed, in a good and workmanlike manner and in accordance with the FINAL PROPOSAL, all other terms and conditions of this CONTRACT, all DOCUMENTS, all Government Approvals, all APPLICABLE LAWS, and Good Industry Practices.

c) All EQUIPMENT, installed as part of PLANT, (i) shall be free from any encumbrance or lien and shall conform to the specifications and descriptions set forth in CONTRACT and (ii) shall be new and unused, free from DEFECTS and Deficiencies of any kind and shall meet the requirements of the Scope of Work.

d) The completed PLANT shall be free of DEFECTS and Deficiencies and shall be designed, constructed and engineered, in compliance with the Scope of Work.

e) PLANT shall be designed, engineered, constructed, tested, completed and delivered based on Good Industry Practices, CONTRACTOR’s specifications and guidelines for operation and maintenance in accordance with the Scope of Work, for CONTRACT PRICE and no later than the COMPLETION PERIOD.

f) All SUB-CONTRACTOR/vendor shall perform their portion of the Scope of Work or supply or install EQUIPMENT in accordance with the applicable terms set forth herein.

g) Adherence to the Operations Manual shall allow safe start-up, operation, maintenance and shut-downs of the completed PLANT, in accordance with CONTRACTOR’s guidelines and will not impair any warranty or guarantee of EQUIPMENT incorporated or to be incorporated into PLANT.
1.2.32.1 CONTRACTOR shall incorporate during design stage maximum utilization of goods manufactured and/or available in India and also avail shipping, insurance, banking, catering and any other services available from India-owned companies for installation of plant, if quality, delivery and overall cost characteristics are equivalent.

1.2.32.2 CONTRACTOR shall arrange insurance pursuant to Clause 28.0 of GCC, at its own cost.

1.2.32.3 CONTRACTOR shall provide necessary information, documentation, and assistance for obtaining any approvals from Financial Institutions or any other agencies or authorities.

2.0 OWNER'S OBLIGATIONS

OWNER shall be responsible for fulfilling all obligations as specified under the following heads:

2.1 Deleted

2.2 Overall Co-Ordination

The objective of overall co-ordination is to organise orderly execution of WORK, bring about requisite integration amongst the various project activities of executing agencies, to avoid interference between the various activities of the parties in order to achieve the earliest possible completion of WORK. The aim will be to integrate, have compatibility between plants and uniform standardisation of design, engineering, layout, etc.

2.3.0 Review and Approval of Work

2.3.1 CONTRACTOR shall associate OWNER’s representatives with WORK as carried out by CONTRACTOR’s personnel. For this purpose, OWNER shall associate with WORK at all stages. Specifically, OWNER shall undertake the following tasks:

   a) Review/APPROVAL of drawings as per Technical Section and other documents connected with basic and detailed engineering.

   b) Review of specifications for EQUIPMENT, lists of spare parts and special maintenance tools, and lists of special construction aids, tools, tackles, and fixtures.

   c) Participation in inspection, expediting and testing of EQUIPMENT at SUB-CONTRACTOR’s / vendor’s works and at SITE, wherever considered necessary by OWNER.
2.3.2 For the smooth functioning, OWNER will nominate an individual who will act as EIC under the CONTRACT. The EIC will have full authority to act on behalf of the OWNER in connection with the CONTRACT. Except as otherwise provided in the CONTRACT, all communications between the OWNER and the CONTRACTOR relating to the WORKS shall be between the ENGINEER-IN-CHARGE and the CONTRACT MANAGER.

2.4 Deleted

2.5 Facilities for CONTRACTOR's Personnel

OWNER shall assist CONTRACTOR in obtaining Visas and other PERMITS from the appropriate authorities for CONTRACTOR's and SUB-CONTRACTOR's / vendor's expatriates to enter and stay in India as necessary for performance of WORK. OWNER shall also provide facilities to CONTRACTOR's expatriates in accordance with the provisions described in Clause-2.8.

2.6 Operating and Maintenance Personnel

OWNER shall provide operating and maintenance personnel according to its organisation, specifications, and standards during the PRE-COMMISSIONING and COMMISSIONING activities, who will work under the direction and control of CONTRACTOR. OWNER may associate its personnel with the construction and erection of PLANT to familiarise the personnel with WORK, and generally to prepare for proper operation and maintenance of PLANT.

2.7 Feed stock and Utilities

OWNER shall make available the feedstock and utilities as specified in section VI-2.0 of bid document for commissioning and PGTR.

2.8 Site Facilities

OWNER shall provide the following SITE facilities:

a) Land for Construction Activities
b) General safety and security without prejudice to Contractor’s obligations.
c) Construction Power & Construction Water shall be provided as per clause 1.1.1 (g)
d) Free and unrestricted access to SITE for CONTRACTOR’s Authorized Personnel

Owner shall NOT provide any accommodation and facilities for travelling to and from SITE to the place of residence to the personnel of CONTRACTOR, deputed at SITE for performing WORK under CONTRACT.
g) OWNER shall NOT provide any accommodation and facilities for travelling to and from SITE to the place of residence to the personnel of SUB-CONTRACTOR and VENDOR.

h) Area for making shed/covered storage for storing EQUIPMENT.

3.0 CHANGES IN WORK/CHANGE ORDER

3.1 OWNER may at any time order change in work scope. OWNER shall have the right to request in writing changes in WORK within the scope of CONTRACT. When the request for a change in WORK by OWNER has been agreed and complied by CONTRACTOR, CONTRACTOR’s obligations under CONTRACT shall remain unaffected unless otherwise agreed.

Changes may consist of additions, deletions or revisions of the Scope of Work, and may cause the CONTRACT PRICE, the work schedule or the COMPLETION PERIOD or any other CONTRACTOR’s WARRANTIES to be adjusted.

CONTRACTOR shall be entitled to an extension of time to COMPLETION PERIOD suffered and/or payment of additional costs incurred as a result of any change in law or legislation, by way of a CHANGE ORDER, in case it is necessitated or if it becomes applicable.

3.2 The ENGINEER IN CHARGE shall have the right to make any alterations in, omission from, additions to or substitutions for in the scope of work, the original specifications, drawings, designs and instructions that may appear to him to be necessary or advisable during the progress of the WORK and the CONTRACTOR shall be bound to carry out the such altered/ extra/ new items of WORK in accordance with any instructions which may be given to him in writing signed by the ENGINEER IN CHARGE, and such alterations, omissions, additions or substitutions shall not invalidate the CONTRACT and any altered, additional or substituted work which the CONTRACTOR may be directed to do in the manner above specified as part of the WORK shall be carried out by the CONTRACTOR on the same conditions in all respects on which he agreed to do the main WORK. The time of completion of WORK may be extended for the part of the particular job at the discretion of the ENGINEER IN CHARGE, for only such alterations, additions or substitutions of the WORK, as he may consider as just and reasonable. The rates for such additional, altered or substituted WORK under this clause shall be worked out in accordance with the following-

CONTRACTOR shall, within 7 days of the date of receipt of order to carry out the WORK, inform the ENGINEER IN CHARGE of the rates which it is his intention to charge for such class of WORK, supported by analysis of the rate or rates claimed, and the ENGINEER IN CHARGE shall determine the rate or rates on the basis of the prevailing market rates, labour cost at schedule of labour rates plus 10% to cover contractor's supervision, overheads and profit and pay the CONTRACTOR accordingly. The opinion of the ENGINEER IN CHARGE as to current market rates of
materials and the quantum of labour involved per unit of measurement will be final and binding on the CONTRACTOR.

3.3. If it is established that a request for Change in Work asked by Owner does not fall under original Scope of Contract, then CONTRACTOR shall promptly submit cost estimate, and / or time extension and / or terms of payment (as applicable) for making the requested change in WORK together with the details of any variation required to be made to any of CONTRACTOR’s or OWNER’s obligations and/or guarantees as per clause 3.2 above.

3.4 If in CONTRACTOR's opinion fulfillment of any of its obligations under CONTRACT would be jeopardised by a CHANGE IN WORK requested by OWNER, then CONTRACTOR shall explain in writing to OWNER the reasons for not accepting these changes within thirty (30) days of receipt of OWNER's written request.

3.5 OWNER and CONTRACTOR shall agree upon the basis and terms of the CHANGE IN WORK in writing.

3.6 It is understood that no change shall become effective and no change will alter the scope of WORK until all of the matters referred to in this Clause 3 have been mutually agreed upon in writing by OWNER and CONTRACTOR.

3.7 It is agreed by both parties that the following changes shall not be considered a CHANGE IN WORK in the meaning in this Clause:

   a) Minor changes requested by OWNER and accepted by CONTRACTOR which do not involve any substantial additional cost or man-hour effort, and have no effect on contractual completion period, and/or

   b) Any change necessitated due to requirements of prevalent laws in India upto the time of submission of FINAL PROPOSAL.

3.8 This clause is to be read in conjunction with Clause No. 5.0 of GCC.

4.0 ACCEPTANCE OF PLANTS AND FACILITIES

CONTRACTOR's liabilities for the Performance Guarantees given for the PLANTS and Facilities in respect of capacity, consumption, product quality and pollution level shall be discharged only when the PERFORMANCE AND GUARANTEE TESTS as stipulated in Technical, Section VI-8 of NIT have been successfully carried out as per Plant Acceptance criteria specified at Clause 5.0 below and OWNER has issued PRELIMINARY ACCEPTANCE CERTIFICATE.

5.0 PLANT ACCEPTANCE CRITERIA
Subject to fulfilling PERFORMANCE AND GUARANTEE TESTS as per Section VI-8.0 of NIT and Clause 18.0 of SCC, OWNER shall be in readiness to accept the PLANT. CONTRACTOR shall take all steps to fulfil the provisions of the CONTRACT for OWNER to issue PRELIMINARY ACCEPTANCE CERTIFICATE. The care and custody responsibility of the Plant shall be passed on to OWNER on PRELIMINARY ACCEPTANCE of the Plant.

6.0 ISSUANCE OF PRELIMINARY ACCEPTANCE CERTIFICATE

Within 30 (thirty) DAYS from completing successfully PERFORMANCE & GUARANTEE TESTS by the CONTRACTOR and CONTRACTOR fulfilling all the obligations under the provision of the CONTRACT, OWNER shall issue PRELIMINARY ACCEPTANCE CERTIFICATE to CONTRACTOR. On issue of this Certificate by OWNER, CONTRACTOR shall become entitled to receive all associated payment as per provisions of the CONTRACT due to CONTRACTOR subject to CONTRACTOR’s fulfilling the obligations stipulated under CONTRACT.

7.0 LABOUR AND STAFF

7.1 The CONTRACTOR shall make his own arrangement for labour, erection and COMMISSIONING engineers and all other staff required for carrying out the WORK. The necessary permissions from Government of India regarding work permit and visa requirement shall be obtained by the CONTRACTOR.

7.2 The CONTRACTOR shall make his own arrangements for providing canteen service to his labour and staff. Open space for this purpose may be provided by OWNER.

7.3 The CONTRACTOR shall at his own cost provide office and other accommodation for his staff and workmen. The CONTRACTOR shall also provide communication, transport and medical facilities to his staff and workmen.

7.4 The CONTRACTOR shall be responsible for all statutory obligations and any other laws in this regard in force from time to time regarding the employment or conditions of service of CONTRACTOR’s labour, workman or employees.

7.5 The CONTRACTOR shall observe all safety rules as required under various rules, regulations and laws in India and shall also strictly adhere to safety regulations of OWNER.

8.0 TRAINING OF OWNER'S PERSONNEL
8.1 The CONTRACTOR shall provide facilities for Training of OWNER's personnel in the operation and maintenance of plant at CONTRACTOR's other similar installations. The timing of training shall be mutually discussed and agreed between the parties. The costs towards travel, transportation and living expenses of the OWNER's personnel shall be borne by OWNER.

CONTRACTOR shall make arrangements, for training of OWNER’s personnel in similar PLANT of CONTRACTOR's design having comparable capacity and design features and in VENDOR's workshops (Refer Section VI-12.0 of Technical part of NIT). CONTRACTOR shall provide assistance to OWNER's personnel for proper co-ordination and management of the practical experience. Detailed programme and modalities for practical experience shall be mutually agreed between OWNER and CONTRACTOR.

9.0 MODE OF CONTRACTING

9.1 Notwithstanding anything stated elsewhere in the CONTRACT documents, the CONTRACT is awarded on Lumpsum turnkey basis with single point responsibility.

9.2 The CONTRACT shall be in all respect being construed and governed in accordance with the Indian laws.

9.3 The Contract shall be treated as a “WORK CONTRACT SERVICE”.

10.0 BID PRICES

10.1 The Bid price is to be filled in the formats given in Schedule of Rates (SOR).

10.2 The TOTAL CONTRACT PRICE quoted shall be firm and fixed without any escalation whatsoever on any account except the statutory variations in Taxes levied by the Government of India within GUARANTEED COMPLETION DATE and otherwise specified in the CONTRACT.

11.0 CURRENCIES OF BID AND PAYMENT

11.1 BIDDER to quote prices in Indian Rupees (INR) only.

ROUNDING-OFF OF AMOUNTS:

In calculating the amount of each item due to the CONTRACTOR in every invoice prepared for payment, sum of less than 50 paise shall be omitted and the total amount on each invoice shall be rounded off to the nearest rupees, i.e., sum of less than 50 paise shall be omitted and sums of 50 paise and more upto one rupee shall be reckoned as one rupee.
11.2 The Lumpsum price quoted by the CONTRACTOR shall be gross of Indian Income Tax, and the lumpsum price(s) shall be deemed to include Indian Income Tax including withholding tax (if any).

12.0 PRICES, TAXES AND DUTIES AND OTHER LEVIES

12.1 Except as specifically provided to the contrary in the SPECIAL CONDITIONS OF CONTRACT:

(i) The CONTRACTOR shall, within the price of materials and scope of supply, be liable to pay and bear any and all duties, taxes, levies and cesses lawfully payable on any goods, equipment or materials imported into India or within any local limits for permanent incorporation in the work(s), and on materials sold and supplied to the OWNER pursuant to the CONTRACT.

(ii) The CONTRACTOR shall within the price of services and scope of services be responsible to pay on behalf of the OWNER any and all duties, taxes, levies and cesses including education cess etc. lawfully payable on any goods or equipment imported into India or within any local limits for use in the performance of the work(s), and on services performed pursuant to the CONTRACT.

(iii) The CONTRACTOR shall be liable for and shall pay any and all Indian fees, taxes, duties, levies and cesses including education cess etc., assessable against CONTRACTOR in respect of or pursuant to the CONTRACT. However, GST payment by the CONTRACTOR to the Tax Authority shall be made by the Owner to the CONTRACTOR at actual limited to the Amount indicated in the Bid.

(iv) In addition, the CONTRACTOR shall be responsible for payment of all Indian duties, levies, and taxes etc., assessable against the CONTRACTOR or CONTRACTOR's employees or SUB-CONTRACTOR'S whether corporate or personal or applicable in respect of property.

12.2 Deleted.

12.3 TAX INDEMNITY

It will be the duty of the CONTRACTOR to duly observe and perform all laws, rules, regulations, orders and formalities applicable under GST and Customs Duty on the manufacture, sale, import and/or supply of any material to OWNER and/or applicable on the services performed by the CONTRACTOR pursuant hereto. The CONTRACTOR shall keep the OWNER indemnified for and against any and all claims, demands, prosecutions, penalties, damages, demurrages and/or other levies.
whatever made or levied by the Court or Customs Authorities with respect to any alleged breach, evasion or infraction of such duties, taxes, charges or levies or any breach or infraction of such laws, rules, regulations, orders or formalities concerning the same and from the consequence thereof.

12.4 All the applicable taxes, duties etc. on supply of materials, services and otherwise required for execution of contract on LSTK Basis as quoted in Schedule of Rates (SOR) shall be included in the TOTAL CONTRACT PRICE.

12.5 The CONTRACTOR confirms that, it has included all taxes, duties, levies etc., as applicable at prevailing rates, in its TOTAL CONTRACT PRICE as quoted in Schedule of Rate. In case, CONTRACTOR has not included any such taxes, duties, levies etc., at all and/or at prevailing rates and CONTRACTOR has to pay such taxes, duties, levies etc., OWNER shall not be liable for payment of such liabilities and/or OWNER shall not reimburse such taxes, duties, levies etc. to CONTRACTOR.

12.6 The award of work shall be on ‘Work Contract Service’ basis. The contractor shall be responsible for payment of any tax levied on the transfer of property and goods involved with relevant GST act and rules made there under including amendments, if any. The contractor shall be liable to have registered with the respective tax authorities and to submit self-attested copy of such registration certificate(s) and any taxes/ duties/ levies being charged by the Contractor would be claimed by issuing proper tax invoice/challan indicating details/ elements of all taxes charged and necessary requirements as prescribed under the respective tax laws and also to mention correct and valid registration number(s) on all tax invoices raised to TFL.

12.7 Any other taxes / duties in relation to this CONTRACT, which in terms of relevant legislation is the liability of CONTRACTOR, is discharged by OWNER, would be recovered from the CONTRACTOR from any subsequent payment due to the CONTRACTOR.

12.8 INCOME TAX

12.8.1 CONTRACT PRICE shall be inclusive of any and all Indian Income Tax payable in India. OWNER shall deduct Indian Income Tax as per rates prescribed for such contracts from time to time, from the payments due to CONTRACTOR and issue Tax Deducted at Source (TDS) certificate to CONTRACTOR. It will the responsibility of the CONTRACTOR to file proper income tax return and pay taxes thereon if any, or claim refund thereof if any. The CONTRACTOR shall give OWNER all necessary documents relating to its income tax assessments and to keep the OWNER informed about their assessments.

12.8.2 Personal income tax payable, if any, in respect of salary and perquisites of CONTRACTOR's personnel / SUB-CONTRACTOR's personnel in India shall be payable by the individual so deputed by CONTRACTOR or SUB-CONTRACTOR. It is the responsibility of the individual or CONTRACTOR to file proper income tax return and pay taxes thereon if any, or claim refund thereof if any. The CONTRACTOR shall
give OWNER all necessary documents relating to income tax assessments of its personnel and to keep the OWNER informed about their assessments.

12.9 Applicable BOCW shall be included in the quoted TOTAL CONTRACT PRICE. The CONTRACTOR shall pay the labour cess under BOCW Act, 1996 for CONTRACT as applicable. The CONTRACTOR shall submit the proof of submission of labour cess to OWNER before submitting the next RA bill. However applicable BOCW shall be deducted at source from the CONTRACTOR’s bill as per latest tax rule.

13.0 STATUTORY VARIATION IN TAXES AND DUTIES

13.1 No variation on account of taxes and duties, statutory or otherwise, (other than due to change in turnover) shall be payable by OWNER to CONTRACTOR, except for GST. Any statutory variation in GST, shall be payable up to COMPLETION PERIOD against documentary evidence. Any reduction in the amount of GST resulting from a reduction in the rate of GST or remission or exemption from GST with respect to Goods and Services provided to the OWNER shall be refundable to the OWNER at actuals within the COMPLETION PERIOD and also during the delayed contractual Project completion, if any. The CONTRACTOR shall submit a copy of the 'Government Notification' to evidence the rate as applicable on the Bid due date and on the date of revision.

13.2 Any new taxes, duties, cess, levies notified or imposed after the submission of Price Bid but before COMPLETION PERIOD shall be to OWNER’s Account.

13.3 In case of delayed completion beyond the COMPLETION PERIOD, even though extension of completion time is allowed by OWNER, for reasons solely attributable to Contractor, all extra costs on account of changes of statutory regulations/ acts, or shall not apply to the Contract price and shall be borne by the CONTRACTOR.

However, any decrease in taxes and duties during the delayed period shall be passed on to the OWNER.

In case the COMPLETION PERIOD is extended for reasons solely attributable to OWNER, then any increase on account of statutory changes in GST until the extended period shall be borne by OWNER. Further, any new taxes, duties, cess, levies notified or imposed after the submission of Price Bid during such extended COMPLETION PERIOD shall be to OWNER’s Account.

13.4 Claim for payment of GST (CGST & SGST/UTGST or IGST)/ Statutory variation, should be raised within two [02] months from the date of issue of ‘Government Notification’ for payment of differential (in %) GST (CGST & SGST/UTGST or IGST), otherwise claim in respect of above shall not be entertained for payment of
arrears.

The base date for the purpose of applying statutory variation shall be the Bid Due Date.

14.0 TERMS OF PAYMENT

14.1 Deleted

14.2 MOBILISATION ADVANCE

The CONTRACTOR shall be paid an interest bearing recoverable Mobilisation Advance limited to maximum 10% (Ten percent) of the TOTAL CONTRACT PRICE (excluding GST) provided Bank Guarantee is submitted by the CONTRACTOR for 110% of advance (including GST).

The interest rate shall be at Marginal cost of fund based landing rate (MCLR) for one year charged by SBI (applicable on the date of disbursement of Mobilisation Advance) plus 2.0% per annum on reducing balance basis.

The interest bearing Mobilization Advance shall be paid in two installments. The first installment of advance shall be maximum 50% of the Mobilisation Advance. Further the disbursement of second installment of balance amount can be made at the end of 3 months from the first installment subject to utilization certificate of first installment but not earlier than 3 months from the date of disbursal of first installment.

Mobilization Advance shall be paid subject to fulfillment of the following conditions:

a) Unconditional Acceptance of Fax of Acceptance (FOA) by CONTRACTOR.

b) Submission of Bank Guarantee(s) for 110% value of the said advance(s) including GST, valid for 3 months beyond COMPLETION PERIOD, as per format F-4. The CONTRACTOR shall, at the request of the OWNER, suitably extend the validity of the Bank Guarantee (s) for such period or periods as may be required to fully recover the amount of the Advance Payment not recovered before the expiry of the validity of such Bank Guarantee, failing which, without prejudice to any other right or remedy available to the OWNER, the OWNER shall be entitled to encash the Bank Guarantee (s)."

c) Submission of Bank Guarantee(s) by way of Contract Performance Security as stipulated in Clause 8.0 of the GENERAL CONDITIONS OF CONTRACT. The CONTRACTOR shall at the request of the OWNER extend the validity of the Bank Guarantee(s) for such further period or periods as may be required failing which, without prejudice to any other right or remedy available to the OWNER, the OWNER shall be entitled to encash the Bank Guarantee(s).

Notes:
1. The CONTRACT PRICE for the purpose of Security cum Performance Bank Guarantee would be derived on date of CONTRACT and would not be revised except in case scope of work is altered.

2. The advance paid to the CONTRACTOR shall be used only for execution of this CONTRACT and the CONTRACTOR shall satisfy the OWNER in this regard whenever required. If it is found that the said advance has been utilised by the CONTRACTOR in whole or part for any other purpose, the OWNER may at its discretion forthwith recall the entire advance and without prejudice to any other right or remedy available to the OWNER, recover the same by recourse to any Bank Guarantee(s).

3. Mobilization Advance shall be recovered from the Running Account Bills @ 15% (Fifteen Percent) of the Certified Bill amount and shall be fully extinguished within 12 months from the date of disbursement of first installment of advance. In case, the recovery of advance is delayed beyond 12 months from the date of disbursement of first installment of advance for any reason, interest shall be levied @ 1 year SBI MCLR + 2% for the unadjusted amount for the delayed period beyond 12 months from the date of disbursement of first installment of advance.

4. Bank Guarantee furnished by the Contractor towards mobilization advance may be reduced quarterly subject to adjustment made from Contractors running bill. The BG against Mobilization advance shall be returned immediately after full recovery of advance.

5. The advance(s), without prejudice to any other mode of recovery available to the OWNER, be recovered from the Running Account Bills @ 15% (Fifteen percent) of the Certified Bill amount and any balance amount shall be fully extinguished within 12 months from the date of disbursement of first installment of advance.

6. The payment curve ie S curve/Monthly Payment Schedule should be prepared after considering the mobilization advance and it’s recovery.

7. In case of termination of CONTRACT due to default by CONTRACTOR, advance Bank Guarantee shall be enchased and unadjusted advance payment recovery will become interest bearing (the interest rate shall be simple interest of 1 year MCLR + 5.25%) calculated from the date of disbursement of first installment of advance.

14.3 Subject to the other provisions of the Contract documents, payments shall be made as follows:

14.3.1 Mobilisation Advance:
Interest bearing Mobilization advance limited to 10% of Contract value shall be given, if asked by the Bidder, as indicated above.

Bidder to indicate their requirement as to the quantum of first installment of Mobilization Advance( not more than 6% of the contract price) and the second installment of Mobilization Advance such that first installment and the second installment add up to 10% of the CONTRACT PRICE.

14.3.2 A FOR SUPPLIES:

i) 10% (Ten Percent) of Total supply value excluding GST (excluding, spares, construction material, consumables) will be released on placement of all purchase orders as per the list of major tagged items to be finalised within 45 days from date of issuance of FOA. This payment shall be released after submission of Bank Guarantee for equivalent value. This Bank Guarantee shall be valid up to 3 months after the COMPLETION PERIOD and may be renewed, as per the instruction of OWNER for such extended period. However, this Bank Guarantee shall be released after receipt of all SUPPLIES (excluding, spares, construction material, consumables) at SITE and acceptance of same.

ii) AGAINST PROOF OF SHIPMENT / DESPATCH OF MATERIALS:

35% (Thirty five percent) on pro-rata basis as indicated in the approved Billing schedule (refer clause 15.0 below). Stage payment against "Proof of despatch of Materials" shall be released on submission of the following documents:

a) Signed Invoice(s)
b) Delivery Challan
c) Packing list.
d) Manufacturer's certificate of inspection for shipment duly approved by the CONTRACTOR in one original and one photocopy
e) Third Party Inspection Release Note clearly indicating that material has been inspected and accepted as per QAP approved by OWNER, or waiver certificate issued by OWNER.
f) Railway Receipt/LR
g) Insurance Certificate/Intimation
h) Guarantee certificate (wherever applicable)
i) Operation & Maintenance manual (wherever applicable)

iii) AGAINST RECEIPT OF MATERIAL AT SITE:

40% (Forty percent) on pro-rata basis as indicated in the approved Billing schedule on submission of:

(a) Signed Invoices.
(b) Photocopy of Third Party Inspection certificate as per QAP approved by OWNER along with Test Certificate.
(c) Entry gate pass duly endorsed by OWNER’s security for verification of physical entry of material to SITE.

(d) Certificate of Verification and Good Condition after receipt of material at site by Owner.

iv) 5% (five percent) as indicated in the approved Billing schedule on issue of MECHANICAL COMPLETION Certificate against CONTRACTOR’s certified running Accounts Bill(s).

v) 8% (Eight percent) as indicated in the approved Billing schedule on issue of PRELIMINARY ACCEPTANCE CERTIFICATE against the CONTRACTOR’s certified Running Account Bills.

vi) 2% (Two percent) as indicated in the approved Billing schedule on completion of balance jobs, if any, against the CONTRACTOR’s Certified Final Bill.

B FOR SPARES, CHEMICALS, CATALYST, LUBRICANTS:

i. AGAINST PROOF OF SHIPMENT / DESPATCH OF MATERIALS:

45% (Forty five percent) on pro-rata basis as indicated in the approved Billing schedule. Stage payment against "Proof of despatch of Materials" shall be released on submission of the following documents with the CONTRACTOR's invoice.

a) Signed Invoice(s)
b) Delivery Challan
c) Packing list.
d) Manufacturer’s certificate of inspection for shipment duly approved by the CONTRACTOR in one original and one photocopy
e) Third Party Inspection Release Note clearly indicating that material has been inspected and accepted as per QAP approved by OWNER, or waiver certificate issued by OWNER.
f) Railway Receipt/LR
g) Insurance Certificate/Intimation
h) Materials Safety Data Sheet (MSDS) for Chemicals & Catalyst

ii) AGAINST RECEIPT OF MATERIAL AT SITE:

40% (Forty percent) on pro-rata basis as indicated in the approved Billing schedule on submission of:

(a) Signed Invoices.
(b) Photocopy of Third Party Inspection certificate as per QAP approved by OWNER along with Test Certificate.
(c) Entry gate pass duly endorsed by OWNER’s security for verification of physical entry of material to SITE.

(d) Certificate of Verification and Good Condition after receipt of material at site by Owner.

iii) 5% (five percent) as indicated in the approved Billing schedule on issue of MECHANICAL COMPLETION Certificate against CONTRACTOR’s certified running Accounts Bill(s).

iv) 8% (Eight percent) as indicated in the approved Billing schedule on issue of PRELIMINARY ACCEPTANCE CERTIFICATE against the CONTRACTOR’s certified Running Account Bills.

v) 2% (Two percent) as indicated in the approved Billing schedule on completion of balance jobs, if any, against the CONTRACTOR’s Certified Final Bill.

14.3.3 FOR SERVICES (EXCLUDING TRAINING OF OWNER’S PERSONNEL AND INLAND TRANSPORTATION)

i) 5% (five percent) on issue of MECHANICAL COMPLETION Certificate against CONTRACTOR’s certified running Accounts Bill(s).

ii) 8% (Eight percent) on issue of PRELIMINARY ACCEPTANCE CERTIFICATE against the CONTRACTOR’s certified Running Account Bills.

iii) 2% (Two percent) on completion of balance jobs, if any, against the CONTRACTOR’s Certified Final Bill.

iv) 85% (Eighty Five) progressive Payment as indicated in the approved Billing schedule subject to the other provisions of the Contract documents, as per the monthly progress achieved.

14.3.4 FOR CIVIL AND STRUCTURAL WORKS

i) 5% (five percent) on issue of MECHANICAL COMPLETION Certificate against CONTRACTOR’s certified running Accounts Bill(s).

ii) 8% (Eight percent) on issue of PRELIMINARY ACCEPTANCE CERTIFICATE against the CONTRACTOR’s certified Running Account Bills.

iii) 2% (Two percent) on completion of balance jobs, if any, against the CONTRACTOR’s Certified Final Bill.

iv) 85% (Eighty Five) Payment as indicated in the approved Billing schedule subject to the other provisions of the Contract documents, Bidder will have the option to fix the other milestone payment according to Contract requirement.
14.3.5 **TRAINING OF OWNERS PERSONNEL**

100% (Hundred Percent) of payment shall be released on completion of training as indicated in the approved Billing schedule.

14.3.6 **INLAND TRANSPORTATION**

100% (Hundred Percent) of Local Transportation charges (including inland transit insurance charges) for the plant and equipment including mandatory spares/insurance spares and also recommended spares (if ordered) shall be paid to the Contractor as indicated in the approved Billing schedule on pro-rata to the value of the equipment/spares received at site and on production of invoices by the Contractor.

14.3.7 **6 MONTHS SUPERVISORY ASSISTANCE**

100% (Hundred percent) on monthly basis as indicated in the approved Billing schedule.

14. 4 All payments other than the Mobilization Advance shall be released only after finalization of the planning and monitoring documents and Progress Schedule.

14. 5 All invoices shall be submitted in quadruplicate to EIC by the Bidder. The payment shall be released within 30 days of submission of invoice.

15.0 **BILLING SCHEDULE**

The CONTRACTOR shall provide a billing schedule based on Monthly payment Schedule (S-curve) within 30 days from the date of FOA for APPROVAL by the OWNER.

The Billing Schedule shall consist of the following Heads:

<table>
<thead>
<tr>
<th>1.0 SUPPLIES (Break-up in line with the Material Control Index-MCI)</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Total of Supplies (excluding Spares, Chemicals, Lubricants)</td>
</tr>
<tr>
<td>b. Mandatory/Insurance Spares as per list enclosed in Section VI-10</td>
</tr>
<tr>
<td>c. Chemicals</td>
</tr>
<tr>
<td>d. Lubricants</td>
</tr>
<tr>
<td>e. Others</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>2.0 SERVICES</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Basic Engineering (Break-up In line with the Document Control Index-DCI)</td>
</tr>
<tr>
<td>b. Detailed Engineering (Break-up In line with the Document Control Index-DCI)</td>
</tr>
<tr>
<td>c. Installation</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>---</td>
</tr>
<tr>
<td><strong>d.</strong></td>
</tr>
<tr>
<td><strong>e.</strong></td>
</tr>
<tr>
<td><strong>f.</strong></td>
</tr>
<tr>
<td><strong>g.</strong></td>
</tr>
<tr>
<td><strong>h.</strong></td>
</tr>
</tbody>
</table>

**3.0 Civil And Structural Works**

**4.0 Transportation Charges**

**5.0 Training of Owner’s Personnel**

**6.0 6 months supervisory assistance after successful commissioning**

The CONTRACTOR shall raise “Tax Invoices” on the OWNER against the GST to enable OWNER to reimburse the same.

Similarly, in case of imports, the import duty paid shall have to be indicated separately in the invoice, duly supported by all the necessary documents, so as to enable the OWNER to reimburse the same.

Likewise, the GST paid on the local procurements by the CONTRACTOR have to be shown separately with all the supporting documents to enable the owner to reimburse the same.

The Bill of Entry shall have to be filed by the CONTRACTOR within the stipulated time with the appropriate authorities.

**Note**

1. Bidder shall indicate all Prices in INR only

2. Spares for Start-up/ Commissioning and Mandatory Spares/ Insurance Spares are in CONTRACTOR’s scope of supplies and are to be included in the quoted TOTAL CONTRACT PRICE.

3. It will be the responsibility of the contractor to include prices of all materials/ equipments/Services/Civil & Structural Works required for completion of work as per the CONTRACT.

4. The total price payable under the CONTRACT shall be restricted to TOTAL CONTRACT PRICE.

5. The Civil & Structural Works shall include but not limited to the Price of Piling, Equipment Foundation, Buildings, Structural Works, etc.
6. Total price of SUPPLIES shall not exceed 60% of the TOTAL CONTRACT PRICE. The SUPPLIES shall include but not limited to the Price of all imported /indigenous materials complete in all respect including Commissioning and Mandatory Spares, etc.

7. Total price of Basic Engineering and Detailed Engineering quoted in shall not exceed 10% of the TOTAL CONTRACT PRICE. The supply of Services shall include but not limited to the Price of all services complete in all respect including Basic Engineering, Detailed Engineering, installation/Erection Services including site fabrication, Transportation, Insurance, Pre-Commissioning, Commissioning, Performance Guarantee Test Run (PGTR), etc.

8. CONTRACTOR shall be entirely responsible for all taxes, cess, stamp duties, and other such levies applicable, on performance of WORK under CONTRACT, outside OWNER’s country. CONTRACTOR shall also be responsible for payment of all taxes, duties and levies such as custom duty, GST, income tax, etc. as applicable on performance of WORK under CONTRACT, in India. All such taxes, stamp duties, cess, licence fees, and other such levies applicable shall be included in the quoted TOTAL CONTRACT PRICE.

16.0 DEEMED ACCEPTANCE

In case conductance of PERFORMANCE GUARANTEE TEST RUN (PGTR) of the PLANT is delayed by 12 months from successful COMMISSIONING due to reasons solely attributable to the OWNER, PLANT shall be considered as DEEMED ACCEPTED with a DEFECT LIABILITY PERIOD of another 12 months from DEEMED ACCEPTANCE. The CONTRACT PERFORMANCE SECURITY shall be extended, accordingly, by the CONTRACTOR.

In case of DEEMED ACCEPTANCE, a reasonable cost for conductance of Performance Guarantee Tests shall be worked out mutually and shall be retained by OWNER. Payment against PRELIMINARY ACCEPTANCE less the aforesaid retention amount shall be released upon DEEMED ACCEPTANCE of the PLANT. The bank guarantee already running as CONTRACT PERFORMANCE SECURITY shall be extended, by the CONTRACTOR so as to ensure validity of three (03) months beyond the date of completion of DEFECT LIABILITY PERIOD.

This provision of DEEMED ACCEPTANCE shall not be applicable in case reasons for delay solely attributable to the OWNER are resolved before the completion of 12 months from successful COMMISSIONING and PERFORMANCE GUARANTEE TEST RUN is started within 12 months from successful COMMISSIONING. In that case, remaining activities including PERFORMANCE GUARANTEE TEST RUN shall be completed as per the terms & conditions of the CONTRACT and CONTRACT PERFORMANCE SECURITY shall be extended, accordingly, by the CONTRACTOR so as to ensure minimum validity of 3 months beyond the expiry of f DEFECT LIABILITY PERIOD.

Even after the DEEMED ACCEPTANCE, CONTRACTOR shall not be absolved from his obligations of carrying out PGTR. However, in such case, the CONTRACTOR shall have no obligation to prove the Performance Guarantee parameters.
The CONTRACTOR may, in consultation with the OWNER, demobilise the team from the Site. It shall remobilise at the time of conductance of PGTR by OWNER which shall be within DEFECT LIABILITY PERIOD. The OWNER shall, in addition to the cost retained as above, reimburse the reasonable cost to be incurred by the CONTRACTOR for remobilization.

In case of DEEMED ACCEPTANCE, OWNER shall be responsible for care, custody and proper maintenance of the PLANT. However, OWNER, at its option, may retain the CONTRACTOR’s services for watch, ward and preservation of the PLANT and reimburse the CONTRACTOR a mutually agreed reasonable cost incurred to do so.

After Deemed Acceptance, on performance of PGTR by the CONTRACTOR, if the Guaranteed parameters are not achieved, then the CONTRACTOR shall furnish the Recommendation/Report for corrective action to be implemented by OWNER to achieve the desired Guaranteed parameters.

17.0 LIABILITY FOR DEFECT

17.1 If at any time before the PRELIMINARY ACCEPTANCE or during the DEFECT LIABILITY PERIOD stated below, the OWNER:

(a) Claims that any matter is a DEFECT; and

(b) as soon as reasonably practicable gives to the CONTRACTOR notice of the particulars of the DEFECT; the CONTRACTOR shall as soon as reasonably predictable make good the DEFECT so notified and the OWNER shall so far as may be necessary place the PLANT at the CONTRACTOR’s disposal for this purpose. The CONTRACTOR shall, if so required by the EIC, submit his proposals for making good any DEFECT to the EIC for his approval.

Subject to clauses 17.4, 17.8 and 17.9, the DEFECT LIABILITY PERIOD shall be a period of 12 months from the date of PRELIMINARY ACCEPTANCE/DEEMED ACCEPTANCE.

17.2 If any DEFECT arises from any breach of the CONTRACT by the CONTRACTOR, the CONTRACTOR shall bear his own cost of making good the DEFECT. In the case of any other matter made good by the CONTRACTOR, the work done by the CONTRACTOR shall be the subject of CHANGE ORDER.

17.3 The performance guarantees are demonstrated only through the performance tests carried out before the achievement of the PRELIMINARY ACCEPTANCE CERTIFICATE.

CONTRACTOR shall carry out further test(s) on the repaired/replaced item during the DEFECT LIABILITY PERIOD having the sole purpose to verify that said item is capable of working in compliance with contractual requirements. Such test(s) shall not be intended as a repetition of the performance tests already performed.

If DEFECT is made good after the issue of a PRELIMINARY ACCEPTANCE CERTIFICATE, the EIC may require the CONTRACTOR to repeat any appropriate performance test for the purpose of establishing that the DEFECT has been made good.
The CONTRACTOR shall be responsible for the cost of any repeat inspection or test in the event of an inspection or test failure.

17.4 If in the course of making good any DEFECT which arises during the DEFECT LIABILITIES PERIOD and CONTRACTOR repairs, replaces or renew any part of the PLANT, this Clause 17 shall apply to the repair or to that part of the PLANT so replaced or renewed and shall further apply until the expiry of a period of 12 months from the date of such repair, replacement or renewal (the extended DEFECT LIABILITY PERIOD). However, extended DEFECT LIABILITY PERIOD shall have an upper limit of 24 months, starting from the date of Preliminary Acceptance Certificate.

17.5 If the CONTRACTOR does not make good with a reasonable time any DEFECT which he is liable to make good under Sub-Clause 17.1 then the OWNER may, in addition to any other remedies or relief available to him under the CONTRACT, proceed to do the work, provided that the OWNER gives at least fourteen DAYS notice of his intention.

17.6 If the OWNER reasonably requires that any DEFECT notified to the CONTRACTOR under Sub-clause 17.1 which arises during the DEFECT LIABILITY PERIOD be made good urgently and the CONTRACTOR is unable or refuses to comply within a reasonable time, the OWNER may, in addition to any other remedies or relief available to him under the CONTRACT, proceed to do the work in such a manner as the ENGINEER-IN-CHARGE may decide, including the employment of a third party.

17.7 If the OWNER has made good a DEFECT in accordance with Sub-clause 17.5 or 17.6, the CONTRACTOR shall reimburse the OWNER his reasonable cost of so doing provided that the OWNER gives a notice to the CONTRACTOR of his intention and submits a claim supported by DOCUMENTS. The ENGINEER-IN-CHARGE and the CONTRACTOR may agree the amount to be paid by the CONTRACTOR, or in the absence of agreement the ENGINEER-IN-CHARGE shall decide such amount as may be reasonable. Such amount shall be:

a) deducted from any money that would otherwise be payable under the CONTRACT; or

b) paid by the CONTRACTOR to the OWNER

17.8 If the PLANT cannot be used because of a DEFECT to which this Clause 17 applies, the DEFECT LIABILITY PERIOD, or if applicable the extended DEFECT LIABILITY PERIOD, shall be extended by a period equal to the period during which it cannot be used. Similarly the DEFECT LIABILITY PERIOD, or if applicable the extended DEFECT LIABILITY PERIOD shall be extended by any period wherein the PLANT cannot be used by reason of the CONTRACTOR putting the PLANT into such condition that it passes any relevant performance test or attempting to do so.

18.0 PERFORMANCE TESTS
18.1 The performance tests to be carried out on the PLANT shall those specified in Technical, Section VI-8.0 of NIT.

18.2 The performance test shall be carried out by the CONTRACTOR in the presence of OWNER/PMC.

The CONTRACTOR shall give a notice to the EIC/OWNER his readiness to carry out the performance tests, including a proposal for the time at which the tests would commence. The CONTRACTOR shall then confirm, at least fifteen (15) DAYS before the commencement of the performance tests.

18.3 Every performance test shall be carried out to completion unless the EIC or the CONTRACTOR shall order it to be stopped because its continuance would be unsafe or unacceptable to either party.

18.4 If PGTR fails due to any reason CONTRACTOR has to make necessary adjustments and modifications and take all remedial measures at his own cost and demonstrate PGTR.

The OWNER shall permit to CONTRACTOR to make adjustments and modifications to any part of the Plant before the repetition of any performance test.

The CONTRACTOR shall submit details of the adjustments and modifications which he proposes to make.

18.5 If any performance test is stopped before its completion, due to reasons attributable to OWNER, such test shall be repeated as soon as practicable thereafter. However, the OWNER shall have the option to operate the plant in accordance with the Operating Manuals provided by CONTRACTOR, whereupon care and custody of the PLANT shall pass on to the OWNER and DEFECT LIABILITY PERIOD shall start. The OWNER shall exercise the option to allow CONTRACTOR to carry out the Performance Tests with grant of extension of time by such number of days of deferment. Such deferment shall not exceed more than 90 days. In case the deferment exceeds 90 days, the Owner shall reimburse the additional cost of remobilisation incurred due to such deferment. However, the outer limit of such deferment shall be 12 months from COMMISSIONING and the provisions of Clause 16 shall apply thereafter. If the PLANT fails to pass any performance test, such test shall, subject to Sub-clause 18.7, be repeated as soon as practicable thereafter. The OWNER shall permit to CONTRACTOR to make adjustments and modifications to any part of the Plant before the repetition of any performance test and shall, if the CONTRACTOR reasonably requires, shut down any part of the PLANT for such purpose and restart it after completion of the adjustments and modifications, which shall be made by the CONTRACTOR with all reasonable speed.

The timing of such shutdown shall be agreed between the CONTRACTOR and the EIC, provided that if any or both i.e. the timing of shutdown or repetition of Performance Test, is required to be deferred, the agreed period of Performance Test Period shall be accordingly extended.
The CONTRACTOR shall, if so required by the EIC, submit to the EIC for his information details of the adjustments and modifications which he proposes to make.

The CONTRACTOR shall make such adjustment and modifications at his own cost.

18.6 The result of the performance tests shall be compiled by the CONTRACTOR and to be submitted to OWNER/PMC for evaluation.

18.7 If the PLANT passes performance tests towards meeting all Performance Guarantees specified at Section VI-8.0 (TECHNICAL) of NIT, but does not pass the performance test towards meeting Works Guaranteed cost for reasons which are the responsibility of the CONTRACTOR, then

i) If, the results of the performance tests towards meeting Guaranteed Works Cost are within the limits for the application of MUTUALLY AGREED DAMAGES, CONTRACTOR shall at its option either:

   (a) may carry out remedial measures necessary to attain the Guaranteed Works Cost and repeat the performance test; or

   (b) pay the applicable MUTUALLY AGREED DAMAGES in terms of clause 31 GCC.

Upon payment or allowance of such sum the CONTRACTOR shall become entitled to PRELIMINARY ACCEPTANCE CERTIFICATE which shall inter alia state that applicable MUTUALLY AGREED DAMAGES have been paid in respect of shortfall in performance and CONTRACTOR shall be released from all liability with respect to PGTR.

Further, in case of a) above, the CONTRACTOR will be allowed only one more chance to pass the performance test.

ii) If the results of the performance tests towards Guaranteed Works Cost are outside the limits for application of MUTUALLY AGREED DAMAGES specified in the CONTRACT, OWNER may at his option:

   a) instruct the CONTRACTOR to investigate or to co-operate with the EIC or others in the investigation of the reasons in its WORK for the shortfall in the performance;

   b) instruct the CONTRACTOR to propose remedial measure and work necessary to correct the shortfall whether as the result of any such investigation or not;

   and/or
c) Recommend the CONTRACTOR to carry out, at CONTRACTOR’S option, whatever remedial measures and work within its scope of WORK may be necessary to correct the shortfall.

Thereafter the EIC or CONTRACTOR may require that the PERFORMANCE GUARANTEE TEST RUN be repeated, the result of which shall be subject to this Sub-clause 18.7 (i).

The CONTRACTOR shall bear his own cost of work undertaken in accordance with (a), (b) or (c) above.

iii. After 3 (three) failed Performance Tests as specified at Technical Section VI-8.0 of NIT for reasons attributable to the CONTRACTOR, the OWNER shall have right to proceed with the encashment of Contract Performance Security, pursuant to Clause 34.2 of GCC.

19.0 FINAL ACCEPTANCE CERTIFICATE

19.1 As soon as DEFECT LIABILITIES PERIOD for the PLANT has expired or the CONTRACTOR has made good all DEFECTS that have within such period appeared in the PLANT in accordance with Clause 17 (Liability for Defects), whichever is later, the EIC shall issue a FINAL ACCEPTANCE CERTIFICATE to the CONTRACTOR stating that the PLANT has been finally accepted.

19.2 The FINAL ACCEPTANCE CERTIFICATE shall constitute conclusive evidence for all purposes and in any proceedings whatsoever between the OWNER and the CONTRACTOR that the CONTRACTOR has completed the PLANT and made good all DEFECTS therein in all respects in accordance with his obligations under the CONTRACT.

No FINAL ACCEPTANCE CERTIFICATE shall be conclusive as stated above if FINAL ACCEPTANCE CERTIFICATE was issued in reliance upon any fraudulent act, misrepresentation or concealment.

20.0 TAXES AND DUTIES

20.1 Notwithstanding anything mentioned regarding Taxes and Duties in Instruction to Bidders, General conditions of Contract, aforementioned provisions of Special Conditions of Contract, or any other portion of NIT, following shall apply under this LSTK Contract. However, all other terms of Instruction to Bidders, General conditions of Contract, and Special Conditions of Contract, so far as they are not superseded by introduction of GST, shall remain unchanged:

“Goods and Services Tax” or “GST” means taxes or cess levied under the Central Goods and Services Act, Integrated Goods and Service Tax Act, Goods and Services Tax (Compensation to States) Act, and various State / Union Territory Goods and Services Tax Laws and applicable cesses, if any under the laws in force (hereinafter referred to as relevant GST laws) w.e.f. 01.07.2017, which shall be fully complied with by Bidders.
The prices shall include all duties, taxes and levies etc. including but not limited to customs duty, GST on imports, any tax / duty/ levy as per applicable GST laws, personnel and corporate tax as applicable. It is clarified that Bidder is required to include the Building and Other Construction Workers Welfare Cess (BOCW) cess, as applicable, in the bid price. Owner shall deduct the aforesaid cess from the running payments and pay this cess directly to the applicable authorities.

Due input Tax credits under GST as per the relevant Govt. Policy wherever applicable, shall be taken into account by the Bidder while quoting his prices. Provision of GST law in respect of Related Persons / Parties may appropriately be taken into consideration by Bidders while submitting their bids.

The Bidders are to quote firm prices. In respect of both direct transaction between OWNER and the Bidder and Bought Out Items to be dispatched directly from the sub-vendor's works to Owner's site, the payment towards all applicable Indian Taxes and duties like Custom Duty, GST and other tax/duty/levy, will be made by OWNER in Indian rupees at actuals limited to the amount indicated in the Bid.

In case of Bought out items to be dispatched directly from sub-vendor's works to Owner's site, the CONTRACTOR shall ensure that his sub-vendors raise tax invoice under the provisions of GST Law, billed to the CONTRACTOR and shipped to Owner's site. The CONTRACTOR shall further ensure that he raises his corresponding tax invoices under the provision of GST Law in the name of OWNER during transit of the Material before the delivery of Material is taken by OWNER.

Notwithstanding anything to contrary contained in the agreement / Purchase Order, Contractor's right to payment under the Contract / agreement / Purchase Order is subject to issuance of valid tax invoice, payment of applicable GST to the credit of appropriate Government and submission of valid particulars of tax invoice under GST returns in accordance with GST act.

CONTRACTOR shall issue tax invoices, file appropriate returns, and deposit the applicable GST to the account of appropriate Government within the time limit prescribed under the GST Law. In the event of any default, CONTRACTOR shall be liable to pay the amount, if so imposed on Owner due to such default.

CONTRACTOR should comply with the provisions of e-way bill notified by appropriate authorities from time to time. The existing provisions of road permit will continue till such time if applicable.

OWNER will deduct GST at source at the applicable rates in case transactions under the CONTRACT are liable to GST deduction at source as per the prevailing provisions of GST Law.
If OWNER is required to pay any quoted Tax / Duty on reverse charge basis, same shall be paid by OWNER directly to tax authorities and deducted from the respective head of Taxes and Duties quoted in the bid.

20.2 Further, Section 171 of CGST Act, 2017 provides that “any reduction in rate of tax on any supply of goods or services or the benefit of input tax credit shall be passed on to the recipient by way of commensurate reduction in prices”. Accordingly, Bidders are required to ensure compliance to the anti-profiteering clause under GST law.

20.3 There will be no materials under the scope of Contract which will be consigned to Owner, unless otherwise specifically mentioned elsewhere in the tender. The Owner will not issue / provide Road permits/e-way bill to the Contractor except in respect of material directly purchased by the Owner.

21.0 GST

21.1 If, any delay is arising in payment against the invoice due to fault of supplier and any reversal of input tax arises due to delay payment of invoice the same will be recovered from supplier along with interest as paid by OWNER due to reversal.

21.2 In case the GST rating of vendor on the GST portal / Govt. official website is negative / black listed at any stage even after supplier order /award of work issued, OWNER has right to reject the supply order/letter of award. OWNER shall not be obligated or liable to pay or reimburse GST to such vendor and shall also be entitled to deduct / recover such GST along with all penalties / interest, if any, incurred by OWNER.

21.3 In case CBIC (Central Board of Indirect tax and Customs)/ any equivalent government agency brings to the notice of OWNER that the Supplier of Goods has not remitted the amount towards GST (CGST & SGST/UTGST or IGST) collected from OWNER or any other person to the government exchequer, OWNER reserve the right to upload such defaulter on website and may also consider for giving holiday/debarring from participating tenders.

21.4 The amount of Statutory levies like, CGST, SGST & IGST will be released when the same will appear in the GSTR-2A of OWNER, in the common portal of GST and after submission of documentary evidence of the deposition of GST taxes and filing of GST returns. If, input tax credit is not available to OWNER for any reason attributable to the bidder, then OWNER shall not be obligatory or liable to pay or reimburse Custom Duty/ GST claimed in invoice and shall be entitled to deduct /setoff/ recover such custom duty and/or GST together with all the penalty and interest if any, against any paid or payable to bidder. Further in this case, OWNER reserves the right to upload the name of such defaulter on the Company website and may also consider for giving Holiday or debarred from participation in future tender.

21.5 Contractor declares that:
1. CONTRACTOR shall ensure timely submission of invoice(s) as per rules/regulations of GST (section 31 of CGST Act 2017 along with rule 46 & 47 of CGST Rule, 2017) with all required supporting document(s) within a period specified in Contracts/ LOA to enable TFL to avail input tax credit. Further, returns and details required to be filled under GST laws & rules should be timely filed by supplier with requisite details.

2. CONTRACTOR would promptly pay GST, as per law, for the supplies made to TFL and would upload returns within the prescribed time to enable TFL, to avail the input tax credit [ITC].

3. All necessary adjustment vouchers such as Credit Notes / Debit Notes for any short/excess supplies or revision in prices or for any other reason under the Contract shall be submitted to TFL as per GST provisions.

4. In the event of default on his part in payment of tax and submission / uploading of monthly returns, TFL is well within its powers to withhold payments, especially the tax portion, until CONTRACTOR corrects the default and / or complies with the requirements of GST and produces satisfactory evidence to that effect or upon GST appearing on the Company GST portal.

5. If, as a result of any delay or default on his part, TFL, is rendered unable to avail ITC, he would, at his own cost, get the shortcoming rectified in the return to be filed immediately thereafter.

6. In case GST credit is delayed/ denied to TFL reversed subsequently as per GST law, due to non/delayed receipt of goods and/or services and/or tax invoice or expiry of timeline prescribed in GST Law for availing such ITC, non-payment of taxes or non-filing of returns or any other reason not attributable to TFL, GST amount shall be recoverable from CONTRACTOR along with interest levied/ leviable on TFL.

7. In the event of delay getting ITC to TFL, due to reasons attributable to the CONTRACTOR, TFL, reserves the right to recover interest at 12% on the tax credit so available for the number of days the ITC was delayed. TFL may recover such amount from the Security Deposit or any such Deposit / Credit Balance / future payments. Accordingly, TFL will raise Invoice/Debit note on the CONTRACTOR.

8. TFL reserves the right to suspend / cancel / terminate the contract in the event of frequent / multiple / repeated defaults by the CONTRACTOR in complying with the above requirements as per GST and CONTRACTOR shall be put under Holiday list as mentioned in the Contract.

9. Advance payments: CONTRACTOR should issue Receipt vouchers immediately on receipt of advance payment and subsequently issue supplies along tax invoice after adjusting advance payments as per Contractual terms and GST Provisions.
10. Anti-profiteering: CONTRACTOR agrees unconditionally that any benefit arising, either directly or indirectly, out of implementation of GST is mandatorily passed on to TFL.

11. Any GST liability arising on TFL under reverse charge before actual receipt of goods and or services and/or invoice thereof would be subject to recovery of interest leviable for the period between the date of such liability and actual date of eligibility of ITC based on receipt of goods, receipt of invoices and other conditions specified in GST law, as applicable.

12. Any late delivery i.e., delivery after the due date attracts payment of damages by the vendor / contractor as agreed mutually. It is agreed by the Contractor that such damages become recoverable by TFL with applicable GST thereon.

13. Contractor will give an undertaking on invoice or as separate annexure along with invoice in following format; “Applicable GST returns has been/ will be uploaded in GST Portal with due time as prescribe in CGST Act and CGSAT, SGST or IGST has been deposited as per provisions of GST Act and rules thereon”.

22. COMPLETION PERIOD:

Completion Period shall be 26 (Twenty Six) months reckoned from date of issuance of FAX OF ACCEPTANCE (FOA). Successful COMMISSIONING of plant shall be considered as date of completion.

1.0 INTRODUCTION

Talcher Fertilizers Ltd. (TFL), hereinafter also referred to as “OWNER” A joint venture company of four major Public Sector Units – M/s GAIL (India) Limited (GAIL), M/s Rashtriya Chemicals & Fertilisers Ltd. (RCF), M/s Coal India Ltd. (CIL) and M/s Fertilizers Corporation of India Ltd. (FCIL) has decided to build a world class coal based fertilizer complex at Talcher, Angul District, Odisha (India) consisting of Coal Gasification Plant, Ammonia and Urea Plant, along with other associated Offsite and Utility Plants. To cater the requirement of steam for the above plants, TFL intends to set up a coal based “Steam Generation Plant” under one LSTK package. Accordingly, TFL intend to invite quotations from eligible contractors on LSTK basis for setting-up a coal based “Steam Generation Plant”.

1.1 Projects & Development India Ltd. (PDIL) has been retained by M/s TFL as a Project Management Consultant for selection of a suitable LSTK Contractor for execution of the project on a Lump-Sum Turnkey basis with Single point responsibility.

1.2 LSTK CONTRACTOR is advised to visit and examine the site conditions and obtain the necessary information/ inputs on its own responsibility that may be necessary for preparing their bid and entering into the Contract. Claims of any kind due to variation or ignorance of site and environmental conditions will not be eligible and entertained by TFL under in any circumstances.

2.0 PLOT AREA

Steam Generation Plant shall be built in the earmarked area as shown in the overall site plan for Talcher Project (Refer: Attachment-1, Drawing No.PC009-0000-0001). LSTK CONTRACTOR should ensure that the available area should be used in the most optimum way.

2.1 Plant Site

A brief status of infrastructure at Talcher Fertiliser Plant Site is furnished below:

- The proposed project will be located within the existing premises of proposed Coal gasification based Fertilizer Complex, Talcher Fertilizer Limited at Talcher, Angul, Odisha.

- The total land area of the site is 933.60 acres and out of which lease hold land from Government of Odisha is 923.27 acres and land purchased from private parties is 10.33 acres.

The area is not falling under coal bearing zone up to a depth of 200-250 meter. FCIL had a full fledged fertilizer complex of Ammonia-Urea plants at this site which was in operation for over a period of 25 years and closed down since December 2002. The old abandoned plant machinery, building, facilities etc have been demolished and removed from site. LSTK Contractor shall carry out the soil investigation study for the selected area for the project within existing premises. However, for reference purpose only, please see attached Soil Investigation Report.
Talcher site is located at Vikrampur in Angul district of Odisha on the Cuttack – Sambalpur National Highway NH-42. NH-42 is passing at about 8 km from the site. The nearest railway station is Talcher which is at about 7 km from the site. Nearest air port Bhubaneswar is about 150 km, about 3 hours journey by road/ rail. Nearest sea port is Paradip, 200 km by rail/road from the site. Talcher is situated at 21° 10” N Latitude and 82° 5” E Longitude.

2.2 PLANTS & ASSOCIATED FACILITIES

The plant would essentially consist of Steam Generation Plant and its associated facilities. The LSTK Contractor shall consider for installation of all the relevant facilities of appropriate capacity as necessary for smooth, safe and reliable operation of the plants.

a. Plants Capacity & Configuration

The Steam Generation Plant (SGP) consists of 3 Nos of boilers with configuration of 2W+1S. Normal Continuous Run (NCR) & Maximum Continuous Run (MCR) of each boiler to be decided by vendor considering export of steam as specified in Section-VI-4.0 Clause No. 2, point no. a & b after meeting all internal steam consumption requirements of Steam Generation Plant. SGP shall have provision of additional steam superheating coils to cater the HP saturated steam received from Ammonia plant for superheating in Steam Generation plant battery limit. For further details, refer Section-VI-4.0.

b. De-aerators

One common De-aerator is proposed for Boilers. Required steam for De-Aeration shall be arranged within internal resources of SGP.

De-mineralised Water (DMW) shall be supplied by owner at the plant B.L 2 months before scheduled completion period.

Boiler Feed Water Pumps

BFW Pumps and associated pipings & systems are proposed as per Section-VI-4.0 (Process Design Basis). Drive of BFW pumps shall meet the stipulations of IBR regulation in force.

c. Gaseous effluents

Flue Gas generated in the Boilers shall contain SOx, NOx, un-burnt combustibles, dust particles, etc. and shall be discharged to atmosphere through dedicated chimneys after necessary abatement/treatment to meet the latest statutory requirement / guidelines.

d. Ash Handling System

Ash generated in all the Boilers (both Bottom ash and Fly ash) shall be transported suitably from Boiler area to the dedicated Bottom Ash / Fly Ash Storage Silo near Ash Pond by LSTK bidder. Further, Refer Section-VI-5.3.4.
e. Plant and Instrument air system

Plant and Instrument air will be provided by Owner 2 months before scheduled completion period of SGP at single point tie-in connection at the battery limit of LSTK Contractor. Required Plant & Instrument air in the above period (2 months before scheduled completion period) shall be arranged by LSTK Contractor himself. Proper instrument air storage (15Min.) & Instrument air distribution network shall be provided for the SGP by LSTK contractor within their B.L. Please refer Section-VI-2.0 of Part-II Technical for plant and instrument air specification.

f. Natural Gas

For start-up of Boilers, Natural gas shall be provided Owner 2 months before scheduled completion period at battery limit of LSTK Contractor. However further necessary arrangement for supply, control and distribution shall be in the scope of LSTK Contractor.

g. Control Room for Steam Generation Plant

Control Room shall be located within the battery limit (B.L) of SGP. Minimum two no. common goods cum passenger industrial Lift of min. Two tonne Capacity up to boiler upper drum level to take care of operation & maintenance activities is also required. Lifts shall cover all the floor levels. Interconnection platform at alternate floors among boilers shall also be provided. The integrated Control Room shall be provided for all the boilers and associated system of Steam Generation Plant.

h. Interconnecting Piping

All interconnecting piping between LSTK Battery Limit and balance of plants shall be under Owner’s scope. Owner shall provide Make-up DM Water, Condensate, Process Water/Service Water, Cooling water, Saturated HP Steam for superheating, Plant Air/Instrument Air, Inert Gas, Fire Water etc., at Steam Generation plant battery limit.

i. Dust suppression system

Adequate Dust Suppression System shall be considered by LSTK Contractor in the plant to maintain a dust free atmosphere within the plant as per latest statutory requirement to meet ambient air quality standard. NOISE level shall be within the limits stipulated by CPCB/OSPCB, whichever is more stringent.

j. Fire Fighting System

All requirement of fire fighting system inside Steam Generation plant shall be as per NFPA standards with due approval from relevant authorities are in LSTK Contractor’s scope. LSTK Bidder shall indicate fire water requirement in their bid which shall be supplied at a given point at the battery limit.

k. Temporary Construction Facilities

The LSTK shall arrange following facilities at his own cost for Construction/Erection purpose.

   1. 1 No. 11 kV Feeder (rated for 2 MVA) at Existing Substation near 132 KV Switchyard shall be made available. Tapping of Construction Power (on chargeable basis) from this feeder
(including supply & erection of all required materials like structural supports for cable tray, cable trays, power cables, control cables, protection & metering, cable termination etc. as well as underground cabling work) and further distribution shall be in LSTK Contractor’s scope.

2. Construction Water on chargeable basis (at one point within factory premises and CONTRACTOR to arrange the pipeline up to their Battery Limit) shall be made available

3. Construction sheds

4. Construction offices

5. Temporary Communication facilities

6. Office furniture

7. Labor colony during construction

8. Temporary stores & security

SALIENT FEATURES
OF
REVISED GEOLOGICAL REPORT ON COAL EXPLORATION IN
BHUANESHWARI BLOCK, TALCHER COALFIELD

1. Location: South eastern part of Talcher Coalfield, Angul District, Orissa.
   Longitude: 85°09'10" to 85°11'37" E
   Latitude: 20°57'50" to 20°59'42" N
   Toposheet: 73 M/1 R.F. 1:50,000
   District: Angul
   Prominent Village: Hensamul, Langijoda, Naraharipur & Kandhal.

2. Accessibility/Communication: This block is connected to NH-23 and NH-42 by all weather roads. The block is about 2 km. & 15 km. from NH-23 & NH-42 respectively. Bhubaneswar is about 153 km. from the block. Nearest railway station is Talcher (6 km.) on Cuttack-Sambalpur section of South-eastern Railway.

3. Objective: Revised assessment of coal seams in terms of their lay and disposition with the associated strata, structural framework, quality and reserves of coal available within Bhubaneswari Block.

4. Period of Investigation: Drilling of this block was done in 3 phases:
   I 1903-09 (G.R. submitted based on the data of March, 1991)
   II 1992-94 (Data generated in these 2 phases are added to earlier G.R. and revised G.R. is formulated now)
   III 1997-99

5. Status of Mining: Barring for a small abandoned quarry in the south-eastern corner of the block, the area is devoid of any mining activity within the block. No appreciable reserve would have been worked out in this small quarry.

6. Area of the block: 5.8 sq.km.

7. Details of Drilling:

<table>
<thead>
<tr>
<th>Sl. No.</th>
<th>Agency</th>
<th>Period of drilling</th>
<th>No. of boreholes</th>
<th>Metreage</th>
</tr>
</thead>
<tbody>
<tr>

<td>1997 - 1999</td>
<td>4</td>
<td>342.20</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Total</td>
<td>137</td>
<td>23226.90</td>
</tr>
</tbody>
</table>
8. Borehole Density: 23 boreholes per sq.km.

9. Other Investigations:
   i) Mapping: Geological Mapping has not been done as the area of the block is covered by alluvial soil.
   ii) Logging: All the non-coal seams and coal cores in 137 boreholes with 23226.90m of cores have been logged visually following standard geological practices.
   iii) Sampling: In all 5,981.11m of coal cores have been packed and sampled in 67 boreholes falling within the block.
   iv) Geophysical Logging: Borehole geophysical logging has been done in 9 boreholes with 2,010.10m.
   v) Surface Geophysics: No surface geophysical studies have been conducted in these 3 phases of drilling operations.
   vi) Remote Sensing: Not within the purview of present investigation.
   vii) Rock Mechanics: Studies not undertaken in this block. However, results of such studies from borehole CMTL-151 falling in adjacent Lingraj block have been presented for reference.
   viii) Hydrogeology: Hydrogeological studies were not been done. However, summary and conclusions of report "Hydrology of Talcher Coalfield (East), Dhenkanal District, Orissa (January, 1988)" submitted by CMPDI (HQ) are presented.

10. Geological Formations: Entire area is covered by paraker formation rocks and coal seams occurring within them.

11. Geological Structure:
    This block is a horst between fault F1-F1 (F11-F11 of Lingraj block) on the southern side and faults F16-F16 & F17-F17 on the northern side having away with throws of >100m.
    Dip: The general dip is 4° to 5° towards east and northeast with local variation ranging from 2° to 7°. In south-eastern part there is reversal of dip direction to northwesterly/west.
    Strike: The general strike of the beds is WNW-ESE to NW-SE with minor local wrappings. In eastern part NW-SE strikes are also seen.

12. Faults: There are 17 no. of faults within the block. Out of these faults, 3 faults mark the northern and southern boundaries of the block. They mostly trend in E-W - NNW-SSE to NW-SE. These faults have either northerly throws or southerly throws. In general, southerly dipping faults have brought the coal seams at shallow depths resulting in better quarriable potentiality.

13. Intrusives: No intrusives have been encountered within the block.
14. Coal Seams and their Quality:

1.0 GENERAL

LSTK CONTRACTOR shall supply & install Steam Generation Plant on proposed Coal Gasification based Fertilizer complex, Talcher Fertilizers Ltd. (TFL) at Talcher, Angul District, Odisha (India) as per the requirements and specifications.

1.1 BIDDER’S SCOPE OF WORK

Scope of work of the LSTK Contractor shall include supply of Basic Design and Detailed Engineering, Procurement, Supply, Fabrication, Inspection by Third Party Inspection Agency (TPI) as applicable, Expediting, Route survey for Over Dimensional Consignments (ODCs), Insurance, Transportation of all equipment / materials to work site, Storage, construction and erection of all civil, mechanical, electrical and instrumentation works, insulation, painting as per specification assembly and Installation, obtaining all necessary statutory approvals, Testing, Mechanical Completion, Pre-Commissioning, Commissioning, Sustained Load Test Run, Performance Guarantee Test Run (PGTR), six months supervisory assistance for operation & maintenance including Total Project Management and handing over of the plants and facilities under contractor’s scope of work duly completed on single point responsibility basis.

Bidder scope of supply & service shall be read in conjunction with Section-VI-4.0 & Section-VI-5.3.7 of this Tender.

The Plant shall be installed outdoor and should be suitable for all weather conditions at site.

1.2 BROAD SCOPE OF SUPPLY/ WORK/ SERVICES

The following plants and facilities shall be under the scope of the LSTK Contractor for Steam Generation Plant and Bidder’s scope of work shall include (but not limited to) following in respect of all equipment, works, systems, facilities & services as required for completeness, satisfactory operation and rated outputs of ‘Steam Generation Plant’ on lump sum turnkey (LSTK) and single-point responsibility basis:

a) Coal feeding & handling system
b) Fluxant (if required) feeding & handling system
c) Crushers/ Mill for coal (-) 30 mm to the required size Crushers/ Mill for Fluxant (if required) to make the required size
d) Boilers along with all accessories –3 nos. (2W+1S)
e) Superheating arrangement for HP saturated steam in all 3 nos. Boiler
f) FGD (Flue Gas Desulphurization Unit) & De-NOx unit for SOx & NOx removal (if required) along with necessary unloading and Pumping & Handling facilities for ammonia & other chemicals. LSTK Contractor’s responsibility is to meet Central & State Pollution Control
Board’s norms in all respect along with SOx, NOx & dust emission norms whichever is more stringent

g) Dedicated RCC Flue Gas Stack for each Boiler to meet emission norms of Central and State pollution control boards whichever is more stringent.

h) Fly ash & Bed ash Removal, Handling & Transportation system to overhead bunker & disposal area within TFL B.L.

i) BFW System (Refer Section-VI-4.0)

j) One no. DM water storage tank along with required pumping facilities and interconnecting piping & fittings for catering 4 hours requirement at normal operating condition.

k) Chemical dosing system :- High pressure & Low pressure (as per requirement):
   a) Independent High pressure dosing system for each boiler with 1W+1S pumps configuration with metering tank. Common preparation tank for all three Boilers.
   b) Common Low Pressure dosing system with 1W+1S pumps configuration, preparation tank and metering tank.

l) Oily Water Separator (OWS) inside LSTK Contractor’s B.L.

m) Central Boiler Control room with all accessories such as DCS, Interlock PLC, BMS PLC, SWAS system, Analyzers etc. (Refer Instrument design philosophy Section-VI-5.2 for details)

n) Fire water network system within steam generation plant Battery limit. Fire fighting & safety system for LSTK’s scope of work as per requirement of NFPA, IS, TAC

o) Procedure and arrangement for safe disposal of hazardous solid waste

p) First fill of all catalyst, chemicals & lubricants and requirement during Pre-Commissioning, Commissioning, Sustained Load Test Run and Performance Guarantee Test Run (PGTR).

q) Chemical storage facility for 15 days.

r) Supply of chemicals, lubricants and consumables required for a period of six months from completion of Successful Commissioning.

s) Six month (After Successful Commissioning) supervisory assistance with designated selected manpower defined by owner in section 2.21 of this section

t) Suitable High pressure Instrument Air storage Vessel with compressor & necessary arrangement for supplying instrument air for 15 minutes’ operation or safe shutdown whichever is higher.

u) Emergency Power requirement within LSTK battery limit shall be furnished by LSTK Contractor. DG and Power distribution board for emergency power shall be provided by LSTK Contractor.
v) All Piping Works within SGP Battery Limit (Refer Section-VI-5.3.1 Design Philosophy : Piping for details)
w) Civil & Structural Work (Refer Section-VI-5.4 Design Philosophy : Civil & Structural Works for details)
x) All material handling works within SGP Battery Limit (Refer Section-VI-5.3.4 Design Philosophy for Coal & Ash Handling.
y) All rotating equipment/ HVAC/ EOT Crain works within SGP Battery Limit (Refer Section-VI-5.3.3/ 5.3.6/ 5.3.8 respectively)
z) All Instrument & control work (Refer Section-VI-5.2 Design Philosophy for Instrument & Control.

aa) Dismantling of temporary construction facilities and cleaning the site by removal & disposal of debris etc. after project completion.
bb) LSTK Contractor shall design the Steam Generation Plant to accommodate within the available area marked in plot plan for Talcher Fertilizer Complex.
cc) CCOE permission to be taken by LSTK contractor for any petroleum product being handled by him.

dd) Continuous blow-down valve shall have arrangement for locking at any position.

ee) All safety valve and vent valves shall be complete with silencers. The steam escape piping shall be provided to discharge steam at a safe height above the height operating point/ floor.

The followings shall also be under the scope of the LSTK Contractor for Steam Generation Plant:

a. Design, Basic & Detailed engineering, preparation of PFDs, P&IDs, Heat & Mass balance, Cause & Effect Diagram, interlock description along with Control philosophy
b. Compliance of all statutory requirements during complete project execution period, PGTR.
c. Preparation of drawings and Documents with necessary software and hardware including submission of as built drawings.
d. Getting the drawings approved, making prints available well before those are actually required by manufacturer, inspector, erector, constructor, site engineer
e. Procurement and/or Manufacture and/or Fabrication,
f. Quality assurance & Quality Control
g. Inspection, Testing, checking, Expediting at Manufacturer's works including inspection by Owner/ Consultant/ Third party/ Statutory Authorities including IBR.
h. Supply, Packing, loading, un-loading, Transportation of all equipment & material to site including customs clearance and port charges, port handling & handling at work site.
i. Route survey for Over Dimensional Consignments (ODCs)
j. Storage, preservation and conservation at site as per manufacturer’s recommendation until erection,

k. Security, Watch & ward till handing over

l. Insurance during transit, storage, erection and commissioning

m. Mechanical completion, Construction and Erection of all civil, structural, mechanical, electrical and Instrumentation items/ works, assembly, installation including loading of materials at contractors warehouse, transportation of materials to contractor’s works/erection site.

n. Testing/ checking at site by Owner/ Consultant/ Statutory Authorities including IBR and obtaining all necessary statutory approvals from concerned government authorities as applicable

o. Obtaining necessary statutory clearances pertaining to execution of Steam package.

p. Supply of spares shall be as per Section-VI-10.0 of NIT.

q. Supply of spares required for 2 years normal operation & maintenance of installation

r. Supply of all equipment, machinery, tools etc required for proper & safe erection/ construction work.

s. Supply of all special tools & tackles

t. Supply and installation of instruments for minor repair & testing work.

u. Training of Owner’s personnel as per Section-VI-12.0 Handing over of ‘Steam Generation Plant and associated utilities’ with all final ‘As-built drawings/ documents’ and operating manual. Drawings, documents & operating manual of bought out items. Test certificates and statutory approvals.

v. Preparation of Network and schedules in latest version of Primavera. Project Planning, Scheduling & monitoring, progress Monitoring and Reporting, Total project management.

w. Co-ordination with all agencies concerned with implementation of the project.

y. All items and equipment though not specifically mentioned in the specification, but needed to complete the system to meet the intent of the specification shall be deemed to be included in the scope of the bidder.

z. Bidder shall note that any work and/ or services mentioned in other sections of tender document and not mentioned in this section or mentioned in this section and not mentioned in other sections shall be considered as if mentioned in both.

aa. All supervision personnel, skilled/ unskilled labour for completing the job in all respect as per provision of the contract.

bb. Custody flow meters of various raw materials & utilities to be provided for permanent measuring arrangements the guaranteed parameters inside their B.L.
1.3 The following Offsite & Utility plants shall be excluded from the scope of LSTK contractor of Steam Generation Plant:
   I. Coal handling and Transportation from Pithead to LSTK B/L.
   II. Coal/ Fluxant (if required) of (-) 30mm size Storage for 15 days.
   III. Instrument & Plant air system
   IV. Inert Gas Generation System
   V. Cooling tower with all associated facilities

1.4 Following raw material & utilities shall be made available to the LSTK contractor at one point Steam Generation Plant Battery Limit after mechanical completion of the unit.
   a) Coal and Fluxant (if required)
   b) Treated water
   c) DM water
   d) Fire water
   e) Instrument Air
   f) Plant Air
   g) Nitrogen
   h) Cooling water
   i) Drinking water/ Potable water

2.0 OTHER REQUIREMENTS

2.1 Tie-up/ hook-up with designated tie-up points for hooking up to other systems executed by other agencies. Perform construction management and supervision of all equipments, material and works.

2.2 Provide and perform comprehensive quality assurance, quality control and inspection of all equipments, materials works - both in manufacturing shop and at work site.

2.3 Provide all manpower, materials, consumables, construction equipment / machines, tools, instruments, storage, fabrication, facility and all other services and inputs etc. necessary to perform the work and complete the plant.

2.4 Comply with all Central, State & Local Govt. regulations, laws and requirements applicable to the work and seek & obtain approvals/ clearances from such statutory bodies/ agencies, as required. Scope of Talcher Fertilizers Limited in this regard will be only to provide authorization in favor of LSTK CONTRACTOR for which all the necessary paper work will be done by LSTK CONTRACTOR.

2.5 Provide necessary temporary construction facilities like fabrication, storage, illumination etc. and removal of temporary arrangement to make the space reusable.

2.6 Comply with all safety practices for and during work as per applicable standards.
2.7 Strictly comply with applicable codes and standards of Engineering, Fabrication, Inspection, Construction etc.

2.8 Arrange services of Manufacturer's installation/ commissioning Engineer(s) at Site during Mechanical Completion, Pre-commissioning, Commissioning and GTR of the entire major equipment and systems.

2.9 Provide all the temporary connections/ supplies required for testing/ pre-commissioning activities and also to provide all instrument metering systems required for measurements of various parameters/ testing during test runs.

2.10 Provide spare parts including all consumables for start-up, pre-commissioning, commissioning, Sustain Load Test Run, PGTR of plants. All such spares are to be available at site prior to commissioning and start up of the plant including various test runs.

2.11 Perform testing, flushing, cleaning and pre-commissioning, start-up/ commissioning. Sustained load run, PGTR.

2.12 Submission of final drawings and documents shall be as per Section No 9.0 (Drawings and Documents) of Part-II Technical.

2.13 Project Management and planning, scheduling and monitoring/ comprehensive reporting services, periodic reviews, meeting notes with Talcher Fertilizers Limited / PMC.

2.14 The scope of work as described above shall be supplementary to the scope of work mentioned under various parts of Tender Document. In case of any contradiction between the two, the stipulations mentioned under various disciplines shall be governing. In this regard, Owner’s interpretation shall be final and binding to LSTK CONTRACTOR.

2.15 Transportation of all the materials supplied by Owner, if any, from TFL’s store to LSTK CONTRACTOR's Store/ work site including loading/ unloading.

2.16 Total painting including special paints, color coding, insulations, refractory, CS / S.S. name plates etc. as per applicable standards.

2.17 Any other work not specifically mentioned above but required for completeness of the plant shall be undertaken by the LSTK Contractor without any additional cost implication to the owner.

2.18 LSTK CONTRACTOR shall perform the HAZOP, HAZAN, SIL Study etc. and implement the recommendations of HAZOP, HAZAN, SIL Study etc. without any additional cost / time schedule implication to Owner.

2.19 LSTK CONTRACTOR shall adhere to Design Control exactly as per provisions of latest ISO 9001. LSTK CONTRACTOR shall submit required records as evidence for
review by Owner/ PMC as and when required, and shall carry out changes based on Owner/ PMC review.

2.20 LSTK contractor shall supply the lubricants, chemicals and other consumables in the LSTK price for the six months after Guarantee Test Run in addition to the Pre-commissioning/ Commissioning/ Sustained Load Test Run and PGTR spares and consumables. Quantity of lubricant, chemicals & consumables shall be based on 100% plant load operation. For subsequent two year requirement, LSTK contractor to provide the list along with price of recommended spares and consumables. However, price is not to be included in the lump sum price.

2.21 Owner desires six months (after Successful Commissioning) Supervisory assistance for Operation & Maintenance with designated selected manpower defined by Owner in below table. LSTK Contractors shall indicate the man-day/ man-month rate in Schedule of Rate.

Manpower required for Supervisory assistance for O&M:-

<table>
<thead>
<tr>

Note-1 The Manpower mentioned in Sr.-1 must have the certificate in Boiler Operation Engineer (BOE).

Note-2 Instrument discipline personal must have the experience of DCS, field & other instruments.

2.22 Supervisory assistance.

2.23 LSTK contractor shall arrange complete manpower mutually agreed by Owner & LSTK Contractor for Pre-Commissioning, Commissioning, Sustained Load Test Run, PGTR, Operation & Maintenance and Supervisory Assistance.

2.24 Lab & lab equipment is not in LSTK scope, List of equipment & apparatus shall be furnished along with BID by LSTK contractor required for testing during the Pre commissioning, commissioning, PGTR & subsequent Operation.

2.25 All geo –technical requirement including geo-technical investigation.

2.26 All civil works and supplies such as painting, provision of the fire water network & system around the boiler as per TAC,IS, NFPA and connection of blow down and oily waste with storm sewers and OWS respectively near the plant area as per general civil specs.

2.27 During erection/ construction LSTK contractor shall ensure that construction of other LSTK contractor should not hamper.
2.28 Feed control station for start-up and normal operation.

2.29 Each Boiler unit shall have its own independent CBD & IBD systems

2.30 Following motor operated valve with provision of manual operation shall be provided as minimum:
   
   a. Main steam stop valve and its bypass.
   b. Start-up vents valve and its isolation valve.
   c. Continuous blow down valve and isolation valve.
   d. Emergency drain valve and its isolation valve.
   e. 1st isolation for each feed control valve.
   f. 1st isolation valve of each PRDS.

1.0 GENERAL
This document (Design basis) covers the requirements for design of Coal fired Steam Generation Plant to be constructed by Contractor on LSTK basis.

2.0 REQUIREMENT PERTAINING TO STEAM GENERATION PLANT
Steam Generation Plant is the source of steam required for the operation of Coal Gasification Plant, Ammonia & Urea Plant, Offsite plants of entire fertilizer complex. Steam generated at required battery limit condition in Steam Generation Plant shall meet the requirement of the entire fertilizer complex. LSTK CONTRACTOR is required to construct the Steam Generation Plant to meet export steam requirement at a required rate, specified pressure and temperature conditions to the Fertilizer Complex steam network continuously during the on-stream days (330 days in a year) of the Complex.

Steam Generation Plant shall be complete in all respect and any item or feature not covered in this specification but essential for safe, reliable & efficient operation & maintenance shall be included by LSTK Contractor.

The Steam Generation Plant shall be designed to meet the following requirements of export Steam at B.L.

STEAM REQUIREMENT

H.P. Superheated Steam Generation
Continuous Normal requirement: 564 MT/hr (100% Plant Load)
Superheating of H.P. Saturated Steam
A separate stream of H.P. saturated steam of 74 Mt/hr (at Normal Flow) from Ammonia-Urea Plant shall be superheated in Steam Generation Plant & will meet the parameters of H.P. superheated steam to be exported to the steam header at the B.L. H.P. saturated Steam quantity may vary from 0 to 82 Mt/hr based on AMMONIA-Urea running status. LSTK contractor to design the super-heater coil & boiler control accordingly.

Refer Section-VI-2.0 for quality parameter of steam.

3. DESIGN BASIS AND CAPACITY

3.1 Steam Generation Plant
There shall be three (3) boilers (2W+1S) of identical capacity for generation of superheated HP steam of 564 Mt/hr which will be exported at B.L.

A stream of Saturated HP steam from Ammonia Plant will be superheated in the operating Boilers. Same shall be made available at LSTK’s B.L. by Owner. Each Boiler shall be capable to superheat additional import saturated steam of 41 Mt/hr from Ammonia Plant. Separate fired arrangement for superheating the H.P. saturated steam shall not be considered.
Net output of H.P. superheated steam shall be supplied through a single header at LSTK Contractor's B.L.

Type of boiler shall be selected by the LSTK Contractor as per specified conditions of steam generation in Section-VI-2.0. Type of boiler may be either “circulating fluidized bed Combustion type (CFBC)” or “conventional pulverized coal type (PC)”. LSTK Contractor to meet the latest pollution norms and guideline as applicable. LSTK Contractor to note that evaluation criteria will be based on both capital cost & operating cost considering plant life of 25 years.

</tbody>
</table>

**Note-1:** - Net quantity of HP superheated steam export includes the amount of HP saturated steam at the rate of 74MT/hr (after superheating, within the battery limit of steam generation plant). The steam will be made available for superheating at the B/L of LSTK contractor’s facility at the specified condition mentioned in the Section-VI-2.0.

**Note-2:**- A stream of LP steam of 10 MT/hr shall be made available by LSTK Contractor at their B.L. for owner use. The specification of steam has been mention in section 2.0 Part-II Technical.

The best machine performances are achieved at specified steam super heat temperature. It is preferred to have a positive control on superheat temperature i.e. the heat transfer surfaces provided for steam superheat in process and convection zone super heaters shall have adequate area to achieve temperature of 15°C above specified superheat temperature and the final superheat temperature control shall be by attemperation.

De-superheating function for various steam headers shall be done through proper devices such as steam conditioning valves to achieve minimum water carry over and wide range operations with quick response type to prevent depressurization of the header.

**3.2 Boiler Feed Water(BFW) SYSTEM**

**DM water**

Make-up DM water shall be made available at LSTK’s B/L by Owner. LSTK Contractor shall provide the DM water storage tank along with pumping (with standby train) & all associated facilities within their B.L. for 4 hours requirement at normal operating condition of Boilers.
De-Aerator

Common De-aerator for three boilers shall be considered for Steam Generation Plant. De-aerating capacity of De-aerator shall be equal to gross MCR steam generation capacity of all 3 nos. Boilers.

The de-aerator shall be of spray-cum-tray type with counter current flow of steam and water. The de-aerator and the storage tank shall be complete with all the fittings and mountings like vents, controlled vent, drains, gauge glasses, pressure indicators, relief valve, steam and water inlet and outlet nozzles, overflow nozzle etc.

The dissolved oxygen content in feed water measured at de-aerator outlet shall not exceed 0.005 mg/litre at all loads from no load to full load condition with normal pressure and overpressure with incoming DM water presumed to be saturated with oxygen (without any chemical dosing).

De-aerator storage tank capacity (Two running boiler) shall be designed for 30 minute of feed water flow at BMCR (Boiler Maximum capacity rating) between normal and low low water level. The free CO2 content of the water shall be ‘Zero’ ppm.

The de-aerator water storage tank shall be provided with two drains. One drain shall be at the bottom most point which shall be connected to the over flow drain to the blow down tank. The other drain shall protrude inside the tank to 25 to 40 mm and it shall be connected to the DM water storage tank. This drain will be used only when the de-aerator is taken up for maintenance.

De-aerator Steam may be arranged from two sources: 1) Boiler Blow Down Drum; 2) Balance LP/MP Steam available from turbine drives inside steam generation plant B.L.

An online O2 analyser at outlet of De-aerator shall be provided for continuous monitoring of required parameters of boiler feed water.

Level transmitter with 2oo3 voting logic shall be provided.

BFW Pump

Each Boiler shall have dedicated 1W+1S BFW Pump configuration.

Boiler feed water pumps shall be capable of meeting the peak generating capacity of the boiler and 2% blow down requirements of the boiler under peak generation. The peak generation capability of the boiler shall be the MCR capacity of the boiler.

Drive of BFW pumps shall meet the stipulations of IBR regulation in force. Minimum circulation line shall be provided for each pump and shall be terminated at De-aerator. Motor drives shall have VFD with bypass arrangement. Suction strainer of BFW pump with remote & local differential pressure indication shall be included for each pump. Auto start of BFW shall be provided.

Boiler feed water treatment

Boiler feed water treatment shall be All Volatile Treatment. Refer Section-VI-3.0
The boiler shall be provided with a tri-sodium phosphate based High pressure (HP) dosing system and oxygen scavenging chemical Low Pressure (LP) dosing system. The HP dosing system shall add the chemical to the boiler water to increase the boiler water pH as per the coordinated pH Vs Phosphate curve. The LP dosing is done to the feed water preferably at the outlet of the de-aerator to scavenge the last traces of oxygen and to increase the feed water pH.

HP dosing pump and other system sizing shall be with One percent (1%) concentration of Tri-sodium-Phosphate with residual phosphate level of 7 ppm in the boiler water and also considering 2% blow down on the peak steam flow. The tank usable volume (the volume between bottom of the overflow nozzle and top of the outlet nozzle) shall be for 24 hours. However, the minimum usable capacity shall be 500 litres. On the quantity of dosing chemical calculated based on the above, 25% margin shall be added to arrive at the rated flow of the pump.

The LP dosing system sizing shall be with 0.1% concentration of oxygen scavenging chemical to remove the residual oxygen in the feed water. In addition, there should be residual oxygen scavenging chemical level of 0.02 PPM in the feed water. The tank usable volume (the volume between bottom of the overflow nozzle and top of the outlet nozzle) shall be for 24 hours. However, the minimum usable capacity shall be 500 litres. On the quantity of dosing chemical calculated based on the above, 25% margin shall be added to arrive at the rated flow of the pump.

3.3 Steam Pressure Reducing and De-superheating Station (PRDS)
Contractor shall provide complete steam pressure reducing and de superheating station (PRDS) system to meet the steam requirement during unit normal operation, intermittent steam requirement of units and station and auxiliary steam equipment for the start-up of the units. Each unit shall be provide with a high capacity pressure reducing and de superheating station (HCPRDS) taking tap off from Main Stream (MS) or intermediate stage of super-heaters (as per bidder’s standard practice).

The steam systems of all units shall be suitably interconnected, so as to enable start-up of unit by taking auxiliary steam from any of the other running unit of the station.

High Capacity PRDS (HCPRDS)
The bidder may offer combined pressure reducing cum de superheating valve or a pressure reducing valve with separate de super-heater.

i. Combined High Capacity PRDS
   a) One number electro pneumatically operated combined pressure reducing cum de superheating valve rated for full duty.
   b) One number motorized isolation valve with integral bypass at the upstream of the pressure reducing cum de superheating valve.
   c) One number non-return valve and one number motorized isolating valve at the downstream of pressure reducing cum de superheating valve.
d) Spray control station comprising of one number each of pressure and temperature control valve, electro pneumatically operated, on the de superheating spray water line along with an identical 100% capacity bypass arrangement.

e) One number motorized isolation valve at the inlet of each of electro pneumatic control valve on the de superheating spray water line.

f) One number motorized isolation valve at the downstream of each of electro pneumatic control valve on the de superheating spray water line. One number of non-return valve on the common spray water line.

ii. HCPRDS with separate de super-heater

a) One number /electro pneumatically operated pressure reducing valve with separate de-super heater rated for full duty.

b) One number motorized isolation valve with integral bypass at the upstream of the pressure-reducing valve.

c) One number non-return valve and one number motorized isolating valve at the downstream of pressure reducing valve.

d) One number of temperature control valve electro hydraulically/electro pneumatically operated on the de-superheating spray water line along with an identical 100% capacity bypass arrangement.

e) One number motorized isolation valve at the inlet of each of electro hydraulic/ electro-pneumatic control valve on the de-superheating spray water line.

f) One number motorized isolation valve at the downstream of each of electro hydraulic/ electro-pneumatic control valve on the de-superheating spray water line. One number of non-return valve on the common spray water line.

3.4 ID & FD Fan

ID & FD Fan for each boiler shall have the configuration of 1W+1S. ID & FD fan shall be Electric motor drive or Steam turbine drive depending upon. However, electric motor drive is preferred. If Steam Turbine drive is selected for Working ID & FD fan then standby ID & FD fan shall have the electric motor drive. Motor drives shall have VFD with bypass arrangement. Capacity of each fan shall be 120% of normal conditions.

In addition, the fans shall also be provided with inlet damper operation in case of failure of VFD. The damper shall be manually controlled from the control room, through pneumatically operated power cylinder incorporating suitable linkages. The fan shall also have solenoid operated damper at fan outlet. IGV / damper operating links / drives should be mounted outside to the extent possible to avoid settlement of dust on links. The fan speed shall not exceed 1000 RPM. The impeller shall be hard faced to avoid erosion of the impeller blades.

3.5 Primary Air Fan (1W+1S) (In Case of CFBC type Boiler)
The Primary Air fan shall be variable speed, horizontal, radial, backward curved and electric motor driven. Primarily the fan control shall be with Variable Frequency Drive (VFD). However, the fans shall also be provided with inlet guide vanes operation in case of any problem in the VFD and the inlet guide vanes shall be controlled through power cylinder. The inlet guide vanes opening shall be manually operated from the control room through pneumatically operated power cylinder incorporating suitable linkages. The fan shall also have solenoid operated damper at fan outlet. IGV / damper operating links/drives should be mounted outside to the extent possible to avoid settlement of dust on links. The fan shall be direct driven with the maximum speed not exceeding 1440 RPM.

3.6 Secondary Air Fan (1W+1S) (In case of CFBC type Boiler)
The Secondary air fan shall be variable speed, horizontal, radial, backward curved and electric motor driven. Primarily the fan control shall be with the variable frequency drive (VFD). In addition, the fans shall also be provided with inlet guide vane operation in case of any problem in the VFD. The inlet guide vanes shall be manually operated from the control room through pneumatically operated power cylinder incorporating suitable linkages. The fan shall also have solenoid operated damper at fan outlet. IGV / damper operating links/drives should be mounted outside to the extent possible to avoid settlement of dust on links. The fan speed shall not exceed 1440 RPM.

3.7 Seal Air Fan/ Scanner Fan
As per equipment requirement, LSTK Contractor to provide the seal airFan/ Scanner Fan.

3.8 LSTK Contractor to consider flame detection mechanism suitable to the Boiler technology.

3.9 Electrostatic Precipitator - CFBC Steam generator
The electrostatic Precipitator shall be sized for the fuel firing conditions as specified in Section-VI-2.0. For the above fuel, the SUPPLIER’s design basis for sizing ESP can be used and the SUPPLIER shall indicate the design basis in the offer.

<table>

3.10 Bottom Ash Air Cooler (If required)
Air cooled bottom ash cooler consider for bed ash cooling with required bed ash cooler outlet gate and bypass chute for the bed ash coolers. Bed ash cooler design capacity shall be selected suitably.

3.11 Sample Coolers
Individual sample cooler for super heated steam, Boiler feed water, Boiler Blow down water shall be supplied and complying ASME PTC 19.11 standard. Suitable draining provision shall be included.

### 3.12 On Stream Factor

Plant design and engineering are to be carried out for achieving a high degree of operational reliability. The plants are to be designed with high on-stream factor with minimum operating cycle of 2 years (including statutory requirement) between turn around.

### 3.13 Turn down Ratio

Minimum turndown ratio shall be 40% for each Boiler capacity without sacrificing product steam quality & considering safety of equipment and operating personal.

### 3.14 Overall Specific Energy Consumption

LSTK contractor shall design plants and utilities under their scope of work to achieve minimum overall specific energy consumption per A) Gcal/ MT of Superheated HP steam and B) GCal/ MT for superheating HP saturated steam (Parameter as given in Section-2.0 part II Technical). LSTK contractor shall indicate specific consumption of raw materials and utilities for plant B.L.

### 3.15 Stack

Individual Boiler shall have the dedicated RCC stack for flue gas venting. Flue gas stack shall be provided with all necessary instruments for online measurement of pollutants as per SPCB/ CPCB. Heat Recovery from the flue gas should be limited such that the flue gas temperature at the exit of economizer is above acid dew point.

### 3.16 Drives

The selection of drives shall be preferred as follows. However, LSTK Contractor may adopt any other configuration as per good engineering practice for the sake of energy optimisation with proper justification. LSTK Contractor to note that Max. Power for SGP Package shall not exceed 8MWhr/Hr. Accordingly, Contractor shall design the LSTK package accordingly.

### 3.17 Selection of Material of Construction
In general, material selection for all the sections of Steam Generation Plant shall be as per good Engineering Practice in order to avoid corrosion problem. Minimum requirements of materials of construction for some major equipment are as follows. However, LSTK Contractor may provide any superior material than as specified if required by the process.

3.20 Effluent Treatment & Pollution Level

Gaseous emissions are expected from Vent Stacks of Boiler Flue Gas. Pollutants viz. SOx, NOx, CO, Un-burnt fuel, SPM etc. Liquid effluents like Boiler Blow Down, Ash handling water, Oily water etc also will be generated from Steam Generation Plant area. LSTK Bidder shall consider adequate measure to maintain the pollution level below norms stipulated by CPCB/Odisha Pollution Control Board. Bidder to consider online data transmission provisioning to Pollution Control Board as latest CPCB/SPCB norms.

Liquid Effluents

The ETP facility *(Owner's scope)* shall treat all effluents, continuous, intermittent or emergency discharges from all process and utility units. LSTK Contractor shall design the ISBL plants such that most of the effluents are recycled back, resulting in zero effluent discharge. LSTK Contractor shall indicate quantity and concentration of the significant components of liquid effluents generated during normal plant operation, plant start up, plant shut down and during any emergencies.
There will be underground drainage system to collect the floor washing etc. to carry effluent to ETP. The condition of effluent at the battery limit of Steam Generation Plant is as indicated below:

<td>100</td>
<td>0.03</td>
</tr>
</tbody>
</table>

Design of the gaseous emission from various points of the plant shall be based on following considerations:

a) Flue gas vent stack shall have online Analyser to monitor gaseous emission for SPM₁₀, SPM₂.₅, SOₓ, NOₓ.

b) O₂ analyzer for measuring excess O₂ in flue gas at economizer outlet shall be provided.

c) Flue gas stacks height shall be as per norms published in Gazette of India No.-435 dated 29 June 2018:

\[ H = 6.902(QX0.277)^{0.555} \]

Q = Emission rate of SO₂ in kg/hr

H = Physical stack height in meter

Or Minimum 100M.

d) ESP (N-1) per boiler system shall be installed to meet the emission norms.

e) LSTK Contractor shall provide Sampling port of adequate size & at height as defined by CPCB/ Odisha Pollution Control Board. There should be platform of adequate size with step type ladder to approach up to the sampling port.

f) The dust content in the exhaust air shall not exceed more than 50 mg/Nm³.

g) FGD (Flue Gas Desulphurization) & NOx abatement units shall be provided, if required. During PGTR, Required Liquid/ vapour Ammonia shall be arranged by LSTK Contractor. Necessary unloading and Pumping & Handling system shall be provided by LSTK Contractor.

The ground level concentration of the following in the atmospheric air of Plant area shall not exceed the limits given below:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>PM₁₀</td>
<td>100 µg/m³</td>
</tr>
</tbody>
</table>
**Noise Limitation**

Noise nuisance from machinery is normally specified as sound pressure level which for standard design shall not exceed, in work areas, 85 dB (a) at 1m distance from each source. Maximum allowable noise limit shall not exceed 120 dB for emergency conditions, such as safety/relief valve blow off.

Following boundary level noise limits may be adhered to:
- Day time: 75 dB (A)
- Night time: 70 dB (A)

**Note:** According to Noise pollution (Regulation & Control) Rules 2000 for Industrial Area, the day time shall mean from 6.00 am to 10.00 pm and night time shall mean from 10.00 pm to 6:00 am.

### 4.0 SITE CONDITIONS

The design criteria for Steam Generation Plant, which are under the scope of the LSTK Contractor, shall be as per following site conditions:

1. GENERAL

The plants shall be designed to operate safely and satisfactorily at a capacity of 40 to 100% of Design Capacity. Equipment and machinery shall be provided so that the plants can operate for at least two years without major overhaul or inspection. All design shall confirm with the latest edition of the applicable sections of ASME, ASTM, IEEE, NFC, TEMA, AISI, NEMA, AISC, ACI, OSHA, UBE and other governing codes or standard practices.

In addition, the following state/local Codes/laws shall supplement:

2.0 DESIGN PRESSURE

2.1 General Rule
Design pressure of Process Static Equipment shall be based on the maximum Operating Pressure. Malfunction and Equipment failure shall be taken into consideration by safety devices. Design pressure shall be selected from the list below. Alternatively LSTK Contractor shall select the design pressures as recommended by the standard engineering practice.

a) For max operating pressure below 2 kg/cm² g use 3.5 kg/cm² g
b) For max operating pressure between 2 kg/cm² g and 15 kg/cm² g use Max. Operating Pressure + 1.5 kg/cm²
c) For Max. Operating Pressure between 15 kg/cm² g and 100 kg/cm² g use Max. Operating pressure x 110 %
d) For Max. Operating Pressure equal and above 100 kg/cm² g use the Maximum Operating Pressure + 10 kg/cm² g. Alternatively LSTK Contractor shall select the maximum operating pressure as recommended by the standard engineering practice.

2.2 Equipment under Vacuum
Equipment normally operated under vacuum is designed for full vacuum and for the highest pressure it can experience in case of vacuum failure. Equipment containing a fluid with a vapour pressure at ambient temperature lower than atmospheric pressure which can be isolated shall be equipped with vacuum breaking device or else be designed for full vacuum. Equipment subject to vacuum due to mal-operation or failure shall be equipped with vacuum breaking devices or else be designed for full vacuum.

</table>
2.3 **Equipment on the Discharge of a Pump**

Equipment which may have to bear the shut-off pressure of a pump shall have a design pressure equal to or higher than the shut-off pressure. Pump shut-off pressure shall be estimated according to Clause 8.0.

2.4 **Reactor Loops and Similar Process Systems**

For reactor loops and similar process systems the recommendations of API RP 521 Appendix F (latest edition) and API RP 520 Appendix B (latest edition) will be followed.

2.5 **Thin walled Tanks and Vessels**

Atmospheric thin walled tanks and vessels shall have a design pressure equal to the highest pressure imposed upon discharge of the pressure relief device. The design pressure for vacuum shall be equal to the lowest pressure imposed upon suction of the vacuum relief device.

3.0 **DESIGN TEMPERATURE**

Design temperature for process equipment shall be whichever is higher:

a) Maximum operating temperature + 15 °C
b) Boiling temperature at design pressure of process medium inside, if applicable.
c) Design temperature shall be rounded up to full 5°C steps.
d) Design minimum temperature shall be specified only if the minimum operating temperature is below 0 °C. Design minimum temperature shall be 5 °C less than the minimum operating temperature. Special attention shall be given to low boiling liquids.
e) For piping, design temperature shall be determined according to ASME B 31.3.

4.0 **CORROSION ALLOWANCE**

Materials of construction and corrosion allowance for all Equipment and machinery shall be for a design life of 25 years (except for heat exchanger tubes). However, minimum corrosion allowance for carbon steel (including 0.5 Mo alloy steels) shall be:

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

In the case of pumps ensuring several services such as reflux and liquid distillate to storage, the residence time of the corresponding vessel will be whichever is greater from the above list.

(*) To be advised by LSTK Contractor.

6.0 HEAT EXCHANGERS

In general heat exchangers shall be designed to 110 % of their operating duty/flow.

Columns overhead coolers shall be designed to 120 % of their operating duty/flow.

Large heat exchangers shall be split into two or more shells for easy operation and maintenance.

As far as possible AES type of exchangers shall not be used.

7.0 AIR COOLERS:

Air coolers shall be used wherever economically feasible. Air coolers shall be designed for 110 % of the operating duty/flow based on the dry bulb design temperature.

8.0 PUMPS

Normally pumps shall be designed to 110 % (else as defined in individual sections) of their maximum required flow rate in worst case of operation. Pumps for fractionation column reflux, pump round and re-boiler, flow rates shall be designed to 120% of their maximum required flow rates.

The shut-off pressure for piping design shall be estimated according to the following criteria whichever is higher:

a) Differential head at rated flow x 125 %(*) + Max. suction static head + design pressure of vessel of pump suction side.

b) Above calculated design pressure at centrifugal pump discharge must be checked with the shut off pressure based on pump vendor data & higher out of two shall be considered.

(*) shall be corrected as per pump vendor data.
BFW pumps shall be designed for 120% of their maximum required flow rate in worst case of operation. BFW Pump drives, electric motor driven or Steam Turbines may be chosen depending upon plant energy consumption optimisation.

9.0 **COMPRESSORS**
In general, compressors shall be designed to a minimum of 110% (else as defined in the individual sections) of their maximum required flow. However, they are subject to special considerations according to the process. All vent valves and anti-surge valve shall be of leakage Class-V.

10.0 **PRESSURE RELIEF VALVES**
Pressure relief valves shall be supplied with locked open isolating valves except those for IBR service. Pressure relief valves for operational failure shall have installed spares. Also PRV on fire case with Hydrocarbon service shall have installed spare. LSTK Contractor shall take care of any additional requirement as per good engineering practice. The set pressure of pressure relief valves shall be equal to the design pressure of the equipment. All safety valves will have bypass valves except safety valves for IBR service. All pressure relief blows out lines in steam service shall be released to atmosphere at a safe height.

11.0 **COLUMNS AND VESSELS**

11.1 **Nozzle**
   a) Minimum size 3/4” (for S.S shall be 1 inch).
   b) Nozzle rating according to once of connected piping for instrument min. Class 150 ANSI rating.

11.2 **Manhole**
   a) Manhole size 24” (*)
   b) Manhole installation for Tray Tower

For tray towers, manholes shall be provided at top, bottom, feed point and draw-off point of tower and after each 20 trays or after every 15 m elevation distance, whichever is lesser as minimum.

(*) In case there is restriction for diameter, minimum 20” may be used.

11.3 **Hand hole or Inspection hole**
   a) Preferable Size 8 inches
   b) Minimum Size 6 inches

11.4 **Vent and Drain**
Vent and drain for vessels will normally be provided at the minimum length on overhead or bottom line in accordance with the following table:
### Volume or diameter of vessel (m³ or mm) Vent diameter (inches) Drain diameter (inches)

<table>
<thead>
<tr>
<th>Volume or Diameter</th>
<th>Vent Diameter (inches)</th>

<td>4</td>
<td>4</td>
</tr>
<tr>
<td>V &gt; 420</td>
<td>6</td>
<td>4</td>
</tr>
</tbody>
</table>

Note: Vent and drain connections are not necessarily located on vessels.

All Columns shall have high efficiency demister for removal of moisture and entrainment.

### 11.5 Steam Out

Steam out nozzles shall be sized as follows:

<table>
<thead>
<tr>
<th>Type of Application</th>
<th>Nozzle Size (inches)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Drums and heat exchangers (when applicable)</td>
<td>2</td>
</tr>

<tr>
<td>b) 4 &lt; D &lt;= 5.5</td>
<td>3</td>
</tr>
<tr>
<td>c) D &gt; 5.5</td>
<td>4</td>
</tr>
</tbody>
</table>

### 11.6 Storage (Chemical)

LSTK Contractor shall consider all facilities necessary for safe loading, unloading, storage and transportation of chemical within the plant Battery limit during Construction stage.

### 12.0 FOULING FACTORS:

The exchanger design shall consider the following minimum fouling factors:

<table>
<thead>
<tr>
<th>Description/Service</th>

1.0 GENERAL

This document describes in detail the scope of work, supply and responsibilities of Contractor for carrying out instrumentation activities for this project.

1.1 The description and requirements contained in this specification are concise by necessity and cannot include all details. However, it is the responsibility of the contractor to execute the job on a turnkey basis in accordance with the specifications and internationally recognized good engineering practices for smooth and successful operation of various units of the plant.

1.2 Any activity specifically not listed in this document, does not absolve the contractor of their responsibility to include such activities in their scope of work and supply, which otherwise is necessary, to complete instrumentation work for the steam generation plant. All such activities shall be carried out by the contractor without any implication.

DDCMIS / DCS: Distributed Digital Control Monitoring & Information System / Distributed Control System

2.0 SCOPE OF WORK & RESPONSIBILITY

2.1 Contractor scope of work and responsibility shall be as per STD-99901 (Responsibility chart) and STD-99902 (Scope of supply & installation) attached along with. However details are being elaborated in the following clauses.

2.2 SCOPE OF WORK

2.2.1 Contractor shall be responsible for implementation of complete instrumentation and controls for the PLANT units of refinery on turnkey basis with scope of work as listed below but not limited to the following:

i) Design and Engineering
ii) Procurement/Supply, Factory testing and Acceptance
iii) Installation, field calibration / testing, loop checking, System Integration and Commissioning
iv) Fire Alarm and gas detection system as per attached specification TS821A, TS821, TS822
v) Co-ordination with other LSTK contractors, package vendors and client.
v) Training for Owner Personnel (as per annexure-Training)
vi) DCS, PLC and BMS
vii) HVAC control room
2.2.2 Design and Engineering

a) The contractor shall be responsible to carry out the design and detailed engineering based on the data provided in the process packages and in line with other technical requirements specified elsewhere in this document. Scope shall also include sizing and sizing verification for all items including where data is dependent upon detailed engineering, detailing of basic engineering designs, preparation of data sheets, coordination drawings for instruments and system oriented items, engineering drawings etc.

b) Residual Engineering of process packages

The contractor shall also be responsible for carrying out any residual basic engineering of the process packages necessary for proceeding with detailed engineering like instrument sizing, utility consumption, specifying derived data in process data sheets, type and material selection of instruments wherever required, analyzer room/shelter sizing etc. Instrumentation and control requirements for implementation of recommendations of HAZOP studies shall also be carried out by the contractor. Contractor shall also be responsible for detailing out various sub-package requirements of Package Equipment covered under BEDP / process document.

d) Control Room Engineering

DCS and whole control system for the facility shall be located in dedicated Steam Generation control room, which shall be blast proof. As per the envisaged operating philosophy, the plant operation would be monitored & controlled using DCS control system for meeting the above requirements for DCS necessary Hardware & Software shall be procured to meet the project specific requirements. GPS based master clock shall be provided for time synchronization. HVAC shall be considered for the control room.

e) Control Systems Engineering

Contractor shall be responsible for the selection of DCS & PLC package, provide all engineering inputs to the DCS / PLC vendor & conduct system engineering meetings viz, Kick off meeting, which shall cover System definition, Software definition etc... Contractor shall also responsible for conducting the Factory acceptance test in presence of Process licensor / package vendors at DCS / PLC manufacturer works along with PMC / Owner. Contractor shall carry out the Site acceptance test after Commissioning / proving the units taking all controls in Auto mode for turndown process condition.
The system includes:

i) Distributed Control System (DCS)

ii) Close Circuit Television (CCTV) IP based

iii) Instrument Asset Management System (HART)

iv) Alarm Information Management System (AIMS)

v) LEL/Toxic Detection system

vi) Burner Management System (BMS) (Independent for each steam generation units)

   BMS Shall take care of all the corresponding ESD logics of individual units.

vii) Other systems such as Fire alarm system/Analyzer systems/ Telephone/LAN network etc.

viii) MMS system

ITCC system is not acceptable.

The MMS vendor/LSTK shall submit clause wise compliance of API 670 latest edition. All field Instruments and control system throughout the complete plant to be designed so as to maintain fewer inventories and have interchange ability at any time. Bidder to submit detailed chart for spare parts interchange ability for instruments/control system.

Each Steam generation unit shall have Dedicated BMS system, and shall have dedicated system bus (redundant), which shall be capable to work independently, this BMS system shall take care the ESD functions of independent units.. This shall be connected to DCS system bus (Redundant); All communication in Steam Generation Plant shall be with redundant philosophy,

All the coal handling systems for each Steam Generation units shall be dedicated and shall be working independently.

f) Engineering Drawings & Documents

i) Contractor Data Requirements attached elsewhere indicate the list of drawings and documents required to be supplied by the contractor, as a minimum. Contractor to note that list specifies only the major deliverables. Documents and drawings not listed but necessary for proper engineering, construction, operation and maintenance shall also be prepared by the contractor.

All rights reserved
ii) Contractor shall be responsible for preparation of all engineering drawings and documents including those necessary for construction at site like instrument index, tray & tray layouts, location plans, cable schedules, installation standards, bill of material etc.

iii) Contractor shall also be responsible for providing all drawings and documents for package! Sub package units including those necessary for installation, Pre-commissioning and commissioning activities.

iv) Contractor shall utilise uniform data sheet formats, being enclosed along with this document, for preparing specifications for various instruments, including those which are being prepared by package! Sub package vendors. Items for which no format has been attached with the document, contractor may use standard ISA formats. Use of manufacturer standard formats shall not be used.

v) The contractor shall supply all the documents in both hard copy and CD. This documentation shall include even those all the documentation, which is required for package units.

ix) Loop drawings for loops connected to DCS/PLC shall be prepared by DCS & PLC System vendor based on the information provided by the contractor.

vii) Any discrepancies in case found between various documents e.g. P&IDs and logic diagrams etc., shall be brought to the notice of the owner/PMC. Contractor shall also be responsible to update the documents incorporating the required changes.

g) The design and engineering work shall also include review of post-order vendor drawings and documents for all instruments and system oriented items. Following methodology must be followed for drawings and documents being forwarded to PMC / Owner:

i) The Contractor shall thoroughly review and approve vendor drawing for all instruments including sub-package items, before forwarding to PMC /Owner. Only the approved drawings duly stamped and signed by a competent representative/ engineer of Contractor shall be forwarded.

Licensor shall review selected documents such as purchase requisition for critical items like analysers, and critical documents such as interlock diagrams, Control schemes, Alarm / trip
settings, etc. of Contractor documents. Finalisation of documents based on licensor comments shall also be carried out by the contractor.

Contractor shall be responsible for forwarding the above documents to licensor for their review & approval prior to DCS& PLC system FAT.

ii) All multi-disciplinary fabrication and construction drawings shall be reviewed and signed by contractor’s respective departmental representatives before forwarding to PMC / owner for review /Approval/record.

h) Contractor shall be fully responsible for coordinating all instrument related activities with the agencies concerned to ensure proper, uniform and smooth engineering. This shall include coordination with:

i) All package unit suppliers for uniformity in engineering and documentation supplied by them including P&ID’s, instrument specifications, installation standards etc. and obtaining all requisite drawing and documents for review, record and final documentation.

ii) All instrument item suppliers including suppliers / manufacturers of various system oriented items in contractor’s scope.

iii) Contractor’s own inter-departmental coordination with departments like mechanical, piping, electrical, pressure vessel, heater group etc; This shall include furnishing all necessary engineering data in the form of drawings & documents and review of drawings & data supplied by other departments.

iv) System vendors for System Oriented items, as necessary.

v) Coordination with other field contractors as desired by PMC / Owner at any point of time.

vi) Contractor shall be fully responsible to co-ordinate with the licensor to obtain any kind of details required during engineering.

2.2.3 Procurement/Supply, Factory testing and Acceptance

a) Engineering for procurement shall include preparation of various material requisitions which shall include data sheets, data sheets for instruments, instrument standard specifications, special requirements etc.; evaluation of offers received from various manufacturers/vendors; preparation of Technical Bid Analysis; preparation of purchase requisition and review/approval of vendor drawings, incorporation of PMC /owner comments etc.
b) All items shall be procured from vendor list attached elsewhere in this package. For the items where no vendor list has been attached Contractor shall submit the sub-vendor list for PMC/Owner review for all such type of instruments and system oriented items. Contractor must desist from procuring any items from vendors not approved by PMC/owner. Approval of vendor list must be obtained from the owner/PMC before initiation of procurement for all such items.

c) Contractor shall prepare purchase requisitions for all instruments/systems which shall consist of a consolidated purchase document including all purchase specifications agreed pre-order with vendor/manufacturer including data sheets, special instructions/requirements (if any), standard specifications/purchase specifications, testing requirements, quality requirements etc. All purchase requisitions shall be furnished to PMC/owner for information/review/approval as applicable.

d) Factory Acceptance Test (FAT) and calibration of all instruments shall be carried out by the contractor before despatch. PMC/Owner shall witness testing of any or all items at various stages during manufacture and/or at final stage before shipment at the discretion of PMC/owner. Testing shall be carried out as per approved procedures. Any system-oriented item procured by contractor like analyser system etc, must undergo integrated factory testing at manufacturer/supplier works. No instrument shall leave manufacturer’s works without factory acceptance test. For system oriented items like DCS/PLC/Analyser etc, the FAT shall also be witnessed by the Owner / PMC / Licensor.

2.2.4 Installation, Field Calibration/Testing and Commissioning

a) Installation

i) Contractor shall carry out installation of all instruments as described in this document.

ii) Installation shall include but not limited to installation of DCS & PLC package, Package PLC if any, all field instruments in the unit, including analyser system, CCTV, Fire alarm system, LEL system, all package vendor items, installation of junction boxes, interconnection between instruments and junction boxes, fabrication, laying and painting of cable trays & cable trays, providing cable trench, laying of all single pair and multi pair cables, tagging, ferruling, glanding and pair/core identification of all field cables including
cables to and from MCC, inside the control room cellar area/ analyzer shelters, within
the unit and as per the battery limit defined for the contractor.

iii) Installation of control room mounted equipment including termination of field cables,
powering up of equipment, interconnections within the control room for the control room
shall be in contractor's scope.

iv) Installation of instruments shall be carried out as recommended in the process packages
by process licensor/PMC standards. For special instruments, the installation may be
carried out as per vendor/manufacturer’s recommendations however all such installation
standards shall be subject to PMC/owner review.

For the instruments where installation standards are not available in the licensor’s/PMC
documents, the same shall be prepared by the contractor inline with PMC standards
attached elsewhere in this package. The same shall be subject to PMC/owner’s review.
Any specific requirements specified in the package shall also be taken care of while
finalising these standards.

v) Contractor shall be fully responsible for providing completely integrated unit wide
earthing system for which Instrument earthing system shall be a part. Contractor scope
of work for instrumentation shall include earth pits, earthing cable/strips (as applicable)
etc. as per the requirements of various instruments and field mounted systems including
analysers, DCS/PLC etc

Contractor shall also be responsible for interconnecting instrument earth pits with unit
earth pits (provided by electrical).

b) Testing & Calibration

Contractor scope of work includes testing of all items and systems at site including impulse lines,
instrument air line, pneumatic signal tubes and instrument cables and special instruments items if any.
Contractor shall also carry out calibration of all instruments as per the requirements specified in section 4.4
of this document.

c) Commissioning
i) It is the responsibility of Contractor to co-ordinate and makes available the services of system vendors / sub vendors for system like DCS & PLC Package, Analysers, VMS, Antisurge controller (if applicable) etc. and other special instruments etc. during installation, testing, site acceptance, start-up/ commissioning of the plant.

ii) Loop Testing

Contractor scope of work shall include loop checking of completely integrated instrumentation and control system including package / sub package system items and units for which control system is being supplied by contractor inline with the requirements specified elsewhere in this package. The coordination with any other units contractor (if required) shall be in the contractor scope of work.

iii) System Acceptance at site.

Contractor shall be fully responsible to demonstrate to PMC / owner all functional requirements for the instruments, control system, in their scope of supply as contractor, specified in this document including their performance in the actual plant environment.

Contractor shall be fully responsible to tune all the plant control loops. It is the responsibility of contractor to arrange for licensor’s Instrumentation specialist for logic & Control scheme checking, Commissioning & loop tuning at Site. In any case commissioning can be considered complete only when all control loops are tuned to perform optimally.

It is the responsibility of the Contractor shall maintain the unit for a period of one month taking all the controls in auto & all interlocks on line from day of stabilization of unit.

vi) Start-up, commissioning and stabilisation of plant with PMC / Owner / Licensor / Other EPC Contractors / System vendors like DCS, PLC, Analyzers, CCTV, LEL Gas detection etc. shall be the total responsibility of Contractor. Contractor shall render all possible help and assistance to all agencies involved in completing these activities. Contractor shall also be responsible to co-ordinate all the activities related to their portion of unit with other agencies/ contractors/ owner/ licensor/ PMC as applicable.

2.3 SCOPE OF SUPPLY

2.3.1 Supply of all items related to instrumentation and control systems shall be as indicated on the Piping & Instrumentation diagrams (P&ID) and other technical documents attached with this document.

2.3.2 The scope of supply shall include but not limited to the following as a minimum:

a) All the instruments required and as included within the battery limit of PLANT unit (including all sub-packages like compressors, pumps etc.) like field transmitters & switches, pressure & temperature gauges,
level gauges, theromwells, thermocouples, special thermocouples, special temperature detectors, RTD’s, flow elements, venturi tubes, orifice assemblies, solenoid valves, Control valves with accessories, Safety relief valves, self actuated control valves, Flame arrestors, Desuperheater system, special instruments etc. or any other instrument necessary to make the scope complete.

Supply of DCS & PLC package, which includes Subsystem like HART Maintenance system, AIMS, IAMS, CCTV, Telecom Network and Documentation server etc as per the architecture.

All the System Cabinets (DCS, PLC, Fire system, all other electronics cabinets) shall be installed with proper ventilation system as per standard design so as to maintain suitable required temperature required for proper functioning of installed Electronics

Supply of Vibration Monitoring system, LEL gas detection system & Package vendor Instrumentation.

b) For the control systems like Analyser System etc. contractor scope shall include supply of all items including their integration with the DCS system.

c) All installation and erection materials such as impulse piping, pipe fillings and valves, tubing, tube fillings, cable perforated aluminium tray/tray and supports, all type of consumables and accessories for mounting of instruments, instrument supports, canopies/sunshields for all field mounted instruments of PLANT units under contractors scope.

d) Supply of all types of cables such as signal, alarm, control, thermocouple extension, RTD, Gas detector cables, power cables, special cables (like for speed governors, analyser cables etc.) as necessary. LSTK CONTRACTOR shall refer to the overall plot plan for information related to location of PLANT unit of this package. Based on the information, contractor shall estimate the requirement of trays / trays and multi pair / single pair and special cable lengths.

e) Main cable GI tray/trench, perforated tray, angle tray, structural supports, consumables for cable laying and routing within respective units, their interface with other EPCC/field contractors for cable routing up to the main control room through cable rack / trench. The scope shall also include supply of cables, trays, trays for routing of cables within cable cellar area and upto cabinets/panels/ racks in the rack room including supply of all structural support required and found necessary. All cable trays shall be installed above ground or overhead as applicable.

f) All system cables/fiber optic cables in the field (including communication between CCR,CR and main fire control station) shall be routed in HDPE Hard pipe. Fillings shall be used for joining the HDPE pipe. HDPE pipes shall be ORANGE in colour with BLACK fillings. All system cables/fiber optic cables shall be routed in the middle 150mm portion of the tray. Wherever it is absolutely necessary to route these cables underground, it should be routed in the RCC Trenches only. Separate route should be followed for redundant system cables. Supply of Cable trays and laying of cables through trenches upto CCR are in bidder scope.

g) Separate junction boxes and cable glands for different types of signals such as intrinsically safe and non-intrinsically safe 4-20 mA dc, thermocouple, RTD, shutdown, alarm, power etc.

h) All piping & pipe fittings, tubes & tube fillings for instrument air supply distribution and steam tracing etc.

i) Insulation and painting of instruments and impulse lines as required in line with the insulation and painting specifications attached elsewhere in this document.
j) Local Control panel/Local gauge boards & accessories (as applicable).

k) Galvanised iron / copper earthing strip and earthing cables for earthing of all instrumentation items including junction boxes etc. to electrical earthing strip in the unit and instrument earthing system as applicable.

l) Supply of MCT blocks and frames for cable entry to control room/analyzer shelters for each unit as applicable.

m) Supply of analyzer shelters as per this document

n) Any other erection material necessary for installation and commissioning of special instruments, if any.

o) Any special tools or tackles for instrumentation

p) Supply of all types of configurators like for field smart transmitters etc. in quantities indicated in this document

q) Supply of spare instruments (e.g. installed, engineering, consumable, mandatory etc.) as listed given elsewhere in this document

r) Supply of drawings and documents as listed elsewhere.

2.3.3 The following criteria shall be also be followed in design and supply.

a) There shall be independent BMS system for each steam generation units, The BMS PLC shall be SIL-3 certified TMR/QMR as per attached specification

b) All control and monitoring of entire plant such as burners, turbines, effluent treatment plant, cooling tower, DM water storage tank, BFW feed pump, Deaerator etc. pertaining to SGP shall be implemented in DCS. The DCS shall be DMR system

c) Deleted

d) Any conveyor system, if applicable, it shall also be automatic and PLC based DMR system Non-SIL.

e) LSTK shall provide complete Steam and water analysis system (SWAS). Silica analyzer of HACK make is preferred. Analysers shall be single channel. SWAS Analysers shall be as per following:

i) Superheated Steam : pH, Specific Conductivity, Cation Conductivity, Silica

ii) Saturated Steam : pH, Specific Conductivity, Cation Conductivity

iii) Blow Down Water: : pH, Cation Conductivity, Silica, Do2

Apart from above, Phosphate analyser shall also be provided. Location can be decided during detail engg.

f) LSTK shall provide all the relevant analysers(e.g. SOx, Nox, CO, CO2, SPM, O2, Unburned Hydrocarbon etc) applicable to the system as per latest(at the time of commissioning) CPCB/State Pollution control boards requirements.

g) Gas detectors shall be provided.
h) Fire Alarm system for all the rooms and fire prone areas
i) CCTV system shall be provided. The system will be guided through CCTV with adequate number of cameras
j) Packaged Air conditioning (HVAC) of control rooms. It shall be designed considering the equipment heat loads, solar heat loads, heat gain into the room, adequate no. of air changes etc. to maintain a uniform temperature and relative humidity within the air conditioned areas.

k) Air Conditioning System

l) All cabling, earthing and lightning protection

m) Adequate furniture in forms of consoles, printer tables, chairs etc shall be provided for control rooms. (Furniture shall be of Godrej Make).

n) All the Instruments as per flow schemes/diagrams and relevant tender drawings, corresponding Mechanical sections and meeting redundancy and other requirements specified under technical specifications are to be provided as a minimum.

o) All Instruments which are Integral to equipment required for control, monitoring and operation of the equipment/plant/ Systems are to be provided. All the instruments shall be provided by the Contractor to meet actual system requirements subject to Employer’s approval.

p) Control Room building shall have 1.5 mtrs minimum false flooring for cable laying. It shall have minimum Manager Room, Shift In charge room, Instrument Maintenance room, Instrument Calibration room, Engineering Room, UPS room, EPABX room, Dining Space/Pantry Room, one ladies and gents toilets. Cable entry to building will be through MCT blocks.

q) Cable entry at the bottom of panels shall be also through cable glands or MCT blocks.

r) Separate earthing for instrumentation earth and panel earth completely separate from Electrical earth to be provided.

s) Local control panel and Junction boxes shall be provided with IP:65 degree of protection

t) All field mounted electronic/ non electronic instruments shall be provided with weather and dust proof protection of IP-65 or better

u) Pneumatic Receiver Instruments shall have receiver elements design for 0.2-1 kg/cm2 g / 3-15 PSI input signal

v) All Instrument Air sub branch to instruments shall be through 1/2” SS pipe whereas main air header coming to product plant shall be 2” to 4” SS pipe as per individual requirement

w) The Control & Instrumentation shall be furnished, erected and commissioned and all other services shall be performed by the bidder as covered under this specification

x) All the Measuring instruments

y) DCS including, modulating controls, interlocks & protection sequential controls, data acquisition.

z) BMS system for individual units (SIL 3 QMR/TMR) No scale Down versions are acceptable
aa) PLC

bb) Deleted

c) Steam and Water Analysis System, Gas Monitoring and Boiler Emission System

d) Control System for Steam Turbine

2.4 Deleted

2.5 DESIGN BASIS

Order of priority for Instrumentation

In the event of conflict between requirements of any two clauses or specification documents, the more stringent requirements shall apply unless confirmed otherwise by the Owner in writing before the award of this contract based on a written request from the Bidder for such clarification.

Hazardous Area classification

- Hazardous Area classification for Instruments shall be Zone 2, IIC, T6. (Where T6 not available then T5/T4 can be used) All instruments shall be intrinsically safe EExib.

- If intrinsically safe item is not available for any instruments, then it must be Flame proof / Ex. Proof EExd.

Electrical / Electronic instruments: IP 67
Sensors; RTD, T/C, etc.: IP 65
Local Gauges; PG, etc.: IP 55
Pneumatic instruments: IP 54
Solenoid valves: IP 67
Local Panel / Skid Mounted Panels: IP 55

EMC compatibility and electrical safety as per latest IEC standard.

Certification for installation in hazardous areas in accordance with IEC 60079 series is shown below:

<table>
<thead>

Control system/PLC for Coal handling/Material handling/ DM water (Bidder’s scope if applicable) / Condensate polishing unit (Bidder’s scope if applicable) shall be DMR non-SIL. Instruments shall be as follows (as applicable):

- All Smart Petitioners: SIL 2
- All Transmitters: SIL 2
All Solenoids SIL 3
All Gas Detectors SIL 2

**ELECTRICAL SUPPLY**

The electrical supply will be as follows:

- **Distributed Control System, trip system, and Control Room Instruments**: 115V AC
- **Solenoid Valves**: 115V AC / 24V D.C
- **Local Panels**: 115V AC / 24V D.C
- **Local Illumination, equipment for air conditioning, space heaters, Ventilation of local panels and similar purposes**: 240V AC
- **Field-mounted Transmitters and switches**: 24V D.C intrinsic safe
- **Safety Circuits**: 115V AC

The 115V AC supply will be an uninterrupted power supply (UPS) of 115V +/- 10%, 50Hz +/- 3%. Where 24V DC is needed, it will be generated by local rectifier units, which are part of the instrumentation supply. The power supply to these units shall be taken from the UPS. Where 24V DC are used for Safety Circuits, the rectifier units shall be duplicated and with high reliability and form a part of ESD vendor. Redundant 24V D.C. power supply shall be powered from two different sources of UPS. A separate instrument earthing system apart from the power supply protective earthing system is foreseen.

There shall be minimum 4 separate earth pits for System, Panel /power and Intrinsic safe signals with different cable colour codes. All earth shall be less than 2 Ohm or OEM specific, if better. The size of Earthing Cable shall be 50 sq.mm minimum and should be routed in proper HDPE conduit, outside the control room building. All above instrument earth pits shall be separate from Electrical earth pits and must have separate colour identification from electrical earths. Minimum 2 nos. Of earth pits of each type (total 8 nos) shall be constructed.

Two separate AC distribution board (Dual ACDB) fed from parallel redundant UPS are essential for Instrumentation power distribution system for the improved reliability. Each DCS or DCS/ESD AC DB shall be fed from redundant UPS feeders & shall have with static switch for change over automatically without power interruption in case of any incomer failure.

UPS supplies shall not be used for utilities supplies cooling fans, panel/cabinet lighting etc. A separate non-UPS supply shall be used for the same. A summary of all critical UPS alarms shall necessarily provided in DCS and hardwired annunciation in control room or any manned location. Only copper cables & tin-plated copper lugs shall be considered for instrumentation power distribution system.

UPS battery backup should be available for a minimum period of 60 minutes at full load condition. The same to be ensured during capacity discharge test of battery bank during pre-commissioning activities. Protection coordination with respect to fuse/MCB ratings from the supply source ACDB/DCDB to downstream distribution panels shall be thoroughly studied by the system designers/OEM and documented as a part of the system documentation and be implemented accordingly.
### ACCURACY OF INSTRUMENTS

Accuracy of the Instruments shall be minimum as follows:

<table>
<thead>
<tr>
<th>Type of Instrument</th>
<th>Accuracy</th>
</tr>
</thead>
<tbody>
<tr>
<td>- Differential pressure &amp; Pressure transmitter - SMART</td>
<td>± 0.075% of span within TD ratio of 1: 10</td>

1. DCS& ESD system as per attached DCS / PLC Architecture is to be used by the LSTK Contractor, for Steam Generation Plant. All DCS& PLC system can be housed in the same control room.

2. Control room Floor level shall be 1.5 meter from the Finished floor Level.

3. Cable Entry to: Control Rooms, Analyser Rooms etc shall be by using MCT Blocks

4. All Analysers, GCs, Mass-Spectrometer shall be Ex.proof irrespective area of installation.

5. **Analyser Shelter**:

   - The LSTK contractor shall house the process analyzers and other analyzers (Control units) in analyser shelter. The construction of each analyzer house shall be prefabricated in press-formed stainless steel sheet. The materials of construction shall have a fire resistance of two hours minimum in accordance with UL 555 and NFPA Standard 90A.
   - HVAC system shall be dual type without any shared components. One shall be working and other standby.
   - Analyser shelter shall have complete redundant air conditioning, venting, heating and/or house pressurization system
   - The analyzer house size shall take into consideration the size of each analyzer plus an allowance for 30% spare on both inside and outside walls for future analyzer and sample conditioning systems
   - Shelters shall be equipped with all safety measures like panic bar at the doors, Emergency alarm push buttons, LEL gas (hydrocarbon) detectors, Fire detection system, warning panels, Fire extinguishers, wash...
basin etc.

- A PLC shall be provided to execute safety logics. PLC shall have redundant CPU. PLC shall be mounted in Ex-proof enclosure. PLC fault shall be annunciated
- Each analyzer house shall have common fresh air intake via a stack mounted on the analyzer house roof. These stacks shall be provided with a rain hood and a mesh to prevent entry of birds etc. also adds tie bars for support of stack. The air shall be drawn from a non-hazardous area and the air intake location shall be at least 1 meter outside the hazardous area. The design of the intake tray and the diameter and length shall be sized by Seller so as to limit the air velocity inside the traying to a maximum of 8m/second. The intake stack shall have filters 5 microns down to 99% efficiency, fire dampers and louvers

6. Internals of All Control Globe / Ball / Butterfly valves, On-off valves, MOV Ball, MOV gate, MOV butterfly valves, MOV Check Valves, Pressure relief valves, Thermal relief valves valves shall be minimum SS316 irrespective of licensor’s data sheet.

7. All control valves / On – Off Valves / MOVs shall be flanged type

8. Control valve / on-off valve, pneumatic valve shall be designed for minimum 4 Kg/cm² air pressure

9. Deleted

10. Thermocouples shall be duplex type.

11. Deleted

12. Temp transmitter shall be used for both open loops & Closed loops.

13. Guided wave radar type instruments (SMART) shall normally be used for level measurement, wherever guided wave radar cannot be used then only external displacer type/Differential pressure type transmitter to be used. Differential pressure transmitter (Capillary type) shall be used for level measurement. Capillary type DPTs shall not be used in vacuum services. Internal displacer type of level transmitters shall not be used.

14. Air distribution pots shall be of stainless steel. Inst. Impulse pipes for process parameters shall be in accordance with piping specifications

15. Perforated aluminium Cable trays to be used.

16. Main instrument air header and Branch header material : SS304

   a. Main instrument air header shall be at least 2" (SS) minimum depending on requirement. It shall have 1" minimum takeoff (SS) with Gate type isolation valve (SS) & further distribution for each instrument through separate ½” SS line with ½” SS Ball valve single piece design with SS handle & with 6 mm OD SS316 tubing.

   b. Inst. Air isolation valve for each instrument: SS304

17. Limit switches shall be proximity type, micro switches shall be avoided

18. All Field Instruments including Gas detectors shall be SIL-2 certified.

19. Hart Compatible gas-detectors to be provided.
20. All line mounted instruments like in-line SOVs, Magnetic flow meter, Rotameter, Mass flow meters etc shall be provided with block & bypass arrangement.

21. Separate Tapping shall be used for each instrument coming for trip, control & monitoring, local display.

22. Separate Sample handing system shall be used for each analyzer. Multi Channel with stream selector can be used, provided the total system including sample handling system shall be imported. Necessary sequence shall be inbuilt in the analyzer for draining the condensate.

23. For double acting valve, air accumulator shall be used for achieving fail safe operation.

24. FRP Canopies are required for Transmitter, JBs, LCPs, Control Valve positioner, Temp Elements, Proximity level switch, remote mounted electronics, mass flowmeter, ultrasonic flowmeter.

25. Temperature, pressure & flow instruments provided in buried vessel shall be located above ground level. IP 68 shall be provided if instruments are under water.

26. System / Marshalling cabinet size shall be 2100 (H) X 1200 / 800 (W) X 800 (D)

27. All field transmitters shall be dual Compartment Type.

28. Conventional Smart type(HART) Transmitter shall be provided for both open loops & closed loops. Minimum 04 Nos. of hand held communicator (HHT) shall be provided. This shall be loaded with latest HART Software.

29. For Monitoring & Control, separate nozzles / takeoff shall be taken for all cases, for 2oo3 separate tapings shall be used, no branching is allowed ,In case of multi-transmitter installation from a single orifice a separate identical pair of tapping to be provided with a separate transmitter i.e. no branching from a single tapping is allowed.

30. Smart positioner shall be considered for all Control Valves and the same shall be connected to Hart Maintenance system. For high temperature services (Above 200Deg C) remote feedback shall be used for the smart positioner.

31. Valve signature software is required for all Control Valves

32. 4 – 20 mA output from all Gas detectors shall be directly connected to ESD PLC. Electrochemical type Gas detectors to be avoided by the bidders.

33. Separate RACK in ESD PLC to be provided for Gas detection system.

34. For all Local panels rain cover to be provided.

35. For Analysers separate feeders to be directly taken from UPS. No sub-branching allowed at any place.

36. GWR shall be used in pump seal plan; Level switches shall be avoided in lube oil system.

37. All Contacts shall be Gold Plated 2 SPDT.

38. In general separate junction boxes shall be used for the following:
   a) 4-20 mA signals (IS)
   b) 4-20 mA signals (non-IS)
   c) DI/DO 24V (Field switches, push buttons etc.)
   d) Interlock and shutdown signals (Solenoid valves)
   e) Power supply to various instruments.
f) Gas Detectors

g) Vibration signals

39. Separate junction boxes shall be used for signals connected to PLC and to DCS. No signal shall be shared between them in the field junction boxes.

40. Only metal tube Rotameter shall be considered. Glass tube Rotameter shall not be used.

41. SMART Positioner : Metso, Fisher, Dresser or Valve Manufacturers own Make

42. All Instrument Hookups shall be approved by owner/PMC.

43. For boiler drum applications special approval of IBR has to be taken for level instruments

44. Tube metal temp. measurement for boiler drum shall be provided, if applicable, depending upon type of boiler.

Design Basis Philosophy

1.0 Control Philosophy

Note 1: Chemical filters shall be used for air condition system in Control Room.

2. No’s of corrosion monitoring (copper & silver) with temperature and humidity measurement of M/S PURAFIL make must be mounted in rack room of each control room. The location of the monitors must be near the duct and cable entry. The four different AI signals corresponding to above measurements from these two monitors must be connected to DCS with suitable soft alarms.

Suitable Clean Agent System is required for Control Room.

1.1 Type of Control and Monitoring:

a) Centralized Distributed Control System ■ (Note 2)

c) Local Electronic ■ Pneumatic □ (If applicable)

d) Final Control Element Pneumatic ■ (Note-3)

Other___________

Note 2: DCS & PLC hardware shall be suitable for corrosive environment protection coating meeting the Environmental classification class G3 as per ISA-S71.04. Dedicated configuration & diagnostics shall be provided for HART device.

Note-3: Positioner shall be Smart type for all loops except antisurge control loop. Partial stroke testing for ON/OFF valves shall be realized through HART Maintenance system.

Note 4: DCS shall be a DMR system as minimum; all closed & Critical loops shall be connected to redundant I/O channels
### 1.2 Interlock and Shut-down system:

    Purged  ■

c) Instruments Type  Pneumatic  □  Electronic  ■

d) Indicating Lamps  PBs  EX-Proof  ■
  Annunciator  (LED)  IS  ■
  Supply  24 V DC  ■

Local panel lamp test logic shall be realized in main PLC.

e) Local indicators  ■  (As per P & ID) Note – 7

Loop powered Indicator shall be IS type

Note – 7: for open loops, repeat indication shall be in series with transmitter, whereas for Closed loop it shall be using single input double output barrier...

2.0 Package Units Philosophy:

2.1 Operating philosophy:

2.2 Logic implementation for package units through Plant PLC
2.3 Anti surge controller

- Conventional Single loop Controller
- DCS
- Dedicated Spl. controller (CCC)
- With serial interface to DCS (Note – 8)

**Anti-surge Control (if any,) shall be dual redundant CCC make, & shall be located in STP (steam Generation Plant) control Room.**

2.3.1 Location of Anti surge Controller

- Control room (on hardwired console)
- SRR
- Local panel (when indicated in P&ID)

2.4 Vibration & Temperature Monitoring

- Bentley Nevada series 3300
- Bentley Nevada series 3500

**VMS/MMS I/O modules shall be within built Barriers. 4-20mA for DCS. MMS to be provided with System-1 monitor. Rule Packs also to be provided. There shall be system-1 monitor enterprise license for STP (steam Generation Plant) with minimum 10 user/client license.**

MMS to be considered as a minimum for Turbine Packages, BFW, ID/FD fan, steam turbine, system etc. shall be connected to independent VMS system; IOs/Controllers/Cards/power supply modules etc shall not be shared. All DOs corresponding to the trip of Machine protection system (Vibration Monitoring Systems) shall be triplicated and connected to ESD on 2oo3 philosophy at ESD. i.e. 3 different DOs cards from BN system must be used. Further all logics corresponding to individual elements (i.e. axial, vibration, temp if applicable) etc shall be implemented in Bentley system but the final DO output must be triplicated at ESD. Also no common trip DO output of two different parameters from MPS is acceptable (for e.g. Axial/Vibration trip clubbed into one DO is not allowed).

2.4.1 Location of monitors

- Control room
- Local panel (In Hardwire Console. Display unit only)

2.5 Location of Speed Governor

- Control room (on hardwired console)
- Local panel (when indicated in P&ID)

2.5.1 Over speeds Trip System

- Pro-Tech GII

2.6 Type of local panel

- Weather proof (Note-11A)
- Purged (for Hazardous Area)
- As per NFPA 496
- Type Z (Note-5)
Note – 8: Dual Redundancy configuration shall be followed.

Note-10: Interlock, shutdown and trip signal shall be hardwired to PLC (Contact signal from machine monitoring). All analog signal from VMS (if any) to DCS shall hardwired. RS485 Communication shall be given as an additional provision. Also Ethernet port shall be provided for connecting the VMS to configuration & diagnostic station (PC based.)

Note –11 Electronics for Governor shall be in Control Room and monitoring shall be from hardwired console only. Redundant or TMR configuration shall be used.

Note-11A with all instruments, items shall be intrinsically safe or flameproof as per clause 1.5. Steam turbine, balance-of-plant equipment, and auxiliary electric equipment.

3.0 DCS Requirements:

GENERAL

The fundamental objective of the various control systems provided for the Thermal Power Project is to facilitate effective plant operations by ensuring the following:-

- Personnel Safety.
- Equipment protection.
- Ease of operation (automation).
- Equipment and cycle efficiency.
- Equipment and system reliability.
- Equipment and system maintainability.

To implement these criteria, normal control and monitoring of the unit shall be from a STP (steam Generation Plant) control Room. The STP (steam Generation Plant) control room shall employ state-of-the-art control system hardware configured for ease of operator interface. From the Control Room, the operators shall be able to start up, load, unload, release for remote dispatch, shut down, and monitor the operation of the associated auxiliary systems. A Distributed Digital Control and Management Information System (DCS) shall be provided as the primary operator interface. Normal operation of the plant is envisaged from monitor and KB. However, it shall be possible to shut the plant to the safe condition (in the event of failure of DCS I/O cards, processors, data highway & MMI).

The principal functions of the DCS are as follows:-

a) Deleted  
b) Provide control steam cycle, steam bypass and water cycle.  
c) Provide control of pulverizes, combustion air, burner ignition, and flame management and Soot Blower.
d) Coal Handling plant, Ash handling plant, CW / ACW system etc. (These will be through Remote Terminal Units

e) Receive input signals that represent the status of process variables and equipment status; condition the signals; and utilize them for control, protection, monitoring, status display, annunciation and SER.

f) Provide the output signals to modulate and control the final devices, such as control valves, control drives, dampers and pumps.

g) 1 No of OPC servers shall be provided for Communication with other systems

h) Deleted

i) Perform information processing functions including logging and printout of historical data, trend displays, elapsed time monitoring, and tantalization of fuel and energy usage and generation.

j) All the control packages of turbo, boiler and their auxiliaries shall be the integral part of DCS.

k) Microprocessor / PLC/Relay based system for individual offsite covering the total functional requirements of modulating control, sequence control, interlocks & protection, monitoring, alarm, data logging, fault analysis, etc. shall be supplied by bidder.

The design of the control system and related equipment shall adhere to the principle of “fail safe” operation at all system levels and provide reliable and efficient operation of the plant under dynamic conditions and attainment of maximum station availability.

Suitable gateways / soft links / protocols and time synchronization facility including all required software & hardware shall be provided for all microprocessor / PLC-based system for interfacing with DCS. Master / Slave clock system shall be supplied by bidder for time synchronization of DCS and microprocessor based system / PLC

l) Status of all drives, pumps, tanks, etc should also be available in central control room.

m) All HT motor bearings shall have duplex RTDs for remote indication and local temperature gauges for local indication.

3.00.01.01 Multi tasking of Processors

The distributed digital control system is required to address the following tasks:-

1) Open loop control (binary)
2) Closed loop control (analog modulating)
3) Plant monitoring/signal acquisition and processing

The microprocessor based system has the capability to perform the above tasks either separately or in a combined form. As multi-function processors have a number of control functions and are preferred to be in completely redundant mode, security of control functions including those of protection would be maintained even with the loss of the active processor as well as the functions could be taken over by standby processor.

3.00.01.02 Signal Acquisition and Processing Modules for Monitoring & Control Functions

Primary instruments for monitoring functions shall be provided separate from those for control tasks. Keeping this segregation of field instruments, the system philosophy could adopt separate processors for monitoring tasks.
Monitoring task being less critical compared to control tasks, the processors for monitoring could be non-redundant. Alternatively, as the hardware for monitoring functions is generally similar/identical to those for the control tasks, it is possible to combine the monitoring portions with control tasks. All processors/cards/power supply etc for closed loop shall be redundant.

3.00.01.03 Processor Task Allocations

The system shall perform overall control tasks having appropriate redundancy built in for all the system functions both at processor and peripheral level. No failure of any single peripheral or processor leads to any system function or data being lost.

For the system with multi-function processors, functional distribution is adopted and geographically, the system can be centralized.

Each functional group consists of dedicated microprocessors including redundancy and dedicated input and output processing. The redundant multifunctional processors are in a hot back up mode with bump less transfer. Following tentative segregation for regulating controls is proposed, however final segregation shall be subject to Owner’s approval during detailed engineering:-

a) Coordinated master controls and Fuel feed control  
b) Air flow and excess air correction  
c) Furnace draft  
d) Mill related controls  
e) Lime control  
f) Feed water/drum level  
g) Deaerator, hotwell  
h) SH steam temperature control (multi variable control)  
i) RH steam temperature control (multi variable control)  
j) HP/LP heaters  
k) Deleted  
l) BMS (TMR/QMR) control. Also the cards and Processor for BMS shall be fail safe type minimum SIL-3 approved.

Segregation further depends upon I/O handling capacity of the processor.

Other loops of the plant e.g. miscellaneous loops can be distributed amongst the above processors.

Each group has sufficient spare capacity of at least 20% to meet modification/extension of the system. Multi-function processors can incorporate the corresponding interlocks (open loop control tasks of the system).
Interlock and modulating controls are to be so assigned to the processors in such a way that failure of any processor does not lead to shut down of the entire unit. In no case CPU loading should exceed 50% of its capacity. Bidder to submit calculation of CPU loading along with his bid.

3.1 Functional Requirements:

Control and Data Acquisition System
Data Logging and Report Generation
Management Reports (limited)
Advanced Control
Plant Optimization
Offsite Automation
Data Storage and Archival
Management Information System reporting
Advance Diagnostics

3.2 Operator Consoles:

All servers, Engineering stations etc shall be in RAID 5 configuration all other (OS/PC) shall be in Raid -1 configuration with min 2TB HDD, 16 GB RAM, with latest windows & anti-virus support at least for 5 years For Client Server Architecture 1:1 Server Shall be redundant (RAID 5)

Network securities shall be provided by the bidders in all control rooms as per IEC 62443 for protection of the system from both internal and external threat. The requirement includes all USB port blocking (including all monitors /CPU), provision of sufficient firewalls, antivirus updation for one year, patch updation, unauthorized logging recording with events etc. must be addressed by the bidder. In case of Server-Client based DCS systems, all operator stations shall be direct connect type (they should not depend on Servers for data). No System Servers shall be used as Operator stations

A. SUPER HEATED HP STEAM GENERATION UNIT/BMS

DCS

3 Nos Operator Stations with, 22” TFT touch screen colour LED type dual monitors (stacked)
1 No. Engineering Station with, 22” TFT touch screen colour LED type

1 no. of Membrane Operator’s Keyboard and 1 no. of QWERTY engineer’s key boards with mouse with each operator station with touch screen, mouse

1 Nos ES/OS dual personality, 22” TFT touch screen colour LED type dual monitors

1 No. Supervisor station

System shall be supplied with equitable tags Licenses shall be for Life Time.
Whole plant data shall be made available in all OS and ES.
BMS

BMS PLC (separate PLC for each Steam Generation Unit)

1 Nos ES/OS dual personality with SOE, 22” TFT touch screen colour LED type dual monitors type for each BMS

1 No. Engineering Station with, 22” TFT touch screen colour LED type (common for all BMS)

1 No. Annunciator with LED lamps with split type architecture for each BMS

1 No Auxiliary Console for each BMS

1 No of engineering station machine Monitoring System for all other facilities such as BFW pumps etc.

1 No of Engineering Station for Wood Ward governor System if any

1 No. Annunciator with LED lamps with split type architecture

2 Nos A3 Heavy duty Colour HP makes Laser printer

System shall be supplied with equitable tags. Licenses shall be for Life Time.

All ES (DCS/BMS) shall be housed in separate Engineering Room in Control Room.

It shall have latest Bentley Nevada Vibration Monitoring system. Suitable speed-monitoring Woodward make and Potech GII or better over-speed trip system shall be provided.

VMS system shall be connected in dual redundant mode to MMS System-1

COMMON FACILITY

1 No of AIMS (alarm information management system)

1 No History Node and Alarm Management PC with long term history license & 1 Year data storage, 22” TFT, COLOR, LED type

1 No. Instrument Asset Management System (IAMS)

1 No OPC server with 22” TFT Color LED monitor with requisite software/hardware for Remote Viewing common for all Steam generation units,

One OPC server shall be provided with DCS/PLC system with OPC connectivity to ERP/MIS system/data exchange. Vendor shall also provide necessary software/hardware (OPC server & software) and manpower support / assistance for establishing connectivity of the other systems system with ERP & other systems.

OPC server tag license must be for minimum 10000 tags, PC server design for Steam Generation Plant will be based on no of STP (steam Generation Plant) related tags only.

1 No. Documentation Node 22” TFT, COLOR, LED type

1 No. Terminal Server, 22” TFT, COLOR, LED type (if required)

1 No. Fire wall minimum
1 No of MMS System-1 Server
1 No of MMS System-1 Client
1 No. Master station for CCTV
1 No. 55” Large Video Screen
1 No Engineering station for F&G PLC

B. ANALYZER PLC
One Analyzer PLC for each Analyzer shelter shall be provided with redundant connectivity to Steam generation control system.

- 1 No of Engineering station shall be provided for Analyzer PLC (common)

C. FOLLOWING SHALL BE PROVIDED AS COMMON FACILITY FOR THE STEAM GENERATION UNITS

b) Console configuration
   - Single
   - Stacked (Dual)

c) Type of monitor
   - CRT
   - LCD/ TFT 22"

d) Open system connectivity
   - Yes (through OPC)
   - No

e) Assignable Recorders on each console
   - Yes
   - No

Historic Trending for all points shall be provided.

f) Engineering functions from operator console
   - Yes
   - No

g) Historic Trending on each console
   - For all points
   - Recording points only

h) Auto tuning facility
   - Required
   - (Note – E)

Note- E Auto tuning as per vendor standard shall be provided.

3.3 Engineering Consoles: Required

Redundant Bulk Power supply with diode arrangements shall be provided for field instruments. Individual power supply Loading 50% only, All BPS Failures shall be connected to DCS as a separate DI signal with clear software alarm description. Make: Quint/ Cosel/ Stahl/ Weidmuller/Wago may also be considered. All Diode O rings failures shall be connected to DCS as a separate DI signal with clear software alarm description. All BPS/Diode O ring must have LED indications for indicating their healthiness locally. All the MCC and Instrument interface (For all
DI/DO/AI/AO signals) shall be connected through a separate shielded cable of 1.5 sq mm and not through control cable.

i) Serial (RS-485) Modbus Redundant 1:1 redundancy
(For Interlock PLC)

3.18 Loading philosophy

Control Processor 50%
Communication Processor 50%
Communication Bus 50%
(Note-13)

Each Controller loading shall not exceed more than 50% (hardware and software load of each controller) in any case, after implementation of complete project and running at peak load. In case more controllers are required to meet 50% loading criteria, CONTRACTOR to include additional controllers without any cost implication.

Note-13: The maximum number of nodes in the network shall not exceed 60% of the maximum capacity.

3.19 Scanning Time

50 msec. for anti surge control loops
200 msec. for flow and pressure control loops.
500 msec. for all other control loops
5 sec. for temperature acquisition loops
1 sec. for all other acquisition loops

4.0 Control panel / Hard-wired console Instrumentation:

4.1 Type of control panel

Graphic Closed back
Non-Graphic Open back
Semi-Graphic Console type

4.2 For Control Room Instrumentation (As per P&ID) (Note-14)

a) Indicators, Integrators, All Critical
Indicating controllers, etc. (As per P&ID)
None

Note-18: 24 VDC wherever required, Shall be provided with redundant bulk power supply unit.

5.3 Power supply distribution:

a) Local Panel
   UPS Distribution Board
   Control Room Distribution Cabinet

b) Analyzer Shelter
   UPS Distribution Board
   Control Room Distribution Cabinet
   SRR Distribution Cabinet

c) Instruments & Analyzer
   UPS Distribution Board
   Control Room Distribution Cabinet

The failure signals of all UPS should be connected to DCS as a separate DI contact.

5.4 Cable Entry to:

a) Control Rooms
   MCT Blocks
   Pipe Sleeves

b) Satellite Rack Rooms
   MCT Blocks
   Pipe Sleeves

c) Local control Rooms
   MCT Blocks
   Pipe Sleeves

d) Analyser Rooms / Houses
   MCT Blocks
   Pipe Sleeves

5.5 Air Supply at Battery Limit

| Operating pressure | Minimum: 4.0 kg/cm²g | Normal: 5.5 kg/cm²g | Maximum: 6.0 kg/cm²g |

5.6 Size of Instrument Nozzles shall be as per following

</tbody>
</table>
Note:-

a. There shall be a separate tapping for each of the instruments on any pipeline/vessel. No multiple instruments from one tapping is acceptable (for example PG and PT from single pipe line tapping with single or double mechanical isolation valves are not acceptable). In case of multi-transmitter installation from a single orifice, a separate identical pair of tapping to be provided with a separate transmitter i.e. no branching from a single tapping is allowed.

b. All type of instrument tapping flange rating shall be minimum ANSI 300#, irrespective of minimum design pressure. However for pressure rating of 600# class and above, RTJ flange shall be used. At few locations, double isolation valves shall be used as per table given below.

5.7 Type of taps for Orifice

- Flange (<= 12")
- Corner (for 1½")
- 2 ½ -8D (For > 12")
- D-D/2 (for > 12")

(Unless otherwise recommended by process licensor)

5.8 Installation / Tubing hook-ups:

a) Instrument Installation

- Close coupled (For all flow instrumentation) (Note- H)
- Remote (for level, Pressure & PDT- Piping & tubing Standard)

b) Instrument impulse lines

- Tubing (for utilities)
- Piping
- Any other _____________

(Note-20) with piping & tubing connection at inst. end only up to 600#. For high pressure only piping shall be followed..
### c) Instrument valve manifolds

- **i) For pressure gauges**  
  - Integral: □  
  - Fabricated: ■ (Note – I)

- **ii) For flow DP transmitter**  
  - Integral: ■  
  - Fabricated: □

- **iii) For Others**  
  - Integral: □  
  - Fabricated: ■

- **iv) For PI**  
  - Integral: ■  
  - Fabricated: □

*Note – I For pump discharge pressure, pressure gauges shall be mounted in a separate stanchion.*

### d) Impulse Line valves (After first isolation valve provided by piping)

| Isolation valves | Gate | ■ | Globe | □ | (All instrument Valves except equalizing valve must be gate type) |
|------------------|------|---|-------|---|
| Vent/drain valves | Gate | □ | Globe | ■ |

### e) Signal and Air supply tubing

- **SS tubing**: ■  
- **PVC covered Copper tubing**: □  

<table>
<thead>
<tr>
<th>Tube size</th>
<th>6 mm OD</th>
<th>■</th>
<th>¼” OD</th>
<th>□</th>
</tr>
</thead>
</table>

### f) Steam Tracing

- **SS tubing**: ■  
- **3/8” OD**: □

<table>
<thead>
<tr>
<th>Tube size</th>
<th>6 mm OD</th>
<th>□</th>
<th>3/8” OD</th>
<th>■</th>
</tr>
</thead>
</table>

### g) Seal pot required for Steam / condensing Vapor instruments

- **Yes**: □  
- **No**: ■  

*Note – J For steam level instruments, seal pot will be used.*

### h) Main instrument air header and Branch header

- **CS**: □  
- **SS**: ■

Main instrument air header shall be at least 2” (SS) minimum depending on requirement. It shall have 1” minimum takeoff (SS) with Gate type isolation valve (SS) & further distribution for each instrument through separate ½” SS line with ½” SS Ball valve single piece design with SS handle & with 6 mm OD SS316 tubing.
i) Inst. Air isolation valve for each instrument.
   Brass ☐ SS ☐

j) Impulse tubing 1/2" OD ☐

5.9 Field Transmitter Type:

a) Open loops Conventional ☐ Smart ☐ Fieldbus ☐

b) Close loops Conventional ☐ Smart ☐ Fieldbus ☐

c) For anti-surge loops Conventional ☐ Fieldbus ☐

d) For shut-down loops/ Safety system loops Conventional ☐ Smart ☐ Fieldbus ☐

Transmitters shall be of 10 years stability

5.10 Deleted

5.11 Field positioner type

Pneumatic ☐ Electropneumatic ☐ Smart ☐ Fieldbus ☐

Partial stoke testing shall be provided for ESD valves.

For ESD valves, Proximity type switches shall be provided for open & close status in addition to Smart positioner.

5.12 Signal type:

a) For Smart transmitters 4-20 mA DC with superimposed Digital Engineering Data (HART) ☐

LCD display in Engineering Unit and % for level in field ☐

LCD display for smart transmitter shall be in line with 5.20

b) Fieldbus Foundation Fieldbus ☐ Profibus PA ☐

c) Pneumatic Signal 0.2-1 kg/cm²g ☐

5.13 Output meter
5.14 Process Instrument Type for shut-down

a) For pressure
   - Process switch
   - Transmitter

b) For Level
   - Process switch
   - Transmitter

c) For flow, temperature
   - Process switch
   - Transmitter

d) For package units including Pump seal
   - Vendor Standard
   - Transmitter

e) Any other
   - As per Licensor’s Requirement

5.15 Hazardous Area Protection: (Note-23)

a) Field transmitters intrinsically safe
   - Flame proof

b) Field switches intrinsically safe
   (For antisurge loops shall be exproof)
   - Flame proof

c) I/P converters intrinsically safe
   (Proximity type LS)
   (Note-24)
   - Flame proof

d) Solenoid valves intrinsically safe
   (where applicable)
   - Flame proof

e) Positioners Intrinsically safe
   - Flame proof

f) Special instruments/ intrinsically safe
   - Flame proof
   - As per manufacturer standard

   Local Panel elements shall be exproof.

Analysers shall be exproof only.

Note-23: If intrinsically safe item is not available for any instruments, then it must be Flame proof Exd. MCC I/Os shall be non-intrinsically safe. The shutdown/interlock inputs to PLC shall be intrinsically safe.

Note-24: Limit switches shall be intrinsically safe.

5.16 Intrinsic safety Barriers

- Required
  - Isolating type

- Not required
  - (If required)

Line monitoring for O/P barriers

- Not required
  - Required

Line monitoring for AO barrier is required.
5.17 Analyzer/GC Installation

5.18 Earthing system:

a) Panels, racks, cabinets, consoles, shelters etc. and all Junction boxes with power more than 110 V (Note-25)

b) Signal earth

Separate signal earthing pit (Note-25)

c) Barrier earth

Separate safety earthing pit (Only for Zener barriers)

For VMS, Governor & Antisurge Controller (if applicable) earthing shall be as per vendor recommendation

Note-25: DCS/PLC console/panel earthing as per DCS vendor recommendation.

5.19 Type of cables:

Flame retardant
Flame retardant and low smoke
Flame retardant and Fire resistant (Note-27)
(Wherever specifically indicated)

Note-27: For cabling to fire-proof valves.

6.0 Other Instrumentation and Systems:

6.1 Flow instruments:
As per Licensor’s requirement
### Instrumentation

#### a) General Service
- For 2” lines and above: Orifice plate
- Other

- For 1½” lines and below:
  - Variable Area meter
  - Meter Run
  - Integral Orifice
  - Other as per licensor

#### b) For Air flow
- Venturi / Ultrasonic flow
- Other

> Airflow measurement shall be Venturi / Ultrasonic type. Pitot tube is not acceptable for airflow measurement.

#### c) For Cooling water
- Mag.flow
- Ultrasonic flow
- Other

> Magnetic flow meter in line mounted shall be used.

#### b) For highly viscous and fouling service, high temperature service.
- Mass Flow
  - (Coriolis type)
- PD meter
- Wedge
- Orifice
- Target
- Other

#### e) Custody and Product Metering

- **i) Liquids**
  - PD meter
  - Turbine
  - Mass / Ultrasonic(5-path)

- **ii) Gas**
  - Orifice
  - Turbine
  - Any Other (As per P&ID)

- **f) Performance Metering**
  - Orifice
  - Mass
  - Turbine
  - PD Meter
  - Any Other (As per P&ID)

- **g) High Rangeability Applications**
  - Turbine
  - Vortex
  - Mass
  - Others

- **h) Flare Flow Measurements**
  - Ultrasonic type
  - Other

- **i) Other** (as per P&ID)

- **j) FD fan air flow** (as per P&ID)

6.8 Fire and Gas Detection (F & G) System:

a) F&G System Required ☐ Not required ☐

b) Gas detection system Required ☐ Not required ☐

(Note-30) Dedicated Gas Detection system shall be provided. 4 – 20 mA output from Gas detector shall be directly connected to Separate Rack of DCS or ESD PLC.

i) HC, H2 Detectors Catalytic diffusion ☐ Only for H2
    IR Type ☐ for HC
    Any other ______

Output 4-20 mA ☐ Vendor standard ☐

Other ______

ii) H2S Detectors Electrochemical ☐ Semiconductor ☐
    Any other ______
    4-20 mA ☐ Vendor standard ☐

Other ______

iii) Toxic gas detector As per P&ID

iv) Other gas detectors As per process package ☐

d) Fire detection system

i) Automatic fire detection Required ☐ Not required ☐
    If yes, any specific areas to be covered_________

ii) Plant / Non plant building

Fire detection Required ☐ Not required ☐

d) Separate F & G LAN Required ☐ Not required ☐

d) Type of F&G PL:F& G system PLC shall be SIL 3 certified, same make as that of ESD system of Steam generation unit.

6.9 Integrated Machine Monitoring System:

Required ☐ Not required ☐

For monitoring ☐

For predictive maintenance ☐
- Each BMS allied network shall have independent MMS system, No electronics shall be shared

6.10 Boiler drum Instrumentation

(Note-32)

Note-32: Test Bench, Testing jig, Testing medium shall be provided by LSTK contractor with valid Pressure testing certificate for entire duration of testing as per Statutory regulations and following all Safety norms.

6.14 Deleted
6.15 Fire proofing of Instrument cable ducts

- Required: ☐
- Not required: ☒

Fire proofing of Instrument cable trays

- Required: ☐
- Not required: ☒

6.16 Flow Element sizing

- Orifice, Ventury: As per ISO 5167 (otherwise as per P&ID)

6.17 IAMS for DCS HART shall be included in the DCS /PLC package.

6.18 For DCS, HART Compatible AI & AO modules shall be provided

6.19 INSTRUMENT SIZING CALCULATION in Intools

All the sizing calculations of Control Valve, Safety Valve & flow element (orifice plate / venture / flow nozzle etc) shall be done using Intools (Smart Plant instrumentation Latest Version). The related dB file of the sizing data and calculation to be provided to PMC/OWNER for checking. LSTK to provide fully functional licensed Intools (SPI) software along with other necessary software (like Oracle etc) to Owner before sizing data is provided to the owner. Training on Intools to be provided from OEM.

6.20 DOCUMENTATION NODE

For documentation node the software to be used shall be PRODOK only. Training in use of the software from OEM.

Spare Philosophy:

a) Mandatory spares: Refer mandatory Spare Section

b) Spare Parts

- For two years operation ☐
- For Startup and Commissioning (As required) ☒
- Consumable spares for six months operation ☒

c) DCS, PLC, Gas Detection, CCTV, Machine Monitoring Spare Philosophy:

- System Spares (Control Room wise)
  - Bus Capacity: 40%
  - Number of Nodes: 30%

- Installed Spares
  - I/O Level: 20%
  - Marshalling: 20%

3.0 DESIGN PHILOSOPHY

3.1 GENERAL

3.1.1 This Document together with the attachments covers the minimum requirements for the design and engineering of instruments and control systems, complete with all accessories, materials and special test equipments for the Project. In addition to above, specifications/requirements for any of the instruments / system oriented items given in the process package shall also be taken care by the contractor.

3.1.3 This document provides in detail, the minimum qualitative requirements of most of the instruments / system oriented items. For instruments, where no such requirements are indicated in this document, the contractor shall submit the same for Owner / Owner Representative Approval.

3.1.4 Contractor shall also be responsible for detailing out the specifications of various instruments / system oriented items from the process licensor’s process packages. Contractor shall also be responsible for meeting all requirements arisen out of clarification sought from the licensor.

3.1.5 The requirements specified in ‘Standard Specifications for Instrumentation Work’ shall also be applicable for various package / sub packaged items in addition to Unit / Units of fertilizer complex.

3.2 CODES AND STANDARDS

3.2.1 Contractor shall refer various codes and standards indicated in clause. 1.3 of ‘Standard Specifications for Instrumentation Work’ in addition to PMC standards attached alongwith this package.

3.2.2 In general, Contractor shall carryout engineering as per IEC/BIS standards. Any other standard, if necessary, can also be referred by contractor during the execution of the job, without diluting the basic requirements, however with prior information to Owner/ Owner Representative. In any case contractor must furnish a list of codes and standards other than those specified in this document which shall be followed by them during engineering.

3.3 DESIGN REQUIREMENTS

3.3.1 OVERALL CONTROL SYSTEM STUDY

Distributed Control a system has been envisaged as main Control & Monitoring platform. All field Instruments & standalone systems shall interact with DCS to provide optimum and adequate information to plant operator for safe and efficient plant operation.

SIL3 certified PLC shall be used for Plant safety interlocks & ESD system, BMS PLC can be used for implementing ESD functions.

3.3.2 INSTRUMENT CONTROL AND OPERATING PHILOSOPHY

3.3.2.1 Instrument control and operating philosophy has been decided considering following process units which are licensed by various process licensors:
3.3.2.1.1 PROCESS UNITS

For PLANT contractors scope cover all field related activities, specific system related items and engineering/co-ordination related activities for the systems procured by owner/PMC.

3.3.2.2 For monitoring & controlling the plant DCS / ESD is envisaged as per the architecture enclosed elsewhere.

3.3.3 INSTRUMENT DESIGN CRITERIA

3.3.3.1 The ‘Instrument Design Basis, together with ‘Standard Specifications for Instrumentation Work’ and other standard specifications enclosed alongwith this document provides the guideline for design, selection and detailed engineering of instrumentation.

3.3.3.2 All residual basic design and detailed engineering shall be carried out by contractor considering requirements specified in ‘Instrument Design Basis’. In case of any conflict between ‘Instrument Design Basis’ and requirements specified by various licensors in the process package, the requirements must be clarified with Owner/PMC before proceeding.

3.3.3.3 The instrumentation selected for the units shall be rugged in design and must be well proven in the hydrocarbon industry. Prototype design or equipment of experimental nature or design undergoing testing etc. shall not be selected and supplied.

Following criteria must be applied before selecting a particular instrument item:

a) For Instrument Items (Other than Systems)

The instruments as being offered/supplied should have been operating satisfactorily in an hydrocarbon industry like Nitric Acid, Ammonium Nitrate Plant, Fertilizer, Refinery, Petrochemical and Gas Processing Plant POWER Power plants under similar process conditions for at least 02 years. from the bid opening date.

b) For System Oriented Item

i) The system (with all its sub-systems) as being offered/supplied should have been installed and operating satisfactorily in an Nitric Acid, Ammonium Nitrate Plant, Fertilizer, Refinery, Petrochemical and Gas Processing Plant for at least 02 years (as collaborated by user certificate).

ii) The system should be supplied engineered & tested from a factory from where the system/sub-systems as offered / supplied, engineered & tested have already been supplied and meet the criteria b(i) above.

iii) All the activities including engineering should be carried out by the agency which have carried out the similar activity in the past and meets the criteria b(i) above.

iv) The system should be supplied by the manufacturer in the fully engineered condition or should be supplied by the manufacturer’s representative/subsidiary who have proper infrastructural facilities and meets the criteria b(i) above.
v) In any case, the manufacturer whose system is being offered/supplied should have a local representation/subsidiary which has the proper infrastructural facilities like engineering, installation, maintenance, testing, spare part support, system fault diagnosis and other related logistic support. Systems which don’t have the local base should be avoided.

3.3.3.4 Control systems shall be designed with a minimum availability requirement of 99.99% with a MTTR figure of 8 hours. Minimum level of redundancy have been specified in the package. Additional redundancies if required, must be provided by contractor to meet these specified availability requirements.

3.3.3.5 Power supply distribution scheme for instrumentation shall be fully coordinated with overall power distribution scheme. Proper fuse coordination, number of feeders, Isolation levels etc. must be evaluated during design. System loads and non-UPS loads shall be powered by two sets of separate isolated feeders by using isolation transformer in non-system related loads. Contractor must ensure the termination and distribution of all these incoming and outgoing feeders with power distribution cabinet.

3.3.3.6 Contractor shall ensure a fully integrated, safe and secure grounding system for the specified units of fertilizer complex, of which instrument grounding system shall form a part. The earth pits wherever necessary e.g. for instrumentation systems, analyser systems or local panels shall be provided by contractor based on the requirements.

3.3.3.7 Contractor shall select instruments in classified area as per clause 2.4 of ‘Standard Specifications for Instrumentation Work’. However contractor to note the following:

a) In general, intrinsically safe philosophy shall be followed for all inputs and solenoid valves outputs in the hazardous area except for MCC/PCC inputs/outputs. The barriers shall be selected based on entity parameters by Contractors, which shall meet the gas group area classification requirement.

   Contractor shall select the barrier based on the following requirements:
   - The barrier shall be of latest/ enhanced available versions of makes selected
   - The model no. selected should be proven as per the criteria specified
   - The barriers selected should have back-up support and representation available locally.

   Contractor to ensure that the instruments selected are compatible to the selected barriers.

  c) Instruments, which are not available as per their standard design from any reputed manufacturer as intrinsic safe, can be supplied in flameproof design. All such instruments shall be certified flameproof for the area classification and requirements indicated in clause(b) above.

  e) Intrinsically safe instruments shall be as per para 2.13 of ‘Standard Specification for Instrumentation work’.

3.3.3.8 The size indicated on P&IDs for control valves, safety valves and instruments requiring sizing (i.e. flow meters, Breather valves, flame arrestors etc.) are indicative only. The final sizing for control valves, safety valves, orifice assemblies, flow meters, breather valves, flame arrestors requiring sizing or any other line mounted instrument requiring sizing is contractor’s responsibility. In case of change in the instrument size from those specified in P&ID or in the Data-Sheet the same shall be carried out by contractor after obtaining approval from the licensor/ owner/PMC.

   Any change in instrument size or revision in line sizes because of sizing shall be carried out by contractor without any implications.
3.3.3.9   All limit switches shall be of proximity type. Mechanical type (microswitch or similar type) of limit switches shall not be used.

3.3.3.10   All solenoid valves in the field shall be certified intrinsically safe with a compatible isolating barrier in the control room. The solenoid coil design shall be suitable for working continuously with the specified voltage levels. The corresponding barrier selection should ensure proper functioning, compatibility and certification considering voltage level, current levels & the coil resistance for the selected solenoid valves.

3.3.3.11   Bearing and temperature monitoring of the motors. Bearing and temperature monitoring of all the motors shall be monitored directly from DCS. In case of Machine Monitoring System provided for an equipment, the bearing temperature element shall be hooked up to Machine Monitoring System. Contractor shall provide all such signals which have been indicated in the Rotating Equipment electrical sections of this document, in the control room. P&IDs shall also be updated by the contractor to show all these signals along with tag nos. The instrument details provided by the contractor for DCS configuration must include all details of all such tag nos. including range, alarm settings, type of sensors etc.

3.3.3.12   Indian Boiler Regulation (IBR) Requirements

3.3.3.12.1   Pressure relief valves (boiler drums, desuperheaters and steam lines before pressure reducing station) shall be designed and supplied as per ASME Section I or Indian Boiler Regulation (IBR) in line with pressure vessel design code. All items including safety/pressure relief valves in IBR service shall have IBR certification.

a)   In case of safety valves in IBR service, the type of valve shall be as per regulation no. 292 with 5% over pressure and 5% blow-down and shall be provided with following certificates:
    i)   IBR Form-III C certificate of manufacture and test of boiler mountings and fillings.
    ii)  IBR form III construction certificate of manufacture and test as per item 11.
    iii)  Type test certificate from IBR authority as per appendix-L of IBR for the valve series supplied.
    iv)   Radiography of all castings as applicable.

b)   In case, ASME Section I valves are supplied, it shall be ‘V’ stamped and should have the certificate from ASME certified laboratory.

c)   The discharge capacity of these safety valves shall be calculated as per IBR regulation no. 293 a, b & c.

d)   Equipment nozzle length and sizes shall meet the corresponding code i.e. ASME Section- I / IBR Requirements.

3.3.3.12.2   Safety valves in utility steam network after main pressure reducing station) shall be as per ASME Section VIII as a minimum with 10% over pressure and 7% blow down unless otherwise indicated in the data-sheet. These valves shall be provided with IBR form-III C certificate.

3.3.3.12.3   All on line instruments such as control valves, Thermowell, flowmeters, orifice flanges and level instruments like level gauges, Displacer type level transmitters etc. shall be provided with IBR Form-III C certificate.

3.3.3.12.4   For pressure gauges on steam service the range shall be selected as below;

a)   For pressure below 35 kg/cm2g, the range shall be 2 times the max. working pressure.

b)   For pressure above 35 kg/cm2, the range shall be 1 1/2 times the max. working pressure.
3.3.3.12.5 Installation items like syphon, condensate chambers, pipe and pipe fillings for the instruments installed in the IBR lines, and steam tracing filling shall have form III C certification.

3.3.3.13 Direct temperature, level switch, flow switch and pressure (low) shall not be used but these are to be achieved using field transmitter. Transmitters analog signal shall be directly connected to DCS/PLC as per requirements.

3.3.3.14 Pump discharge pressure gauges are to be either diaphragm seal type with capillary with capillary or the gauges are to be mounted at a distance from the discharge pipe through longer impulse line and proper support to minimise vibration. In any case the mounting location of these gauges shall be as per operational requirements. Glycerin filled gauges shall be used for pressure fluctuating services like reciprocating compressors and pump discharges etc.

3.3.3.15 For differential pressure transmitters with tapings at long distances apart particularly in columns, separate pressure transmitters are to be considered and differential pressure shall be calculated in DCS.

3.3.3.16 All contacts in the intrinsically safe service shall be gold plated. Colour of the canopies shall be finalised during detailed engineering.

3.3.3.17 All the instruments shall be provided with canopies of adequate size to protect instruments from direct rain & sunlight. All such canopies shall be prefabricated type.

3.3.19 All instruments and equipments shall be suitable for use for specified site climatic conditions and industrial environment in which corrosive gases and/or chemicals may be present. In general, all instruments and enclosures in field shall be dust proof and weatherproof to IP-65 as per IEC-60529/IS-13947 to be considered, and secure against the ingress of fumes, dampness, insects and vermin. All external surfaces shall be suitably treated to provide protection against corrosive plant atmosphere.

In case of contradiction between licensor specifications, approved P&ID and this design Philosophy, P&ID shall be final document and shall prevail.

The design of electronic instruments shall be in compliance with the electromagnetic compatibility requirements as per IEC 61000-4 'Electromagnetic compatibility for Industrial Process measurement and Control equipment'.

a. In general, instruments, used in hazardous areas shall be intrinsically safe and shall be selected based on entity parameters. However where specific type of instrument is not available in IS as standard, the same can be considered with flame proof only. All field Instruments shall be suitable for Zone 2 IIC T3, EExib shall be certified by a statutory body with gas grouping as per requirement. In addition to any certification depending on manufacturing location, additionally instruments shall be certified by CCE, India irrespective of the origin. Certification agency will be vendor standard. Also indigenous flameproof equipment shall comply with BIS requirement. Enclosure housing material for all transmitters, Temperature elements, positioners shall be Die-cast Aluminum epoxy painted. In general purging is not acceptable for Instrument enclosures.

b. Material of construction and end connection rating shall be as per piping material specification as a minimum. However thermowell with it’s flange shall be as a minimum SS316. It is LSTK Contractor responsibility for correct selection of materials for all instrument items.
c. In general, transmitters shall be used for all process alarms/trips including for Pump seal and all other applications. Transmitters shall be provided instead of level/flow/pressure or temperature switches. Use of switches to be avoided and this requirement shall govern over other specification specified elsewhere.

d. The instruments like control valves, orifice flanges, level instruments, thermowell etc., coming on pipes and vessels under IBR shall be certified by IBR or IBR authorized representative.

e. In general, field transmitters shall be smart type with LATEST REVISION OF UNIVERSAL HART PROTOCOL. However where in some specific type of instruments, it is not available, like mass flow meters, analyzers etc., the same will be non-smart. All field instruments shall be SIL -2 certified.

f. for steam drum level measurement, additionally one GWR suitable for boiler application shall be provided.

The SMART shall be with “Advanced diagnostics” capabilities.

The rangeability and accuracy shall be as below:
- The Overall rangeability shall be 1:100 for Normal transmitters with calibrated accuracy of ± 0.075% of span within a turndown ratio of 1:10.
- The Overall rangeability shall be 1:30 for Draft Range Transmitters (<500 mm WC) with calibrated accuracy of ± 0.15% of span within a turndown ratio of 1:10.
- The Overall rangeability shall be 1:100 for Diaphragm seal transmitters with calibrated accuracy of ± 0.2% of span within a turndown ratio of 1:10.
- Transmitters shall have minimum static pressure rating of 100 kg/cm²g except for very low-range for which the static pressure will be considered suitably based on the availability.

The accuracy of temperature transmitter with RTD shall be as follows
- For temperature above 350 °C, equal to or better than ± 0.075% of full scale
- For temperature in range of 150°C to 350 °C, equal to or better than ± 0.15% of full scale
- For temperature below 150°C , equal to or better than ± 0.25% of full scale

The accuracy of temperature transmitter with cold junction compensation for thermocouple, shall be as follows
- For temperature above 350 °C, equal to or better than ± 0.2% of full scale
- For temperature in range of 150°C to 350 °C, equal to or better than ± 0.5% of full scale
- For temperature below 150°C , equal to or better than ± 0.75% of full scale

The accuracy is defined as the combined effect of repeatability, linearity and hysteresis.

The transmitter response time shall be as follows as a minimum
- For range of 760 mmWC and above, 500 milliseconds or better
- For range of below 760 mmWC , 1seconds or better

f. Threaded end connections shall be to NPT as per ANSI B 1.20.1. Flanged end connections shall be as per ANSI B 16.5.

g. All standards to be followed in this project to be reviewed and approved by PMC / OWNER for avoid any mistake during execution stage.

h. For 3500 series vibration proximeters screwed terminals to be used for cable connection not push type connectors and I/O modules with built in barriers.
j. All logic should be implemented in main ESD PLC.

k. For machine monitoring system vibration/temp/speed probe cables to be taken through flexible armoured conduit up to JB. Un armoured cables shall be routed through GI Conduit pipe.

l. For the following instruments, as applicable, involvement of OEM engineer is required during installation as well as during commissioning. For ASC & Performance controller, OEM should present for tuning and surge test during commissioning:

   a) DCS& PLC System (including IAMS/ AIMS / CCTV etc.)
   b) Deleted
   c) Machine monitoring system.
   d) Stack & Process Analyzers
   e) Gas Detection System.
   f) Special Control Valves.
   g) Flexible thermocouples
   h) Mass flow meters & Vortex flow meter.
   i) RADAR type instruments.
   k) Any other special field instruments.

m. In general, intrinsically safe philosophy shall be followed for all inputs/outputs in Hazardous area except for MCC/PCC inputs/outputs.

n. All junction boxes shall be certified for weather proof with IP 65 certification for IS signal. For non IS signals, Junction boxes shall be flame proof for IEC Zone 1 & Gas group IIC Ex. Proof.Anti-corrosive paint shall be provided, Junction boxes

o. All Contacts shall be Gold Plated 2 SPDT.

p. All solenoid valves shall be of SS body.

q. For pump seal plan, guided wave radar level transmitter to be used to implement alarm etc. Level & pressure switches should not be used.

r. In general, the logic for the package units shall be executed in unit main plant PLC. All package unit logics shall be realised in main plant PLC only

t. All spares hole of JBs, T/C head etc to be plugged with metallic plugs.The metallic plugs, Junction box hinges, Handle, DIN rail, Allen screws shall be SS material of construction. Cable glands shall be provided with Cables shrouds.

u. Ultrasonic flow meters should be used for flare flow measurement.

v. Transmitter body shall have integral vent & drain facility. External manifold for vent & drain is not acceptable. For all type of transmitters glass filled Teflon O-ring to be used for oval flange. Bottom entry process connection is not acceptable.

w. For piping impulse, integral 3 ways manifold should not be used.

x. For instrument high-pressure drain vent line cap should not used. In such cases blind flanges to be used.
y. Draft transmitter open to atmosphere port to be connected with helical copper tube coil and the coil free end to be put inside a perforated pot with ceramic balls to avoid spurious tripping during high wind velocity.

z. Deleted

aa. Intrinsically safe barrier shall be active isolating type. Barriers must be selected on entity concept. It is desirable to use one make of barrier for entire plant; make shall be MTL/P+F. Barrier shall be with three-port isolation type.

bb. Junction box shall be of die-cast aluminum alloy (LM-6) anti corrosive painted. All junction box shall be weatherproof to IP-65 as well as flameproof. Junction box shall have screwed covers. All cable entries to junction boxes shall be side or bottom.

dd All instruments shall be of latest models with proven track record of minimum 2 years and spares shall be available for 10 years. No prototype instrument of an experimental nature shall be offered or supplied. No instrument requiring special maintenance or operating facilities shall be offered.

e.e Devices and equipment located in indoor/air-conditioned areas shall be designed to suit the environmental conditions indicated elsewhere and shall be suitable for continuous operation in the operating environment of G3.

f.f All Instruments connected to Process & Machine interlock circuit which leads to plant trip shall be from three separate transmitters to implement 2oo3 logic, this includes machine monitoring signals for vibration, over speed, temperature, etc.

g.g No tripping parameters shall be interfaced through serial communication and soft links, only hardwired signals shall be used. Transfer of data through serial link from DCS to PLC and vice versa shall be used only for monitoring purpose and not for control & trip.

h.h Emergency shut down push buttons of all the electrical drives shall be connected directly through MCC and not through PLC. Location of Auto / manual station as per process requirement. If auto / manual station is located in field, the same shall be directly connected to MCC.

i.i Two separate AC distribution board (Dual ACDB) fed from parallel redundant UPS are essential for Instrumentation power distribution system for the improved reliability. Each DCS AC DB shall be fed from redundant UPS feeders & shall have with static switch for change over automatically without power interruption in case of any incomer failure.

jj UPS supplies shall not be used for utilities supplies cooling fans, panel/cabinet lighting etc. A separate non-UPS supply shall be used for the same.

k.k A summary of all critical UPS alarms shall necessarily provided in DCS and hardwired annunciation in control room or any manned location

ll Only copper cables & tin-plated copper lugs shall be considered for instrumentation power distribution system.

mm UPS battery back up should be available for a minimum period of 60 minutes at full load condition. The same to be ensured during capacity discharge test of battery bank during pre-commissioning activities.
n.n Protection coordination with respect to fuse/MCB ratings from the supply source ACDB/DCDB to downstream distribution panels shall be thoroughly studied by the system designers/OEM and documented as a part of the system documentation and be implemented accordingly.

o.o Minimum two BPS shall be configured for powering all control & field devices.

p.p Use of multiple set of BPS (Bulk Power Supply) of smaller capacity in place of single set of higher capacity per unit shall be considered.

q.q A set of redundant-BPS shall be fed from two separate AC feeders. Power looping in and out shall be avoided/eliminated.

r.r The loading of individual BPS should be such that the failure of single BPS shall not result in loading of the other operating/redundant BPS beyond 70% of their individual rated capacity.

s.s “BPS failure” alarm shall be provided in hardware annunciation system and in DCS with highest priority.

t.t PLC consoles shall be considered in the new system to understand the status of the “Logic Flow” of the respective systems.

u.u Conformal coating application may be ensured in DCS/PLC cards, which are installed in control rooms or in the field-mounted control systems.

v.v SOV’s shall be IS type only. For SOV with FMR provision, tamper proof type FMR shall be used. The trip SOVs shall be in redundant pairs and configured/connected for increased reliability. The signal for these redundant SOV’s shall be driven through separate DO contact. All Coils of the SOV’s shall be hermetically sealed.

w.w For the shelter analyzers, Temperature & pressure indication shall be provided at DCS for monitoring.

x.x.1 Wherever RCC cable trenches will be used. RCC Separation shall be done within the trench for laying power cables.

x.x.2 No perpendicular crossing of Instrument and electrical cable trenches / tray. Separation of electrical & instrument cables as per ISA.

x.x.3 Road crossing of trenches shall have be done through Box Culverts.

y.y. Instrument cable crossing with electrical cable in cable trenches shall be avoided. If unavoidable reasons, Instrument trench can take over the top portion.

z.z All drawing / sketches attached with the tender are indicative only. The installation shall be done as per engineering design philosophy and process licensor by the Bidder after obtaining owner / consultant’s prior approval before erection.

a.a.a The Bentley Vibration and Temperature monitoring system shall be located in Control Room with field display unit in LCP. BN system Modules shall be mounted with Internal Barriers.

a.a.c Corrosion Monitors shall be provided in control rack room.
a.a.d Flow (with Pressure and temperature correction), Pressure and Temperature Measurement shall be required for common facilities like Inst Air, Cooling Water, Steam etc.

a.a.e G3 coating as ISA standard for DCS/PLC system hardware from OEM.

a.a.f UPS Voltage and Current trends to be made available in DCS. Provision for repeating common fault alarm to the substation to be provided.

a.a.h All Printers Shall be Laser Printers

a.a.i Latest revision of Hart protocol shall be used in universal Hand Held Configurator.

a.a.j NACE to be considered for Sour services.

a.a.k H₂S, HC detectors shall be considered as per P & ID

a.a.l Deleted

a.a.m There shall be one separate controller in DCS for all the foreign device interface

The Total Number of controllers shall be decided based on scan time and controller loading as per ITB.

a.a.n Functional distribution of I/Os shall be section wise for boiler for HT & LT, for foreign device interface

a.a.q Adequate number of smoke detectors, heat detectors, fire alarm system, rodent repellent (electronic type) shall provided in the Control room.

a.a.r Control room shall have aesthetic looking flooring, false ceiling and lighting arrangement. Bidder to take approval from PMC/OWNER for control room ambience.

a.a.s. Interpanel distances 1.6 m.

a.a.v Clean Agent System, HVAC shall also be provided in the control room.

3.3.3.20 APPROVAL / REVIEW OF DOCUMENTS

Approval category of Documents

- DCS & PLC Package.
- Package PLC Control system
- Process & stack analyzers.
- Control valves, Special Control valves
- Shutdown valves
- Gas detection & CC TV system
- Vibration Monitoring system
- Local Control Panel
- Package vendor Control panels
- Field Transmitters
3.3.4 EMERGENCY SHUTDOWN PHILOSOPHY

3.3.4.1 The Emergency Shutdown (ESD) system is designed to monitor key process variables and equipment and respond automatically or to operator initiated commands, in such a way as to reduce the risk of hazardous or destructive incidents.

3.3.4.2 The ESD system shall be independent of the primary control system and will perform the following functions regardless of the availability of the DCS:

a) Monitor dangerous conditions and take appropriate automatic shutdown action.

b) Respond to manual requests for shutdown, Reset and Override from the operator consoles or from the field as per requirements.

c) Record on a suitable Sequence of Event Recorder (SER) all events / alarms and actions taken by the ESD system.

d) Indicate to the control operator that a trip has been initiated and has been successfully completed, or has not been successfully completed.

3.3.4.3 All Process interlock inputs shown in the P&ID shall also be configured in the shutdown PLC.

3.3.4.4 ESD Logic for process packages like. Process compressors etc shall be executed in the main PLC unless specifically recommended otherwise by process licensor or sub-package supplier because of performance guarantee requirements.

In case separate PLC is used for such packages, the configuration and peripheral requirement shall be same as the main PLC. All such package PLC’s shall be located in main control room and shall be serially interfaced to DCS using dual redundant link. For all Package PLC’s, all Interlock graphics shall be made available with First out feature in DCS.

3.3.4.5 To ensure proper implementation of Engineering in line with our requirements indicated elsewhere in the document, contractor must furnish the I/O count including I/O count for all such packages in their offer with a reasonable accuracy as defined elsewhere. However final I/O count shall be based on the detailed engineering.

Generally dedicated sensors have been used for monitoring/control and shutdown

For 2oo3 logics separate I/O cards shall be used for each signal. ie; each one of the 3 signals shall be connected to three different cards, The PLC cards and racks shall be segregated equipment wise. Remote start commands for standby and main equipments shall be from different I/O cards. Bidder may also note that all the 3 signal in a 2oo3 logic shall be terminated in three different Junction boxes.

3.3.5 PACKAGE AND SUB-PACKAGE CONTROL PHILOSOPHY

3.3.5.1 The control philosophy for the packages / sub packages shall be as defined in the Instrumentation Design Basis in this package and process package. However the execution philosophy as defined in ‘Standard Specifications for Instrumentation work’, shall be followed in general.
3.3.5.2 Detailed P&IDs of the packages/sub packages shall be submitted by the contractor to Owner/PMC, showing the complete scope and connectivity to the central control systems (DCS/PLC).

3.3.5.3 Contractor shall also show in the P&ID’s all instruments and control systems necessary for safe and efficient operation of the various packages / sub packages, which are not specifically listed in this document but are required as per contractor's/manufacturer’s experience/recommendation. All such instruments and their accessories shall also be supplied by the Contractor.

3.3.5.4 For pump seal plan instruments as provided by pump supplier, their connectivity to main control system including supply of cables and junction boxes etc. shall be in Contractor’s scope and shall be shown in the P&ID.

3.3.5.5 For the packages being supplied by contractor, it is preferred that the complete Instrumentation engineering and supply shall be through the equipment sub-supplier, considering a package approach.

3.3.5.6 All package units shall have local panels which shall be used for start up, shut down and normal critical operations only unless otherwise indicated in the process package. Following points shall be kept in mind while engineering the local panels:

a) Panel shall only house switches/pushbuttons, status lamps, important alarms. No electronics/electronic devices or Instruments except intrinsically safe indicators (if necessary) and explosion proof (EEExd) alarm annunciators shall be located on the local panel. The alarm annunciators shall be integral type and shall be certified explosion proof by statutory authority.

b) In general, the logic for the package units shall be executed in unit PLC. Where unavoidable, contractor may use separate PLC. However such unit must be located in the control room and shall preferably have same make, model no. & configuration as that of unit PLC being procured by purchaser. A laptop PC with all required softwares shall be provided with package PLC as configurator.

c) The pushbutton/selector switches and lamps on the local panel shall be certified flameproof. However process switches shall be intrinsic safe with barriers in the control room/local panels as applicable. The pushbuttons/switches connected to MCC/PCC/substations shall be also be certified flame proof.

d) Anti Surge Controller, if required, shall be a separate dedicated controller in redundant configuration and shall be which should be located on hardwired console in main Control room by others.

e) Deleted

3.3.6 JUNCTION BOXES AND CABLELING PHILOSOPHY

3.3.6.1 Cable Routing

3.3.6.1.1 Contractor to note that overhead tray shall be used for routing multicables within the unit. The main tray shall be routed over the pipe rack with suitable accessible location.

3.3.6.1.2 From field junction box to over head cable tray, the cables shall be routed through perforated aluminium trays. Single pair cables from instrument to junction box shall be through perforated trays. Cable glands shall be provided at instrument end and junction box end and at local panel end (as applicable). Cable glands at control room end except for the cables connected to contractor supplied panels/cabinets in control room shall not be in their scope...
3.3.6.1.3 Wherever trenches are required, Contractor to provide RCC trench for routing of cable. Buried cable laying shall be avoided unless otherwise necessary which shall be approved by owner/PMC. All cable trenches shall be back filled with sand after cabling is completed.

3.3.6.1.4 The cables entry to main control room shall be through trenches. Multiple MCT blocks of appropriate size shall be provided by contractor for cable entry in order to avoid congestion.

3.3.6.1.5 Once inside the control room building, the cables shall be routed through the cable tray under the false flooring. The cables shall be segregated in the main cable tray/tray truck route as per unit and type of signal carried by the cables. The cables from the main trunk route shall be routed in feeder or link trays to the respective cabinet. The contractor shall be responsible for:

a) To supply, support and lay the main trunk cable tray/trays, feeder/branch/link trays to cabinets.

b) to provide all supports necessary for main /feeder/link /trays &trays.

c) Segregating all cables in the main trunk tray/tray and feeder trays and laying these upto the cabinets.

3.3.6.1.6 Proper routing of following type of cables shall be planned within control room as well as in the field trays, trenches, analyzer shelters etc. to ensure ease of cable installation and to prevent the interference among the cables:

- IS Analog 4-20 mA cables
- Non-IS Analog 4-20 mA cables
- Contact/alarm cables
- IS Shutdown cables (for solenoid valves)
- Power cables
- System communication cables

3.3.6.1.7 Cable Tray and Trays

a) Perforated aluminium tray shall be used for cable routing between junction boxes & control room and shall be routed in the topmost tier of pipe rack. Trays shall be considered only for branch cable routing.

b) Contractor shall provide continuous channel for support of the overhead tray and the same shall be suitable for a load considering 100% filling of the tray by cables. However as a good engineering practice, trays shall be sized considering 65% occupancy of the tray by cables. For ladder and angle trays Contractor shall provide support at a minimum interval of 1.5 meter.

c) The Tray shall be fabricated in general as per Tray fabrication attached elsewhere in this document. All tray/trays shall be of perforated aluminium.

e) Plant communication cables shall run in the middle compartment of the cable tray whenever no instrument cable is laid in this area. In case contractor plans to lay any type of instrument cable in the middle portion e.g. fiber optics or serial cable, separate tray/tray shall be used for laying plant communication cables. No electrical cables shall share the instrument cable tray including plant communication cable.

**ELECTRICAL FIELD WIRING**

Colour Coding for cables as per IEC.
a) Instrument electronic signal & alarm cables, single pair shall be 1.5 mm² and multi pair shall be 1.5 mm² twisted in pair individually and overall shielded with aluminum Mylar tape with drain wire and armoured.

b) Control wiring for actuating devices and solenoid valves of the interlock and shutdown system shall generally be 1.5 mm² armoured cable.

c) Multipair extension cables for Thermocouples if required shall be 20 AWG single conductor twisted pairs, armoured, individual pair and overall aluminum Mylar shielded with over all drain wire. Single pair extension cables shall be armoured cable with 16 AWG single conductor wire. The Triad single and multipair cables shall be 1.5 mm² armoured type.

d) The power cables shall be Cu contrayor and the size shall be selected based on voltage drop. The minimum size shall be 2.5 mm² armoured.

e) All cable glands shall be of SS316 and they shall be of double compression type suitable for armoured cables. All cable glands (SS316) are to be provided with PVC shroud. Flameproof glands may be provided wherever required.

PVC insulated cables shall be used. Insulation type shall be verified by respective LSTK Contractor during detail engineering and select as required.

g) For longer distances cablesizes shall be selected based on voltage drop.

h) Only 12 pair multicables shall be used for signal, control and thermocouple extension cables. 6 triad or 8 triad shall be used for RTD if required. The cable type for gas detectors is also to be included.

i) Screened twisted pair cables shall be used proximity switches, 24VDC SOVs and for cables between MCC/substation to DCS/PLC.

j) All instruments cables shall be flame retardant low smoke cables as minimum.

k) The DCS data bus outside control room / rack room shall be fibre optic armoured.

l) Multipair JBs for DCS signal & PLC signals should be separate. PLC/DCS signals should not be connected in the same JB.

m) All field mounted emergency push buttons for heaters & critical pumps/motors or any other operation should be with glass cover to avoid inadvertent operation of these switches.

3.3.6.1.8 Trench

a) Where ever cables are to be routed underground, these shall be laid in RCC trenches. RCC trenches shall have a minimum width of 2000 mm and depth of 1000 mm with angle inserts provided at 100 mm above the bottom of the trench at every 1500 mm interval. All RCC trenches shall be provided with removable RCC covers.

RCC trenches shall be sized considering future expansion of the fertilizer complex. Trench space equivalent to 40% additional cables of largest size shall be considered while sizing these trenches.
c) Each underground cable (concrete trenches) shall be provided with identifying SS Plate tags of lead securely fastened every 25m of its underground length with at least one tag at each end before the cable leaves / enters the ground.

d) For any crossing of cable trench (underground) with electrical trench, it must be made at 90° only and the cross-section area of the trench must be same at the point of crossing. The trench should have 20% space as a minimum for the future excluding the standard space for sand filling and cover.

3.3.6.1.9 Since all local panels shall have bottom entries for cables, the cable trench may be used for routing cables upto panels. The length of cable trench shall be kept minimum. The platforms where panels are installed shall be raised by 150mm above the finished level.

3.3.6.1.10 Road crossing of trenches shall have been done through Box Culverts designed for the Heavy vehicles/ crane Movements.

If for some reason, box culvert is not possible, then At road crossings, RCC cable trench shall be provided by the contractor for the cable run. Trench slabs shall be designed for the Heavy vehicles/ crane Movements.

3.3.6.2 Multicables

3.3.6.2.1 All multicables between field / analyzer shelters & main control room shall be as per clause 12.4 of standard specification for instrumentation work and shall follow the following philosophy as a minimum:

a) Signals: 6/12 pair individually and over all shielded (4-20 mA or switch contact) (screened) and armoured, twisted, 1.5 mm2

b) Thermocouple: 6/12 pair TIC extension cable

c) RTD: 8 Triad 1.5 mm2

d) Solenoid valves: 6/12 pair individually and overall shielded, armoured, 1.5 mm2

e) LEL gas detector: 8 Triad 1.5 mm2

All system cables/fiber optic cables in the field shall be routed in HDPE Hard pipe. Fillings shall be used for joining the HDPE pipe. HDPE pipes shall be ORANGE in colour with BLACK fillings. All system cables/fiber optic cables shall be routed in the middle 150mm portion of the tray. Wherever it is absolutely necessary to route these cables underground, it should be routed in the RCC Trenches only. Within the control room all system cables shall be routed within an enclosed perforated aluminium. Separate route should be followed for redundant system cables.
f) All multipair/multi-triad cables in area containing hydrogen (IEC Gas group IIC or NEC Gas Group B) shall have primary insulation of polyethylene with maximum capacitance of 100 pF/m. All other cable specifications shall be same as specified in 3.3.6.2.1 above.

g) Any other cable requiring lower capacitance necessary because of type of instrument used (for performance), intrinsic safety (for entity parameter compatibility match), for system compatibility (e.g. with HART maintenance system) etc. Contractors should use cables specified in (f) above.

3.3.6.2.2 Contractor shall clearly state if any of the above cable does not suit vendor’s instrument requirements in the offer stage itself and indicate type of the cable required.

3.3.6.2.3 In general, 80% of pairs of multicables shall be used i.e. connected to instruments. Remaining pairs shall remain unused however same shall be suitably terminated at junction boxes/Local control panels/Marshalling racks etc.

3.3.6.2.4 The multicore cables entry shall be from the bottom of the junction box. Two cable entries shall be provided for this purpose in the bottom of Junction box. Proper junction box numbering, cross-direct ferruling of the termination along with the copper lugs shall be at both the junction box end and the control room end.

3.3.6.3 Fire Resistant / Survival Cables

Any cable which is necessarily required to keep its integrity even in case of fire or where specifically indicated in P&ID or any other document attached elsewhere in this document, all these cables shall have mica insulation and shall be as per IEC-331 CAT-A type.

3.3.6.4 Junction Box

3.3.6.4.1 In general separate junction boxes shall be used for the following:

a) 4-20 mA DC signals (IS)

b) 4-20 mA DC signals (non-IS)

c) Thermocouples (if used)

d) RTDs (if used)

e) Contact signals (Field switches, push buttons etc.)

f) Interlock and shutdown signals (Solenoid valves)

g) Power supply to various instruments.

h) Gas Detectors

h) Vibration signals

3.3.6.4.2 Separate junction boxes shall be used for signals connected to PLC and to DCS. No signal shall be shared between them in the field junction boxes.

3.3.6.4.3 3-way junction boxes shall be used for connecting the field transmitter and field mounted analog intrinsic safe indicator in series with control room receiver.

3.3.6.4.4 The multi-cable entry for 6/12-pair & 8 Triad JB shall be 1” & 11/2” NPT (F). Each junction box shall be provided with 2 multi-cable entries from the bottom of the junction box with one plugged with weather proof plugs.
All spare cable cores shall be terminated in the Junction box, at the marshalling panel end and wired through spare barriers / isolators or relays (as the case may be) right upto the corresponding spare channel of I/O module.

All spares hole of JBs, T/C head etc to be plugged with metallic plugs. The metallic plugs, Junction box hinges, Handle, DIN rail, Allen screws shall be SS material of construction. Cable glands shall be provided with Cables shrouds.

3.3.6.4.5 Junction boxes, cable glands and accessories shall be weather proof in general. Slipper type PVC sleeves shall be used over cable glands for all cable entries in junction boxes to avoid water entry in junction boxes. In case of explosion-proof components used (only for packages), the respective junction boxes, cable glands and accessories shall be certified weatherproof and explosion proof.

3.3.6.4.6 All analyser sample lines shall have electrical tracings.

3.3.6.4.7 The junction boxes in the field as well as in local panel shall be provided with sufficient number of terminals to terminate all the pairs of multi-cable (including spare pairs) and shields of individual pairs as applicable.

3.3.7 FLOW METERING PHILOSOPHY

Sizing calculation shall be carried out in “Intools” (Smart Plant Instrumentation).

3.3.7.1 Contractor shall follow the flow metering philosophy as recommended by process licensors in the P&I D’s or the Instrument data sheet in the process packages. Wherever type of flow element is not shown or indicated in the process package, guidelines provided in standard specifications for Instrumentation work elsewhere in this package shall be followed.

3.3.7.2 In general, orifice plate shall be used as main flow element unless other types are specifically recommended or required because of specific process conditions like custody metering, rangeability, accuracy, line size, flow velocity, pressure drop, nature of process fluid etc.

3.3.7.3 All flow calculations/sizing calculations shall be carried out.

3.3.7.4 The sizing calculations for flow elements like orifice plates, venturi tube and flow nozzles etc. shall be carried out as per licensor’s recommendations.

3.3.7.5 In case of multi-Transmitter installation on a single element, a minimum of two pairs of taps shall be provided in such a way that not more than two transmitters shall be installed on any tap. Each instrument shall be provided with isolation. Any other guidelines over and above this requirement if indicated in P&ID or in process package, shall supercede this requirement.

3.3.7.6 Orifice plates below 2” shall be avoided. When used below 2”, calibrated meter runs shall be used along with orifice plate. Integral orifice shall be used whenever specified in the process package. Any other guidelines over and above this requirement if indicated in P&ID or in process package, shall supercede this requirement.

3.3.7.7 Restriction orifice in critical pressure drop applications or excessively high pressure drops in liquid or gas service shall be multiple orifice only. Contractor must furnish sizing calculations and design along with the Purchase requisition.
3.3.7.8 Use of PD & Turbine meters should be avoided instead; mass flow meters to shall be selected. Multiple mass flow meters may be used if single meter is not able to meet the flow requirements.

3.3.7.9 Although the flowmeters shall be selected as per the process package/P&IDs, however wherever PD/ Turbine meters are shown in the P&IDs/process package, contractor shall bring the same to owner/PMC’s notice and replace the same with mass flowmeter if so confirmed by owner/PMC without any implication. Whenever indicated, ultrasonic flow meter shall be used for applications like flare flow measurement from the unit and highly viscous flow measurement.

3.3.8 INSTRUMENT PURGING AND FLUSHING

3.3.8.1 Purge type installation shall be used in plugging, congealing and viscous services wherever permitted. However contractor shall follow the recommendations given in the P&ID’s as a minimum.

3.3.8.2 In general, continuous flushing oil purge and gas purging (fuel gas/nitrogen) shall be provided for all transmitters in heavy residue services, congealing/toxic service. However purge media shall be selected as per P&ID.

3.3.8.3 Contractor scope shall include complete purge kit including rotameters, constant differential relay, non-return valves, restriction orifice/needle valve regulators etc. as per installation standards for purge installation.

3.3.8.4 All diaphragm seal instruments (in toxic, viscous and congealing service etc.) shall be provided with purge connection. In addition flushing block with a provision to vent and drain shall also be provided in all such installation.

3.3.9 HEAT TRACING AND INSULATION

3.3.9.1 Heat tracing and insulation of line mounted instrument shall be carried out as per line specifications. Similar philosophy shall also be followed for equipment mounted instruments.

3.3.9.2 Instruments mounted on jacketed lines and jacketed equipments shall be jacketed only. In case the jacketing of any particular instrument item is not possible, heat tracing may be selected after intimation to owner/PMC before proceeding ahead.

3.3.9.3 For all steam traced lines and steam jackets, a suitable type of steam trap must be provided for proper and efficient tracing. Separate dedicated steam trap shall be used for each instrument. Steam trap shall preferably be located on ground level with its outlet connected to drain funnel or as advised elsewhere in the package. Block & bypass shall be provided for each steam trap for maintenance. The steam traps shall be imported only. Items procured from local market shall not be accepted.

3.3.9.4 Wherever electric tracing is shown in the P&ID and selected for instruments and instrument lines, this must be suitable for the line temperature rating.

3.3.9.5 In addition to lines where tracing is shown, impulse lines of all remote mounted transmitters in negative temperature typically up to -100 C shall be steam traced to maintain vapour phase. Adequate care shall be taken to minimize direct heat into the main line by cold insulating the impulse line near the take-off.

3.3.9.6 Steam tracing shall be avoided inside any room/shelter. Typically, heat tracing required within analyzer shelter shall be carried out using electric tracing. Sample line for analyzer shall be electrically heat traced.
3.3.9.7 Insulation of all in-line instruments like control valves, safety valves etc. shall be done as per the line requirements. Also all direct equipment mounted instruments like level gauge, displacer/float type instruments etc. shall be properly insulated as per insulation requirements of the equipment on which these are installed.

3.3.9.8 Asbestos rope shall not be used for the insulation of impulse tubes. Instead contractor may utilise ceramic rope unless any other requirement is specified in this package. Proper protection shall be ensured whenever ceramic rope is used.

3.3.10 INSTRUMENT DRAINS

3.3.10.1 Instruments like displacer type level transmitters and level gauges in hydrocarbon service shall have drains connected to the close blow down (CBD) system. For any additional requirements, P&IDs/process package shall be followed.

3.3.10.2 The drain line material shall be as per impulse line material.

3.3.10.3 For purging and viscous services, the drains connected upto the CBD line shall be steam traced and insulated.

3.3.11 INSTRUMENT PAINTING REQUIREMENTS

3.3.11.1 All instrument impulse lines and instrument structural items shall be painted by the contractor.

3.3.11.2 The painting/coating shall be performed in totality for all instrument items such as:

a) All line mounting and equipment mounted instruments.

b) All instrument impulse piping.

c) All instrument structural items like G.I cable trays, G.I cable trays, instrument supports and tray/tray supports, instrument stanchion, impulse line supports etc.

d) All surfaces of GI items wherever repair has been carried out shall also undergo painting.

e) All cabinets/panels, base frames which have undergone repair at site shall also be painted.

3.3.11.3 The final coating on external surfaces shall be applied just before handing over the plant or commissioning of the plant.

3.3.11.4 Paint color of the canopies shall be decided during detailed engineering.

3.3.11.5 Name of the manufacturer, colour and quality of all types of primers and paints shall be subject to approval of the owner/owner’s representative.

3.3.12 INTERFACE WITH OTHER SYSTEMS

3.3.12.1 Apart from project interface with owner/PMC for various activities defined in this contract, contractor shall also be responsible to carryout coordination activities defined herein.
3.3.12.3 Bidder to provide total two remote Operator station with password protection n in the central control room, for Steam generation unit.

3.3.12.4 Optical fibre cable shall be redundant wherever used for communication including communication between Steam generation plant control room, CCR and main fire control room. The laying of the cable shall be done with different routes and some distance apart to avoid the blackout in the CCR in case of any eventuality.

3.3.12.5 Bidder to provide interface for CCTV and Telephone network with the central control room networks, Bidder may co–ordinate with other contractor to do the same.

3.3.12.6 Fire Alarm system shall be interfaced with the Central fire station, all the necessary communication up to the central fire system PLC shall be in bidder's scope. Including OFC and network switches etc. Any alarm generated in steam generation station unit shall be displayed at Fire Control Room. Repeater panel at central fire control station shall be in bidder scope.

3.3.12.7 All network switches must have redundant power supply with a DI contact configured in DCS for monitoring the healthiness of Network Switch power status in DCS.

3.3.13 ELECTRICAL/INSTRUMENTATION INTERFACE

3.3.13.1 In order to have smooth and trouble free engineering, a proper well defined methodology must be adopted to define the interface between Electrical and Instrumentation department.

3.3.13.2 In general, contractor shall follow the philosophy defined electrical & instrument interface to this document, for the interface between these two departments. Any change from this philosophy must, in principle, be brought to the notice of Owner/PMC.

3.3.13.3 Substation interconnection with PLC/DCS are to be made through unit multipair cable only. It should have dedicated laying route inside cellar room. All these cables should enter cellar through dedicated MCT blocks.

3.3.13.4 Separate Multi pair cables shall be laid for Motor run contacts to PLC / DCS. Similarly for Start & stop Commands from PLC, separate Multipair cables shall be laid. All these cables shall be laid in Electrical Cable Trench. RCC partition shall be provided in the Electrical cable trench for separation of these signals. Separate Junction boxes shall be considered for these signals & the same shall be provided at MCC end.

Electrical/instrumentation interface system to be submitted by LSTK for PMC/OWNER approval.

3.3.14 ILOAD REQUIREMENTS

3.3.14.1 The UPS load requirement for instrumentation shall be calculated by contractor considering:

a) UPS required for various systems like contractor supplied DCS, PLC, etc. located in the control room.

b) UPS requirement for the systems and instruments connected to DCS /PLC. (Systems mean Analysers system etc. which is in contractor’s scope).

c) UPS load requirement for the non-system loads like local panels, 3 wire/4 wire instruments etc.
d) Any other load indicated in this package or as required by the contractor.

3.3.14.2 A minimum 20% additional load shall be considered over and above the actual calculated load for sizing the UPS.

3.3.14.3 Contractor shall furnish the feeder details for the units in their scope.

3.3.14.4 110 V AC UPS feeders for the systems other than DCS and PLC shall be fully isolated using Isolation transformer.

3.3.14.5 For field non-DCS higher loads like analyzer, Special Instruments, separate feeder shall be provided in UPS ACDB.

3.3.14.6 Spare Feeder minimum of 10% or one of each rating and type shall be provided un the UPS Distribution box.

3.3.14.7 The size of Terminal shall be suitable for the size of the incoming cables.

4.0 JOB SPECIFICATION

4.1 GENERAL

This document defines the instrument job requirements over and above various Standards attached alongwith this document.

4.2 TECHNICAL SPECIFICATIONS

4.2.1 INSTRUMENTS

4.2.1.1 The selection of type of instruments is Contractor’s responsibility. For the instruments where type is already identified in the P & IDs / data sheets, the Contractor shall follow the same. However during the engineering / procurement stage if it is found that a different type of instrument is most suited for a particular application then the same shall be referred to Owner / PMC for review, and if suitable, the changed instrument shall be supplied by the contractor. Contractor shall also be responsible for selecting and reviewing the type of instrument where specifically indicated in P& ID.

b) Instrument selection and specifications shall be carried out as per Licensor requirements, Design requirements, and Standard Specification for Package units in general, as appended by special requirements specified here in.

c) Instruments/systems which are common for different process conditions shall be selected accordingly. Any hardware/ additional instrument required to meet the varying process condition (e.g. regeneration, turndown etc) shall be supplied by contractor. Any software additionally required in system such as Governor system, Antisurge controllers (if applicable) etc., shall be in contractor’s scope. Any updating of P&ID and other document to include above shall be contractors responsibility.
d) Field switches should not be used. Mechanical type of limit switch not to be used.

e) Any instrument specified as proprietary item by licensor in process packages shall be procured with same specifications and from same vendors as given in the process package.

f) Special treatment (e.g. silicon coating) shall be given to Threads & stem to avoid galling.

g) CONTRACTOR shall supply SS 316 flareless compression tube fitting of three-piece construction of Swagelok / Parker or equivalent make only. The tube fittings shall be of minimum 3000 LBS rating.

The fitting/ferrule hardness shall be in the range of RB 85-90 so as to ensure a minimum hardness difference of 5 to 10 between tube and fittings. The ferrule shall be of stainless steel material, in general.

Socket-weld type forged pipe fittings of suitable material and rating shall be supplied for pipe fittings. The minimum rating shall be 3000#. Weld neck fittings shall be used where socket weld types are not allowed by piping class.

All threaded fittings shall have NPT threads as per ANSI/ASME B16.11 only.

The CONTRACTOR as per spare parts list philosophy shall supply spares against all these items.

All the pipe fittings shall be of 3000# minimum rating.

All tubing shall be properly clamped as per international standard and good engineering practice.

i) For all analysers and other special instruments, contractor shall be responsible to provide services of manufacturer personnel during engineering, testing, loop checking, commissioning of system and plant. No alternate representation shall be acceptable in any case.

j) Contractor shall supply all instruments required for the advance control requirement and connecting these the DCS. However the implementation of the advanced control strategies in DCS or supervisory computer shall be carried out by client in future, unless specifically indicated in process package/P&ID or other documents attached.

k) The material of elastomers used in instruments shall be suitable for the specified service. Use of asbestos or asbestos bearing materials shall be avoided unless absolutely necessary. The type and material of Gaskets should be strictly as per piping specifications.

4.2.1.2 Field Transmitters

4.2.1.2.1 Contractor shall supply all transmitter of SMART type transmitters with HART protocol as per design basis unless there is any technological limitation (not any specific vendor portray limitation) or specifically specified otherwise. However for PLANT, Hart functionality shall be inhibited.

4.2.1.2.2 Accuracy of the pressure and differential type of transmitters (flow, DP type level, differential pressure, gauge and absolute pressure transmitter) shall be ± 0.075% of span or better within the rangeability of 1:10. This accuracy includes the combined effect of linearity, hysteresis and repeatability. Transmitter element material shall be minimum AISI SS 316. Accuracy for analogue transmitters(non-smart) type shall be ± 0.2% or better.
All smart transmitters shall have rangeability of 1:100. Transmitter with lower rangeability shall not be supplied.

The response time of diaphragm seal transmitter shall be of the order of 3 seconds but in no case shall exceed 5 seconds. The SS316 armoured capillary shall be with PVC covering over the armour.

Static pressure rating for all the transmitters should be of the order of 100 Kg/cm² for all applications in general. However contractor must ensure that static pressure shall not be less than 1.5 times of maximum operating pressure.

The contractor shall supply at least four number of universal type of hand held communicators, contractor shall supply a minimum of two chargers for charging hand held communicators.

Update rate of the SMART transmitters shall be in commensurate with the process. It shall be equal or better than half of the scan time of the control loop specified else where in this package.

The cables for smart transmitters shall be selected based on Hart maintenance system requirements.

The square root extraction for the differential pressure based flow measurement shall be carried out in DCS.

All the transmitters should have horizontal impulse entry only for easy interchangeability without impulse modification in future.

Temperature Instruments

All temperature elements shall be duplex type.

For transmission of individual temperature signals, thermocouples shall be used in conjunction with field mounted temperature transmitters.

Resistance Temperature element (RTD) may be used as temperature primary elements where greater accuracy and better reproducibility are required than is afforded by thermocouples. RTD shall conform to standard IEC-751.

All temperature elements shall generally be protected by thermo-wells. Class 'A' / Class ‘1’ tolerance as per IEC 751 / 584-2 shall be specified for RTD / thermocouple for temperature measurement used in closed loops, interlocks and monitoring of critical parameters.

Thermocouples:

Electrical properties and tolerances shall be as per IEC-584-2.

Thermocouples shall be spring loaded, magnesium oxide mineral-insulated metal sheathed with grounded tip. Other specification shall be as below:

- Wire size shall be 18 AWG for single and 20 AWG for Duplex type.
- Sheath material shall be in stainless steel 316.
- Outer diameter of sheath shall normally be 6.4 mm.
- 'K' / 'E' type thermocouple shall be used. (For measuring of low temperature 'E' type thermocouple shall be considered.)
- Thermocouple extension wire and calibration shall conform to ANSI MC 96.1.  
- Skin thermocouples shall generally be RETRACTO type of Geyesco design with material as per API unless specified otherwise in the licensor specification/Job specification.
- Heater skin thermocouple standard should be very carefully followed based on heater piping orientation.

- For heater thermocouples, mineral insulated Inconel-600 sheath shall be considered for Non-sulphurous atmosphere and SS-446 sheath shall be used for sulphurous services. Kanthal sheath material shall be used above 870 deg. C temperature.

Resistance temperature elements

- RTD shall conform to be PT-100, 3-wire type. Din 43760 standard
- RTD shall be spring-loaded, mineral insulated and SS 316 metal sheath type
- The sheath diameter shall be 6.4 mm as a standard unless otherwise specified.

RTD/Thermocouple heads shall be as follows:

- The thermocouple head shall be connected with thermowell with 3-piece union to ensure proper contact of TC junction to thermowell.
- Head cover shall be screwed type, with SS retaining Chain fixed to body.
- Head cover shall be weather proof and ex proof suitable to specified hazardous area classification.
- Cable entry shall be 2 nos. 1/2” NPT (F) with one entry plugged with SS 304 plug.
- Terminals shall have separate screws for connecting element and extension cable.
- All RTDs including for Bearing & winding temperature shall be 3 wire, Pt 100 to DIN 43760 standard. Special application thermocouple like Skin temperature measurement for heater or reactor etc shall comply with Licensor’s specification.

Temperature Switches shall not be used.

Temperature Transmitters

Temperature transmitter shall be provided for all temperature elements (i.e. for both open / closed and interlock loops).

Temperature transmitters shall be Remote mounted type (on 2” Pipe), Smart with HART protocol with integral output meter. Transmitter shall be dual compartment type.

Head mounted transmitters shall not be used.

Conventional transmitter shall have universal input for thermocouple / RTD and output 4-20mA DC for 2 wire system.

Transmitter output signal shall be linear and directly proportional to the measured temperature with overall accuracy of +/- 0.1% FS

Transmitter shall have automatic cold junction compensation for thermocouples.

Burnout protection (selectable Up Scale / Down Scale) must be provided for temperature transmitters.

Temperature transmitters shall be provided for all temperature elements.
Temperature transmitters shall be directly connected as analog input to DCS / PLC for monitoring, controlling & trips.

**Filled system / bimetallic element local gauges**

Gas filled gauges shall be considered. No mercury filled system to be used.

Filled system elements shall be as per gas-filled (as per SAMA) as required by temperature limit and span consideration.

(Explosive, flammable or toxic liquid/gas should not be used as the filling medium)

The thermal filled system shall be equipped with ambient temperature compensation, over range and/or under range protection. Accuracy shall be ± 1% of span.

Element bulb extension shall be with armoured capillary in 316 SS having capillary length of 3.5 meter minimum.

Thermal element bulb shall be protected in thermowell.

½” NPTM adjustable bush & gland of SS shall be provided on element bulb stem to maintain the firm insertion of the bulb in thermowell.

Filled system instruments shall not be used if process contamination due to system failure is not acceptable.

Dial size of the gauge shall be 150 mm diameter.

The stem and case material of the gauges shall be 316 SS.

Range shall be selected from manufacturer's standards such that normal operating temperature indication is approximately at midscale.

In vibrating services bimetallic thermometers shall not be used and only filled capillary type be used.

All temperature gauges are to be gas filled, every angle type and no mercury liquid filled type temperatures gauges are envisaged.

Temperature gauge casing shall be SS

**Special Thermometers**

Infrared radiation thermometer, thermistor sensor etc. shall be used based on the process requirement.

**Thermo-wells**

Thermo-wells shall generally be provided for protection of the primary measuring element.
Thermowell shall be designed to two-phase flow velocity. Vibration analysis test to be carried out for Thermowells to be used in high-pressure two-phase applications. Wake frequency calculation shall be done & the same to be submitted to PMC/OWNER for review.

Reformer Thermowell shall be as per licensor specification.

Thermowells for all services shall be in SS 316 minimum, and drilled in a single piece from solid bar stock and tapered.

Thermowells process connections shall be flanged 11/2" ANSI, 300# rating. Well and flange material shall be SS 316 minimum.

For sour services, thermowell material shall be as per PMS. All thermowell shall be flanged type only. Also all thermowells with rating 900# and above shall be RTJ type only

These shall be fabricated from bar-stock.

Immersion length of thermowells for different line sizes shall be as follows:-

<table>
<thead>
<tr>
<th>Line Size</th>
<th>Immersion length (U)</th>
</tr>
</thead>
<tbody>
<tr>
<td>4&quot; to 6&quot;</td>
<td>280 mm</td>
</tr>
<tr>
<td>8&quot; and above</td>
<td>320 mm</td>
</tr>
<tr>
<td>Vessels</td>
<td>400 mm</td>
</tr>
<tr>
<td>Flue Gas Tray</td>
<td>Minimum 120mm projection inside the tray after the tray insulation,</td>
</tr>
<tr>
<td>Heater Box</td>
<td>Minimum 120mm projection inside the tray after the tray insulation,</td>
</tr>
</tbody>
</table>

Immersion length is based on 200 mm length between flange face and inner well of pipe. In vessels, where fouling with vessel internals is expected, the immersion length shall be suitably modified. However licensors standards / recommendation shall be followed as governing case.

Other sizes and immersion lengths may be considered based on special condition / actual requirements.

Generally thermowell shall be drilled bar stock. Built-up thermowells may be considered in low pressure and low velocity services like in fired heaters and also where longer thermowell immersion length are required (for greater than or equal to 500 mm).

For Alloy steel piping classes, the thermowell and flange material shall be of SS321 / SS347 (no dissimilar welding).

The design of the wells shall be verified by means of stress analysis, resulting from stream velocity condition. The wake frequency shall not exceed 66% of the thermowell natural frequency.

Pipe line below 4" nominal bore shall be blown to 4" NB size to install thermowell.

Only thermowell (test well) when specified, it shall be provided the element entry plugged with SS plug and SS chain.

All the thermowells shall be offered for hydrotesting at site to PMC/OWNER before installation.

4.2.1.3.1 Thermocouple sheath material shall normally be SS 316 as a minimum. (Inconel 600 sheath shall be selected for temperatures greater than 600 C).
4.2.1.3.2  The gauge head of the Temperature elements (TIC, RTD’s) shall be 80 mm, as a minimum to ensure maintenance ease.

4.2.1.3.3  All held mounted temperature transmitters shall be remote mounted and shall meet the requirements specified in process package. The temperature transmitters except for those in anti-surge control loop shall be smart type. and shall provide ‘HART’ output.

4.2.1.3.4  Contractor to note that all thermowells except surface temperature instruments shall be of flanged type only.

4.2.1.3.5  Skin Thermocouple Assembly

a) The heater tube skin temperature or equipment wall skin temperature shall be measured using a well-proven skin thermocouple assembly design. Process licensor recommendation wherever provided, shall be followed in toto.

b) Manufacturer’s recommendations shall be followed for the installation, which shall take care of tube expansion and lateral movement. Enough expansion loops shall be provided. The entry point shall be suitably sealed with insulation like Rockwool to ensure unhindered movement.

4.2.1.3.7  Contractor must carryout vibration analysis for all thermowells and provide suitable design wherever analysis points toward fatigue failure. The vibration analysis calculations shall be forwarded to owner PMC for review.

4.2.1.3.8  Thermowells for High Temperature

a) The thermowells for main combustion chamber shall be provided with ceramic thermowells.

b) The thermowells shall be specifically designed to meet the severe service conditions as specified in the data-sheets.

c) The thermowells shall be handled with care and shall be installed only after the completion of the complete unit installation works. The location of installation shall be such that the thermowell is not subject to any mechanical vibrations or thermal shock.

d) The thermowells sheath shall be suitable for the chamber temperature. Unless otherwise specified in the data sheets, the sheath material shall be Incalloy 800 or Inconel 600.

4.2.1.4  Level Instruments

Level Transmitter

a) Guided wave radar type instruments (SMART) shall normally be used for level measurement up to 1219 mm, wherever guided wave radar cannot be used then only external displacer type transmitter to be used. Differential pressure transmitter (Capillary type) shall be used for level measurement above 1219 mm and for services requiring purge or where liquid might boil in external portion. Internal displacer type of level transmitters shall not be used.
b) All displacer type of level transmitters shall be of torque tube type with torque tube material of inconel, as a minimum.

c) Non-contact type level transmitters may be used on corrosive, congealing, slurry services where diaphragm seal type transmitter cannot be used.

d) For all other services except vacuum, DP type diaphragm seal (capillary) instrument shall be used except for H2 services. However, capillary length should be sufficient to install the transmitter below the lower tapping. In no cases the transmitter should be installed in between lower and upper tapping. Capillary length should be decided based on CC distance, required DP range and nearest best possible place for mounting the same taking into account all structural and approach to the instrument.

e) Radar type Level transmitter to be used in place of internal displacer type wherever service is of varying density.

f) Water cut measurement with radar is to be provided for tanks, Servo for local indication can be considered only if it is essential to install over and above the radar gauge.

g) Only ultrasonic or radar type level instruments are to be used for all acid and alkali tanks.

h) For sumps and tanks, Radar type level instruments shall be used.

i) For CBD applications non-contact type top mounted level measuring instruments like radar type shall be used.

j) The level tapping from the vessels & columns are not to be taken from bottom. The lower tapping is to be from side of the column / vessel. And accordingly minimum measurement level will be considered from the minimum possible level nozzle location. The standpipe from the tapping is to have a positive slope towards the tapping.

k) Level measurement for protray tanks, two level instruments shall be provided for each tank. Both level instruments shall be different type. In general one shall be radar type & other shall be servo type. As far as possible level measurement of process equipments guided wave process radar instrument shall be used in place of Displacer type of instrument.

4.2.1.4.1 Steam Drum Instrumentation

<table>

</tr>
</tbody>
</table>

Hydra step level transmitter shall be provided in addition to this one extra GWR type level transmitter suitable for boiler application shall be provided in all steam drums.
Level transmitters used for drum level control shall not be used for rip application. 2oo3 voting logic shall be considered for trip application.

4.2.1.4.2 Level switches shall not be used as per plant philosophy, instead level transmitters shall only be provided.

4.2.1.4.3 For all the level tapings / standpipe tapings for all vessels, columns, tanks etc., free draining slope toward the vessel shall be provided.

4.2.1.4.4 All level gauges for plant shall be magnetic type except for steam drum, which shall be bicolor type.

4.2.1.4.5 Contractor shall be careful in selecting metallurgy of the instruments inline with guidelines provided in this section. However for hot and cold condensate separator, diaphragm/float material shall be tantalum as a minimum as has been recommended by licensor.

Level Gauge Glasses

All gauge glasses shall be generally steel armoured reflex or transparent type. Body material and cover material shall normally be forged carbon steel. 304 SS or other materials may be used, if required, by process conditions. Tempered borosilicate glass with asbestos or other gaskets shall be used. All gauge glasses must have a rating equal to or more than the vessel design pressure and temperature.

Reflex type will be used for clean and colourless liquids, except liquids level interface. Transparent type will be used on acid, caustic, dirty or viscous, coloured liquids and liquid interface.

Liquid level gauges shall be used for local indication. Gauge glasses shall be made of borosilicate armoured / toughened glass. Gauge glass shall be a single piece forged construction.

The transparent gauge glass shall be provided with protective shield.

In case of service of crystallizing and viscous fluids, need steam tracing at ambient temperature, level gauge shall be provided with facility of tracing.

The visible range of level gauge shall be selected to cover the operating level or the operating range of level instruments provided for the vessel.

The maximum visibility length of a single gauge shall not exceed 1500 mm. Normally glass of 300 mm (approx) section length shall be used.

On low temperature services with liquids having very high vapour pressure at ambient temperatures safety valves shall be provided on the vent connection of the gauge glass.

Frost protection shall be considered for minus temperature fluid application

Steam Drum Level Measurement

Hydra step or conductivity type measurement shall be provided for steam drum applications in addition to DP type level measurement and all other instruments, in addition to this one GWR type level transmitter suitable for Boiler application shall be provided in all steam drums/boilers.
4.2.1.4 Usage of standpipe criteria:

Level instrument and standpipe installation shall be as per requirements indicated in process package. However where no such requirements are indicated in process package, following may be adopted:

a) The usage of standpipe shall be considered for clean, non-viscous and non-crystallizing services. The size of standpipe shall be 2" NB, unless otherwise indicated by licensor’s in their process packages or shown in P&ID.

b) Standpipe shall be used if there are more than 4 nozzles required for level instruments e.g. one displacer instrument and one level gauge can be mounted directly on the equipment.

c) The maximum number of nozzles on the standpipe shall be limited as follows:

   i) To 8 with no displacer type level instrument on it.
   ii) To 6 with displacer type level instrument on it.

d) Connection of standpipe from the bottom of equipment shall not be considered.

e) The minimum readable liquid level from the bottom tangent line for level gauge with Top and Bottom connections and when both the nozzles of level gauge are from the equipment side shall be 300 mm with / without standpipe against 150mm for side-side connections.

f) Multiple gauges shall be used for visible lengths more than 1470 mm.

g) Separate standpipe to be used for boot interlace level measurement in addition to standpipe used for horizontal vessel. The intermediate connection from vessel to standpipe (third nozzle) shall be provided for interface measurement as required.

h) Where level gauges are to be used alongwith transmitter, the visible length of the level gauge shall be selected to cover the complete transmitter range.

4.2.1.5 Flow Instruments.

A) The choice of primary differential producing devices will depend on service conditions and on the permanent pressure loss, which can be tolerated. A square edged concentric orifice plate is the usual selection if conditions
permit. Quadrant edge or quarter circle orifice plates shall be used for viscous liquids and for pipe Reynolds number below 10,000 Conical entrance type of orifice plates shall preferably be used for very highly viscous liquids upto throat Reynolds number of 250. These shall be fabricated as per ISO 5167. Vent and drain holes shall be provided wherever necessary.

The primary element shall generally be thin plate, square-edge concentric orifices plate mounted between a pair of weld-neck type orifice flanges with flange taps. The minimum pressure rating of flanges shall be as per PMS. Eccentric and Segmental type of orifice plates shall be used for specific application. Quadrant edge or conical entrance orifice plates shall be used for services with low Reynolds number.

In case of multi-transmitter installation from a single orifice, separate identical pair of tappings to be provided for the separate transmitters i.e. no branching from a single tapping. All tappings emerging from orifices shall be horizontal and shall have sufficient straight length in mass balance application or if specified by Licensors.

In case, three or more transmitters are provided on single orifice, individual tapping shall be considered with isolation for transmitters.

B) Coriolis mass flowmeters shall be used where greater accuracy is required like for custody transfer, blending, feed flow from battery limit, etc and for highly viscous and fouling fluids like fuel oil etc. In no case Turbine type or PD flow meter shall be used. Where Mass flow meter is not applicable Ultra sonic flow meter/Magnetic flow meter can be used. For the measurement of Cooling water flow magnetic flow meter shall be used in general.

For airflow measurements Venturi shall be used. Pitot tube is not acceptable.

Venturi and flow nozzles may be selected where system requires low-pressure drops.

Vortex meter shall be considered as per licensor recommendation.

Ultrasonic flow meter may be considered for the flow meter on large bore piping such as flare gas measurement.

Variable area flowmeters may be used where measurement with low accuracy is accepted.

Flow nozzles, venturies, target meters, magnetic flowmeters, Vortex, ultrasonic flowmeters, self averaging pitot tube etc may be used wherever specified in the data sheet or as required.

DP type flow transmitter shall normally be electronic SMART type with integral LCD indicator for output indication.

For cooling water supply & return flow measurement, magnetic flow meters should be used. Annubar should not be used in CW line. CW line should be above ground for instrument installation purposes.

No flow switches shall be used. The same shall be achieved through flow transmitters, which shall be directly connected as analog input to DCS/PLC.

No PD / Turbine meters shall be considered unless otherwise specified by Licensor. Only Mass flow meters shall be used instead of PD / Turbine meters.

Vortex flow meters shall be taken for high rangeability applications.

Eccentric and Segmental type of orifice plates shall be used for specific applications like highly viscous fluid etc.
Quadrant edge or conical entrance orifice plates shall be used for services with low Reynolds number.

Vent and Drain holes shall be provided wherever necessary.

For fuel oil service, coriolis mass flow meter shall be used.

For steam service above 16", flow nozzle can be provided.

For combustion air flow measurement in heaters, venturi to be used instead of annubar.

However, requirement of upstream and down stream straight length should be taken care by piping group and same should be offered for review during 3D review by Instrument personnel.

C) Thin Plate Orifices:

Orifice plate shall be thin plate with square-edge concentric orifice. The plate shall be mounted between a pair of weld-neck flanges with flange taps to form orifice plate assembly.

The following sizing principle shall be followed:

a) Maximum meter flow shall equal the nearest preferred factor greater than or equal to 1.43 x Normal flow, if only the normal flow is known. If maximum flow only is given, Maximum meter flow shall equal the nearest preferred factor greater than or equal to 1.1 maximum flow given. If a rangeability larger than 30% to 90% is required, two measuring instruments with different ranges may be considered.

Orifice diameters should be selected so that the d/D ratio is between 0.30 to 0.70 for gas and steam and upto 0.75 for liquids.

b) Orifice meter differential range, shall normally be 2500 mm H2O, dry calibration. Other preferred ranges will be 500 mm, 1250 mm, 5000 mm and 10,000 mm. For compressible fluids, the selected differential in inches of water shall not exceed the upstream static pressure in pound per square inch absolute.

c) Metering orifices shall not be installed in lines less than 1½” nominal diameter. If process lines are less than 1½” the lines shall be blown to the 1½” size for the meter run, keeping the d/D ratio within limits. When the meter runs cannot be blown to 1½” calibrated meter runs may be used. If d/D ratio exceeds 0.75 for 5000 mm differential range, then the process line shall be blown for the meter run.

- Design calculation of standard type orifice plates shall be as per ISO 5167.

The flow range shall be selected such that normal flow rates are between 50% and 70% of the flow upper range value.

Material of construction of orifice plate shall be 316 SS except where this material is unsuitable for the service because of corrosion or erosion considerations, in which case an alloy shall be chosen whose corrosion allowance is equal to or better than line material. Orifice plates dimensions, finishing, flatness, tolerances for dimensions and identification information shall be in accordance with ISO standard. Orifice plate shall be provided with tab handle, which is welded on the orifice plate and engraved with following information on the upstream of the tab handle:

- UPSTREAM or UP
- Instrument tag number
- Orifice diameter, Beta
- NPS (Nominal Pipe Size) and ANSI flange class
- Material of the orifice plate

All rights reserved
CONTRACTOR shall submit the sizing calculations for orifice plates to PMC for review.

D) Flange taps orifice shall generally be used for line sizes 2” to and including 14”. Above 14” line size, D and D/2 taps shall be used. Meter run shall be provided instead of Integral Orifice assembly.

Orifice assembly shall be provided with two sets of “Flange Taps” located in accordance with latest AGA standards. The orifice assembly shall be provided with jack screw for removal of orifice plate. In case of 2 out of 3 logic requirement, three transmitters shall be used. In such case six set of taps shall be provided in orifice assembly.

Instrument tapping connections shall be 1/2”NPT (F).

E) Orifice flanges

Orifice flanges shall be in accordance with the ANSI B16.36, ANSI B16.36a, IBR, Hydrogen service and sour water requirement, and applicable piping specification.

F) D/P Flow Transmitters

For congealing services, 3”diaphragm type DP transmitters shall be used.

Flow transmitters for use with differential producing devices shall be smart Transmitter with Universal HART protocol with Latest Revision with integral LCD indicator and be furnished with test terminals and bypass diode to facilitate field testing without disconnection of integral indicator. The transmitters shall have over-range protection.

Body pressure rating shall be 100 bar minimum and measuring capsules shall be able to withstand pressure up to the body rating in either direction without damaging the instrument or shifting the zero more than 0.5% of the span. The body and other wetted parts material shall be SS 316 minimum. Other materials such as hastelloy, Monel or tantalum may be used as per process requirement.

The transmitter electronics shall be capable of monitoring their performance during normal operation. The transmitter diagnostics shall be able to detect both an input sensor failure and transmitter electronics failure. The sensor &/or electronics failure shall be transmitted to the host system (e.g. DCS / PLC). The stability shall be better than +/- 0.5% of upper range limit for 10 year.

Process connections shall be 1/2” National Pipe Thread (NPTF) and from the side/horizontal to the transmitter. Cable entry shall be 1/2” (NPTF).

Three-valve/five valve manifold and oval flange adaptor shall be provided in place of isolation & equalizing valves in the impulse piping of flow transmitters for the service up to 600 # rating. However in case of high pressure service and any special requirement, piping manifold with single / double isolation valves and equalizing valve shall be considered.

All transmitters body material shall be SS material.

G) Rotameters

Rotameters may be required as indicators or transmitters. Accuracy of measurement shall be within 2% full scale. Rotameters shall be mounted in-line for pipe sizes less than 2 inches. Armoured glass / metal tube meters shall be
used on hydrocarbon (liquid or gas) service, steam or other hazardous application. Rotameter Rangeability shall be
more than 10:1. Flow damper shall be provided for pulsating flow. Cooling fins shall be provided for high
temperature service (150 deg C & above) & extension well shall be provided for low temperature service (0 deg C
and below). Jacket shall be provided for crystallizing fluid at ambient temperature. For critical rotameters, magnetic
filters shall be installed at the inlet of the meters.

Only metal tube Rotameter shall be considered. Glass tube Rotameter shall not be used.

H) Purgemeters

Purgemeter units shall consist of a glass / metal tube rotameter with needle valve at the inlet and a built-in check
valve at the outlet. A differential pressure regulator shall also be supplied in applications where either the purge
supply or process pressures are likely to vary significantly.

The design requirements for Purgemeters include: rangeability of 10:1, accuracy of +/-2% of maximum flow, “O”
ing ring construction, and end connections of 1/4” N.P.T (F).

4.2.1.5.1 Orifice meter with flange taps shall be selected in general with other type of flow meters and type of orifice
taps as specified in process package.

4.2.1.5.2 For orifice meters where the flow rangeability exceeds 4:1, dual/ multiple transmitters shall be used
irrespective whether same is shown in the P&I D’s or not.

4.2.1.5.3 All flow transmitters etc. shall be supplied alongwith integral manifolds and integral indicators, wherever
applicable.

4.2.1.5.4 For mass flow meters,. steam jacketing wherever required, shall be part of original instrument design and
shall be manufactured and tested at the manufacturer's works only. Cables from sensor and transmitter
shall be provided alongwith the instrument and flexible conduit, as necessary. The instrument shall have
terminals for each cable termination. Flying leads shall not be used. Contractor shall ensure that selected
mass flow meter has a valid statutory certification for hazardous area upto the maximum operating
temperature specified.

4.2.1.5.6 Contractor shall supply Flare flow meter of ultrasonic type, suitable for pipe mounting (not external clamp-
on type). The flow meter shall be complete with ultrasonic transducers with insert, retract mechanism with
full bore ball valve, preamplifier transmitter with transmitter console, special cabling etc. or any other item
required to make system complete. The interconnecting cable shall be armored type only. The
preamplifier/transmitter shall be microprocessor based field mounted certified flameproof for the area
classification. The transmitter console/display unit shall be provided for display of readings, configuration,
and calibration. The transmitter shall be capable of performing the pressure and temperature comparison
and hence mass flow calculations. Separate pressure (absolute) and temperature transmitters shall be
used for flow compensation irrespective of representation on P&ID. Additionally fault and flow alarm shall
be provided. The flow meter shall meet the following requirements:

Material of construction : SS 316 (Sensor1 Housing, Ball Valves)

Accuracy: Better than ± 5% of volumetric flow with no effect of
molecular weight variation on the accuracy
Repeatability : ± 1.0% of full range
Range ability: 1000:1
Output update: Better than once in 5 seconds.
Output: Isolated 4-20 mA for each volume flow rate, mass flow meter, molecular weight and velocity.

Contractor shall consider the straight length requirements while designing the system to meet the accuracy requirements.

### 4.2.1.5.7 Pressure Instruments

#### A) General

Gauge Pressure / DP transmitters shall be used for measurement & control of process pressure from DCS. Local indication shall be by means of pressure gauges (bourdon tube, diaphragm or other element) to suit the application.

#### B) Pressure Transmitters

All transmitters (including diaphragm seal) used in Hydrogen service shall be SS316 L Gold plated type.

No pressure switches shall be used. Instead pressure transmitters shall be considered which shall be directly connected as analog input to DCS/PLC. In case of DP applications in vessels & reactors, if the DP range is more than 1 KG/cm², two individual PT to be used in lower & upper level and DP to be calculated in DCS. This is to achieve better reliability and to avoid effect of accumulation of condensate in upper leg of DP transmitter

Pressure transmitters shall have suitable pressure sensing element and normally be with integral indicator.

The pressure transmitters shall have zero and range adjustable, and it shall be specified so that the normal operating pressure is within 40% to 70% of the calibrated range.

Overrange protection to 1.3 times the maximum range of the instrument shall be provided.

Transmitters in vacuum service shall be capable of withstanding full vacuum regardless of range, without damage or calibration shift.

Pressure transmitter process connections shall be 1/2” NPT (F).

The cable entry for transmitter shall be ½” NPT (F).

The body and wetted parts material shall normally be SS 316. Other element materials shall be based on process requirement.

Transmitter output, as specified, shall be linear, directly proportional to the applied pressure.

All transmitters shall be Smart type with HART protocol and with integral LCD indicator. Also transmitter shall have test terminals and bypass diode to facilitate field-testing without disconnection of integral indicator.

The stability shall be better than +/- 0.5% of upper range limit for 10 year.

Flush type diaphragm seal element with capillary shall be used for congealing, corrosive and highly viscous services. The extended capillary shall be minimum 3 meter long.

The process connection shall be flanged 3” ANSI RF.
The material for the diaphragm shall be as per process requirement, but minimum 316 SS

The flange material and rating shall be as per piping specification / SS-316 minimum.

C) Pressure Gauges

All gauges shall be provided with safety glass or shatterproof glass.

Local indication shall be by means of pressure gauges utilizing a bourdon tube, diaphragm or other element to suit the application.

Local pressure gauges shall have 150mm dials and shall be quality gauges designed for the process industry.

Ranges of gauges shall be selected such that the normal operating pressure indication is approximately at mid-scale.

Accuracy of local pressure gauges shall be +/-1.0% of full scale.

All pressure gauges in toxic service or with ranges 0 to 100 kg/cm² and above shall have safety type, solid front case.

In general for all transmitters like (Pressure, Flow) shall have an integral output meter with configurable LCD display with engineering unit, will be considered. It may be that in instruments, where configurable engineering unit display not available as standard, then the same to be considered as per standard available. Remote mounted meters may be provided for specific applications. However, same should not be put in series in the main loop. For realizing this requirement, single input & dual output barrier & AO Barrier shall be used.

Diaphragm seal element with capillary shall be used for congealing, corrosive and highly viscous services. Capillary shall be of minimum SS316 and shall have SS304 armouring with PVC covering.

No pressure switches shall be used. Instead pressure transmitters shall be considered which shall be directly connected as analog input to DCS/PLC. In case of DP applications in vessels & reactors, if the DP range is more than 1 KG/cm², two individual PT to be used in lower & upper level and DP to be calculated in DCS. This is to achieve better reliability and to avoid effect of accumulation of condensate in upper leg of DP transmitter.

Pressure gauges in pump discharge services are to be either with capillary diaphragm seal type or located in a remote location.

All pressure gauges shall have SS casing.

Pressure gauges shall be capable of withstanding intermittent overpressures of 1.3 times the maximum scale reading without damage or calibration shift of more than 1% of the scale reading. Blow out disc shall be provided for all ranges & solid front shall be provided for ranges above 100 Kg/cm².

Cases for gauges having ranges between 0-2 and 0-20 Kg/cm² shall have blowout discs in the back of the case.

Cases for gauges having ranges above 0-100 Kg/cm² shall be of the solid front type having blowout backs.

Gauges connections size shall be 1/2” NPT (M). Connection location shall be bottom for local mounting with wrench flats or back for local panel board with mounting flange.
All the gauges shall be equipped with 2 way valve manifold.

The standard measuring element shall be a bourdon tube of AISI 316 stainless steel, except where the process fluid requires the use of special material.

Bourdon tubes shall be welded to socket and tip and stress relieved as required.

Diaphragm type shall be used where necessary to protect gauges from corrosive fluid, crystallizing fluid, fluid including solids and high viscous fluid.

Diaphragm seals shall be of welded diaphragm type close coupled to the instrument, or connected to it with capillary tubing.

The connection size for diaphragm type gauge shall be 11/2” flanged. The diaphragm material shall be minimum 316 SS & flange material and rating shall be as per piping specification / minimum SS 316.

In case, the diaphragm seal type instrument with extended capillary is used extended capillary tube shall be armoured with stainless steel, and length shall be as determined individually but minimum 3 meter.

Diaphragm seals shall have flush connection 1/4” NPT with plug and filling connection.

For viscous fluids, the diaphragm seal shall be clean-out type with removable bottom case.

Sockets and tips shall be of the same material as the measuring element and shall be welded to the element using the same filler material. Movements shall be SS 304.

Dial face shall be white with black graduations marked. Also, the operating range shall be marked with ‘Green’ band and above range shall be marked with ‘Red’ band.

The gauge pointer shall be adjustable without removing it from its shaft. All pressure gauges shall be provided with block and bleed valves securely fastened with identification tags.

Pressure gauges in pump discharge services are to be either with capillary diaphragm seal type or located in a remote location.

Case shall be of stainless steel, solid front type and IP-65 minimum.

D) Auxiliary components for pressure gauge

Over range protector (gauge saver) shall be provided where a pressure gauge cannot withstand a protuberant pressure due to unavoidable operation. Over range protector whenever used shall be of SS316, as a minimum.

Pulsation dampener shall be provided for all pulsating services e.g. Reciprocating pump discharge piping etc. Pulsation dampeners shall be of minimum SS 316 and have connection 1/2” NPT (F) on both ends. Dampener shall be provided with integral screw head needle valve to adjust aperture externally.

Pigtail type siphon shall be provided for steam service. Siphons shall be made of minimum SS 316 having connections 1/2” NPT (M) on both ends.

E) Draft Gauges
In general, the draft gauges shall be provided for each process heater to measure draft at burners, and in the stack, if required by process. Direct connected gauges for indication of very low pressures and vacuum in the range of 0-0.5 m bar to 0-150 m bar shall be vertical scale gauges utilizing a slack diaphragm (rubberized nylon or equivalent) as the sensing element.

Draft gauges shall be designed for 2-inch pipe mounting.

Where draft gauges are for use in the field, a suitable housing shall be provided.

The design of the draft gauge shall incorporate linearizing linkages where necessary to ensure a linear response of the indicating pointer.

Draft gauges shall be required to have an accuracy of +/-3% FS or better and shall be capable of withstanding pressures or vacuum equivalent to 100% overrange.

Process connection shall be 1/4” NPT (F).

### 4.2.1.6 Control Valves

**General**

a) Control valves shall normally be Globe type single seated or double seated. For clean services, guiding shall be top and bottom/cage type. For highly viscous services, cage guiding shall be avoided. All control valves shall be with Leakage class IV as minimum for all types.

b) All shutdown valve tubing should be of 12 mm size in general.

c) Ball valves shall be considered for services where solids in suspension, high rangeability, low-pressure drops, and tight shut-off are required.

d) Triple offset Butterfly valves /Rotary type valves shall be considered for services where solids in suspension, low pressure drops and high capacities are required. All butterfly valves shall be triple offset type with leakage Class IV as minimum.

e) Angle valves shall be considered for services where flashing, coking, solids in suspension or very large pressure drops are encountered. Angle valves should be in general multistage plug type and not cage/channel stream type.

f) Smart positioners shall be provided with metallic casing/cover along with software for valve signature collection.

h) For steam / BFW application, body metallurgy of control valves shall be WC9 or F22 as minimum.

As a minimum, trim MOC shall be hardened stainless steel like 440 C, 17.4 PH. For BFW service control valves trim shall be SS316 with nitride/440C or better. Stellite is not recommended for BFW services.

For erosion service, high pressure drop, cavitating service hard surfacing of plug and seat material, stellite shall be used for all cases. Special cases valve may require 17.4PH seat and 440C solid plugs or other suitable material for severe services like steam etc.
i) Class VI leakage class with metal seat shall be considered for fuel gas services to flare below 200 deg C and/or 20 Kg/Cm² pressure drop. Above this pressure & temperature, leakage class V with metal-to-metal contact is to be considered.

j) Only SMART Positioners shall be used for all control valves and damper control. Usage of I/P converters shall be avoided. For high temperature services (Above 200 Deg C) remote feedback shall be used for the smart positioners.

k) All Solenoid valves shall be of SS body. All solenoid valves shall be either intrinsically safe type with 24VDC. It shall have integral terminal box. Flying leads are not acceptable. Solenoids shall be de-energized to trip. All the SOVs shall be direct operating type. Pilot operated SOVs shall be avoided. The trip SOVs shall be in redundant pairs and configured/connected for increased reliability.

l) The filter for AFR is to be 5 micron.

m) Block valve shall be line size and bypass valve control valve body size. Drain valve size shall be ¾” gate valve and provided with Blind flange.

n) All the shutdown valves shall be full port Ball type unless otherwise specified in the process package or P&ID. Other type of valve body shall be selected if ball type of shutdown valve can’t be used

A) Butterfly valves /Rotary eccentric type valves shall be considered for services where solids in suspension, low pressure drops and high capacities are required

B) Control Valve body shall be flange joint type.

C) Anti-cavitation trim shall be selected wherever cavitation is expected in the valve.

D) Sizing of control valves shall be as per ISA-S75-01. Also valve selection to be made for the manufacturer’s valve “CV” at maximum opening is not less than 160% of the CV calculated for normal design flow or 110% CV of maximum flow, whichever is higher.

Valve travel shall be between 20% to 70% for specified minimum & maximum flow.

Minimum body size of the control valve shall be 1” for all the line size. Reduced trim shall be considered for smaller line size / small flow.

CONTRACTOR shall submit the sizing calculations for all control valves in INTOOLS Package.

E) Valve Trim Characteristics
Equal percentage plugs shall normally be used when there are large variations in valve pressure drop.

Linear characteristic plug shall be selected for
   a) Level control
   b) Over pressure control in steam or gas service
   c) Small variations in valve pressure drop
   d) Operation by remote hand controller
   e) Split control and parallel control by two valves
   f) Small CV and low noise valves as designated by MFR.

Quick opening trim shall be used for ON-OFF and Emergency Shutdown Valves.

Material used for Trim shall be minimum 316 Stellite, with guide bushing of hardened stainless steel like 440 C, 17-4 PH all up to a pressure drop of 10 kg/cm. For higher pressure drops or erosive and slurry services and in general for all steam services, hardsurfacing of plug, seal rings and sealing area of inner valve with stellite shall be used.

Special cases may require 17-4 PH seat ring and 440 C solid plugs or other materials like Hastelloy, Monel etc.

Licensor requirements shall take precedence

F) Face to face dimensions of the control valves shall be as per ANSI/ISA-S75.03

G) Noise level measured at 1 metre downstream and 1 m upstream of pipe wall shall not exceed 85 dB. Source treatment of noise shall be preferred by using special trims like anti-noise trims.

H) Copper or copper alloys in valves and accessories shall be avoided.

I) Seat leakage shall be chosen in accordance with process demands, safe operation of the plant and shall conform to ANSI / FCI 70.2

J) Bonnet shall be provided with cooling fins or extension when the fluid temperature is 230 °C and more and shall be of extension type for low temperature -18 °C and below.

K) Flanged bolted type gland stuffing boxes shall be used. Packing shall normally be Teflon on liquid and gas service upto 200°C. Grafoil shall be used on steam service and temperature above 200°C.

L) Generally, control valve actuator shall be of the spring and diaphragm, pneumatically actuated type. Standard air control signal to positioner shall be 0.2 to 1.0 kg/cm2g. Piston type actuators with or without fail-safe capacity tanks shall be considered if actuator force requirements fall beyond the normal range of diaphragm actuators. All actuators shall be adequate to fully stroke the valve under the maximum differential pressure specified by the process requirements.

M) Smart positioners to be considered for all control valves. Air filter Regulator filter to be 5 micron. Miniature type, plastic body & drain assembly etc as parts of air filter regulator are not acceptable. For high temperature services (Above 200 Deg C) remote feedback shall be used for the smart positioners

N) E/P positioner shall be Smart type, operating on input signal 4-20 mA DC, and with HART protocol for diagnostic & remote calibration. Canopy shall be provided for E/P positioners and other accessories as required.
Partial Stroke testing shall be provided for ON / OFF valves using Smart Positioners for fail close valves. DCS AO (open loop) shall be used for realizing this partial stroke testing.

Partial Stroke Testing

Partial Stroke Testing (PST)
Partial stroke testing shall be performed to ensure satisfactory operation of on-off valve including all accessories on demand. The test shall be performed automatically by partially (around 10%) stroking the valve while these valves are in service. The test hardware and software shall meet the following minimum requirements;

a) Partial stroke test scheme shall be complete with all hardware and softwares which shall include solenoid valves, valve positioner and logic solver. All components used in PST shall be fail safe and shall not affect the on-off valve performance under any circumstances.

b) The PST design shall ensure;

i) The testing shall be carried out automatically at pre defined intervals which shall be adjustable.

ii) The shutdown demand shall always over-ride if PST is in operation at that time.

iii) The valve shall not operate beyond a predefined maximum allowable stroke valve under any condition or failure. When valve positioner is used to realise PST, the positioner output shall be limited beyond the allowable value in case of valve stuck condition.

iv) Audit trail shall be available to indicate time and date of PST, test results (OK / fail), reason of failure, changes made etc as a minimum.

v) Upward connectivity to purchaser’s Host system.

Vendor shall supply the complete testing assembly duly tubed / piped / wired on a SS mounting plate of thickness 3.2mm suitable for 2” pipe stanchion mounting. Standard pre designed rigidly mounted components shall also be acceptable for PST assembly.

O) Deleted

P) E/P Positioners, solenoid valves, booster relay, air lock relay, limit switches etc shall be supplied wherever required. Smart positioners shall be provided with metallic casing/cover along with software for valve signature collection.

Separate air filter regulator shall be used for each E/P Positioners.

Q) In general all tubing and fittings for control valve pneumatic signal shall be SS 304 minimum.
R) Hand wheel shall be considered where the block and by-pass valves are not provided in the process piping or when required by process. In general no by-pass or hand wheel shall be used for shutdown valves unless otherwise specified by licensor.

S) Limit switches (Proximity type) and any other electrical accessories shall conform to the electrical area classification and environmental conditions.

T) Limit switches shall be of Proximity type and intrinsically safe certified. Limit switches shall be provided both for close and open positions for all shutdown valves.

U) SIL3 certified 2oo3 Solenoid valves (Direct acting type) with plunger feedback shall be used as the pilot valve to trip a critical shutdown valve, Redundant SOV shall be used for non critical trip valve. Solenoid valves, wherever used, shall be universal type and shall be continuous rated type with class H coil insulation as per IEC 85/IS 1271. Ingress protection shall be IP67. All SOVs shall be SIL 3 certified.

Solenoid valve shall be of SS body with SS316 trim, as a minimum. Field manual reset shall be provided as per P&ID.

The solenoid valve operating voltage shall be 24 V DC and IS (intrinsic safe). For SOV with Field Manual Reset, the same shall be tamperproof manual reset type else SS illuminated ex-proof PB station shall be provided in field.

Direct line mounted SOV shall not be considered.

W) Seat leakage class for single ported and double ported valves or cage-guided valves shall be minimum class IV type. All tight shut-off valves specified by Licensor shall meet class V seat leakage class requirements for metal-seated valves and class VI requirements for soft-seated valves as per FCI 70-2.

Class-VI leakage class with soft seat shall be considered for fuel gas service to flare below 150° C and/or below 20-kg/cm2-pressure drop, other than this metal-to-metal contact with leakage class-V to be used.

X) The other auxiliary devices such as lock up relay, pilot relay, booster relay volume tank etc. shall be provided as parts of the actuating system in order to achieve the required stroke-speed, fail safe action etc. Instrument Air volume tank shall be of SS material of construction. Air reservoir shall be sized to maintain the valve open for 30 minutes of instrument air failure.

Y) All control valves in service for temperature less than –20 deg.C, shall undergo cryogenic testing in line with BS-6364.

Z) Deleted

Z1) Deleted

Z2) Class VI leakage class with soft seat shall be considered for fuel gas services to flare below 200 deg C and/or 20 Kg/Cm2 pressure drop. Above this pressure & temperature, leakage class V with metal-to-metal contact is to be considered.
Z3) Actuators
   a) Diaphragm actuators shall generally be used with 0.2 - 1.0 kg/cm²g spring range. For larger dP shut offs, higher spring range/higher areas shall be considered.
   b) Piston actuators can be considered for high-pressure drop services.
   d) Control valve / on-off valve, pneumatic valve shall be designed for minimum 4Kg/cm² air pressure.
   e) Valve actuators shall be designed with 1.5 times factor of safety.

Z4) All limit switches shall be proximity type only including the packages

4.6.1.6.3 All control and shutdown valves shall have flanged body. Welded type control valves shall not be used for any service, unless otherwise indicated by the licensor in process package.

4.2.1.6.4 For all valves with temperatures above 200 ºC, valve bonnets shall be with radiation fins / extension bonnets. This temperature limit shall be followed irrespective of any manufacturer claim of suitability of standard valve upto higher temperatures.

4.2.1.6.5 For all control valves, the trim characteristics shall be Equal Percentage except for high noise, cavitating or extremely low flow application where parabolic/modified =% shall be used. However for valves in open-close service, the trim inherent characteristic shall be On-Off.

4.2.1.6.6 The type of control valve body shall be selected by the contractor as per process package/P&ID. Contractor shall, in any case, be responsible for the correct selection based on the application and process data.

4.2.1.6.7 All the shutdown valves shall be full port Ball type unless otherwise specified in the process package or P&ID. Other type of valve body shall be selected if ball type of shutdown valve can't be used. Wherever timing requirements are specified by licensors for shutdown valves contractor shall meet the same and take approval from owner for the hook up arrangement of such tags.

4.2.1.6.8 Wherever shutdown valves have been specified as ‘Fire-proofed’ both valve body as well as valve actuator shall have fire proofing meeting requirements of API-607. For actuator where no testing standard exists, the testing requirements specified in API-607 for valve shall also be applicable for valve actuator.

4.2.1.6.9 Wherever contractor shutdown valves are installed in vacuum service or are likely to experience vacuum, the valve gland design shall be suitable for such a service.

4.2.1.6.10 For split range application, independent manipulated signal shall be used for each split range valve (i.e. use separate controller and Smart positioner for each valve).

4.2.1.6.11 Contractor to note that for the control valve actuator-coloring scheme shall be as follows:

   Direct Acting (Open on Air failure) valves : - Green.
   Reverse Acting (Close on Air failure) valves - Red

   Also all the control valve shall be tagged by fixing Acrylic tag plate.
4.2.1.6.12 In case multiple valves are required to be installed because of controllability or rangeability requirement, the same shall be provided by contractor irrespective of representation shown in the P&ID.

4.2.1.7 Pressure Relief Valves / Safety Valves

A.1 Sizing of safety relief valves shall be in accordance with API RP-520 (latest edition), Indian Boiler Regulations ASME Section I (Power Boilers) and ASME code for Pressure Vessels Section VIII'. The code stamps shall be provided for safety valves in case ASME and Indian Boiler Regulations design.

Safety relief valves shall normally be direct spring loaded types and provided with full nozzle type. Balanced bellows type safety valves shall be provided when variable backpressure exceeds 10% of the set pressure or fluid is corrosive. Pilot operated pressure relief valves shall be used for special services and where set pressure is closer than 10% of the operating pressure, in general. Thermal relief type valves shall be used for thermal expansion of liquid or gas. Vacuum relief type valves shall be used for Storage tank. Steam jacket type safety valves shall be used for crystallizing fluid at ambient temperature.

A.2 Thermal relief valves shall be flanged with Inlet 1” 600# RF and outlet 2” 150# RF with typical “D” designation and typically 0.38 cm² orifice size.

A.3 The body material shall, as a minimum, be as per piping specifications. Nozzle and disc material shall be SS316 as a minimum with machined stainless steel guide, and spindle. Whenever semi nozzle designs are unavoidable, body material shall be atleast same as nozzle material.

11.4 The spring material of pressure relief valves shall be as follows unless otherwise necessary because of process conditions.

-29°C to 250°C : Cadmium/nickel plated carbon steel
Above 250°C : Tungsten alloy steel
Below – 29°C : Stainless steel 316

A.5 Flanged connection shall normally be specified

A.7 Conventional type safety valves shall have vented bonnets with screwed caps; balanced bellows type safety valves shall be of the yoke type with screw setted caps.

A.8 Plain lifting levers shall be provided for steam and air services. Packed lifting levers shall be used when protection against leakage is required.

A.9 CONTRACTOR shall submit calculations for all safety relief valves.

A.10 All safety relief valves relieving to flare header shall be balanced bellows type only with trims and bellows in SS 316 L.

A.11 Pressure relief valves required for liquid service shall have liquid trim with discharge coefficient certified by ASME.

A.12 Pressure relief valve body casting and nozzle casting with inlet rating of 600 # and above in Hydrogen service shall undergo Helium leak test.
4.2.1.8 Pressure Reducing and Desuperheater Station

4.2.1.8.1 Desuperheater specification shall be as per requirements specified elsewhere and other specifications as specified elsewhere in this package. Wherever pressure reduction is also required along with Desuperheater, PRDS design shall be with separate pressure reduction valve and separate temperature valve. Integral PRDS are not acceptable. The valve shall be specially designed for high differential pressure, high temperature and high pressure steam application. This should also be ensured in case of Desuperheater design.

4.2.1.8.2 Desuperheater design should ensure that the temperature at the outlet shall be maintained within ±5 deg. C of the desired outlet temperature, unless otherwise specified by the process licensor.

4.2.1.8.3 Separate liquid injection valve and steam valves, if provided, must be installed along with block and bypass valve.

4.2.1.8.4 The body and trim material of construction shall be suitable for the service. In general trim including spray nozzles shall be STELLITED.

4.2.1.8.5 The PRDS/DSC in steam application including valve in Boiler Feed Water line shall be IBR certified.

A.1 Desuperheater design shall ensure that temperature at the outlet shall be maintained with +/-5 deg. C of desired outlet temperature, unless otherwise specified by the Licensor.

A.2 Separate liquid injection valve and steam valve, if provided must be installed along with block and bypass valve.

A.3 The body and trim material of construction shall be suitable for the service. In general trim including spray nozzle shall be stellited.

A.4 The PRDS/DSC in steam application shall be IBR certified including valve in boiler feed water line.

A.5 The CV shall be calculated in accordance with manufacturer’s calculation procedure and selected based on following points:

- Valve sizing shall be based on the maximum capacity of 1.25 times the normal flow or 1.1 times the max. Flow, whichever is greater.
- The minimum flow capacity shall be suitable for rangability of 30:1. The valve stroke shall not be less than 20% opening at the minimum flow capacity.
- Fluid velocity at the outlet shall be selected suitably in consideration of the property of fluid, the differential pressure of the valve and the line size etc.
- Noise level at 1 meter down stream of DS and at distance of 1 meter from the pipe surface at normal flow shall not exceed 85 DBA.

A.6 A manual operator, limit switch, solenoid valve or any other auxiliary devices shall be provided.

A.7 Mfr. Standard manual operator / Hand wheel shall be provided.

A.8 Direction of flow shall be permanently affixed on DS body.
4.2.1.9 Rupture Disc

A.1 CONTRACTOR shall provide rupture disc assembly wherever shown in P&ID. The assembly shall consist of:

A) The rupture disc fitted in a pre torqued holder assembly.
B) J bolt for proper installation
C) The Rupture disc experiences vacuum, shall be provided with vacuum support as recommended by manufacturers.

Disc material shall be compatible with the vessel contents and shall be consistent with the bursting requirements. Inconel discs shall be used above 100ºC if compatible with the process fluid.

A.2 When rupture disc is used upstream of a pressure relief valve, a pressure gauge, pressure switch and excess flow check valve / safety relief valve as recommended by manufacturers. (Tell-tale assembly) shall be provided on the downstream of the disc to indicate any rupture of the disc. In addition derating capacity factor for the safety valve – rupture disc assembly as recommended by ASME section VIII shall apply. Tell –tale assembly as above must be provided irrespective of P&ID representation. For plugging toxic service pressure gauges shall be diaphragm seal type.

A.3 Each rupture disc must be supplied with minimum 3 number of additional discs. This is in addition to discs required for carrying out burst testing at factory.

A.4 The indication of leaky rupture disc (i.e. the disc with a pen hole) or burst rupture disc shall be provided in the main control room.

A.5 The bursting tolerance of the rupture disc shall be ±5% of the specified bursting pressure or less. Unless otherwise specified.

4.2.1.10 CABLE TRAYS

a) Cable trays shall be perforated aluminum material.

b) All branch cables/tubes shall be run on cable trays. These cable trays shall be perforated type made of galvanized mild steel sheets of 2.0 mm thickness as a minimum.

c) Cables shall be laid over ground on racks or sleepers except for exceptional cases, where underground cabling required.

d) Cable trayroute should be away from hot pumps.

e) Cable tray laying to take care of the necessary clearances for fire proofing of structures.

g) Optical fiber cables and other communication cables pertaining to Machine monitoring system / analyser systems etc. shall be armoured.
4.2.1.11 EARTH PITS

Separate earth pits shall be provided for system earth, IS earth, power earth, and general body earth for instruments, equipments, junction box body etc. These earth pits shall be separate and isolated from electrical earth pits. Earth pit resistance and exact no earth pits/electrodes shall be considered based on the DCS/PLC & other instrument's manufactur's requirements and recommendation. For system earth redundant earth pit shall be provided. Both earth pit shall be connected to form ring loop. Earth resistance shall be decided in consultation with DCS/PLC vendor.

4.2.2 SYSTEM ORIENTED ITEMS

a) All units of LSTK package shall utilize the following control systems;
   i) Unit regulatory Control- DISTRIBUTED DIGITAL CONTROL AND MANAGEMENT INFORMATION SYSTEM (DCS)
   ii) Unit shutdown and interlock system- Programmable Logic controller (SIL3 certified)
   iii) Sub-Package Unit interlock & shutdown system (SIL 3 certified)- Unit programmable logic controller unless dedicated recommended by sub-package supplier.

c) For contractor supplied system/PLC all system cabinets especially those with electronic modules power supplies shall have enough number of cooling fans and ventilation louvers. In case of failure of any fan, contact shall be provided by contractor for generating alarm on DCS. In addition, all cabinets shall have temperature sensors for monitoring & alarm in DCS.

d) The minimum specifications of the DISTRIBUTED DIGITAL CONTROL AND MANAGEMENT INFORMATION SYSTEM (DCS) and programmable logic controller being procured by Contractor as given in the following clauses. In case, any additional feature is absolutely necessary for the proper unit operation, contractor shall supply necessary hardware & software to meet the system functional requirement without any cost & time implication.

PROVEN TRACK RECORD

LSTK contractor as offered / selected all instrument & accessories shall be field proven and should have been operating satisfactory for a minimum period of 2 Years. As on bid due in similar process condition in a Refinery / fertilizer. Items with prototype designs or items not meeting provenness criteria specified above shall not be offered.

The following information shall be furnished as a minimum along with their offer to support the proveness of the instruments being offered by them.

- Name of the Plant and Customer
- Model No. of the supplied Instrument
- Year of supply and commissioning
- Name, address, telephone/ fax no., e-mail of the contact person
- Application details

For DCS / PLC system the proven record must be available for the selected console / controller combination as a minimum.
The proven track record shall be as typical formats attached in Sample PTR Formats
4.2.2.1 Specific Requirements to DCS& PLC package.

The Special instruction shall read in conjunction with Design Philosophy requirement DCS / PLC Data Sheet and Job standard specification for DCS, design other specifications and other requirement shall be complied.

In case of conflict, the data sheets and this SIV shall override in general, however it shall be obligatory on the contractor's part to bring to the notice of the purchaser all such conflicts, wherein the PMC/OWNERS decision shall be final.

SPECIAL INSTRUCTIONS

4.2.2.1.1 Contractor to note that they shall be fully responsible for the Bill of Material submitted by them to meet all hardware and functional requirements as indicated in tender document. In addition, contractor shall be fully responsible for the total scope of work indicated in the document on turnkey basis and meeting all functional requirements through hardware and software during detail engineering.

4.2.2.1.2 In case of conflicts with respect to specifications, datasheet and any other engineering requirement or legal regulations, the contractor shall consider the most stringent requirement by default while selecting the DCS and PLC system.

4.2.2.1.3 System Modification / Change Management.

a) Contractor shall carry out all the modifications/changes/revisions necessary to be incorporated and pointed out at the time of FAT including graphic changes, wiring changes, I/O assignments, logic changes etc.

b) Contractor shall carry out all changes/modifications/revisions which are to be carried out during installation including additional inputs for sub-package items, configuration of new tags, termination changes, incorporation of cable schedule connections, modification and addition of new graphics, modification of group trend history etc.

c) Contractor shall carry out any changes required during loop checking and pre commissioning activities such as range change, graphic display changes, d) reassignment of I/O, termination changes etc. shall be performed by contractor.

e) Contractor shall carry out changes/modifications required in the system during commissioning and start up due to operational requirements like graphic changes, tag reassignment, tags new assignment, history trend and grouping, format changes, set point range changes, logic modifications etc. Contractor scope shall include incorporation of all such software/hardware configuration, engineering changes that may occur for normal engineering project execution.

f) Any changes mentioned in (a) to (e) shall be carried by Contractor on Free of Cost basis.

4.2.2.1.4 Contractor to note that Purchaser reserve the right to associate their personnel at any or all stages of project execution. Further, contractor shall not proceed without getting prior approval from purchaser for the documents required to be approved under "Contractor Data Requirement".

4.2.2.1.5 The storage of items / equipment at site shall be contractor's responsibility for all the items / equipments supplied by them. Handling of material at site is contractor's responsibility.

4.2.2.1.6 -
4.2.2.1.7 The loop checking shall be carried out in co-ordination with site Contractors, package contractors, purchaser / Field Contractors in accordance with Job standard specification for DCS and the requirements given in this document. It is essential that dedicated team of skilled personnel from contractors side shall be provided at site for each package item so that the execution activities such as installation, loop checking, commissioning, SAT are independently and conveniently done as required.

4.2.2.1.8 Power supply:

4.2.2.1.8.1 115 VAC UPS

115 VAC UPS systems shall be provided for New PLANT units by contractor as per specification the Electrical part of this document.

i. One 115 VAC UPS for EACHPLANT in Control Room UPS Room. Supply and laying of all necessary power supply cables is in contractor scope.

ii. For Non-DCS loads, major loads above 1.5 KVA, the feeder shall be provided from UPS AC Distribution Board (UPS ACDB) located at UPS room.

iii. For smaller loads, the distribution shall be provided from power supply distribution cabinet (by contractor) in Rack rooms.

iv. UPS feeders from ACDB to DCS loads shall be redundant whereas UPS feeders for Non-DCS loads shall Non-redundant.

v. No automatic sequential start-up is required for any power supply.

vi. The Contractor shall prepare a list Non-DCS UPS load requirement.

vii. 20% or minimum one no. Spare feeder shall be provided by the contractor for each feeder rating.

viii. The Size of UPS shall be arrived at after considering system and user loads. The system load shall be calculated considering:

   a) Expandability of I/Os including installed spares and installed future spare space.

   b) In rush current and PF for system/user load shall be considered.

The UPS sizing shall be arrived at after considering additional 10% capacity over and above the total of both system and user load.

4.2.2.1.8.2 230V AC:

The contractor shall provide 230V AC feeders with power distribution cabinet at for the 230V AC power supply for cabinet / Panel lighting, utility sockets and fans other load requirement.

4.2.2.1.8.3 24 VDC

i) 24 VDC power supply required for interrogation voltage, solenoid valve supply, lamp, pushbutton, etc and for other packages shall be supplied by contractor using dual redundant Bulk Power Supply (BPS).

ii) Each redundant bulk power supply shall be sized for 35% loading of its capacity in normal time; the maximum loading is to be 70% of its capacity of BPS.

iii) All bulk power supply (BPS) shall be provided with surge protection capability. BPS shall also provide with cooling fans and with fan failure alarm indications in DCS.

4.2.2.1.9 The system Power cables from PDB at rack room to DCS contractor supply items including cabinets etc. within control room shall be of copper only and shall be supplied by Contractor. The supply and laying of all incoming and pout going cables is in contractor scope.

4.2.2.1.10 110 VAC UPS Power supply feeder failure alarm before PDB shall be provided in DCS by using double pole MCB in PDB. One contact of these MCBs shall be wired to DCS for alarm purpose.
4.2.2.1.11 Fan failure alarm shall be provided in DCS for each cabinet.

4.2.2.1.12 Separate PDB cabinet shall be provided for primary & Redundant feeders.

4.2.2.1.13 The power distribution schemes shall be submitted for review and approval by PMC / Owner.

4.2.2.1.14 **Specific requirements for DCS/PLC:**

4.2.2.1.14.1 The PLC system shall be Tripple Modular redundant (TMR) or Quadruplicated Modular redundant (QMR) SIL-3, TUV certified PLC as a minimum.

4.2.2.1.14.2 The PLC for each unit shall be sized considering I/Os and other sizing requirements like scan time, CPU loading etc as per PR. The sizing calculations shall be reviewed during detail engineering. Contractor shall be fully responsible to supply number of PLCs as required meeting above requirements and approved sizing calculations.

4.2.2.1.14.3 The main PLC processor and I/O cards replacement should be possible on line without compromising the plant safety and TUV guidelines. The PLC system shall have high availability.

4.2.2.1.14.4 In case of two out of three voting inputs in PLC, the inputs shall be wired in three different cards.

4.2.2.1.14.5 Online programming changes shall be possible in PLC without requiring cold start. Further PLC Processor shall be Hot standby **(all time available)**. The communication between DCS and ESD PLC shall be less than 500 msec.

4.2.2.1.14.6 PLC shall be TUV AK5/SIL3 as per IEC 61508 certified and copy of certification shall be enclosed.

4.2.2.1.14.7 **PLC Console**

Each PLC system must be provided with PLC console at console area in control room for each unit and a programming & maintenance terminal PC (of latest version available at the time of supply) with printer in engineering room.

The programming terminal shall not be online under normal operating conditions (either powered off or have multiple password protection). Printer provided with programming terminal shall be able to print alarms (system and process) and documentation.

The PLC console shall be located along with operator console and shall be used by the operator for monitoring, issuing commands, maintenance override etc. The PLC console shall have full graphic capability and shall display shutdown and interlock graphic of the unit and it shall meet the requirement specified in Job standard specification for DCS.

The functionality of PLC engineering stations shall be as per specification.

4.2.2.1.14.7.1 SOE Recording with resolution of 1msec scan time shall be provided as inbuilt feature of PLC. At least 96 hours history for sequence of events should be available in PLC PC/ loader hard disk with LIFO facility. The SOE A&E printer shall automatically be updated on SOE PC as and when they occur and shall have automatic periodic archive and retrieval facility to prevent database overflow errors.

4.2.2.1.14.7.2 All PLC I/O signals shall be two wired, with no looping or common sharing of power supply or negative points as specified in the Job standard specification for DCS.
4.2.2.14.7.3 Maintenance over ride switches (software switches) shall be implemented from PLC console.

4.2.2.14.8 Interposing relays, Power Supply unit for TUV, SIL-3 Certified PLC shall be TUV, SIL-3 certified. However for IS barriers for PLC, both SIL-3 and SIL-2 certified barriers are acceptable.

4.2.2.14.9 Instrumentation shutdown and interlock shall be de-energizing to trip.

4.2.2.14.10 All Intrinsically safe DI / DOs shall be provided with barrier. All MCC Digital inputs / output, Field input / output (Non IS, if any) shall be connected through external interposing relay.

4.2.2.14.11 Hardwired switches, pushbuttons, lamps in Aux. Consoles shall be powered in 24 VDC circuit through external relays.

4.2.2.14.12 Contractor to note that the operator keyboard shall be membrane type. Each keyboard either integral or as a separate attachment shall have a set of dual function user configurable keys. 64 nos. of such functional keys are required and the same shall be provided in either of the following ways:

1. 64 hard keys.
2. Minimum 32 hard keys with balance functions provided as soft keys.

However when soft keys as per the point no. 2 above are provided for the balance 32 nos., the following condition shall be met:

For soft keys, key graphic display to be available to operator all the time without occupying the operator area of display.

These 64 nos. functional keys shall be configured to access important pages in single keystroke. These keys shall have LEDs which flash on preconfigured alarm conditions. However LEDs on hard keys which flash on pre-configured alarm conditions can be realised in DCS monitor as a soft display. These requirements supersede the requirement specified in Job standard specification for DISTRIBUTED DIGITAL CONTROL AND MANAGEMENT INFORMATION SYSTEM (DCS)

4.2.2.14.13 Contractor shall provide touch screen facility for the bottom tier TFT monitor of the dual tier operator console. Touch screen facility shall also be provided for Engineering station as well as Operator cum engineering station.

IAMS System shall be considered and provided by contractor for all analog(SMART) signals to DCS and PLC as per standard specification. All Field signals to DCS and PLC shall be SMART type with HART protocol. The I/O cards for DCS shall be HART protocol compatible. IAMS system shall include the following function:

- Interface with control and shutdown systems field devices.
- Record and compare valve signatures / operation.
- Log and interface with any partial valve stroke test systems used in the shutdown system.
• Maintain instrument test records
• Interfaces with other systems to enable integration into the overall AIMS.
• All maintenance related data like diagnostics alarms, transmitter range, settings etc.
• Trend data for all devices.
• Facility to re-range, configure and calibrate HART devices remotely.
• An audit trail for a complete historical record of all configuration, calibration and device alerts.
• Data on predictive maintenance such as list of transmitters experiencing drift, control valve losing as-shipped characteristics etc.
• Consider 1.4 times the maximum number of tag data for sizing.

Instrument Asset Management System shall facilitate the maintenance management of all smart and conventional field instruments. Unless otherwise specified, the system shall manage the maintenance of following:

• All smart instruments connected to Distributed Control System or Programmable Logic Controller.
• Non-smart / conventional and field instruments like local gauge cannot be connected to IAMS.
• All necessary DD/DTM files to connect IAMS with supplied smart instrumentation shall be supplied along with IAMS software.

Where ever HART pass through cards are considered IAMS shall be integrated, However if cards are not considered separate HART mux shall be provided. The VDU shall be 24" color TFT LED touch monitor along with a keyboard and a printer. The system shall support multiple authorization levels for carrying out configuration charges and calibration adjustment.

The Instrument Asset Management System shall meet the following requirements:

**Instrument Configuration**

It shall be possible to configure, verify the configured parameters, reconfigure, re-range and calibrate / recalibrate the smart devices from IAMS console.

**Device Status Monitoring**

The system shall monitor the status of all field devices and shall report any maintenance alarm generated by these devices. In general, following shall apply;

- Diagnostic alarms from smart devices in device failure and device diagnostic categories.
- Out of limit alarm shall be generated to indicate device failure alarm for conventional devices.

The system shall be capable of displaying and generating maintenance report listing all devices currently under alarm. The report may be generated unit-wise / area-wise or for complete plant.
Maintenance database
The system shall be able to maintain maintenance database for all the instruments which shall include date of commissioning, last calibration date, next due calibration. The system software shall have capability to manage and track scheduling of all such maintenance related activities. The software shall also provide data as predictive maintenance such as list of transmitter's experiences excessive drift, list of control valves loosing on shipping characteristics etc.

Audit Trail
The system shall have capability to provide an audit trail for a complete historical record of all configuration, calibration and device alert data. This shall include tracking of maintenance history for all instruments in the plant, typically recording the type of maintenance work done, smart and compiliation times of activity, person responsible for the activity etc.

Partial stoke testing shall be provided for ESD valves.
Partial Stroke testing shall be provided for ON / OFF valves using Smart Positioners for fail close valves. DCS AO (open loop) shall be used for realizing this partial stroke testing.

Partial Stroke Testing
Partial Stroke Testing shall be performed to ensure satisfactory operation of on-off valve including all accessories on demand. The test shall be performed automatically by partially (around 10%) stroking the valve while these valves are in service. The test hardware and software shall meet the following minimum requirements;

- Partial stroke test shall be complete with all hardware and software which shall include solenoid valves, valve positioner and logic solver. All components used in PST shall be failsafe and shall not affect the on-off valve performance under any circumstances.
- IAMS shall be provided with time stamping from GPS.

The PST design shall ensure;
1. The testing shall be carried out automatically at pre-defined intervals which shall be adjustable.
2. The valve shall not operate beyond a predefined maximum allowable stroke valve under any condition or failure. When valve positioner is used to realize PST, the positioner output shall be limited beyond the allowable value in case of valve stuck condition.
3. Audit trail shall be available to indicate time and date of PST, test results (OK / fail), reason of failure, changes made etc. as a minimum.
4. Upward connectivity to Purchaser’s Host system.

The SOV's of all critical valves should have 2oo3 operating mechanisms, with online coil changeover facility, partial stroke testing & plunger feedback which must be wired in the relevant DCS / ESD / Vendor Packages.
For rotating equipment such as turbines, 2oo3 mechanism for solenoid valve with online coil changeover facility may not be feasible due to space constraints. Valve vendor shall provide Factory Valve Signature Test Report in the form of hard copy and softcopy for each control valve provided with smart positioners. (Soft copy of native files shall be provided). Valve Vender shall supply valve signature software for all control valves and same shall be installed in IAMS.

**Advanced diagnostics**

The system shall be able to provide advanced diagnostics such as device step response, device signature, and dynamic error band etc. special device diagnostic software whenever required shall run in the system.

**Documentation**

System shall generate documentation like trend reports, diagnostic reports, pre-detectivemaintenance report, audit report, historical data and device specification sheet etc. Definition, engineering, configuration, loading and completion of all reports whether specificallyindicated are available as standard and shall be supplied as part of Vendor scope of supply

4.2.2.1.14.14 For PLC analog inputs only, if HART pass through card is not available as standard from the PLC manufacturer, bidder shall provide necessary HART multiplexer, as required, for communicating to IAMS.

4.2.2.1.14.15 The offered IAMS system shall be suitable for running / loading advance diagnostic software of following makes of SMART Positioner : Metso, Fisher, Dresser.

4.2.2.1.14.16 The plug–in advance diagnostic / valve signatures software of Smart positioner, shall loaded on the IAMS station. However proper loading, integration and compatibility checking with the DCS vendor’s IAMS system shall be the complete responsibility of Contractor. Any other specific software other than plug-in software, if required by for implementing advanced diagnostics features in IAMS shall be supplied by Contractor / DCS vendor.

4.2.2.1.14.17 ---.

4.2.2.1.14.18 The large screen shall be integrated with the PLANT CCTV system. It shall be contractors responsibility to integrate the same and supply all necessary hardware, software including cable between CCTV system and large screen.

4.2.2.1.14.19 The time synchronization with external clock i.e. GPS shall be provided by DCS vendor as per clause 5.8.3 of Part-I of Job standard specification for DISTRIBUTED DIGITAL CONTROL AND MANAGEMENT INFORMATION SYSTEM (DCS) for DCS, PLC, IAMS, OPC, BMS PLC and other third party devices like VMS etc.
4.2.2.14.20 For Analog output of DCS, the barriers shall be provided with line fault detector.

4.2.2.14.21 All proximity probe input to PLC / DCS shall be provided with IS barrier cum pre-amplifier.

4.2.2.14.22 Fan failure alarm shall be provided in DCS individually for all cabinets.

4.2.2.14.23 For all split range applications the controller shall provide two independent output signals one for each control valve.

4.2.2.14.24 Separate cabinet shall be provided for analog, Digital signals separately for DCS and PLC as applicable. Similarly separate cabinet with interposing relays shall be provided for MCC inputs and output.

4.2.2.14.25 Type of report generation shall be finalised during detail engineering by operation/process department of client.

4.2.2.14.26 Screw less terminals shall be considered by contractor for all terminations. All terminal shall be sourced from reputed make like WAGO.

4.2.2.14.27 Fabrication / installation of Channel base frame and modification of finished floor in Control Room shall be under Contractors scope.

4.2.2.14.28 Civil work related to provision of cable entry in wall of Control room is also be in Contractor scope.

4.2.2.14.29 -

4.2.2.14.30 Repeat indication in field shall be in series with transmitter for open loops whereas for closed loops it shall be from control room using Dual output barrier. For close loops contractor shall also provide separate IS output barrier for signal transmission to IS local indicator in addition to dual output barrier.

4.2.2.14.31 For control systems where the architecture necessitates that the transmitter power supply be segregated from controller power supply and the input/output power supply, the system shall be designed with capability to discriminate between transmitter failure and zero signal value. The detection of the transmitter failure shall be alarmed and shall cause the controller output to be held at the prior valid signal output value until the operator takes action by transferring the control to manual.

4.2.2.14.32 Expandability Philosophy
All the spares shall be calculated based on various requirements specified in the PR, including I/O summary, power supply etc.

4.2.2.14.33 Communication Sub-system

The communication subsystem cable shall be secured in G.I. conduit pipe inside the control room. The communication subsystem, in each case must perform to the offered specifications for error rate, signal attenuation, noise immunity, etc. No other cable (signal, alarm,power) should be kept in GI conduit.

All communication cables, data highway cable routed in the field shall be via dual redundant fibre optical type. The optical fibre cables shall be with two layers of steel tape armouring. Contractor shall provide specific converters wherever necessary for the same. All fibre optical cables shall be routed through hard HDPE conduits and shall be totally enclosed within using HDPE matching fittings. The HDPE conduits shall be as per IS-4984 or equivalent IEC standard. The outer colour of the conduit shall be orange with black fittings throughout the run. Use separate conduits for laying redundant fibre optical cables. Wherever fibre optical cable is to be routed underground, this shall only run in tray provided in concrete trenches with
HDPE conduits provided as above. For redundant system / fibre optic / serial link, the two cables shall be laid apart as far as possible in same cable tray.

Contractor may use common fibre optical cables to carry more than one data signals. In such cases, separate fibres shall be used for each of the signals. For all such multi fibre cables, provide minimum four fibres for future use. Individual fibre optical cable if used shall have minimum one pair of spare fibre. All fibre optical cables shall be rodent resistant and armoured type only.

4.2.2.1.14.34 Connectivity with Central Control Room and Advanced process control (APC) server

4.2.2.1.14.35 The control system for new PLANT shall be connected to client’s Central control network by using the OPC Servers in DCS system. Contractor scope and responsibility shall include establish connectivity between OPC server and PLANTDCS System.

4.2.2.1.14.36 Contractor shall provide the web based server with firewall for remote log in. Web Based server shall be a UHN and shall meet the specifications for UHN.

NOTES:-

*** For these systems Remote I/O panels with push buttons, indication lamps and annunciation shall be provided for subsystems where manned local operation is required.

1. For soft-link communication between PLC and DCS, PLC Vendor shall supply PLC end Modem/Converter and DCS Vendor shall supply the DCS end Modem/Converter. Communication armored cable between PLC to DCS shall be in PLC Vendor’s scope. Communication protocol between the Modems shall be RS485/Modbus and the maximum communication time for receipt of signal at DCS end should not exceed 2 seconds. **There shall be only one soft link between Station C&I DCS and each PLC.**

2. PLC Vendor will provide necessary industrial grade redundant UPS power supply with 60 minutes battery backup for PLC Control Panels, Operating station & printer etc. In case MCC are in the package vendor’s scope, then package vendor shall arrange feeders for power supply with all hardware and cables. Provision should be made in DCS & PLC for redundant communication (Modbus TCP/IP, Cu) with Electrical LMS for communication of Electrical HT & MCC Data.

3. Whenever control system is PLC based, annunciation system shall be driven by PLC. For other control systems, solid-state annunciation system shall be provided.

4. Deleted.

5. PLC system without OEWS (Operating & Engineering Work Station) shall have panel mounted push buttons, lamps, H.W. annunciation and MIMIC etc for operation & control purpose.

6. All the PLC control system shall be of one make and shall be supplied directly from manufacturer/vendors. PLC system supplied/engineered by system houses shall not be acceptable.

7. All remote I/O cards if any shall be with IP-65 protection class and should withstand up to 70 deg.C temperature.
8. All cables terminated in the terminal block (Phoenix/ Wago / Weidmuller or very standard make push in type terminal block to be used.), power distribution scheme instruments shall be ferruled. Ferruling shall be double cross ferruling (i.e.) source and destination addresses shall be marked on both sides of the tube ferruling.

4.2.2.14.41. Foreign Device Interface Sub-system

PLC, vibration & temperature monitoring system, Machine monitoring System, BMS, anti surge controller, Analysers and Chromatographs, etc. shall be interfaced with DCS. The interface shall be dual redundant with auto time synchronization and with interface diagnostic available at both central level and at local level. The interface shall be of serial type.

The following shall be noted:

- The serial interface shall be through controller & data acquisition subsystem / processor subsystem and the no. of serial links per serial interface module shall be restricted to 4 subject to meeting loading criteria.
- Total no. of redundant gateways / serial interface modules shall be calculated and provided accordingly by contractor for each network meeting the other requirements of specification.

It is Contractor responsibility to co-ordinate with the supplier of foreign devices identified in design basis and establish communication for transfer of data with them. Unless the above communication is established, the Control System shall not be considered commissioned. It is the responsibility of the contractor to make final documentation for interfacing details.

Contractor to ensure that there should not be any operational disturbance in case of failure of serial link communication. Necessary hardwired instrumentation as required for this purpose of smooth interfacing with foreign devices to be selected by contractor as part of detail engineering. The link shall allow bi-directional signal transfer from foreign device system to DCS.

4.2.2.14.42 Hardwired Console Layout

The detailed layout for Hardwired console shall be worked out during detailed engineering by contractor. The layout for all hardwired consoles shall be reviewed by the PMC / Owner.

Hardwired console shall match with the operator consoles including the dimensions. The No. of Hardwired console shall be decided based on functional requirement.

Hardwired console shall be of mosaic finish design for ease of adding/ deleting any hardware on the console. It shall be possible to add or remove any item from console front by removing or adding mosaic tiles.

When selector switches are specified and current signals must be used, dummy load resistors shall be provided to maintain circuit continuity in all switch positions.

The HWC shall be installed along with operator interface subsystem as man-machine interface, which shall be equipped with indicating lamps, pushbuttons, Selector switches etc.
For preparing HWC drawing Contractor shall note that all push buttons / selector switches as indicated / required (manual reset of trip, manual activation of trip, control room reset for solenoid valves etc.), auto start / stop logic for pumps, compressors and other packages shall be indicated on HWC layout drawing with appropriate tag no. and legends.

All HW items like PBS, lamps etc. shall be of miniature type IDEC IZUMI, EAO or equivalent. Back-lighted push-buttons / switches for status indication on HWC shall be considered.

Provision shall also be kept for keeping Plant communication console / Handsets also on hardwired console.

Alarm annunciator shall be hung from the ceiling for which necessary mounting accessories, mounting rod, cable support shall be supplied by contractor. Necessary steel insert plates and supports for mounting ceiling hung type Alarm Annunciator shall be provided by contractor.

4.2.2.14.43.1 For laying of cables outside buildings, contractor shall lay cables in cable trenches / trays / trays.

4.2.2.14.43.2 All system cabinets (DCS, PLC) shall be provided with toughened glass door at front side; all other specifications of cabinet shall be as per datasheet and Job standard specification for DCS.

4.2.2.14.43.3 EARTHING REQUIREMENT:

Dedicated redundant earth pits shall be provided for both signal (IS), Non IS, Panel and chassis (system) grounding for DCS/PLC Earthing system at Control Room. Preparation of earth pits outside Control Room shall be under Contractor scope. Supply of earth electrodes, grounding cables (separate for signal grounding and instrument grounding) and other related accessories required for barrier earth, system earth and installation shall also be in the scope of work Contractor. Copper conductor shall be of 1Cx10 Sqmmas minimum. For surge protection devices separate earthing shall be used.

Grounding requirement for other system to be taken care by Contractor

Earthing of all new equipments / instruments located at control room for New PLANT of new earth pit at control room, if the existing earthing pit is not suitable the necessary new earthing pit with all cables, electrode, pit shall be provided by contractor.

4.2.2.14.43.4 All items shall be supplied from PMC / Owner approved contractor list. For any items not listed in approved contractor list, contractor shall obtain prior approval from PMC / Owner before ordering.

4.2.2.14.43.5 All Panels, cabinets shall be of RITTAL or Equivalent. Entry to Cables in the cabinets of DCS / ESD shall be through SS single compression weatherproof IP55 cable glands or MCT IP55 blocks. Load bearing capacity of panel shall be 1400kg and shall follow IEC 62208 multifolded profile panel. Against external mechanical stresses as per EN50102 / IEC62262 complete paint process including solvent will be RoHS compliance and automated.

4.2.2.14.43.6 Panels / Cabinet wiring / termination

a) Contractor to use OMRON make or equivalent relays wherever required. All DCS hardware including engineering console / operator console shall be proprietary equipment and shall be supplied through original manufacturer of the system. Other reputed make with requisite PTR shall be accepted only for SIL 3 relays subject to PLC contractor.
certify the same for its compatibility with their system and review/approval by PMC/Purchaser during detail engineering. Minimum no. of contacts for all relays shall be 2.

b) The ferruling philosophy/type shall be decided during detail engineering based on overall philosophy for the fertilizer complex. Unless otherwise specified, cross-direct ferruling concept shall be used.

c) Cabinet lighting shall be 230 V AC non-UPS only and the lamps shall be white threaded type. One no. additional socket for 230 V AC shall be provided in each cabinet for use of other testing devices.

d) In all analog marshalling cabinets provision shall be kept for mounting hand held configurator for smart transmitter.

e) All field cables shall be first terminated in separate TB (marshalling terminals) and further the same shall be connected to the barriers / relays.

4.2.2.14.43.7 The system and documentation and instruction manual CD/DVD shall be submitted with proper labelling and CD storage / carry case and not loosely.

4.2.2.14.43.8 Refer to the Job standard specification for DISTRIBUTED DIGITAL CONTROL AND MANAGEMENT INFORMATION SYSTEM (DCS) clause 2.2.2.7 of Part-II, all I/O's (100%) shall be simulated in controller and data acquisition sub system to verify proper system response for both analog and discrete signal.

4.2.2.14.43.9 Contractor shall carry out tuning of controller, complex control scheme simulation, interlock simulation at site during field testing.

4.2.2.14.43.10 System installation audit shall be carried out by system expert technical audit team of the contractor for the entire DCS / PLC system including all subsystem to ensure compliance to the contractor's quality installation procedure. Such audit shall be carried out during system internal loop checking & field loop checking for all I/Os, interlock simulation, taking all the controls including complex controls in auto mode, tuning of controllers, proving of all subsystems. OEM's technical audit team shall carry out following minimum checks at site before power on and detailed report shall be furnished.

1) Earthing checks.
2) PDB checks.
3) System bus cable laying as per recommendation.
4) Individual cabinets wiring checks.
5) Hardwired console / HAAS checks.
6) Third party system checks, etc.

4.2.2.14.43.11 Site acceptance test for all the subsystem /packages to be considered i.e AIMS, IAMS etc.

4.2.2.14.43.12 Procurement and Engineering done by contractor on third party procurement if any shall be certified by original equipment manufacturer.

4.2.2.14.43.13 Contractor to provide / select the best possible accessories / peripherals of PC during detail engineering for PLC and DCS system.

4.2.2.14.43.14 Graphic, control Groups, Trends, logs and reports shall be approved by purchaser prior to start of engineering/ implementation, however plant graphics colour shall be as per existing plant operating philosophy.
4.2.2.14.43.15 Wiring for Inputs and outputs to the PLC system shall be as per the OEM recommended philosophy that is with use of recommended FTA boards (with fuse blown indication), TB’s, barriers etc. Recommended philosophy must have requisite PTR.

4.2.2.14.43.16 Rodent control after start of cabling to Site acceptance test shall be done by contractor in the control Room.

4.2.2.14.43.17 For anti-surge controllers, field cables to/ from transmitters/ anti-surge control valve to be directly wired to anti-surge controllers console and outputs also to field directly, not via marshalling panel.

4.2.2.14.43.18 Static transfer time will be verified during SAT or before SAT by online changing over the UPS, by pass UPS, UPS on battery bank etc. The functionality of DCS, PLC should not be affected. Contractor to demonstrate at site after the Power on of the system.

4.2.2.14.43.19 Emergency shutdown switches (push buttons) shall be red in colour and Push type with lamp and cover protection.

4.2.2.14.43.20 Cable entry into the Control Room shall be through Multi Cable Transit (MCT) blocks and is in contractor scope of supply. The MCT frames shall be of standard RGB type of M/s Brattberg or G type of Roxtec or equivalent and of stainless steel or galvanized steel construction including frames, stay plates, wedges bolts etc. The MCT block shall be provided with centre core with adjustable OD with peeling off arrangement. Contractor shall provide 20% spare usable insert blocks in each cable size/O.D. as loose supply.

4.2.2.14.43.21 The power cables for instruments shall be suitably separated from the other cables and shall be routed through separate MCT blocks. In general, the MCT frame considered for instrument shall not be used for electrical cables.

4.2.2.14.43.22 The MCT shall be installation as per the recommended practice of supplier. No spare space shall be left uncovered in the frame. The same shall be provided with MCT block with secured centre core. The size of quantity installed spare block on MCT shall be proportional to the blocks used for cables.

4.2.2.14.43.23 Contractor shall provide necessary cable tray inside the rack/ of Control Room and Cable tray/ tray as required in Control Room/rack /console/ engineering/ training room in Control room for laying of cables below the finished flooring i.e. in cable at control room. The trayshall be properly supported by contractor from the bottom of the cellar roof and trayshall be covered from all the sides. The traywidth shall be 600 mm in general and it shall cover the cutout portion of the floor. The traymaterial shall be of perforated aluminium material.

4.2.2.14.43.24 For Operator console & SOE PC, engineering console, AIMS and IAMS PC shall be minimum sever grade with dual hot swappable power supply and RAID configuration, The detailed requirements are specified in Attachment Specification of Server grade.

4.2.2.14.43.25 Site Acceptance shall be carried out as per clause 5.0 of Part-II of Job standard specification for Distributed control system.

4.2.2.14.43.26 The Owner / PMC / Licensor shall participate in the following areas of system engineering:
Kick off Meeting, System definition Meeting, Software Definition Meeting & other Engineering review meeting.
Review of system sub contractor drawings / documents.
Factory acceptance test at sub contractor works for bought out items & FAT
For DCS/PLC.
Loop Checking / testing & commissioning.

4.2.2.14.43.27 The Project schedule shall be made during KOM for achieving the various milestones.

4.2.2.14.43.28 Any meetings considered necessary by PMC / Owner in order to achieve the Project schedule with DCS contractor, the contractor & DCS contractor shall consider the same at discretion of Owner / PMC.

4.2.2.14.43.29 AIMS shall be from IMAC or X-Force (M / s SSM Infotech) or equivalent reputed make meeting the specification and PTR requirement.

AIMS shall be a fully configurable system capable of processing all alarms in an appropriate manner to maximize the information provided, but to minimize the number of alarms displayed with suppression and / or filtering techniques. AIMS shall have capability to analyze various alarms / data and inform plant operator the probable reason, make recommendations as the action to be taken and provide operational alternatives in case of unit start up and upset condition. AIMS shall have capability to generate / compute alarms based on a logical combination of states, conditions and events. The purpose of Alarm Information Management System (AIMS) is to provide a centralized Alarm information which shall be used for acquiring, sorting, adding value and provide redistribution

4.2.2.14.43.30 DCS I/Os for all closed loops shall be redundant.

4.2.2.14.43.31 No Remote I/O shall be used for this project.

4.2.2.14.43.32 Separate rack shall be considered for Gas Detectors. PLC rack allocation shall be from any one of the PLC. Also rack shall have DO cards for generating Hooters / Beacons.

4.2.2.14.43.33 Process Licensor / Package Contractor shall witness the FAT at DCS system contractor’s works.

4.2.2.14.43.34 All the serial interface points coming from each foreign device shall be interfaced and annunciated in DCS.

4.2.2.14.43.35 Smart Positioners are considered by purchaser for Partial Stroke Testing on ON-OFF Valves and these positioners shall be connected to AO cards of DCS (open loops). Contractor shall demonstrate the partial stroke testing during DCS system FAT.

4.2.2.14.43.36 Wherever Fault Tolerant Ethernet Switch is considered for connection of fibre optic cables, the make shall be preferably from CISCO. Separate Ethernet switch shall be considered for each bus cable. No. of ports (IN & OUT) shall be indicated for switch. Ethernet switch shall be mounted in a separate cabinet at both locations.

4.2.2.14.43.37 Contractor in addition shall supply the following

- Four no. of LED / LCD clock with GPS connectivity
- Six numbers of panel mounted phones for operator console and four numbers of cordless phones for Operator chairs for all DCS and PLC operator / engineering consoles and workstation. Quantity shall be estimated based during detailed engineering.
- Necessary furniture for housing documentation and spares
- CD storage case for system and documentation and instruction manual CD/DVD with proper labelling
- Contractor shall provide two numbers of Cu (Cooper) and Au (Silver) corrosion transmitter (4-20 mA and RS3485 interface to DCS) in the control room of Purafil or Circulaire make.

### 4.2.2.2 HART MAINTENANCE SYSTEM

In order to aid maintenance of Field transmitters, a common “Hart maintenance system” has been envisaged for all the units. This system shall interact with all Smart Transmitters to provide:

a) Monitoring of device (Smart Transmitters) status on-line.
b) All maintenance related data like diagnostics alarms, transmitter range, settings etc.
c) Trend Data for all devices.
c) Facility to re-range, configure and calibrate field transmitters.
e) An audit trail for a complete historical record of all configuration, calibration and device alerts.
f) Data on predictive maintenance such as list of transmitters experiencing drift.
g) Advanced diagnostic features like device step response, device signature, dynamic error band etc.
h) Documentation like various trend reports, Diagnostic reports, and predictive maintenance reports, audit reports, historical data and device specification sheets in addition to those available with selected software as stand-alone.

Definition, engineering, configuration, loading and compilation of all reports whether specifically indicated in this specification or available as standard with the selected software shall be in the scope of contractor.

The systems shall be supplied fully engineered with all the tag nos. for the smart transmitters configured.

### 4.2.2.3 ANALYZER SYSTEM

#### 4.2.2.3.1 Contractor shall be responsible to supply complete analyser systems for PLANT.

a) Contractor scope shall include supply of all stack analyzers indicated in the P&ID’s duly installed in analyzer shelters complete with sample system designed for the specific purpose.

b) The analysers shall be supplied as per licenser’s specifications. The following shall be considered by contractor;

i) The sample handling system design for each Analyzer shall be carried out by analyser manufacturers and submitted for Owner's / PMC’s review.

ii) Traced sample lines wherever required shall be traced pre-fabricated insulated tubes of DEKRON or eqv.

iii) For stack analysers, contractor shall provide reports as per ODISHA pollution control board requirements.
iii) Scope of supply shall include carrier gas, calibration sample cylinders for zero as well as span calibration of each analyzer for a period of one year after the system acceptance. The calibration sample requirement shall be calculated based on once a day calibration. For sample blends which deteriorate with time, contractor shall consider the deferred delivery of the cylinders. The cylinder material of construction and rating must be certified. The calibration sample concentration must be certified for their guaranteed accuracy over a period of one year.

iv) Contractor shall be fully responsible for satisfactory performance of all the analyzers. Contractor shall also arrange analyzer vendor's assistance during site testing, calibration, commissioning and site acceptance of analyzer system. All other activities are expected to be carried out at manufacturers' works.

HVAC system shall be dual without any shared components. One shall be working and other standby.

All Online Analyser shall be considered as per the process licensor requirement and P&ID. Only Ex-proof analyzers are required. Only certified Ex ip analyzer shall be provided if no ex-proof version is available.

Analyzer shall be located to keep the sample tubing run as short as possible to minimize transport time delay.

- Sample handling components that require periodically maintenance / replacements like sample pumps, filters, etc shall be dual; one working and other standby.
- Flow indicators, Pressure gauges and temperature gauges shall be provided as required to properly maintain sample, sample by-pass, sample vent and utility flow rates and other parameters. Also they shall be permanently tagged to show the required values.
- All SHS shall have provision for lab sample grab.

Critical analyzer sample and utility parameter indication shall be provided in DCS.

a) Process analyzers shall be supplied as specified in the P&IDs enclosed with the Process package and as per licensor's specification. Where no specifications are available in the Process packages, contractor shall detail out the same in line with international codes and practices, process data and process package specifications provided with this document and last but not the least as per good engineering practices followed by analyzer industry.

In all such cases, contractor in their own interest must get performance specification reviewed by Owner / PMC before proceeding with further engineering & procurement.

b) All the analyzers shall be installed in prefabricated analyzer shelters unless indicated specifically otherwise in the process package/P&IDs.

c) Number of analyzer shelter, location of analyzer shelters and number of analyzers installed in each of these shelters shall be decided based upon:

i) Allowable transportation time for each sample.
ii) Available space requirement for analyzer shelter room.
iii) Accessibility with respect to approaches & obstructions.
iv) Space required for equipment maintenance and calibration.
v) Proving the analyzers as per process requirements specified by process licensor.
In no case, the transportation time should exceed the recommended figures indicated by licensor in the Process package. Incase no value is indicated the transportation time should be considered less than one minute.

In case more no of shelters are required, the same shall be considered by contractor For the purpose of analyser shelter sizing contractor shall consider the minimum width of 3000 mm and height of 2500 mm. The length should be decided based on factors indicated above.

d) Contractor shall consider provision of fast loops and sample return to process based on process package, process requirements, fluid handled, sample disposals and manufacturer’s recommendations as necessary to meet performance requirements. Where sample has not shown connected back to process in the P&ID, contractor shall provide a suitable sample return location and shall consider this as a part of residual engineering.

e) The design of sample handling system shall ensure a clean representative and measurable sample for the selected analyzers. System shall include sample probe, pressure reducing station, heat tracing, filters, coalaseer, regulators, safety valves, sample valves, sample pumps, sample cooler etc. However minimum requirements as specified in ‘Requirements for Analyser Systems’ attached as annexure-VI must be adhered to. The design must include a sample flow switch which will provide alarm and inhibit analysis whenever a low flow is sensed. Alarm for low flow and faulty analysers shall be provided at local as well as in control room.

f) Sample return to process shall be designed considering sample condition and return header process data. Where sample returns can’t be sent back to process because of degradation of sample (rendering it unsuitable for mixing with process stream), contractor shall develop a suitable disposal scheme. All such liquid hydrocarbon streams shall be disposed to close blow down header/system and gas samples to be connected to flare.

g) Analyser shelter shall be fully ventilated, pressurized and air conditioned and shall meet all the requirements specified in shelter specification (Refer Clause No. 4.6 of this document) and specification for HVAC system attached elsewhere in this document.

In case where any single process analyser can’t be located in shelter considering factors like transportation time with respect to vicinity with the analyser shelter; the analyser can be located in a suitable analyser cabinet provided with the cabinet mounted air conditioner suitable for the area classification. A suitable protection against dust, sunlight and rain shall also be provided. Cabinet shall be weatherproof as minimum.

h) The design must ensure the adequate number of air changes to render analyser shelter/room safe under normal conditions. However design should not consider recirculation of air for HVAC design.

i) All the analysers located in analyser shelter shall be suitable for area classification under ventilation failure condition. However an item which does not meet area classification shall be switched off whenever there is ventilation failure.

j) The material of construction selected by contractor must be suitable for process fluid being handled. Contractor must select SS316 as a minimum.

k) All analyzers shall be microprocessor based in general and shall be capable of providing detail diagnostic alarms, messages to help maintenance personnel.
I) Sample handling system shall incorporate auto calibration system to suit similar facilities available with the analysers. Wherever analysers auto calibration facilities are not available, calibration sample injection shall be done automatically using manual command. Contractor scope shall include provision of all hardware and software necessary to meet this requirement.

m) The process analyzer shall be connected to the DCS, which shall include the following:

   i) Each shelter shall be provided with facility for either hooking up a portable PC with each analyser or a fixed PC with a printer in each shelter for fault analysis, calibration or as a maintenance & monitoring tool.

   ii) All Process analyzer shelters and all analyzers shall provide 4 — 20 mA isolated output for remote indication on the Central DCS. Contractor may use serial output from analyser wherever available.

4.2.2.3.3 Stack Gas Analysers

a) Each stack shall be provided with flue gas monitoring analysers namely Sox, Nox, O2 or any other stack gas analyser specified in the process package. Number and type of analyser shall in general be as per details provided in process package or specified elsewhere in this package.

b) The stack analysers shall be housed in analyser shelter only. Location of these analyser shelters shall be decided by the contractor considering vicinity to the stacks and maximum allowable transportation time allowed by EPA / TUV. Typically transportation time of one minute may be selected in the absence of any guideline.

c) Stack gas analysers shall adopt dilution/hot extraction technique for drawing the sample from the stack. Contractor must design the sampling system meeting requirements of effective analysis and requirements of selected analysers.

d) All analysers as selected must bear the approval of international pollution board authorities like EPA, TUV etc. Analysers not meeting these certifications shall not be supplied. In addition to above contractor shall also be responsible for meeting local pollution control requirements set forth by state pollution control board.

e) Analser shelter if located in hazardous area shall be ventilated, pressurized and air conditioned and shall meet all the requirements as per clause 4.6 of this specification. Air to be sucked from the top safe location. The number of air changes shall be selected by contractor to render shelter/room safe during normal working conditions. In case of failure of ventilation, power supply to all these analysers shall be cut-off. In case analyser shelter/ house is located in safe area, the requirement of ventilation shall be evaluated by contractor. In any case, the analyser shelter/ room must be air conditioned in line with requirements and specifications specified elsewhere in this package.

f) The design of sample system shall ensure a clean representative and measurable sample for the selected analysers. System shall include sample probe, filters, regulators, sample cooler, etc. However minimum requirements as specified in ‘Requirements for Analyser Systems’ attached elsewhere must be adhered to. The design must include a sample flow switch, which will provide alarm and inhibit analysis whenever a low flow is sensed.

g) All stack analysers shall be microprocessor based and shall be capable of providing detailed diagnostic alarm, which shall provide helpful message to help maintenance personnel.
h) Analyser and sampling system shall incorporate auto-calibration facilities. All accessories to meet auto calibration facility like solenoid valve, timer etc. shall be supplied by contractor.

i) Analyser shall be capable of providing 4-20mA (isolated) output as well as serial (RS485/232) output to DCS. Analysers shall also have diagnostic/fault alarm outputs to DCS.

j) Analysers shall be selected by contractor to meet the ranges in the process data sheets or as specified by the heater vendor during detailed engineering. Requirements of State Pollution board shall be kept in mind while deciding on analyser ranges. Each component of interest / component as specified in the process package shall utilise a dedicated analyser. No two components shall share the same analyser or any component of analyser. However they may share the same sample lines provided these analysers share the common sample take off point. Stack mounted analysers and field mounted analyzers (except for Zirconia probe) shall not be acceptable. Various stack analysers shall meet the following performance specifications as minimum:

i) NOx Analyser- type- Online chemi-illuminance type
Repeatability- ±0.5% of full scale or better.
Linearity- ±1.0% of full scale or better.
Least detectable limit- ±0.5% of full scale or better.
Response time- <40 sec or better.

ii) SOx Analyser- type- Online UV absorbance.
Repeatability- ±0.5% of full scale or better.
Linearity- ±1.0% of full scale or better.
Least detectable range- ±0.5% of full scale or better.
Response time- <15 sec or better.

iii) O2 Analyser- type Zirconium oxide with remote mounted controller
Accuracy- ±2.0% of full scale or better.
Repeatability- ±0.2% of full scale or better.
Response time- <60 seconds or better.
Electronics in field shall be certified by for use in hazardous area.

iv) Other analysers such as
   a) Silica analyzer
   b) Sodium analyzer
   c) Hydrazine analyzer
e) TOC (Total Organic Carbone) analyzer
f) ORP (Oxidation Reduction Potential) Analyzer
g) DO (Dissolved O2) Analyzer
h) Chloride Analyzer Etc
i) SPM Analyzers
Can be added according to process condition.

4.2.2.4 CCTV MONITORING

The CCTV system shall be IP based.

4.2.2.4.1 Closed Circuit Television system for the PLANT units shall consist of the following elements:

a) High resolution charge coupled device (CCD) day & night, tamperproof color camera

b) Auto iris zoom lens, pan and tilt, near & far focus, screen wiper, ON/OFF control equipment, color monitor and video recorder system

c) Automatic computer based switching device including Quad splitter.

d) Ceiling hung CCTV monitors such that these can be suitably matched with control room aesthetics by dimensions appearance etc.

e) Coaxial cables, control cables, optical cables, connector etc. of required type & size.

f) Video recorder located in Control Room.

4.2.2.4.2 The complete hardware and software for PLANT shall be procured by Contractor.

Contractor scope shall include:

a) Identification of suitable location for mounting cameras in the field. Contractor shall coordinate the locations, with PMC/owner.

b) Installation of cameras and their associated accessories in the field (equipment free issued to contractor). This shall include any structure, support or stanchion required for installation and their accessories.

c) Cabling (cable shall be free issued to contractor) from respective camera to main control room and termination of cables in the field, as per recommendations by CCTV manufacturer. This shall include any additional support or tray/trayspace provision by contractor.

d) Coordinate with CCTV manufacturer/supplier during testing, pre-commissioning and commissioning of complete system.

e) Bidder to provide facility to connect FO cable from central control room CCTV network to steam generation plant network. Supply and laying of these FO cables will be in others scope.

4.2.2.4.3 The tentative number of CCTV camera shall be as follows:

PER PLANT nos.

i) In ash handling Area for each boiler one camera
ii) At the burner area total 5 no of cameras

iii) At burner feeding conveyors 2 no’s

iv) Deleted

v) There shall be provision to connect 4 more camera , bidder to provide sufficient space and power supply for the same for future.

4.2.2.5 TELEPHONE EXCHANGE AND ASSOCIATED ACCESSORIES.

BASIS OF DESIGN

The system and all the equipment shall conform with all relevant and the latest edition of Indian, International, OISD and CCITT/ITU standards using field proven microprocessor based design techniques for all processing and control functions. The exchange shall be based on a robust, reliable, virus protected, IP based platform for connecting IP phones, Digital phones as well as Analog extensions. As a minimum, the following standards shall apply.

a. IS: 2148 Flameproof enclosures for electrical apparatus.

b. IS:13346 General requirements for electrical apparatus for explosive gas atmospheres.

c. IS:5572 Classification of hazardous areas (other than mines) for electrical installation areas having flammable gases & vapours.

d. IEC:79(Applicable parts) Electrical apparatus for explosive gas atmosphere.

e. IS: 13408 Code of practice for the selection, installation & maintenance of electrical apparatus for use in potentially explosive atmospheres.

g. IS: 5571 Selection of equipment for Hazardous areas.

The offered exchange should be capable and equipped with requisite software / hardware for networking with different EPABX Systems of other makes for feature transparency.

The VOIP Box shall comply with the ITU-T, IEC Standards with latest amendments (if any). The system shall support fax messages via IP trunking

The telephony system shall be interconnected with the PA/GA systems such that communications can be automatically established by authorized subscribers of any of the systems without operator intervention.
The telephony system shall also be connected to the Public Switched Telephone Network (PSTN) through the PABX, and shall comply with all the telecommunication carrier’s requirements; technical compatibility between the public and private networks shall be ensured.

SERVICE CONDITIONS

All the equipment shall be suitable for the site conditions as specified in design basis. Indoor equipment shall be installed in a HVAC controlled environment.

AREA CLASSIFICATION

All the outdoor equipments shall be suitable for installation in hazardous area and shall be Flameproof to Ex-d IIC/T6 and weatherproof to IP67 as per IEC529, irrespective of plant’s hazardous area classification.

All the outdoor equipments shall have certification for use in Zone-1, Gas group IIC/T6, irrespective of plant’s hazardous area classifications and by the recognized testing and certification authorities such as ‘CMRI’ Dhanbad, BASEEFA (UK), UL (USA) etc., or the relevant authorities of the country of origin.

Indigenous equipment for hazardous areas shall be approved by CCEO and all flameproof equipment shall be under a valid BIS license.

The exchange shall be fit operate on the following power supply.

a) UPS Supply voltage 115 A.C. ±10%

b) Supply frequency 50 Hz ±3%

DESIGN SPECIFICATIONS:

The system shall comprise of fully microprocessor based digital central exchange(s) consisting of system control hardware, which shall be located at central control room. It should be an expandable system. The system shall have capacity of 50 extensions. The systems exchange shall be extending up to 100 telephone lines. It should support IP / Digital / Analogue phones. A redundant interface for connecting any other Telephone Exchange.

An Internet Protocol (IP) based telephony system shall be provided. The Exchange shall have facility of connection to the LAN system with POE switches.

The Telephone Exchange shall be interfaced with FGS system via 2 wire, RS-485 serial interface over MODBUS. The Telephone Exchange system shall provide general failure alarm signals for presentation on the DCS system in the Control Room (CR).

The telephony system shall be interconnected with the PA/GA systems such that communications can be automatically established by authorized subscribers of any of the systems without operator intervention.

The EPABX and a Main Distribution Frame (MDF) shall be located at control room. CPU and power supply shall be provided with 100% redundancy. Each office (or equivalent) telephone
set shall dispose of two connection possibility points as a minimum. The additional connection points could be used either to change location inside the room or to add further telephone subscribers.

The cable supply and installation rules shall follow the same rules than the instrumentation cables. The telephone JB supply and installation rules shall follow the same rules than the instrumentation items. The system shall have automatic broad casting of alarm when a fire or gas alarm signal is initiated from the fire and gas system. Bidder has to provide complete layout of the Telephone network in its scope of the building. Complete supply, erection of the exchange system shall be in bidder scope. Bidder has to provide complete system in fully working condition.

The IP EPABX system must support IP TRUNK (SIP (mandatory) and should permit management of communications between SIP terminals and the traditional telephony devices (IP, analog, private or public lines). Central exchange and switches shall be provided with Redundant FO port. FO cable laying and supply will be in scope of others.

The offered exchange should be capable and equipped with requisite software / hardware for networking with different EPABX Systems of other makes via QSIG protocol (QSIG-SIP, QSIG-PRI, QSIG-Analog etc.) for feature transparency as per ECMA Standards (QSIG over ISDN & IP trunks).

The EPABX shall be suitable for up to minimum 5 digit extension numbering scheme. This numbering scheme should be flexible. System shall also allow mixed numbering scheme (open & closed numbering).

EXCHANGE

The central exchanges shall be fully digital, microprocessor based freely programmable exchanges, working independent of each other. Programming shall be by means of user friendly menu driven software via a dedicated lap top, which shall also be supplied by the system vendor. The specification of laptop shall be latest Intel hardware, Microsoft OS and MS Office software at the time of supply. It shall be possible to program / re-program the exchange through external laptop PC, using text/graphic editor, via USB/RS 232 or other suitable interface. This shall enable the user to carry out the following operations without any additional software. It shall be possible to interface the system with Fire Alarm system via RS485 serial interface over MODBUS protocol and with the central EPABX system via EPABX digital lines. The exchange shall have conference module. Complete hardware racks related to both these exchanges shall be accommodated inside control room at central cabinet room in a common panel/cabinet. The cabinet shall be fabricated out of minimum 16-gauge sheet steel, naturally ventilated, dust and vermin proof with IP-41 enclosure as a minimum. The panel shall be with swing out assembly of plug-in-card racks.. It shall be possible to locate faults by monitoring from the cabinet.

The central exchange shall have a processor module for the control of the central exchange. The exchange shall have a completely non-blocking type switching system and associated circuitry for call recognition and acknowledgement. The offered system shall be flexible and modular in construction with the possibility of expanding to a bigger system in the future. All hardware necessary for fault isolation and troubleshooting shall be supplied as a part of the cabinet along with each exchange.
The system shall have capacity of 50IP extensions. Bidder has to supply the following number of telephones as a minimum for all the plant area and closed buildings.

4.2.2.6 LOCAL AREA NETWORK (LAN) FOR CR

The Bidder shall lay the LAN required for Main CR area.

BASIS OF DESIGN

The system shall have as a minimum the following for CR:

1. Manageable L2 switch with 1G/10G port, Jack panel and cable manager. 50% spare port shall be kept in L2 switch.
2. Switch shall have with 4 redundant Fibre optic port. One redundant Fibre Optic Port shall be used for connection to main Plant LAN switch/servers.
3. Cabling shall be CAT6A cabling. UTP CAT6A cabling shall be done with one spare cable.
4. 24 Nos 6 m/Cat6a patch cords for end user
5. Cable and passive components shall be from AMP. I/O

4.2.2.7 EXECUTION METHODOLOGY FOR SYSTEMS

Refer Job Standard Spec for DCS_PLC and section 3.3.3
4.2.2.6.1 DCS& PLC system envisaged for monitoring, control & Interlocks of PLANT shall be installed in CONTROL ROOM by Contractor.

4.2.2.6.2 The supply engineering, testing, installation, commissioning site acceptance etc., of the control system catering to above units is in the scope of the Contractor.

4.2.2.6.3 Contractor shall also be responsible for the system engineering, field-testing and site integration of control system with existing DCS/PLC system pertaining to New PLANT. The scope shall also include conducting the various meetings with DCS& PLC vendor for smooth execution of detailed engineering, generation of all DCS engineering documents, review of DCS/PLC vendor generated drawings and documents, co-ordination with DCS vendor, participation in factory acceptance tests at DCS/PLC vendors shop, participation in field testing and any other activity needed for successful commissioning of PLANT unit with field and control system fully integrated.

4.2.2.6.4 Drawings/documents which are required for the engineering of DCS/ PLC and other control systems pertaining to the PLANT shall be developed by the contractor. The engineering of control systems shall be carried out based on the general philosophy to be followed for all the units of the refinery and the philosophy shall be furnished to the contractor at the time of engineering. The completeness and correctness of the control system engineering documents for the PLANT shall be contractor's responsibility. These shall include, but not limited to the following:

a) Functional schematics and I/O count duly segregated based on the various type of field inputs like IS & NON IS signal, etc.,

b) Overview / group view assignment
c) Trending requirements and assignment
d) Dynamic graphic display
e) Logging and report requirements with formats and tag no.
f) Instrument details (Database) including those of package units.
g) Operator guide messages
h) Alarm management and page assignments
i) Control room engineering for Package units.
j) Logic diagram
k) PLC display requirements
l) Advance control requirements, if any
m) Serial interface details and tag assignment
n) Package unit interface details
o) Any other requirements! inputs as found necessary.

4.2.2.6.5 Contractor shall be responsible to ensure that the system is configured as per the requirements. Contractor shall involve their personnel in the various phases of project like.

a) System Design
b) System engineering including participation in kick-off, system definition, functional design and approval meetings, engineering review meetings etc.
c) System testing, integrated factory testing and acceptance
d) System vendor drawing review/approval
e) System testing at site including loop testing etc.
f) System commissioning and site acceptance testing.

4.2.2.6.6 Contractor shall provide all necessary inputs and protocol details to regarding various system oriented items like analysers, Steam Governor control system etc. for proper interface. It is the responsibility of contractor to coordinate with their system suppliers and provide all necessary details in specific formats/soft media etc. as required by the DCS vendor for interface. Contractor shall supply either the serial device or its simulator during integrated factory testing. Unless the interfacing is established, the contractors respective system shall not be considered commissioned.

4.2.2.6.7 Contractor shall review totality of sub-package vendor drawings including P&ID's, documents required for system engineering and ensure the same are in line with the process philosophy followed in process units.

4.2.2.6.8. -

4.2.2.6.9 The control room layout including console and racks. Factory Acceptance Test & Site Acceptance Test procedure are common documents for the plants referred. Contractor shall provide the inputs as required by system vendor for configuration. The inputs shall be provided separately for each unit.

4.2.2.6.10 The loop checking shall be carried out in coordination with DCS vendor as detailed elsewhere. It is essential that dedicated team of skilled personnel are positioned at site so that site execution activities like installation, loop checking, commissioning, SAT etc., are carried out independently and concurrently as necessary.

4.2.2.6.11 -

4.2.2.8 Monitoring and Protection of the Turbo/Compressor Train

For the purpose of monitoring the “health” of the machine and for automatic shut-down in case of emergency, a highly reliable continuous monitoring system shall be supplied. The monitoring system comprises machine mounted sensors and transducers and the monitoring instruments installed in the auxiliary panel the central
control room. The monitoring system shall have built in computer interface unit(s) for connection to an overall monitoring and diagnostic computer system.

4.2.2.8.1 Sensors

The complete system shall be from the same instrument manufacturer, Bentley Nevada 3500 series, in order to have single source system responsibility. Below is listed the minimum number of sensors required. The list is indicative and should not preclude the vendor from including other parameters which in his judgment are necessary for the safe and reliable operation of the train. Temperature sensors shall be mineral insulated duplex RTD elements. In all sliding surface babbitt bearings, the temperature sensor should normally be between 0.75 mm to 1.5 mm under the surface of the babbitt to ensure that the wall thickness is sufficient to prevent the oil pressure from penetrating the babbitt.

No common trip DO output of two different parameters from Machine protection system is acceptable (for e.g. Axial/Vibration trip clubbed into one DO is not allowed). Trip signal from MMS system to ESD system shall be on 2oo3 logic based, ie, three Dos from different cards shall be taken to ESD system as 3 different Di to different cards. Two sensors per radial bearing (one for redundancy) at the calculated maximum load deflecting bearing under abnormal conditions.

One sensor in each two shoes for thrust bearing on both the active and inactive side. Sensors on the machine case at various locations in accordance with the machine vendor’s recommendation.

Vibration and Thrust position sensors shall be Eddy current proximity sensors in accordance with API 670 latest edition. To allow adjustment and replacement during operation, external probes with no connectors or probe lead wires inside the machine is preferred. If internal probes are provided, they should be mounted on rigid brackets that will not vibrate and the armored lead wires shall be sufficiently long to terminate in weatherproof connectors outside the bearing housing. Necessary supports, strain anchors and suitable feed shall be used where required inside the machine.

Two sensors at or near radial bearing, 90 degrees apart and normally 45 degree from each side of the vertical centre. Installation at the nodal points shall be avoided under any circumstances. The X-Y probes shall be in the same radial plane throughout the machine train. It is desirable that one of the mid turbine probes is a dual probe consisting of a seismic velocity transducer and a proximity probe. The seismic transducer may be un-monitored and used for connection to diagnostic instruments.

Two axially oriented sensors at each thrust bearings with at least one of them observing a surface i.e., integral to the rotor. It is preferred that none of the probes are monitoring the thrust collar, as the thrust collar may get loose and the axial probe monitoring the thrust collar no longer measure true rotor movement. One key-phasor radian on the driver of the machine train with a corresponding one event per revolution marking groove under the probe. It must be ensured that thrust float and differential expansion do not move the mark out from under the key-phasor probe. Bentley probes material as ceramic capped for high temperature applications.
Key phasor measurement shall be provided for compressor LP/HP and turbine.

**4.2.2.8.2**

Monitors shall be of Bently Nevada make series 3500. The monitors for the machinery protection system shall be installed on the panel in the local compressor control room. Installation and area classification shall be in accordance with the plant requirement. All instruments shall be highly reliable and shall conform to API 670 latest edition. The machine supplier must ensure that the potential free contacts are available from the system for all alarm and trip signals. The monitoring system shall comprise of the following instruments:

- Power supply for provision of the DC voltage necessary for the system but with a separate power source for the key-phasor.
- Digital shaft speed indicator operated from the signal supplied by the key-phasor probe. The indicator shall have provision for repeating the speed signal to the central control room. The repeater signal shall be a pulse signal. Local indication of speed shall also be available near the machine.
- Dual voting thrust position monitor for each casing, designed to prevent false trips due to transducer or collar failure. The monitor shall have built in adjustable time delay of 0 - 3 secs.
- Sensor output panel for termination of unmonitored transducers used for periodic checks and diagnostics.
- Temperature indicators with high alarm relays form radial and thrust bearings.

All information from the backplane electronics of monitoring instruments in the local control room shall be available in the central control room. The transmission shall be through serial communication. However all vibration, axial displacement and speed signals are connected with DCS through 4-20 MA loop. All interfaces, bus cables and PC shall be supplied by the vendor. The computer for transient data management system shall be located in the central control room.

Two plane radial vibration monitors for each casing for continuous monitoring of the outputs of the two radial probes mounted 90 degrees apart at the same bearing. The installation shall be such that either of the transducer pairs from the same casing can be connected to the monitor. The monitor shall be designed to prevent false trips due to transducer failure and shall be provided with built in time delay.

Transient Data Manager of Bently Nevada/equiv make shall be provided for monitoring data from all compressors.

VMS/MMS I/O modules shall be within built Barriers. 4-20mA for DCS. MMS to be provided with System-1 monitor. Rule Packs also to be provided.

Interlock, shutdown and trip signal shall be hardwired to PLC (Contact signal from machine monitoring). All analog signal from VMS to DCS shall be hardwired. RS232C/485 Communication) shall be given as an additional provision. Also Ethernet port shall be provided for connecting the VMS to configuration & diagnostic station (PC based.)
4.2.2.8.3 Speed Control of Turbines (If, applicable)

All the over-speed trip and monitoring system shall be implemented in latest Woodward/Protech/Braun make systems. The speed control system shall be designed to provide maximum economy of operation and high reliability with a minimum of maintenance, and shall fulfill the requirements in API 512 standard.

Speed control and over-speed systems shall be independent. There shall be separate TMR over speed trip system for the rotating machines as per the relevant API Code. The speed governor shall be electronic type and have remote speed setting from the main panel and the central control room as well.

The system shall be digital governor suitable of providing an accurate speed control. The make of governor shall be Woodward model Micronet plus/505 with Dual modular redundancy. The governor shall be installed in the CR with serial communication to DCS.

The electro-hydraulic type converters for turbo machinery shall be Voith make only. Hazardous area classification of the field devices shall be suitable for plant hazardous area classifications. The required power supply to these units shall be fed from central cabinet room PDBs. Dual redundant 24 V DC bulk power supply for these systems, if required. These power supply units shall be installed in PDB located at central cabinet room and required power cables (with proper sizing and armouring) shall be laid in overhead cable trays/ducts between PDB and field devices.

The steam inlet and extraction valve shall be cam or bar lift multi valves to provide maximum efficiency for all turbine load conditions. Because of the well known wear and vibration problem with mechanical linkage system to those valves, special attention shall be paid to the design of these systems.

The points mentioned below shall be carefully observed when designing the control system.

The valves shall be positively held stems to prevent spinning, chattering and sticking.

Surface hardened stainless steel bushings shall guide the valve stems into lapped seats, sealing the valves against leakage. All linkage shall be external to provide greater accessibility and freedom to perform visual inspection. Each cam or bar shall be individually adjustable to give the desired rate of opening and to provide maximum efficiency during all loads.

External location of cams or bars and visible valve stems with position indication shall be foreseen.

4.2.2.8.4 Over-speed Trip Systems for Turbines

All the over-speed trip and monitoring system shall be implemented in latest Woodward/Protech/Braun make systems.
To protect the operating personnel and equipment, the turbine shall be equipped with an 2oo3 overspeed trip device that shuts down the turbine, when rotating speed exceeds the maximum speed by approximately 10 percent. The emergency governors shall operate totally independent of the normal controlling speed governor.

The whole over speed trip system ( 2oo3) shall be very carefully designed to ensure that the turbine will trip in all situations of over speed, especially the time lag in the mechanism shall be kept to a minimum, ensuring very fast operating of the trip and throttle valves. The trip valve shall be provided with a limit switch for indication of closed position (running light) in the central control room.

The following shall be provided as a minimum

- 3 Speed probe required for measurement & control – Latest Woodward system
- 3 Speed probes for 2oo3 trip.- Latest Protech/Woodward system

All Speed Probes shall be of Braun / Protech make.

2oo3 trip system shall be of Protech/Woodward only.

The system shall close not only the trip and throttle valve, but also steam admission valves.

A hand trip device for emergency manual tripping shall be located in front of the turbine where it is readily accessible. It shall be possible to verify trip set points while the turbine is coupled to the compressor.

The secondary hardware of these system shall be installed in central cabinet room in a standard RITTAL panel of 1200mm (W) x 800mm (D) x 2100mm (H) or 600mm (W) x 800mm(D) x 2100mm(H) with RAL7035 color shade.

A dedicated laptop for programming and back up of all machines’ wood word protech 2 out of 3 devices shall be provided along with required software/cable. The laptop shall be with latest Intel hardware, OS and MS office software at the time of supply.

4.2.2.8.5 Contractor shall be responsible to supply completely engineered, integrated, tested and ready for commissioning system with state-of the art control system for effective, safe and efficient operation of BMS unit. The complete package shall be supplied by the BMS VENDOR with only coordination activities carried out by contractor.

4.2.2.8.6 The type of the instruments and control system shall be as per the BMSVendor recommendations. However, contractor must ensure that minimum requirements specified herein with the client/pmc requirements are met. Contractor shall also ensure that the vendor list attached with the package is followed. In case of any deviation, contractor must forward the Vender recommended makes and models along with performance guarantee requirement of licensor specific for this project.

4.2.2.8.7 Contractor must note that BMS supplier shall be fully responsible for complete instrumentation including;
a) Supply of complete instrumentation for BMS unit including all field instruments, control valves, shutdown/cyclic valves, analyzers & control system (to be located remotely in Control Room), all installation materials, all interconnecting cables etc.

b) Supply of all field instruments duly mounted in the Boiler with wiring/cabling complete up to junction boxes. Local panel, if necessary, shall be supplied as part of the skid.

c) Design, engineering, integration, testing and supply of control system as per requirements.

d) Installation and integration of control system with field mounted skid. All interconnecting cabling shall be armoured type only.

e) Design, engineering, testing and supply of all analysers as per process package requirements either in a separate analyser shelter or in any other PLANT shelter if design conditions and requirements permit.

4.2.2.8.8 Contractor must ensure that BMS VENDOR Instrumentation and control system specialist is available at site during loop checking, integration and commissioning & Performance guarantee run of BMS units.

4.2.2.8.9 All the instruments within BMS unit shall be certified by the statutory authority for use in IEC Zone-I Gas group IIC.

4.2.2.8.10 BMS unit shall have a dedicated control system located in the control room. The control system shall be a programmable-based control system capable of handling sequence control and analog controls as per unit requirements. The main architectural features of the control system shall be in line with PLC datasheets & design basis.

a) The I/O testing shall run automatically in a predefined testing period and also shall be event driven (a mismatch of I/Os for analog inputs shall also be acceptable provided
- maximum no. of analog I/Os per module shall be four only.
- The maximum no. of control loops per module shall not exceed two(2).

c) The control system shall be supplied with two operating Stations (PLC consoles) each of which is able to operate and engineer the complete BMS unit independently. Both these consoles shall be interchangeable operationally.

The consoles shall have one nos. of LCD Displays with the following requirements:
- Both Console shall have full graphic capability and shall be configured with bms unit graphics.
- LCDs shall also be capable of operating in engineering mode.
- LCDs shall be supplied in a console mountable model such that these can be installed in any of the operator console.

d) The system shall be provided with dual serial links with RS-485 modbus specification. These links shall be used for linking BMS system with DCS.

e) BMS VENDOR shall provide all information on the data transfer to DCS so that the control system is interfaced with DCS seamlessly.

4.3 INSPECTION AND TESTING
REFER STD 9998 FOR INSPECTION AND TESTING.

4.3.1 All instruments and system oriented items shall undergo factory testing and inspection by contractors authorised representatives, PM, Owner / PMC, unless specified otherwise.

4.3.2 Wherever inspection at manufacturer's shop is waived because of any reason, the contractor shall carry out the inspection at vendor/sub-vendor's shop and Contractor shall forward these inspection reports for verification by owner/PMC before dispatch. In no case, items shall be released without proper inspection / verification.

4.3.3 The inspection and testing shall be carried out as per related specifications, international codes and practices/standards, approved documents and / or any other document attached along with specifically suggesting extent of testing to be carried out at manufacturer's works.

4.3.4 Items for which ‘Witness Inspection’ is specifically exempted, manufacturer shall forward the test certificates as desired for review. The material shall be dispatched only after obtaining written dispatch clearance.

4.3.5 No system or system oriented item shall be dispatched without integrated factory testing witnessed by representatives of contractor/ purchaser / Owner / PMC. The testing procedures shall be detailed out by contractor based on testing requirements indicated in individual system specifications and shall be approved by owner/ PMC. Contractor must certify that the system is actually ready before calling the Owner/ PMC for FAT. Also all the necessary documents & technical catalogues are to be submitted before calling for FAT.

4.3.6 Testing and inspection for all items shall be carried out as per approved factory testing procedures. For items where no testing is witnessed by the PM, following test certificates shall be forwarded for review before dispatch of such equipment:

a) Verification of certificates as applicable for the material certificates, NDT reports like radiography/ X-ray / die-penetration/ MP, special testing reports like cryo testing, IGC testing etc., statutory certificates (from CCOE/DGFASLI) for Intrinsic safety and explosion proof, certificates of conformity etc.

b) Visual verification for quantity, quality and workmanship.

c) Hydro testing and pneumatic testing as applicable.

d) Functional and performance testing including calibration, accuracy, repeatability testing.

e) Seat leakage tests & hydraulic Pressure test, actuator cycling & fail condition tests for control valves

f) Set pressure, reseat pressure & seat leakage for pressure relief valves.

g) Radiographic test for control valves, pressure relief valves, flow meter bodies, thermowell etc.

4.3.7 Contractor must detail out performance specifications of each item which shall be verified by contractor or contractor appointed agency / Owner / PMC during factory testing.

4.3.8 Deleted
4.3.9 Contractor shall submit all test records / test results for records to purchaser as bound volume along with the test procedure for each test carried out.

4.3.10 Contractor shall follow the Inspection and Testing Table attached along with INSPECTION AND TESTING TABLE for minimum testing requirements for instrument items.

a) The table indicates the summary of testing requirements of various commonly used instruments. Contractor shall detail out these requirements in order to ensure quality of instrument items.

b) Testing procedures shall be developed by contractor based on relevant codes, international standards and practices followed internationally for various items unless otherwise indicated separately.

4.3.11 Acceptable criteria for Radiography and other NDT requirements for all the instruments / instrument castings shall be inline with those specified in ‘valve / piping specifications’ for the similar service. Valve specifications/piping specifications have been attached elsewhere in this package.

4.3.12 IBR Certifications shall be provided by contractor in the appropriate format duly signed by IBR authority or their authorized agency.

4.3.13 All sub packages shall be tested with job control system and control panel, as far as possible.

4.3.14 CCOE/DGFASLI certificate shall be supplied by the contractor for all instruments installed in hazardous area.

4.3.15 For carrying out integrated factory testing of all system oriented integrated systems like DCS, BMS, PLC etc where many foreign device interfaces are also interfaced, contractor shall supply simulators for all foreign devices, which are in their scope of supply, at DCS/PLC vendor works along with their engineer during factory testing. A 100% checking of complete application shall be carried out for all foreign devices to ensure proper integration.

4.4 INSTALLATION, LOOP CHECKING AND COMMISSIONING

Instruments shall not be mounted on vibrating equipment

All instruments shall be installed in accordance with standards drawings provided and for new one the same shall be developed with approval of PMC / Owner.

4.4.1 INSTALLATION REQUIREMENTS

4.4.1.1 All instruments shall be accessible from grade or a platform for operation and maintenance. In case of gas services, where the instruments are mounted above the process tapping, installation of platform shall be considered if accessibility is not available. Ladders shall be provided for all such platforms. Approach for all instrument tapings shall be considered in all piping, other equipments and from platforms so that all instrument tapings are accessible.

4.4.1.2 Contractor shall consider the, “PMC installation standards “as attached or. Equivalent for installation of each instrument. In case, any instrument require a special installation or any instrument not provided with installation standard the contractor shall prepare the standard and get it approved by Owner / PMC along with other documents.
4.4.1.3  Impulse pipe of size ½” shall be used as impulse lines. The impulse pipe for instrument installation shall be as per the piping material specifications of respective process lines. Tubing when used between manifold and the instrument shall be 12mm OD with SS316 material of construction as a minimum. The material selected shall be suitable for the process fluid conditions.

4.4.1.4  Instrument in gas service are to be installed only above or at least parallel to the tapping with a slope in the impulse piping towards the tapping to achieve self draining condition.

4.4.1.5  Control valve/Pressure Relief valves, flowmeters etc. to be installed in line only after proper flushing of the lines.

4.4.1.6  For liquid service the instruments shall be installed below the taping points in general.

4.4.1.7  No unions shall be used in impulse lines instead break flanges shall be used.

4.4.1.8  Gate valves shall be used for isolation and vent & drain valves, however globe valves shall be used for equalising service.

4.4.1.9  Wafer seal instruments are to be used for congealing services.

4.4.1.10  Impulse piping are to be suitably painted.

4.4.1.11  Insulation of impulse lines shall be as per piping class.

4.4.1.12  Sch 80 seamless pipe with at least 3000 lb rating fillings should be used as a minimum for impulse piping.

4.4.1.13  For steam tracing of instruments copper tube 3/8" OD and brass fittings shall be used. Tube filling shall be double ferrule type.

4.4.1.14  The steam tracing installations standards attached along with this package are typical. Contractor shall develop the steam tracing standards in line with the above. All steam traps required for steam tracing of instruments shall have block and bypass valves for steam trap maintenance. These specifications shall be over and above those indicated in installation standards mentioned above.

4.4.1.15  Based on the installation standards for each type of instrument, contractor shall prepare Bill of materials (BOM) which indicates the requirements of different materials for installation of each instrument.

4.4.1.16  Use of standpipe for level instruments shall be as per licensor’s documents. The level tappings from the vessels and columns are not to be taken from the bottom.

4.4.1.17  Trays shall be fabricated as per standard approved by owner/PMC.

4.4.1.18  Cable trays shall be supported at the bottom longitudinally on both edges, throughout its length by means of MS channels (minimum 100 mm) to avoid sagging due to cable weight.

4.4.1.19  Cable tray laying shall take care of the necessary clearances for the fire proofing of the structures wherever provided.

4.4.1.20  Mounting of instrument (if remote mounted)/JB on the stanchion or instrument support shall be at the height of 1.3M from the grade level / finished floor level.
4.4.1.21 Extension in the impulse piping of suitable length may have to be provided for those instrument installations where process fluid temperature is higher than the maximum withstanding temperature of the instrument/diaphragm.

4.4.1.22 The installation and erection materials like, cables (signal, control, thermocouple extension and power), cable glands, junction boxes, instrument valves and manifolds, impulse pipe and pipe fillings, pneumatic signal tubes, instrument air line fittings and valves and cable trays/trays required for installation of complete instrumentation shall be as per specifications in standard specifications for instrumentation work enclosed in this package along with additional standards in this package.

4.4.1.23 As far as possible, the instrument tapping shall be located such that the instruments are approachable from the platform. If not, then the instrument nozzles should be provided such that common platform could be provided to service the number of instruments. Platforms shall also be provided on the pipe racks for approach to instruments.

4.4.1.24 The stack analyser probe should be at the lowest possible level and must have a suitable platform with it along with proper approach. The said platform should be connected with the furnace stack. The tapping points of the furnace analysers are to have clear approach for maintenance and opening of tapping flanges.

4.4.1.25 Wherever multiple transmitters being used, separate take off from shall be taken from the flange itself.

4.4.1.25 Instrument Air distribution

(Please refer design basis)

a) For instrument air distribution, Contractor shall bring the air supply line to a single point to various process unit battery limit and shall distribute further to the individual consuming points i.e. control valve smart positioners, actuators etc. Further distribution of air to all control valve smart positioners etc. using necessary piping, tubing, isolation valve and fittings shall be in Contractor’s scope. Adequate nos. of unions shall be used in instrument air line distribution. Refer to drawing attached. Contractor shall work out the air supply distribution as required and air supply distribution details shall be indicated in relevant instrument location drawing.

b) SS pipes and fittings shall be used for instrument air distribution from instrument air headers upto the instrument air isolation valves. Further distribution shall be by 6 mm SS tubes with SS tube fittings, air filter regulators etc. The connection of instrument air line to main air header shall be screwed and no welding is allowed.

4.4.2 LOOP CHECKING AND COMMISSIONING

4.4.2.1 Contractor is fully responsible for all work related to loop checking including cable laying, dressing, identification, ferruling, calibrations, loop testing in coordination with DCS vendor.

4.4.2.2 Before proceeding for loop checking the calibration results of individual elements shall be recorded on the Contractor supplied proforma which shall be approved by Owner) PMC for correctness of installation) measurements and calibration results.
4.4.2.3 For calibration of special instruments, loop checking and for loop checking of sub-vendor packages Contractor shall do necessary coordination with sub-suppliers. The Contractor shall carry out the necessary loop checking to the satisfaction of Owner / PMC which shall be part of Contractor's scope of work.

4.4.2.4 For special instruments like Analysers, Programmable logic controllers, steam turbine control system Anti-surge controllers sub vendors of compressor package etc contractor shall ensure the presence of suppliers, technical personnel during field testing/loop checking and during commissioning to assist in above activities.

4.4.2.5 The procedure as outlined in Part-II of (Testing, installation commissioning and acceptance of DCS system) shall be followed for loop checking and commissioning for example;

The procedure and scope of loop checking shall be as detailed below for the loops connected to DCS/PLC, LCP, etc. Contractor's scope is to lay single/multipair cables etc. upto the control room cellar area through Multi Cable Transit (MCT) blocks as per MCT vendor's recommendation (in contractor's scope), laying of all cables through MCT, laying of cables on trays, branching trays at cellar area till cabinets, tagging of all field cables, performing continuity/insulation test of cable, identification of all cables and cores and dressing, glands and terminations at both ends.

i) Calibration of all field instruments independently.

ii) Providing all assistance to control system sub-vendor during loop checking. This shall include providing signals from the field instruments and checking valve operation with respect to the output from control system to enable control system vendor to verify loop performance.

iii) Ensure proper Co-ordination with control system sub-vendor to meet loop checking schedule. It shall be contractor's responsibility to demonstrate/prove measuring signal levels of field instrument output in control room in the respective identified pair of cable, in case of any problem.

iv) Rectification/re-calibration of field instruments, if found defective during loop checking.

The termination of field cables, checking of interconnection between Instrument/equipments inside control room, ferring/tagging (follow cross-direct ferring concept) of interconnecting cables inside control room and performing loop checking with the co-ordination of contractor shall be in the scope of Contractor.

Loop testing shall be contrayed to check the functional performance of all elements comprising the loop, thereby ensuring proper inter-connections and operations.

Before proceeding for loop checking, the calibration results of individual elements shall be recorded on the contractors supplied proforma which shall be approved by PMC/Owner for correctness of installation, measurements and calibration results.

Loop testing for all control loops shall be generally by simulating process conditions for at least 0%, 25%, 50%, 75% and 100% of full scale inputs. Detailed procedure shall be submitted to PMC/Owner for approval before proceeding with the loop checking.

In case of shutdown systems, field/receiver switches are simulated for abnormality by disconnecting the wires at terminals and software alarms are simulated in DCS/PLC. Function of all associated systems are checked including performance of solenoid valves, On/Off type control/shutdown valves including proper functioning of limit switches and other accessories.
Adjustment of limit switches wherever necessary also form part of checking of loop performance.

Performance of individual loops shall be accepted for an overall accuracy of ±1.5%. Where deviation is found to exist more than specified limit, contractor shall re-calibrate the instruments which shall also form part of loop testing, without any implication.

After the loop test is complete, contractor shall connect back any terminations and connections removed for loop checking. Also, any bypass software or hardware, simulated signals, overrides etc. simulated during loop check shall be restored to normal state.

In case of loops in which instruments like receiver alarm cards, field receivers) switches are calibrated by control system sub-vendor, loop checking shall be performed in co-ordination with them. If a defect in the calibration of the instruments in contractor’s scope is observed, same shall be rectified by contractor to the satisfaction of PMC / Owner. If defect is detected in the calibration of the instruments in the scope of control system vendor, same shall be rectified by System vendor. After the calibration has been rechecked by control system sub-vendor, the loop checking would be performed to the satisfaction of PMC /Owner, which shall be part of contractor scope of work.

Contractor shall complete all entries in the ‘Loop Sheet related to field instrumentation including calibration, installation checks, interconnection of tubing and cabling, hydrotest etc. and get it signed by PMC /Owner. All loop sheets duly filled and signed shall be handed over to control system vendor for overall loop checking records.

The control system vendor shall complete the loop check column in loop sheet after acceptance of loops and hand over the sheets to PMC /Owner.

Contractor shall be completely responsible for simulation of the logics from the field by physically actuating the switches and generating the signals in case of transmitters. Simulation of interlocks shall be carried out by Contractor & the same would be witnessed by OWNER / PMC / Licensor. Necessary format shall be generated by contractor & the same shall be approved by PMC before carrying out the interlock simulation test.

**4.4.2.6** The sub package items like Machine Monitoring System, analyser system, etc., clause 4.4.2.5 is applicable. Contractor shall demonstrate the entire data signal at required location with specified accuracy. Contractor shall also coordinate with System vendors for system integration testing of the above.

**4.4.2.7** For items/systems/instruments which are free issued to contractor for installation, contractor shall satisfy the owner/respective vendor of proper installation and help them to complete loop checking calibration and commissioning. This include CCTV and Gas detection system.

**4.4.2.8** Complete loop checking of the systems and equipments being supplied by contractor or any item/cabinet located in rack room/control room shall be carried out by contractor.
4.4.3 SYSTEM ACCEPTANCE TEST

The owner will take over the system including (all systems oriented items like DCS/PLC, Analyzers, field instruments etc.) from the contractor after the final acceptance test attended by Owner/ PMC, which is defined as successful uninterrupted operation of the integrated system for three weeks for PLANT. Uninterrupted Operation shall be defined as follows:

- All field Instruments, analyzers, gas detectors, Machine protections etc shall be commissioned, fully operational & shall be proved as per process.
- All control schemes including Complex schemes shall be taken in Auto / cascade mode
- All controllers shall be optimally tuned for both normal & turndown condition.
- All interlocks shall be taken on line without Bypassing the interlocks
- All constants, timer values shall be configured as per licensor / OEM recommendations.

System Vendor’s personnel shall be present during the test. Any malfunctioning of the items supplied by the contractor shall be replaced / repaired as required. Once the system failure is detected, the acceptance test shall start all over again from the beginning. The warranty period commences from the day owner takes over the contractor supplied equipment.

4.5 CONTROL ROOM

4.5.1 The CONTROL ROOM shall house all the system Racks. It shall be totally new blast proof building and the same shall be in bidder scope.

It shall have clean agent room, battery room, Rack Room, UPS, HVAC.

Rack Room: Area where all cabinets, racks and panels like marshalling cabinets, barrier cabinets, system cabinets, power supply distribution cabinets, LEL panels etc. are located.

The cables upto the respective cabinets shall be routed from main trunk trays through feeder/branch trays in the false flooring upto racks in rack room.

4.5.3 Contractor shall be responsible for all control room and control room engineering / execution. This shall include but not limited to:

a) Generation of all inputs for control room layouts such as I/O listing, cable schedule, MCT layout finalisation, contractor supplied items to be installed in control room etc. for DCS system and other package vendor items, and finalise various layouts.

b) Laying of cables inside the control room in cellar area as defined elsewhere in branch on trays/ trays. The branch trays shall be provided by the contractor. Contractor shall finalise the sizes and the routing of trays and layouts before commencement of cable laying. The layout shall be prepared considering following cross-sections as a minimum:
   i) MCT blocks
   ii) Main Tray
   iii) Branch tray
Each cross-section shall show layout and cable no. covering all cables within their units.

c) Preparing details of cabinets such as dimensions, base frame details for providing base channels contractor and the installation of these cabinets.

4.5.4 Cable routing

Contractor shall consider the following:

Separation while routing shall be followed for various types of cables to ensure ease of cable installation and to protect the interference among the cables.

a) Signal Cables
b) System Communication cables
c) Power supply cables
d) Alarm cables
e) Shutdown cables

Separate route shall be followed for redundant cables. Also all the network cables/cables carrying serial signals.

4.5.5 Junction Boxes

Two numbers each of signal, contact & T/C spare JBs shall be installed for each unit PLANT & 1-12 and 1 multicable wired upto control room marshalling rack room. Location of JBs in the field shall be intimated during detailed engg.

4.5.6 Multicable Transit Blocks (MCT)

a) Contractor to note that the cable entry into cable cellar shall be through Multi Cable Transit blocks (MCT) only. The MCT shall be sized, supplied and installed at site by Contractor for PLANT entry. The minimum no. of size supplied by the contractor shall be as follows:

- Individual MCT block for different types of signals

The actual sizing shall be the responsibility of contractor based on the actual no. of cables. The sizing defines the minimum requirement.

Suitable cutout based on the sizes given with this specification for installation of MCT frames on the blast proof wall of control room shall be provided by contractor for MCT blocks. In case any additional entry or modified entry is required after the cellar wall is cast the same shall be taken care by of by the contractor.

The MCT entries shall be closed with a thick CS plate, which shall be removed by contractor whenever the MCT is installed.

b) The MCT frames shall be of standard RGB type of ROXTEX or equivalent and of steel construction. The supply shall be complete with insert blocks, spare blocks, stayplates, end packing etc. For flexibility in the engineering peel off sleeve’ type of design shall be used.
c) Contractor shall size the MCT considering 50% spare for each cable size /OD. In addition to installed spares, Contractor shall also provide 50% spare insert blocks in each cable size /O.D. as loose supply. All spare entries in the MCT block shall be plugged.

d) The power cables for instruments shall be suitably separated from the other cables and shall be routed through separate MCT blocks. In general, the MCT frame considered for instrument shall not be used for electrical cables.

e) The MCT shall be installed by contractor as per the recommended practice of supplier. No spare space shall be left uncovered in the frame.

f) The electrical power and control cables shall not be routed through instrument MCT's. If necessary separate MCT's may be used for the same.

g) For analyser shelter MCT sizing /supply shall be carried out by the contractor based on (b) to (e) above.

4.6 ANALYZER SHELTER

Refer JOB STANDARD SPECIFICATION for analyser shelter.

4.7 PACKAGE UNIT INSTRUMENTS

Refer STANDARD SPECIFICATION FOR PACKEG UNIT

Instruments and controls for Cooling Tower, Effluent Treatment Plant, etc shall be in general standalone type dedicated Electronic microprocessor based control system. Normally all controls shall be possible from Local control panel. For utilities like power supply, water, and instrument air shall be provided at the battery limit. Instrument types and models shall be standardised across the plant.

Local Control Panel shall be stand-alone type and suitable to be interfaced to the main DCS through a serial link RS 485 MODBUS RTU protocol, (DCS shall be the master and UCP the slave), to transfer data and alarms.

The Safety systems shall operate independently of the control system. Shutdown signals between the LCP and the Plant ESD System shall be hardwired.

A plant ESD may require the Package to be shutdown during a process upset condition.

Equally, the Package LCP may need to signals the plant ESD System that it has shutdown due to process upset conditions within the package. These signals shall be distinct and separate.

The level of this interface will depend on the Shutdown Philosophy and shall be developed during the Detail Design.

As a minimum the Package LCP shall allow the DCS operators to change set points, starting, stopping of motors, fans etc.
Microprocessor based control systems for packages shall be fully functional and operational in a safe mode even without interface to the plant DCS/ESD systems. The LCP shall be able to fully control of the Package in safe manner.

The systems chosen will be modular so that fault-finding at electronic module level will be minimal, utilising high levels of auto-diagnosis.

**Package Vendor’s scope supply includes:**

Instruments for safe and efficient running of the plant/machine. The supply shall include control valves, suction and discharge auto block valves, relief valves, shut off valves, solenoids, speed indicators, transmitters, pressure and temperature gauges, switches, sensors etc.

Alarm system, safety interlock system, motor alarms, machine monitoring and protection system if any shall be housed in central control room.

Gauge Board to be located near each machine with local gauges mounted on it

All instrument erection materials such as cables, pipes, pipe fittings, supports, trays, conduits, junction boxes etc.

Tools for service calibration and maintenance

Spares parts for 2 yrs. operations

Consumable for one year

Engineering documentation

**Process Alarm, Motor Alarm and Shut down System**

**General**

Critical alarms and shut downs must be derived from direct process sensors and shall be entirely separated from any other system (including process connection). All trip alarms shall always be preceded by a passive alarm from an independent primary measurement. However, the same primary element can be used for measurement of vibrations and displacement. No critical alarm sensors shall also be independent of shut down sensors, but may be common with sensors used for control or indication. Filled temperature elements shall not be used. Alarm signals from analog loops shall be derived via a trip amplifier. Inputs from thermocouples shall be provided with cold junction compensation and downscale burns out feature for high temperature shut downs and vice versa for low. a passive alarms shall warn about the burn-out.
The alarm and shut-down system shall be fail safe type and utilising field contacts that open in alarm conditions.

The logic for alarms (process and motor) and the logic for shut down system shall be independent.

A common output contact for the process alarm and motor alarm system for remote indication shall be provided. The contact shall be potential free and suitable for low level signals, i.e. gold plated. All alarms shall be integrated with DCS. The current trends for critical motors shall be available in the DCS.

**Physical Description**

The process alarm and motor alarm systems shall be supplied with displays, logic and power supply as an integrated package for flush mounting on the main panel front. Alarm facias may be separated from the electronics by prefabricated cables.

The shut-down system shall be shown in a logic graphic display on Mosaic Display on the main panel front containing the various trip alarms, by-pass lamps and switches, including open and closed positions of any automatic block valves. The logic and duplicated power supplied shall be located inside the panel.

The internal power packs shall have an output of 24V/DC, full wave rectified, generated from the 11VAC supply.

The annunciator sequence for process alarms shall be ANSI/ISA-SI8.1, Type “A-14”.

**Monitoring and Protection of Compressor/ Machines**

For the purpose of monitoring the “health” of the machine and for automatic shut-down in case of emergency, a highly reliable continuous Machine monitoring system shall be supplied for Vibration, Axial displacement, Thrust, Overspeed, Key-phasor etc..

The monitoring system comprises machine mounted sensors and transducers and the monitoring instruments installed in the main panel in the local control room. The complete system shall be from M/s Bentley Nevada, in order to have single source system responsibility.
5.0 MANDATORY SPARES

Refer attached Mandatory Spares.

a) Contractor shall supply all spare instruments and Instrument spare parts as per the mandatory spares list attached elsewhere in this tender document.

b) The list covers only the generic names of various spares/spare parts. Contractor shall co-relate the same with the actual instrument/system being supplied. In any case, contractor shall not delete any spare part/spare instrument from the mandatory spare list attached with this package.

c) The instruments which are covered under this contract but don’t appear in the mandatory spare list, contractor shall prepare a list of spares and forward to owner/PMC for review.

d) The mandatory spare list shall be forwarded by the contractor for owner/PMC reviews as a separate document. The document for each instrument shall contain a mandatory spare format and the published part list document with highlighting spare parts being indicated.

The mandatory spare format shall contain the following formats:

- Instrument details like Tag number, Type of Instrument and data sheet number
- Serial number
- Spare part name/part number
- No of spare parts per instruments
- Total no of Instruments
- Total no of spare parts required
- Total no of spare parts offered

The format shall be completely filled and contain all the information duly filled in the format attached.
### CONTRACTOR DATA REQUIREMENTS

#### Drawing and Documentation

**INSTRUMENTATION**

List of Deliverables of the LSTK Contractor. shall comprise of but not limited to the following:

NOTES:

(1) This list indicates the minimum drawings and documents requirements. However vendor shall submit complete list of document & drawing schedule listing all drawings and documents to be submitted by them during the course of execution of the job. The schedule shall list all drawings and documents along with their number and expected date of submission.

(2) As spelt out elsewhere in the Bid, Review / Approval / Information requirements of PMC, & Owner shall be intimated separately for the above documents, later.
STANDARD SPECIFICATION

FOR

ANALYSER SHELTER
Instruction to the Bidder

1. The Vendor shall submit complete Analyzer shelter GA drawings, BOM, HVAC details, BOM etc.

2. The construction of each analyzer house shall be prefabricated in press-formed stainless steel sheet. The materials of construction shall have a fire resistance of two hours minimum in accordance with UL 555 and NFPA Standard 90A

3. Seller shall supply the **complete redundant air conditioning, venting, heating and/or house pressurization system**

4. ORDER OF PRIORITY
   A) Instruction to Bidder
   B) Design Philosophy
   C) SHELTER SPECIFICATION

   In case of conflict, it shall be brought to notice of PDIL / OWNER for conflict resolution.

1.0 GENERAL

1.1 Scope
The main purpose of an analyzer house/shelter is to ensure continuity of safe operation of analyzer systems at a specified rate of reliability by providing a suitable operating environment for analyzers which cannot otherwise operate properly, i.e. if exposed to outdoor or ambient conditions, the operating environment may be affected by requirements concerning

• Outside Area Classification EX. PROOF ZONE-2 GR IIC T3
• Inside Area Classification EX. PROOF ZONE-1 GR IIC T3
• Environmental conditions, mainly temperature and humidity
• Sample handling and conditioning
• Effective maintenance

Hazardous situation arising from the toxicity of gases and vapors which have to be handled shall be the subject of a special study, on the basis of which the appropriate measures shall be decided on and submitted by Seller to client for approval

The following measures are necessary to ensure the safe conditions in the Analyzer house:
• The quantity of flammable materials retained in the analyzer house shall be kept at minimum.
• An efficient ventilation system shall be provided to continuously dilute any internal release of flammable gas or vapors, in order to reduce the concentration at all time below 20% of the lower explosion limit.
• The provision of safe disposal arrangement for samples.

SCOPE OF SUPPLY

WORK INCLUDED
Analyzer house seller shall be responsible for the design, fabrication, construction and commissioning of each house. The house shall be delivered as a fully assembled analyzer house complete with all monitoring equipment, sampling systems, calibration gas supports, tubing, The electrical equipment, fire and gas detectors, alarm beacons, annunciation panel, safe guarding system and HVAC equipment in place, wired and connected.

For Field mounted analyzers, Seller shall be responsible for the design, construction and commissioning of shelter along with the sample conditioning system, sample lines including sample probes and test or calibration gases.

The analyzer house seller shall be responsible for the supply of all associated auxiliary equipment that will be mounted remotely from the analyzer house and for field mounted analyzers.

The analyzer house seller shall supply all the necessary calibration gas cylinders for each analyzer.

Seller shall be responsible for the installation and commissioning of Analyzer Management System along with all necessary hardware in analyzer house, SRR and Central Control Building (CCB).
STANDARDS

1.1.1 This specification, together with the data sheets covers the requirements for the design, materials, nameplate marking, inspection, testing and shipping of analyzer shelter with HVAC system complete with accessories, which are required for housing industrial process analyzers and their associated piping, wiring and auxiliary instruments.

1.1.2 The related standards referred to herein and mentioned below shall be of the latest editions prior to the date of the purchaser's enquiry:

- ANSI/ASME American National Standards Institute American Society of Mechanical Engineers.

- B 1.20.1 Pipe Threads General Purpose (Inch)

- ANSI/ASME B 31.3 Chemical plant & Petroleum refinery piping

- B 16.5 Pipe Flanges and Flanged Fittings NPSY2 through NPS24

- B 16.20 Metallic Gaskets for Pipe Flanges, Ring Joint, Spiral wound and Jacketed.

- EN 10204 Inspection Documents For Metallic Products.

- IEC-60079 Electrical Apparatus for Explosive Gas Atmosphere.

- IEC-60529 Degree of Protection Provided by Enclosures (IP Code).

- IEC-61511 Functional Safety instrumented system for the process industry sector.

- IS-13947 Specification for Low Voltage Switch gears and Control gears.

1.1.3 In the event of any conflict between this specification, data sheets, statutory regulations, related standards, codes etc., the following order of priority shall govern:
  a) Statutory Regulations
  b) Data Sheets
  c) Standard Specification
  d) Codes and Standards
1.1.4 Purchaser's data sheets specify the minimum acceptable materials. Alternate superior material for construction shall also be acceptable provided vendor assumes complete responsibility for the selected materials for their compatibility with the specified operating conditions.

1.2 Bids

1.2.1 Vendor's quotation shall be strictly as per the bidding instructions to vendor attached with the material requisition.

1.2.2 Whenever a detailed technical offer is required, vendor's quotation shall include the following:

a) Compliance to the specifications.

b) Whenever the requirement of detailed specification sheet for analyser shelter is specifically indicated, a detailed specification sheet for each analyser shelter shall be furnished, which shall provide all the details regarding type, material of construction as applicable. The material specifications and the units of measurement for various parts in vendor's specification sheet shall be to the same standards as those indicated in purchaser's data sheet.

c) Proven references for each offered analyser shelter inline with clause 1.2.3 of this specification.

d) General arrangement / Layout drawing of each shelter.

e) List of utilities with expected consumption of each shelter.

f) A copy of approval from local statutory authority, as applicable, such as Petroleum and Explosive Safety Organization / Chief Controller of Explosives (CCE), Nagpur or Director General of Mines Safety (DGMS) in India, for the electrical and electronic equipments installed in electrically hazardous area along with:

i) Test certificate from recognized test house like CMRI/ERTL etc. for flameproof enclosure/intrinsic safety, as specified in the data sheet, as per relevant standard for all Indian manufactured equipments or for items requiring DGMS approval.

ii) Certificate of conformity from agencies like LCIE, BASEEFA, PTB, CSA, FM, UL etc. for compliance to ATEX directives or other equivalent standards for all equipments manufactured outside India.

g) Deviations on technical requirements will not be entertained. In case vendor has any valid technical reason, they must include a list of deviations tag number wise, summing up all the deviations from the purchaser's data sheets and other technical specifications along with the technical reasons for each of these deviations.
h) Catalogues giving detailed technical specifications, model decoding details and other related information for each type of analyser shelter and other equipments / instruments covered in the bid.

1.2.3 All items, as offered, shall be field proven and should have been operating satisfactorily individually for a period of minimum 4000 hours on the bid due date in the process conditions similar to those specified in the purchaser's data sheets. Items with proto-type design or items not meeting proveness criteria specified above shall not be offered.

1.2.4 All documentation submitted by vendor including their quotation, catalogues, drawings, installation, operation and maintenance manual etc. shall be in English language only.

1.2.5 Vendor shall also quote for the following:

a) Unit rate of any special items.

b) Any special tools and tackles needed for maintenance work. In case no special tools are necessary for maintenance for the offered shelter, vendor must certify the same in their offer.

1.3 Drawings and Data

1.3.1 Detailed drawings, data, catalogues and manuals required from the vendor are indicated by the purchaser in vendor data requirement sheets. The required number of reproducible, prints and soft copies shall be dispatched to the address mentioned, adhering to the time limits indicated.

1.3.2 Final documentation consisting of design data, installation manual, operation and maintenance manual etc. submitted by vendor after placement of purchase order shall include the following, as a minimum:

a) Specification sheet for analyser shelter and its accessories.

b) Certified drawing for each analyser shelter, which shall provide following details;

   i) Overall / Mounting Details of the complete shelter in millimetres
   ii) Clearance space required for maintenance work.
   iii) Schematic diagram for the complete assembly including utilities required for the shelter.
   iv) Heat load calculations and dehumidified air flow rate calculation.
   v) LEL level of gases present with calculation for safe limit dilution of inside shelter air.

c) Copy of type test certificates

d) Copy of the test certificates for all tests indicated in clause 4.0 of this specification.

e) Installation procedure for analyser shelter.
1.4 Definitions

1.4.1 Analyser Shelter

Enclosed prefabricated building or part of a building containing process / stack analysers and associated equipment where streams for analysers are brought in and which is regularly entered by authorised personnel for operation and maintenance.

1.4.2 Analyser Shed Structure with one or more sides open and free from obstruction to the natural passage of air, in which one or more analysers are installed. The maintenance of the analyser is normally performed in the protection of the shed.

1.4.3 Analyser rack
An open analyser mounting structure with / without canopy used for mounting analysers, sample handling system and their accessories individually or together in combination.

1.4.4 Analyser cabinet
Small housing in which analysers are installed individually or grouped together. Maintenance is performed from outside the cabinet with door(s) open.

1.5 LOCATION AND SIZE OF ANALYZER HOUSE

In general, Analyzer house shall be located in Non-hazardous area. Where this is not possible, the highest area classification acceptable for the location of an analyzer house shall be Zone 2.

Analyzer house and field mounted analysers shall be located as close as practically possible to their relevant sample points in order to minimize sample transport lag and prevent sample degradation. Analyzer house location under pipe racks or other structures shall be avoided.

Additional to the requirements of IEC 61285, the location of analyzer house or shelter
• Shall be at least 15 meters away from furnace / reactor.
• Shall be such that the vibration level does not exceed that specified for the equipment accommodate inside the analyzer house
• Shall be free from spills of water and process liquids

Seller shall size each analyzer house. The analyzer house size shall take into consideration the size of each analyzer plus an allowance for 30% spare on both inside and outside walls for future analyzer and sample conditioning systems. Analyzers shall be installed along the longitudinal walls of each house; they may be mounted on the wall, using ‘Unistrut’ or equal or on free standing racks in such a way that all parts are freely accessible for maintenance. The analyzers shall bear clear identification plates stating their service. The preferred analyzer house sizes are listed below, seller to select the best suited for the application:

• TYPE 1 – 3m(L) x 3m(W) x 2.8m(H)
• TYPE 2 – 4m(L) x 3m(W) x 2.8m(H)
• TYPE 3 – 6m(L) x 3m(W) x 2.8m(H)
• TYPE 4 – 8m(L) x 3m(W) x 2.8m(H)
• TYPE 5 – 10m(L) x 3m(W) x 2.8m(H)

The minimum walk space between fixed obstacles should be 1 meter taking into account the constraint that cabinet doors may be locked in the open position on one side. There shall be sufficient clearance between cabinets and equipments to allow for maintenance access. Sufficient space shall be provided inside the analyzer house for installation of sink, work bench and auxiliary equipment such as control units and if required recorders, signal converters, printers, computer terminals, etc.

2.0 DESIGN AND CONSTRUCTION

2.1 General requirements

• The construction of each analyzer house shall be prefabricated in press-formed stainless steel sheet. The materials of construction shall have a fire resistance of two hours minimum in accordance with UL 555 and NFPA Standard 90A. The material shall be resistant to attack from oil and chemicals and other environmental factors such as high humidity and solar radiation, etc. All fittings, supporting framework, cable trays etc. shall be compatible with the house construction to minimize corrosion. Seller shall indicate their proposed type of construction in the offer.

• When the house structure is used for equipment support, there shall be sufficient rigidity to minimize vibrations. If required, anti-vibration pads and flexible pipe connections shall be used to isolate vibration sensitive equipments from the pipe work or structure.

• Each analyzer house shall have unobstructed internal headroom of at least 2.5mtr. Dead corners, trenches and spill or drain pits that may collect gases are not allowed inside the house.

2.1.1 The analyzer shelters are provided for housing industrial process analyzers and their associated piping, wiring and auxiliary instruments. The analyzer shelters are designed:

   a) To create a space within a hazardous area (Zone-I) in which under normal operating conditions a non hazardous atmosphere exists, so that testing or calibration of analyzers and maintenance can be performed with opened casings and electrical circuits alive.

   b) To create a controlled environment in which analyzers and their associated equipment are adequately protected against adverse weather conditions.

2.1.2 The analyzer shelter shall be fully prefabricated, assembled, tested and shall be supplied as ready-to-install at project site with all items including analyzers and the accessories duly mounted, wired, tubed and tested before shipment.

2.1.3 The arrangement of equipments shall be such that it provides enough access to front/back/sides of the equipments as necessary during normal operation as well as during start up and maintenance. Sufficient space shall be provided for workbench, signal and power cables entries and routing, power sockets, utility supplies, auxiliary and control equipments. Suitable arrangements shall also be made for locating devices like recorder, portable printers etc. near each equipment.
2.1.4 Shelters shall be equipped with all safety measures like panic bar at the doors, Emergency alarm push buttons, LEL gas (hydrocarbon) detectors, Fire detection system, warning panels, Fire extinguishers, wash basin etc.

2.1.5 Shelter shall be provided with ventilation and air-conditioning to maintain the temperature and humidity suitable for the analyzers stable performance, maintenance and human comfort.

2.1.6 Shelter shall be provided with both internal and external lighting for proper operation and maintenance.

2.1.7 All electrical equipments, fittings, fixtures shall be Flame proof suitable for hazardous area classification.

2.1.8 Analyzer shelter shall be sized considering 30 % additional spare space and facilities like HVAC load, power load etc. for future use.

2.1.9 The design shall be in compliance with the electromagnetic compatibility requirements as per IEC 61000-4.

2.1.1 Design Consideration

Analyser house design calculations shall be based on the following loads:
• Dead load including weight of analyzers, analyzer house, HVAC equipments, and all other equipments forming the part of installation
• Fixtures for HVAC equipment
• Transport loads (Vertical & Horizontal)
• Live loads including furniture & analytical equipment trolley, etc.
• Roof live load and concentrated loads
• Wind & rain loads
If straightening or flattening is required, it shall be accomplished in a manner that will not damage the material or detract from its appearance

WALL
The External walls of Analyzer house shall be fabricated from 2mm thick Stainless Steel sheet. All mating joints shall be fully welded and fixed by welding to a main support frame and each section to have gussets welded in position.

The Interior walls of Analyzer house shall be of a smooth design and fabricated from 1.5mm thick Stainless Steel sheet. The inner wall panels may be riveted in place provided that the panels are suitably sealed against the framework and that the floor is continuously extended vertically at the walls to provide a continuous skirting 150mm high (not at doors).

Each analyzer house shall have mineral fiber insulation (UL Approved for fire resistant construction) sandwiched between the inner and outer walls to meet the 2 hour fire rating. The insulation shall have a minimum thickness of 75mm. Asbestos or other hazardous material for insulation shall not be used. Seller shall consider the use of stiffeners between cavities. Seller shall ensure that gas or liquid cannot build up within the cavity.

Additional wall supports shall be provided as required to adequately support all wall mounted
equipments. Equipments shall be mounted using supports bolted to the inner wall.

**ROOF**

Analyzer house roofs shall be constructed of the same material as the main house (stainless steel) and be insulated. Houses shall have a centre pitch for rainwater drainage, complete with gutters and down pipes and designed to withstand uniform loadings at 0.75kMN/m2. The rainwater drainage system shall be sized to cope with the rainfall of 61mm/Hr and 522mm/24Hr.

Roof and ceiling panel shall be made of 18(1.3mm) gauge stainless steel sheet as minimum.

Roof shall be flat type with minimum practical slope of 25mm per meter.

Roof panels shall provide a net overhang of 300mm on all sides. The analyzer house shall have a canopy along each side of the house to protect external equipments. They shall be designed to withstand a wind speed of 50m/s. This canopy shall be “free venting”.

Roof panel joints shall be interlocked in such a way to provide a complete watertight fit.

**DOORS**

Analyzer house door shall be constructed of the same material as the main house (Stainless Steel).

Each analyzer house shall have outward opening doors at both the ends. One door shall be used as main entrance and other shall be used as Emergency exit. The minimum dimensions for both the doors shall be 900mm wide and 2100mm high. It shall be possible to remove all analyzers or other equipments installed inside the house through main entrance without disassembly.

Doors shall be hung on three recessed stainless steel butt hinges and fitted with weather strips. Each door shall have suitable gasket to prevent ingress of air, rain, etc. and loss of conditioned air and heat.

Each door shall be fitted with a panic bar and self closing spring system. Two hour fire rated double glazed viewing panels shall be fitted on each door, constructed from shatterproof safety glass and installed with suitable gaskets. Each door shall have lock with a master key for main entrance.

Both the doors shall be fitted with limit switches which shall initiate an alarm if left opened for longer than 30 Seconds.

**FASTENERS**

Bolts, nuts, and washers for structural connections shall conform to ASTM A325, and shall be hot dipped galvanized. Prior to final bolting, all galvanized A325 bolts shall be lubricated.

All sheet metal and/or self-tapping screws, self-drilling screws shall be Class 410 stainless steel.

Fasteners which penetrate the wall or roof covering shall be installed with a neoprene washer under the head.

**FOUNDATION & MOUNTING**

Each analyzer house will be mounted on a concrete base which shall be impervious to hydrocarbons (supplied by Client). Seller shall use fully welded Durbart floor plates (or equal). The floor shall be coated with a durable anti-skid, acid resistant epoxy coating on wear surfaces. The floor of the
analyzer house shall slope to the door(s). The doors shall not have an entry lip. This will allow any spillages to be swept out of analyzer house.

The Supplier shall supply detailed drawing mentioning the location, alignment and size of the anchoring bolts.

There shall be no openings at the base of the Analyzer House, including around support members.

The Analyzer Shelter shall be designed with provisions for a building-to-foundation seal after installation upon the concrete slab or structure.

The base of the Analyzer Shelter shall be minimum 6 inches (150 mm) deep steel channels and/or beams, which will also serve as the skid for shipping.

The skid frame shall be designed to support the Analyzer House with all the equipment while being lifted.

The skid shall be designed so that it is flush on all sides with the outside walls of the Analyzer House. The joints between the sidewalls and the base shall be sealed.

Lifting of each analyzer house shall be by Seller specified “eye-bolts”, mounted on each analyzer house roof, at suitable locations and sized to take load of analyzer house fully fitted with all equipments. If any special equipment such as Spreader Bar is required, they shall be supplied by House seller.

PAINTING
After primer has cured, two finish coats of epoxy resin, fire retardant paint shall be applied. The surface preparation and painting shall not be carried out until all welding is complete, including all brackets, mounting plates, etc. Surface finish should be applied to all external and internal surfaces including surfaces that will be enclosed with the double skin.

ALYZER SHELTER
The analyzers which are not mounted in Analyzer house shall be installed in a Shelter.

Shelter shall be provided with its own lighting and local switch mounted outside of the shelter certified for use in the hazardous area in which it is located.

The power isolation switch for each analyzer installed inside the shelter shall be supplied by Seller.

There shall be main power isolator switch mounted outside the shelter suitable for the area classification.

Shelter shall be so designed and constructed to allow free ventilation such that equipment contained within them can be certified the same as the area classification.

2.2 Construction
2.2.1 The shelter shall be constructed using materials capable of satisfying all the functional requirements and shall not create any safety hazards.

2.2.2 The design and construction of the shelter shall be self-supporting type and shall be sized to house required analyzers, their sample conditioning system and other accessories. Shelters shall also be provided with suitable transportation arrangement.

2.2.3 The base structure of the shelter shall be constructed using suitable size T beams, channels, and angles, welded properly and adequately. All structural members shall be sized to ensure structural rigidity and to prevent deformation during dragging, lifting, loading and unloading operations of the shelter.

2.2.4 The floor shall be fabricated from anti slip and non-corrosive Aluminium plates as a minimum, strong enough to withstand load of all equipments and at least I O-maintenance personal. It shall also be unaffected during transportation and various other obvious forces and shall be sealed to prevent any loss of ventilation pressure.

2.2.5 External sidewalls shall be ribbed interlocking stainless steel sheet of thickness 2mm and internal walls shall be stainless steel sheet of thickness 2mm. The walls of the shelter shall be strong enough to take load of the rack mounted analyzers, related sample conditioning system and associated accessories.

2.2.6 The shelter roof shall be capable of supporting the combined weight of at least 4 men without permanent deformation and shall be sealed properly to prevent loss of ventilation pressure and entry of rain and jet water.

2.2.7 Lifting of the complete shelter along with all analyzers, sample conditioning systems and associated accessories mounted in it shall be assured by means of suitably designed lifting lugs.

2.2.8 The walls and roof shall be insulated by using glass wool of high density and low thermal coefficient, of adequate thickness commensurate with the HVAC design.

2.2.9 The shelter shall be provided with a main door and an emergency door opposite to main door. Both the doors shall be opening outwards, provided with wire reinforced safety glass window, automatic spring door closer opening by simple push, fitted with panic bar for use in case of emergency. The main door shall be provided with outside pad lock holes. Warning light shall be provided at both the Main door and the emergency door indicating the Hydro carbon presence within the shelter.

2.2.10 Extension roof (overhang) made of stainless steel sheet shall be provided all along the walls of the shelter and over the sampling system for protection of the sampling system and maintenance personal from the direct weather conditions. The extension roof shall be overhung at least 1000 mm outside the analyzer shelter.

2.2.11 A nameplate with the analyzer shelter number shall be fixed near the main door and emergency door. Tag numbers of the analyzers shall be fixed near the main door. Tag Numbers of each analyzer and sampling system shall be fixed near the respective items. All inlet & outlet tube/pipes shall be provided with tag number & proper identification numbers engraved in the stainless steel plate. All electrical wires/leads shall be identified inside the junction box/equipment by proper plastic ferrules. All cables shall be identified with stainless steel plate engraved tag nos.
identification numbers.

2.2.12 Provision shall be made for keeping all fast loop devices, distribution devices outside the shelter. A suitable restriction orifice shall be provided in each sample line to limit the sample flow not exceeding thrice the normal flow in the event of tube rupture/opening of the tube down the line.

2.2.13 All pipes which introduce flammable gases inside shelter shall have readily accessible shut off valves.

2.3 Safety considerations

2.3.1 Analyser shelter shall be provided with pressurisation/purging with fresh air with air changes as per specs to make it safe for installation, operation and maintenance of analysers.

2.3.2 All junction boxes and electrical equipments shall be explosion proof as per area classification.

2.3.3 All analysers installed shall be suitable for working as per inside area classification even without fresh air purging / pressurisation.

2.3.4 The equipments which are not suitable for inside area shall be de-energised in case of ventilation failure and gas detection.

2.3.5 Warning panels, alarm annunciator, and repeat contacts to control room shall be provided for safety related parameters.

2.3.6 Gas detection, fire detection and oxygen deficiency detection shall be provided as per specs.

2.3.7 A PLC shall be provided to execute safety logics. PLC shall have redundant CPU. PLC shall be mounted in Ex-proof enclosure. PLC fault shall be annunciated.

2.4 Warning Panels

2.4.1 The following safety related local alarms / indicators shall be generated and displayed:
   a. Ventilation failure
   b. Flammable gas detected (> 20%)
   c. Fire detected
   d. Oxygen deficiency
   e. Gas detection Instrument fault
   f. Manual emergency (panic)

2.4.2 These alarms shall be supported at the following locations:
   a. Inside shelter on annunciator panel
2.5 Hazardous Area Classification

2.5.1 Hazardous area classification shall be as indicated in the job specification ~or outside the shelter. Hazardous area for inside the analyser shelter shall be considered as IEC Zone-I Gas Group IIC, temp. class T3 considering pressurization failure condition. All equipments inside the analyser shelter shall be suitable for operation in area classification under pressurization failure condition.

2.5.2 Non explosion protected equipments will be de-energised in case of pressurisation failure and gas detection.

2.5.3 Restart of such equipments shall not be possible without appropriate authorization.

2.6 HVAC System for Analyser Shelter

VENTILATION AND AIR CONDITIONING

GENERAL
- The purpose of ventilation and air conditioning system is to provide
- A safe operating environment for equipments and personnel
- The required climatic conditions for optimal equipment performance
- A sustainable climate for the comfort of personnel in line with local regulations and/or practice
- To dilute flammable or toxic gases and/or vapors that may accidentally escape from equipment inside the analyzer house to a non-hazardous level around any potential means of ignition
- To keep house pressurized to prevent possible entry of flammable or toxic gases from the outside atmosphere into the house
- Seller shall supply the complete redundant air conditioning, venting, heating and/or house pressurization system. The system shall be capable to maintain the inside house conditions as mentioned below:
  - Temperature 24°C ± 2°C
  - Pressure 5 – 10 mmwc
  - Humidity 50% RH ± 5%

Suitable temperature and pressure indicators shall be provided inside the house by Seller. Pressure switch shall be provided to initiate an alarm on loss of house pressure.

Each analyzer house shall have common fresh air intake via a stack mounted on the analyzer house roof. These stacks shall be provided with a rain hood and a mesh to prevent entry of birds etc. also adds tie bars for support of stack. The air shall be drawn from a non-hazardous area and the air intake location shall be at least 1 meter outside the hazardous area. The design of the intake duct and the diameter and length shall be sized by Seller so as to limit the air velocity inside the ducting to a maximum of 8m/second. The intake stack shall have filters 5 microns down to 99% efficiency, fire dampers and louvers.

All duct penetrations through fire rated walls shall include fire and gas dampers manufactured and
installed in accordance with the requirements of UL 555 and NFPA Standard 90A.

The dampers Shall have a two hour fire rating and shall spring close tight when released by a fusible link or by a Fire and Gas signal. The direction of the air flow within each house shall ensure air movement throughout, and around all equipment installed inside, irrespective of wind direction and strength.

The inlet ducting shall be fabricated from hot dipped galvanized steel to BS729, the size of the ducting shall be such that air velocities inside will not create noise level which exceed 70dB(A).

The flow of air from the HVAC unit shall be sufficient to dilute escaping gas or vapors, resulting from the failure or rupture of any sample or service line, to less than 20% of LEL around any potential sources of ignition and to maintain house pressure 5mmH2O above the atmospheric pressure to prevent entry of hazardous gas.

Seller shall ensure for each analyzer house the ventilation rate at least 10 volume changes per hour or at least 20m³ of air per installed analyzer per hour, whichever is greater, to dilute any flammable gas or vapor to a non-hazardous level.

Two pressurization fans each rated at 100% of the design duty with automatic changeover shall be provided with each analyzer house. The fan motors shall be suitable for use in Zone1 area. The fan shall be non-sparking type. The ducting to the fan inlet shall be protected from the ingress of rain water or significant blowback by wind, and shall be complete with a wire mesh screen to prevent the entry of birds, vermin or particulate matter. Neither wind speed nor direction shall have any effect on the ventilation.

Analyzer house shall be air conditioned by air handling units. The unit shall comprise of fan section, pre-filter (EU3) direct expansion cooling coil and refrigeration compressor and associated air cooled condenser. This equipment, including any controls, shall be suitable for use in a Zone 1 area.

Air shall enter the analyzer house at ceiling level from ducting via openings with adjustable flow diverters to facilitate a proper direction and flow of air throughout the analyzer house. The ventilation air shall escape from the house through vertical ducts at two opposite corners of the house, via louvers with adjustable openings.

The ducts should be installed on the outside of the short walls and connected to the interior of the analyzer house by openings in these walls which are flushed at floor and ceiling level to allow escape of gases and vapors both heavier and lighter than air.

There shall be separate power supply for the ventilating fans and shall have tripping circuit to trip the motors in case of fire.

Each fan support and casing construction shall be of adequate rigidity to prevent resonance and vibration. The fan bearing support shall be the part of fan casting.

Low flow switch shall be provided with each fan to detect air flow to the house. The switch shall be set to indicate flow failure when flow falls below 60% of design flow. A time delay of 1 min. to be provided to avoid spurious operations due to short term disturbances. Low flow alarm shall initiate visible (lamp on annunciator) and audible alarm and makes change over to the other system.
During start up of the house, both the HVACs shall run for the predefined period.

Reset buttons for both the HVAC units shall be provided on safeguarding panel. This switch shall be used to reset the latched HVAC unit alarm. The alarm latching is required to avoid the changeover to the same HVAC unit until it is attended to.

2.6.1 Vendor shall design, engineer, procure, manufacture, inspect & test at works, shop-paint, pack & forward, transport, supply install, test and commission the HVAC System for Analyser Shelter complete with all auxiliaries required for efficient & satisfactory operation. Vendor shall carry out Performance Guarantee (PG) test at site to prove the Guaranteed Parameters. The specifications for HVAC system shall be as detailed in 2.6.2 for Analyser Shelters located in hazardous area and 2.6.3 for Analyser Shelters located in safe area.

2.6.2 HVAC System for Analyser Shelter Hazardous Area

2.6.2.1 Analyser Shelters shall be air conditioned and pressurized to prevent the entry of flammable gases & vapours and combustible dusts.

2.6.2.2 Air Conditioning and pressurization shall be achieved by providing packaged type HVAC units as per manufacturer’s standard practice.

2.6.2.3 Pressurisation system shall be provided for analyser shelter with 2 nos of HVAC system (one working unit and one standby unit) each of same capacity without any common / sharing components. Fresh air shall be taken from safe area. Fresh air intake arrangement comprising of fresh air blower with drive & back draft dampers, cleanable type filter (95%, 5 micron) and bird screen etc. shall be provided. Relief dampers shall be used to exhaust room air at 5 mm WG over pressure. Shelter internal positive pressure shall be maintained at 2.5 mm WG minimum. Fresh air stack with rain cap shall be of carbon steel, welded in construction of minimum 2 mm thick. Fresh air shall be taken from nearest safe area through fresh air stack in a guy wire style or through horizontal/ vertical duct. The Ducts shall be completely leak proof while passing through hazardous area. Loss of pressurization shall initiate an audio-visual alarm. Manual HVAC selector switch to alternate between the HVAC shall be provided in the shelter. Special anti-corrosive coating shall be provided for coolant tubes to withstand harsh refinery environment."

2.6.2.4 Fresh air make up requirements shall be calculated by the vendor based on the requirements as specified in Clause 8.3 of NFPA 496, (Latest Edition), i.e. where a release of flammable gas or vapour within an enclosure can occur either in normal operation or under abnormal conditions, protection shall be provided by diluting with air to maintain the concentration of flammable gas, vapour, or mixture to less than 25% of its lower flammable limit of any individual flammable gas or vapour entering the enclosure. However minimum 5 air changes shall be provided as per IEC 61285 for ventilation purpose. Inside temperature rise shall be limited to 5°C above ambient, by fresh air from pressurisation system, in case of failure of AC system.

2.6.2.5 Vendor shall confirm that all analysers installed inside Analyser Shelters are suitable for continuous operation in this temperature (Max. ambient +5°C). In case any analyzer being supplied is not suitable for this temperature limit, vendor shall provide high temp pre alarm inside shelter. A separate potential free contact of this alarm shall be provided in alarm J.B. for
connection to control room also. The power to analyzer shall be cut off in case of high temperature.

2.6.2.6 Vendor shall submit heat load calculation for review during post order engineering. Heat load on account of fresh air shall be considered while calculating the capacity of air conditioners.

2.6.2.7 All equipment shall be suitable for operation in their respective area classification. For Analyser shelters located in classified area (Zone - 2, Gr. IINIBIIIC), HVAC unit is required to be explosion-proof in construction. All flameproof equipments manufactured locally (within India), the testing shall be carried out by any of the approved testing houses – CMRI/ERTL etc. The item shall, in addition, bear the valid certification from PECB/CCE and also the manufacturer shall hold a valid BIS license. All equipments manufactured abroad shall be certified by any approving authority like BASEEFA, FM, UL, PTB, LCIE etc. In addition certification by Indian Authorities PECB/ CCE, Nagpur, is mandatory.

2.6.2.8 Chemical Filters shall be provided in the fresh air intake to protect the electronic equipment installed inside the analyzer shelters against corrosive gases like H,S, SO" NOx etc. as per specification clause 2.7.

2.6.3 HVAC System for Analyser Shelter Safe Area

2.6.3.1 Analyser shelters are to be air conditioned and pressurised to prevent the entry of dust.

2.6.3.2 Air Conditioning and pressurization shall be achieved by providing packaged type HVAC units as per manufacturer's standard practice.

2.6.3.3 Pressurisation system shall be provided for analyser shelter with 2 nos of HVAC system (one working unit and one standby unit) each of same capacity without any common / sharing components. Fresh air intake arrangement comprising of fresh air blower with drive & back draft dampers, cleanable type filters (95%, 5 micron) and bird screen etc shall be provided. Minimum 5 air changes shall be provided as per IEC 61285 for ventilation purpose. Inside temperature rise shall be limited to 5° C above ambient, by fresh air from pressurization system, in case of failure of AC system. Relief dampers shall be used to exhaust room air at 5 mm WG over pressure. Shelter internal positive pressure shall be maintained at 2.5 mm WG minimum. Loss of pressurisation shall initiate an audio-visual alarm. Manual HVAC selector switch to alternate between the HVAC shall be provided in the shelter. Special anti-corrosive coating shall be provided for coolant tubes to withstand harsh refinery environment.

2.6.3.4 Vendor shall confirm that all analysers installed inside Analyser Shelters are suitable for continuous operation in this temperature (Max. ambient +5°C). In case any analyzer being supplied is not suitable for this temperature limit, vendor shall provide high temp pre alarm inside shelter. A separate potential free contact of this alarm shall be provided in alarm J.B. for connection to control room also.

The power to analyzer shall be cut off in case of high temperature.

2.6.3.5 Vendor shall submit heat load calculation for review during post order engineering. Heat load on account of fresh air shall be considered.
2.6.3.6 Chemical Filters shall be provided in the fresh air intake to protect the electronic equipment installed inside the analyser shelters against corrosive gases like H2S, S02, NOX etc. as per specification clause 2.7.

2.6.3.7 Vendor shall submit heat load calculation for review during post order engineering. Heat load on account of fresh air shall be considered while calculating the capacity of air conditioners.

2.6.4 **Inside Conditions to be maintained**

Following inside conditions are to be maintained and guaranteed by vendor throughout the year:
- Dry bulb temperature: 26°C ± 1°C
- Relative humidity: 35% to 70%

2.6.5 **Outdoor Design Conditions**

Outdoor design conditions, as mentioned elsewhere, shall be considered for heat load calculation.

2.6.6 **Spares**

Spares for commissioning and start up as required shall be provided by vendor without any additional time & cost implication.

2.7 Chemical Filters

2.7.1 The design, selection, manufacture and supply of chemical air filters for the duty specified shall be in vendor’s scope.

2.7.2 Chemical air filters are required to be installed in fresh air circuit.

2.7.3 **Selection Data for Chemical Filters**

The following conditions shall be considered as a minimum for outside ambient air:

<table>
<thead>
<tr>
<th>GAS</th>
<th>OUTSIDE (g/m³)</th>
<th>INSIDE (PPM by Vol.)</th>
</tr>
</thead>
<tbody>
<tr>

* Normally not associated with Refinery emission.
2.7.4 Technical Specifications for Chemical Filters

2.7.4.1 Chemical air filter unit shall be selected to provide inside conditions as given above considering the outside ambient concentrations given under Max. (8 hrs. average) column.

2.7.4.2 Chemical air filter shall be selected for the chemical media life of minimum 2 years. The outside gas concentration given above shall be considered while evaluating the life. Chemical Filter supplier to furnish the calculations and nomographs etc. in support of the chemical media life, at post order stage.

2.7.4.3 Chemical air filter unit shall be skid-mounted cubicle for horizontal installation.

2.7.4.4 Three stage chemical filter shall be provided – one/two modules containing Puracarb or equivalent media and other metal modules containing chemisorbant or equivalent media.

2.7.4.5 Filter packs suitable for removal of specified gases shall be housed in an adequately rigid & reinforced sheet metal enclosure, with flanged inlet & outlet connections, inspection cover/manhole.

2.7.4.6 The pre-filters at inlet & fine filters at outlet shall be capable of removing dust particles of 10 microns with 90% efficiency & of 1+ microns with minimum 90% efficiency respectively.

2.7.4.7 Unit shall be suitable for outdoor installation & continuous operation. It shall be painted as per painting specifications of the Bidding document.

2.7.4.8 It should have adequate provision for easy removal & servicing of filter packs.

2.7.4.9 Unit shall be provided with indication of differential pressure across the filters.

2.8 Power Supply

2.8.1 Unless otherwise specified, the following power supplies shall be provided for each shelter at one point near the shelter by owner. Further distribution step down etc. as per requirement shall be done by the vendor:

i) 415V, 50Hz, 3 phase with neutral for the HVAC system.

ii) 110VAC 50Hz Single phase for analyser, alarm system, horn and other related accessories.

230V 50Hz Single phase for lighting (internal and external) system of the shelter and heat tracing shall be developed by vendor.

2.8.2 The supply voltage fluctuation of ±10% and supply frequency fluctuation of±3Hz from the specified value, shall not affect the system performance.

2.8.3 The size and number of incomers shall depend on load and distance and shall be finalized during detail engineering. Vendor shall provide necessary terminal sizes and suitable cable glands.

2.8.4 Main switches for all three-power supplies shall be mounted outside the analyser shelter,
which shall be weather proof to IP66 and explosion proof suitable for the specified hazardous area classification. The power supply cables will be terminated after the main switches inside the shelter in different junction boxes with terminals and switch fuse unit for power distribution to the relevant equipments/items. Individual switches shall be provided for each instrument for independent de-energisation of the items. ‘Power Supply on’ indication shall be provided on the main power supply line to each analyser on PDB.

2.8.5 Two power sockets of IIOV 50Hz and nov 50Hz supply for electrical tools or test equipments shall be provided at two opposite corners of each shelter.

2.9 Other Utilities

Owner shall provide following utilities at one point near each shelter. Further distribution shall be done by vendor as per the requirement.

2.9.1 Steam

   a) Pressure:  2.5 - 5.5 kg/cm²
   b) Temperature:  Saturated

   c) Line size connection:  1" NB NPT (M) with valve.

2.9.2 Instrument Air

   a) Pressure:  4.0– 6.0 kg/cm²
   b) Dew Point:  - 40°C at atmospheric pressure

   c) Line size connection:  1.0" NB NPT (M) with valve

2.9.3 Cooling water

   a) Pressure:  3.5 - 5.0 kg/cm²
   b) Temperature:  33°C

   c) Connection size:  1.0" NBNPT (M) with valve

2.9.4 Nitrogen

   a) Temperature:  Ambient
   b) Pressure:  5 - 8 kg/cm²

   c) Connection size:  1.0" NBNPT (M) with valve
Vendor shall furnish the list of utilities required with expected consumption.

2.10 Lighting

2.10.1 Power supply for lighting inside and outside the shelter shall be 230 V 50 Hz.

2.10.2 Internal lighting shall be provided by fluorescent tube lamps to provide in illumination of 300-400 lux at all places on the floor.

2.10.3 External lighting shall be under overhangs to provide illumination sufficient for maintenance / repair work.

2.10.4 Lighting fixtures inside and outside the shelter shall be suitable for the hazardous area classification specified.

2.10.5 Lighting switch shall be provided outside the shelter near to the main door.

2.11 Terminal Housing

2.11.1 The terminal housing shall be suitable for the area classification indicated in the purchaser's data sheets. Unless otherwise specified, the enclosure shall comply with the following requirements as a minimum:

Weather proof housing: IP-65 as per IEC-60529/IS-13947

Flameproof housing: Flameproof/Explosion proof i.e., Ex (d) as per IEC 60079 / IS2148 for explosion proof construction

Flameproof housing shall also be made weather proof and shall be provided with metallic enclosure.

2.11.2 All cables shall terminate on the terminal blocks in all vendor-supplied equipments, Separate terminal blocks shall be provided for power and signal cables. Unless otherwise specified, terminals shall be suitable for terminating following conductor sizes, as a minimum:

- Signal cables : 1.5 / 2.5 sq. mm
- Power cables : 6 sq. mm

Separate terminal box shall be provided in case instrument terminals available as standard are not suitable to accommodate the specified conductor sizes.

2.12 Tubing / Piping / Wiring

Tubing and piping runs shall be installed such that they will not interfere in the maintenance or removal of any analyzer or equipment in the house or shelter nor encroach on space allotted for future instruments. All valves and instruments shall be readily accessible.

Traps shall be provided and installed by Seller outside the house or shelter for all steam traced inlet
sample lines and steam users. Each steam user shall have its own trap.

All users of instrument air shall have block valves at the take off point. All sample inlet and outlet points shall have isolation valve.

All piping and tubing shall be adequately supported. All tubing shall be protected by running it in trays or channels.

All tubing shall be annealed SS-316, 1/2 inch OD by 0.049” wall thickness or 1/4 inch OD by 0.035 wall thickness as appropriate. Fittings shall be Flare less SS-316.

Other materials for tubing and/or fittings may be considered where required by process conditions.

2.12.1 All safety valve outlets shall be terminated in a common header of 2” NB schedule 80S Stainless Steel 304 pipe and single outlet shall be provided out side the shelter with one non return valve and lock open type 1” ball valve. Similarly all vents to atmosphere shall be terminated in a similar 2” NB Schedule 80S Stainless Steel 304 pipe and single outlet shall be provided. If commom header is not there then with non-return valve and Lock open type 1” ball valve.

2.12.2 All atmospheric gas out line shall be equipped with protection from climatic condition.

2.12.3 All tubing work shall be done by using 1/2.” OD or 118"OD SS tube aod Swagelok/ Parker/ Hamlet flare less, double compression type fittings.

2.12.4 All wiring/ tubing and all other erection work shall be done in accordance to API RP 551-5

2.12.5 All cable entries/outlets in the junction boxes/ distribution boxes etc and to the analyzer shall be provided with double compression type certified flameproof cables glands suitable for the indicated hazardous area. The material of the same shall be Nickel-plated brass.

2.12.6 All cabling/wiring works inside the shelter shall be in accordance with the international Standard / industry practice for similar application. However the cables shall be armoured as a minimum.

2.12.7 Dimensions and layout of each shelter shall be provided by contractor for Owner / PMC review before taking up for fabrication.

2.13 **Hook up of Analyser Shelter**

2.13.1 End Connections shall be provided for all interconnections (fast loop return, sample return, utilities, flare, vent, drain etc.) as specified in purchaser's data sheet for their hook up.

2.13.2 In case end connection for hook up of vendor's standard supply is different than that specified in the purchaser's data sheet, vendor should include the required hook up material in their scope of supply.

2.13.3 Unless otherwise specified, end connection details shall be as below:
a) Threaded end connections shall be NPT as per ANSI/ASME B 1. 20.1.

b) Flanged end connections shall be as per ANSI/ASME B 16.5

c) Grooves of ring type joint flanges shall be octagonal as per ANSI 16.20.

d) Flange face finish shall be as per clauses 6.4.4.1, 6.4.4.2 and 6.4.4.3 of ANSI/ASME B 16.5. The face finish as specified in the data sheets, shall be as follows:

<table>
<thead>
<tr>
<th>AARH</th>
<th>125 to 200 AARH</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 AARH</td>
<td>32 to 63 AARH</td>
</tr>
</tbody>
</table>

2.14 Foundation:

2.14.1 The analyzer shelter shall be installed on 200 mm high concrete pedestal provided on paved area in the plant by owner. The pedestal shall be extending 1 meter all around the footprint of analyzer shelter.

2.14.2 Analyser shelter shall be supplied with base channel of min. ISO mm height which will be bolted to the pedestal.

2.14.3 Vendor shall arrange all equipments outside the shelter including HVAC in such a manner that they are accommodated on the pedestal.

2.14.4 All civil works necessary to install the shelter on pedestal and any residual civil work to provide additional foundation for any accessory shall be in Vendor scope.

2.15 Painting

2.15.1 Non SS parts of the analyzer shelter shall be treated and painted as follows:

a) All surfaces including structures shall be sand blasted and grinded smooth and free of scale, rust etc.

b) Chemical treatment shall be done to remove rust, oil, entrapped impurities and other foreign materials.

c) Exterior and inside colour of shelter shall be finalised during detailed engineering.

3.0 NAMEPLATE

3.1 Each analyser shelter shall have a stainless steel nameplate attached firmly to it at a visible place near the main and Emergency doors, furnishing the following information:

a) Tag number as per purchaser's data sheet.

b) Manufacturer's serial number (If any).

c) Manufacturer's name/trade mark.
d) Area classification in which the shelter can be used.

e) Size of shelter.

Seller shall fit a nameplate with the analyzer house number (e.g. AH-01) to both doors on each analyzer house.

Seller shall also fit an appropriate warning boards like following:
• Analyser house protected by artificial ventilation
• Warning - doors shall be kept closed
• Warning - risk of H2S
• Warning - flammable material shall only be introduced into the analyser house if specifically permitted and recorded.

Seller shall clearly identify all services with name plates, (for steam this shall also indicate maximum pressure and temperature), at entries to analyzers both internally and externally and entries to sample conditioning systems.

Seller shall clearly identify all sample flow and return lines, carrier gas and calibration gases with name plates, at entries to analyzers both internally and externally and entries to sample conditioning systems.

All nameplates, labels and signs shall be in dual language, Hindi and English. In addition any signs for extreme caution, such as the risk of Hydrogen Sulphide shall also be in Bangla.

All parts inside and outside of the analyzer house, inside sample conditioning system, HVAC, safe guarding PLC shall have a nameplate indicating the label of that part for identification. The parts in Sample conditioning system shall also be printed with their set point or normal values in the second line of the label.

4.0 INSPECTION AND TESTING

4.1 Unless otherwise specified, purchaser reserves the right to test and inspect all the items at the vendor's works.

4.2 Vendor shall submit the following test certificates and test reports for purchaser's review:

a) Material test certificate as per clause 3.1B of EN 10204 for flanges, fittings and sheet steel.

b) Certificate of radiography/ X-ray for header welded joints. Dye penetration test certificate shall be provided for joints where radiography/ X-ray is not possible.

c) Dimensional verification certificate as per clause 4.3 of this specification.

d) Hydrostatic testing of all headers.

e) Leakage and continuity testing.

f) Power Distribution and wiring check

g) Functional check for HVAC
h) Type test certificates

Seller shall carry out a complete inspection of all analyzer houses, to ensure all analyzers, analyzer sample systems, pipe and tube work, utilities, drain and vent systems, heating and ventilating system plus all analyzers which are field mounted are in manufacturer’s perfect working order. The analyzer house Seller shall permit inspection by the client at any time during the actual construction of any part or parts of the project.

Seller shall make following facilities available for test:
- Sufficient qualified labour to carry out the test.
- Air or nitrogen at required pressure for the full duration of the test.
- Air bubbler, maximum working pressure 10kg/cm2(g).
- A gas/air leak detector
- Measuring equipment for supplies and outputs (multi-meter).
- Special measuring tools/equipment for components installed.
- Power supply units as applicable.
- Three copies of the as built drawings.
- Test and calibration gas/liquid samples for each analyzer.

Inspection and full functional testing shall then be carried out at Seller’s premises of all analyzer houses and systems and all field mounted analyzers, with the analyzer house Seller’s responsible analyzer specialist and the Client. This will include a full calibration test of each analyzer.

The analyzer house seller shall then ensure safe transportation of each analyzer house, complete with analyzers, sample systems and contents, plus all field mounted analyzers and their equipment, to the site, where they shall be installed by client under Seller’s supervision.

All field equipments, including field mounted analyzers sample systems and as sociated analytical equipment that is not mounted in each house shall be installed by Client under Seller’s supervision.

Analyzer house Seller’s responsible analyzer specialist shall then carry out a complete inspection to ensure all analyzers, their systems and all utilities are in manufacturer’s perfect working order before each analyzer system and all utilities are commissioned by the analyzer house specialist. This will include a full calibration test of each analyzer.

The sample transport and return lines shall be disconnected from the preconditioning panel and sample conditioning cabinet and then flushed out with demineralised water. The system shall then be dried using clean air or nitrogen.

Analyzer house Seller shall carry out pressure test and inspect the sample transport and sample conditioning systems before the system is offered for inspection by the client.

During the leak test, all inlets and outlets shall be capped off, with the exception of those which are provided with a valve. The isolating valve shall be closed for these connections. The analyzer shall not be included in the leak test and shall be disconnected at the inlet and outlet connection. All other valves and reducers shall be fully opened. The maximum pressure applied shall not exceed 10 kg/cm2(g). Each system shall be pressurized for at least five minutes while the bubbler is carefully observed.

Systems or parts with a design pressure up to 9k g/cm2(g) shall be isolated from the system having higher design pressure and shall be opened to atmosphere during the pressure test. Systems or parts of
systems with a design pressure higher than 9kg/cm²(g) shall be pressurized at 1.5 times the design pressure via a tight shut-off valve and a high-quality pressure gauge.

4.3 Dimensional Verification

4.3.1 End connection dimensional details shall be verified for all instruments and their accessories in accordance with approved drawings. In any case, the variation shall not exceed ±2.0mm.

4.4 Hydrostatic Testing

All headers shall undergo hydrostatic testing at 1.5 times the header design pressure with water at ambient temperature. These shall not be any visible leakage during the testing.

4.5 Continuity Testing

a) All power cables shall be megger tested at minimum 600V. The insulation shall be as per IS-1554 Part I.

b) All signal cables / wires shall be checked for continuity, termination and identification using multimeter.

4.6 Leakage Testing

All tubing and piping shall undergo leakage testing when pressurised with nitrogen at 100 psig. No bubbles shall appear when testing with soap solution.

4.7 Witness Inspection

4.7.1 Vendor shall offer all analyser shelters for pre-dispatch inspection at their works. Following tests/checks shall be carried out, as a minimum.

a) Physical dimensional verification and workmanship as per clause 4.3 of this specification.

b) Leakage testing of tubes and headers with nitrogen as per clause 4.5 and 4.6 of this specification.

c) Power distribution and wiring scheme check

d) Insulation resistance work

e) Functional check of HVAC

f) Review of all certificates and test reports as indicated in clause 4.2 of this

4.7.2 In the event the witness inspection is not carried out by purchaser, the tests shall anyway be completed by the vendor and documents for the same shall be submitted to purchaser for scrutiny.
5.0 UTILİTY SERVICES

Seller shall provide a suitable distribution system as required. All service lines must have a minimum distance of 25mm clear between neighboring flanges. Steam and condensate lines shall have an allowance for insulation.

Seller shall provide a suitable distribution system for carrier gas, calibration gas, instrument air, etc as required for each analyzer. A means shall be provided to initiate an alarm on low pressure/volume in the header or cylinders.

All piping and tubing from headers, analyzers, cabinet drains, vents, steam users and steam tracing inside the shelter shall be brought to the outside so that, at the jobsite, all connections can be made outside the shelters.
6.0 SAFEGUARDING SYSTEM

Each analyzer house shall be protected by a safeguarding system against hazardous situations. Seller shall supply safe guarding PLC, fire & gas detector, alarm initiating devices, annunciatior etc. fully wired with respective junction box or PLC.

Seller shall develop the “Cause & Effect Diagram”, “Functional Logic Diagram” and Input-output list for safe guarding PLC and submit the same to the client for approval. After client’s approval Seller shall develop the logic and load into the PLC. The logic and Input-output configuration shall be uniform for the all analyzer houses supplied by Seller.

The proposed interconnectivity among the systems like Safe guarding PLC, Annunciatior, GC, AMS system, plant FGS, plant DCS, AMS PLC, etc. shall be provided. The seller shall prepare the final interconnection diagram during detail engineering stage and submit to the client for review and/or approval.

**AIR INTAKE**
The presence of flammable or toxic gas at the point of fresh air intake of the ventilation system shall be monitored by Gas detectors. The Gas detectors shall be fitted in such a way that the prevailing flow profiles and air speed inside the ducting do not adversely affect either representative sampling or the accuracy of detection. The detector should easily accessible for maintenance.

**INSIDE ANALYZER HOUSE**
Flammable gas detectors shall be installed in the direct vicinity of the controlled outlet opening of the ventilation system inside the house. Toxic gas detectors shall be located at positions where leakage into the analyzer house is most likely to occur in case of failure or mal-operation. Hydrogen gas detectors shall be installed if Hydrogen is used as carrier gas for Gas Chromatographs. Optical Smoke detector shall be installed inside the house to detect smoke/fire. Oxygen detector shall be installed inside house to alarm on oxygen deficiency. Flashing lights – RED & GREEN shall be installed inside the house. Flesching RED light shall indicate “unsafe” condition inside the house. Steady GREEN light shall indicated “healthy (safe)” condition of the house. The lights shall be installed in such a way that the person can see through the glass window mounted on the.

**OUTSIDE ANALYZER HOUSE**
A Manual Call Point (MCP) shall be provided outside the analyzer house near main entrance. Actuation of MCP shall trip the analyzer house. RED & GREEN lights shall be over the roof of the house. RED light shall indicate trip condition of the house and GREEN light shall indicate healthy condition of house. These lights shall server the purpose of indication of house condition from remote. Air horn shall be installed outside the analyzer house. The horn shall blow whenever any alarm or trip is initiated by any of the device inside or outside the house. The horn shall have minimum sound amplitude of 100dBA.

**ANNUNCIATOR**
Indication lamps for each gas or fire detection, HVAC run/fault, house purging, house pressure, power available, etc. shall be provided on annunciator panel outside the analyzer house near main entrance. Alarm acknowledge, reset and lamp test push buttons shall be provided on the annunciator. All signals annunciator shall be wired to Safe guarding PLC. The annunciator enclosure shall be suitably certified for the area classification.
SAFE GAURDING PLC
Safe guarding PLC shall be supplied by analyzer house seller and shall be installed in a purged enclosure inside the analyzer house along with all necessary wiring, power supply, barriers, relay, MCBs, etc.

The safe guarding system shall be independent of the main process ESD system.

The Fire & Gas System(supplied by other) of main plant will receive inputs from the fire and gas detectors of analyzer house and send output to safe guarding PLC for annunciation, beacon, alarm or trip.

In the event of an analyzer house power being isolated by the safe guarding system the power shall be restarted only by pressing the reset switch located outside the analyzer house.

• Safe guarding system for each analyzer house shall perform following actions, in the event of ventilation failure, loss of over-pressure, flammable or toxic gas detection, O2 deficiency, etc.
  • Initiate an appropriate audio and visual alarm
  • Isolate power to the wall sockets
  • Isolate power to analyzers not certified for use in Zone1 hazardous area, isolate data highway for any analyzers connected to the Analyzer Management System and isolate any non- Intrinsically safe signals.
  • In the event of fire detection or actuation of MCP outside the house, the safe guarding system shall carry out the above actions and the following:
    • Isolate power to the analyzer house
    • Isolate all sources of flammable material – sample, carrier gas, etc.
    • Isolate the ventilation fans
    • Close the fire damper at air inlet stack

Seller shall ensure that all equipments to be isolated above with the exception of the ventilation fans, cannot be re-energized until the ventilation system is operating, the house is repressured and at least five fresh air changes have taken place. All internal panel wiring shall be within plastic trunking. There shall be separate trunking for signal types including IS and Non-IS and for Electrical supplies, with sufficient segregation to eliminate interference. The trunking shall be sized with at least 40% spare capacity.

Between two rows of terminal there shall be plastic trunk (75mm x 75mm) minimum to receive field wiring for the panel.

7.0 ELECTRICAL UTILITIES

POWER
Following power to the analyzer house shall be supplied by client at single point on analyzer house:

220VAC ± 3%, 50 Hz ± 0.5Hz UPS power for Analyzers and Safe guarding PLC
240VAC, 50Hz Non-UPS power for lighting, maintenance socket, heater in Sample conditioning system, Sample pump, etc.

415VAC, 50Hz, 3-Phase for HVAC motors, sample pump motors, etc. Further distribution to individual device or equipment shall be supplied pre-wired by Seller.

A manual power disconnect switch for each voltage feeder with padlock option shall be installed on the outside wall of each analyzer house / shelter.
All power distribution boards mounted on the analyzer wall shall be suitable for use in Zone1 area and classified EEexd IIC T6, these shall be supplied by seller.

Seller shall calculate the expected load, for each supply voltage, with a 30% allowance for future expansion; these calculations shall be supplied to the client. All distribution boards shall have 30% spare capacity for future expansion.

The protection of power circuits shall be provided in both live and neutral lines and shall be either switches/fuses or MCBs. It shall be possible to “lock off” an isolated circuit. Cables entering distribution boards shall be terminated at suitably sized and rated terminals.

Bus bars and fuse blocks / switch blocks / MCBs shall be used for power distribution and shall be installed in such a way that any equipment can be disconnected from or connected to the system without interrupting power supplies to other equipments. Provision shall be made to provide a minimum of 30% spare for future requirement. Power supply wiring shall not be jumped from one instrument / device to the other.

Seller shall provide wall sockets installed along the internal walls. These shall be provided with adequate protection for a Zone 1 area. The supply to wall sockets shall be protected in both live and neutral lines by residual current breakers and either switches/fuses or MCBs. In the event of ventilation failure or 20% LEL gas detected power to the sockets and equipment not certified for Zone 1 IIC T6 use shall be isolated. The sockets shall be provided for both 240VAC UPS and 240VAC, utility supply.

Power to all electrical equipments inside the house which are not suitably protected for a Zone 1 hazardous area shall be isolated by Safe guarding system if a ventilation failure occurs.

CABLE

Electrical Power and Instrumentation Signal/Communication cables shall enter and leave analyzer house via separate cable transits mounted in the analyzer house walls.

Cable glands shall be used on all junction boxes or equipment entries. Glands shall be suitable for cable types and hazardous area classification.

Cable connections from chromatograph analyzers to its programmer or its computer shall not be cut. The cable shall be extended through the analyzer shelter intact, coiled, and marked by the Supplier so that connections can be made to the proper remote control section or computer.

All internal cabling shall be run on perforated galvanized cable tray. Adequate separation of signals level and voltage shall be maintained to ensure signal integrity.

The minimum size of power and lighting circuit cables shall be 2.5mm2 and also for all fire and gas detector cable size shall be 2.5mm2 and other instrument signal wiring shall be 1.0mm2 minimum.

Physical segregation of wiring for each signal type and power supply shall be maintained. Single core cables within panels shall be color coded for different signal types and power. Seller shall supply details of his color coding system.
JUNCTION BOX

Seller shall provide NEMA 4X (IP65) terminal boxes on the outside of each house and shall be certified for Zone1 hazardous area. Separate junction boxes shall be provided for Analog signals, Digital Signals, Fire & Gas signals and Communication signals. Seller shall provide leads inside the shelter from these junction boxes to each analyzer, fire & gas detector or safe guarding PLC.

Further cabling from these junction boxes to Plant DCS, ESD or Fire & Gas detection system shall be carried out by Client.

The multi-core cables shall enter the junction box via bottom gland plate and all other cables shall enter via side gland plates. There shall be no top entries.

All terminal blocks shall be of the screw type, with barriers and marking strips. All wires shall have cross ferrules at each end by means of a small plastic sleeve (permanently stamped). Each terminal block shall have a minimum of 20 percent spares.

Wiring between terminals shall be continuous runs and shall not be spliced. With the exception of solid jumpers, not more than two wires shall be connected to one terminal.

The wiring shall be segregated as AC wiring, intrinsically safe DC wiring, and non-intrinsically safe DC wiring, communication wiring and power wiring.

LIGHTING

Seller shall supply suitable and adequate lighting for each house, both internally and externally, to supply illumination level minimum of 400 Lux. All fittings shall be suitable for use in a Zone 1 area, certified EEExd IIC.

Failure of any one light fitting shall not mean that any part of the house shall fall below an acceptable illumination level. Seller shall provide minimum one light with battery backup for one hour with each house.

Both internal and external lights shall be controlled from switches placed externally at both entrance doors. Switches shall be certified for Zone 1 use.

EARTHING

Provision shall be made for three (3) independent earth connections to the safe guarding panel - plant earth, instrument earth and intrinsically safe (IS) earth.

The Plant earth - All removable doors and covers, gland plates, instrument cases, etc, shall be connected to the plant earth. Earth studs, size M10, shall be provided inside the panel, located at the bottom of the panel. All protective earths shall be connected to these studs.

Instrument Earth - an electrically isolated copper instrument earthing busbar shall be located at the bottom of the panel. Both ends shall have an earthing lug capable of accepting a 16mm² copper earth wire. The busbar shall be positioned below terminal blocks to allow easy access for the connection of earth wires. Cable screens and electronic loops requiring earthing shall be directly connected to the earth busbar and loop-connection of screens shall not be allowed. A minimum of 30% spare connecting points shall be provided.
Intrinsically Safe Earth - An electrically isolated copper IS instrument earth busbar shall be located at the side of the panel. Both ends shall have an earthing lug capable of accepting a 16mm2 copper earth wire. This earth bar shall be used for intrinsically safe circuits. A minimum of 30% spare connecting points shall be provided.

Apart from the above earthing, Seller shall supply a non-insulated “plant” earth bar within the analyzer house above floor level. All metal enclosures for electrical equipment, including analyzers and auxiliary equipment shall be bonded to this earth bar. The minimum size of earth conductor shall be 6m2. Provision shall be made for site connection of two 70mm2 earth conductors to the earth bar. Earth continuity shall be ensured throughout the analyzer houses including all doors and framework.

8.0 DOCUMENTATION

Seller shall submit to the client following design and engineering documents as minimum:
• Schedule of Seller documents and drawing
• General arrangement in detail with all assemblies or items within the assembly including overall dimensions and location, gross weight, transporting support, lifting arrangement, earthing details, face to face dimensions, etc.
• Exploded/cross sectional View – Drawing indicating assembly details, description of component and material description and part no. against which the spares can be ordered.
• Analyzer house and panel layout drawings - clearly showing overall size, cut out details, list of instruments showing label engravings, paint finish and color, frame dimensions, etc.
• Schematic Drawing – Drawing shall indicate the electrical arrangement of all components shown in a de-energized state.
• Interconnection diagram - Block diagrams will show interconnecting cables among Instruments, analyzers, electrical equipment, junction box, safe guarding plc, annunciator, sample conditioning system, etc. indicating cables not in Seller’s scope of supply.
• Internal wiring diagram for all instrument and electrical termination details including Junction box, safe guarding plc, analyzers, etc. terminations.
• Instruments layout drawing – indicating location of each instrument with tag no. with elevation, tubing or cable layout, instrument air line layout, etc.
• Functional logic diagram – for sequence of operation and interlock logic of safe guarding plc.
• Instrumentation data sheet for each instrument installed in the house including Fire and gas detectors.
• Instrument & Electrical Cable schedule – which will list all cables with type, size, length and location.
• Installation, commissioning, operation and maintenance manual for all equipments installed in the house including, HVAC, PLC, Annunciator, Analyzers, fire and gas detectors, instrumentation items, electrical items, etc.
• Instrument loop diagrams – indicating location and termination details of each instrument with safe guarding plc or analyzer
• Sample hook up drawing – from sample take off to sample conditioning system to analyzer and return to sample line. This will indicate vent and drain lines.
• Detailed bill of materials for all items / parts with their make, model and ordering information.
• Commissioning spare list

9.0 PACKING AND SHIPPING
Each instrument and all moving parts shall be securely packed and properly packaged, boxed, or crated to prevent damage to instruments and parts while handling, during shipment, delivery, and warehousing.
All glass shall be covered with cardboard or wooden protectors and the complete instrument wrapped or packed in a container of suitable design to withstand normal shipping, handling, and indoor storage.

All openings (including tubing and pipefitting) shall be covered, plugged, or capped to prevent entrance of foreign materials and contaminants during transit and storage.

All framed openings of the shelter shall be weather sealed for shipping.

Field mounted analyzers, auxiliary equipment or other heavy items shall be provided with additional bracing to prevent them breaking loose during shipment. All supports which will be in contact with equipment in the analyzer houses shall be suitably protected.

10.0 SERVICE AND SUPPORT
Seller shall accept full system responsibility for all supplied hardware, operating and application software, and provide the necessary training, and site support for the construction, staging, testing, installation and pre-commissioning phases per this specification until successful hand over to the contractor.

• Seller’s responsibility shall include, but is not limited to, the following items:
  • System engineering support
  • System hardware and operating system software
  • Software for interfacing all foreign devices
  • System documentation
  • Recommended spare parts
  • Factory acceptance testing
  • Packing and shipping per the accompanying requisition
  • Warranty

• Failure of this Specification, Attachments, and/or drawings to state or show materials essential to make the equipment specified complete and operable shall not relieve Seller from the responsibilities for furnishing such materials.

The Client’s review of Seller’s drawings does not relieve Seller from the responsibility of furnishing equipment that will function as intended by this Specification.

Seller must take full responsibility for all supplied equipment and adhere to the requirements of this specification.

11.0 SPARES
Seller shall submit full bill of material including all items with respective manufactures part No. Commissioning spares shall be in seller’s scope of supply.

Bill of Material shall include following
• Analysers (Chromatograph Spares)
• Sample Conditioning System Spares
• Safe Guarding PLC & it’s spares
• JB spare Details
• Fire & gas Detector spares
• Instrumentation items installed inside/outside Analyzer House.
• Electrical Spares including HVAC motors, pumps, tube lights, MCBs, emergency light, etc.

FORM NO: 02-0000-0021F2 REV1  All rights reserved
• Mechanical Spares Details
• Calibration or carrier Gas cylinder details
All above spares details will include complete ordering information for future procurement.

12.0 SHIPPING

All threaded and flanged openings shall be suitably covered to prevent entry of foreign material.

Glass windows shall be covered with thermo-coal sheet of appropriate thickness to avoid damage during transport.

Shipping breaks shall be provided in all equipment, which are supplied in installed condition inside the analyser shelter. Equipment, which is likely to damage during shipment, shall be packed separately for shipment.
REQUIREMENTS FOR ANALYSER SYSTEM

FOR

ANALYSER SHELTER
ANALYSER SYSTEM SPECIFICATIONS

1. GENERAL

1.1 This specification defines the minimum requirements of Analyser System / systems designed for reliable and effective analysis of various process streams.

1.2 All analysers along with their associated equipments shall be installed by the contractor inside the analyser shelters.

1.3 All analyser shelters shall be ventilated, pressurized and air-conditioned. However, all analysers and other associated equipments shall be so designed and selected that these will continue to operate even in case of ventilation / pressurization failure.

1.4 Contractor shall provide all installation material including consumables to install the analysers, sample conditioning systems, sample transfer lines, vent lines and all other accessories. All instruments shall be completely accessible to permit adjustments, calibration and maintenance.

1.5 The components to be furnished for each sample system will depend upon the sample stream conditions. The contractor shall select and provide all the necessary components for each of these systems accordingly.

2. SAMPLING SYSTEM

2.1 The sampling system shall consist of necessary components, including sample probes, sample filters, pressure reducers, safety relief valves, pressure and temperature gauges, moisture separators, flow regulators, flowmeters, isolation valves etc. necessary to prepare the sample for proper analysis.

2.2 All components shall be sized and coupled so as to keep the sample volume to a minimum.

2.3 Calibration zero and span gas connections shall be provided for each analyser.

2.4 The sampling system shall have various sub-assemblies as required. The minimum requirements of each sub-assembly shall be as given below.

2.5 Sample Probe Assembly

a. Sampling probe shall be designed to extract true representative sample from the process line. The design shall prevent particulates from entering into the sample system.
2.6 **Sample Stream Pressure reducing stations:**

a. Contractor shall design and provide sample stream pressure reducing station to minimize sample transfer time maintaining the integrity of the sample. Sample stream pressure reducing stations shall consist of pressure regulators, relief valves, pressure gauges, temperature gauges etc as required.

b. These stations will be located at the sample process connection to minimize transport time lag from the sample point to the analyser.

2.7 **Sample Transfer Line**

a. The sample transfer lines shall transport the fluid sample from the sample stream pressure reducing stations to sample conditioning system located at the analyser house/shelter.

b. Contractor shall provide heat tracing for sample line wherever necessary, in order to maintain the sample integrity.

c. The routing of sample transfer lines shall be done in such a way that the total length between the sampling point and the analyser sample conditioning system is minimum. Short radius bends shall be avoided to avoid excessive pressure drop.

2.8 **Sample Conditioning System:**

a. Sample conditioning system shall be provided by the contractor at the analyser shelter.

b. Multi stream analyser system shall have a separate sample handling subassembly for each stream.

c. Sample conditioning system shall include, but not limited to, moisture separators, filters, rotameters, pressure gauges, flow switches, solenoid valves etc. as necessary for proper analysis of each sample stream. Isolating valves shall be provided as required.

d. Stream selecting valves shall be located as close as possible to the analyser to minimize connecting tubing-length and to minimize the possibility of cross contamination of samples.
e. Stream selecting valves shall be double block and bleed and shall fail closed so as to block the sample from the analyser on loss of motive power.

f. Block valves shall be provided on all process sample lines.

g. Rotameters for measuring all sample flows shall be included.

h. Special precautions may be necessary where catalyst fines and coaling material, and other difficult stream conditions are present.

i. Wherever it is necessary to maintain the handling system at elevated temperature to properly condition the sample, it shall be enclosed in a thermostatically controlled heated enclosure. Enclosure heating shall be with steam heater unless specified otherwise. Sample stream flow adjustments and analyser shutoff valves shall be operable from the front of the enclosure without opening the enclosure door. Sample stream flow, pressure and temperature indication shall be visible from the front of the enclosure.

j. Sample tubing between the sample conditioning system and the analyser shall be kept as short as possible.

2.9 Sample Stream Bypass/ Fastloop:

a. Sample stream bypass/fastloop shall be provided for the sample streams to meet the required sample transport time.

b. Flowmeters shall be provided by contractor for sample bypass/fastloop flow.

space, within or otherwise hazardous area, in which under normal operating conditions a non-hazardous atmosphere exists.

4.3 The interior temperature shall be maintained at 26°C ± 2°C maintained. Contractor shall provide necessary air conditioning, heating, pressurization and ventilation.

4.4 Contractor shall propose a layout of analysers and their sample conditioning system such that the length of tubing in between the sample conditioning system and the analyser shall be located in such a way that it is completely accessible to permit adjustments, calibration and maintenance.

5. ANALYSER:

5.1 The analyser shall be furnished with all the necessary equipment to properly analyse the sample.
5.2 Material of construction for the components in contact with the sample stream shall be SS316 except where the stream composition requires other material.

5.3. The detector cells shall be of a type that will provide adequate separation of components, minimize analysis time, minimize maintenance time and meet the performance requirements of this specification.

5.4. The analyser system temperature shall be controlled by an accurate (V1EC) electric heating system to ensure the proper sample separation and minimize the analysis time.

5.5. A shutdown switch shall be provided to protect the analyser from the loss of carrier gas or loss of fuel gas.

5.6 Solenoid operated multi function valves for sample inlet and column switching shall be provided.

6. PROGRAMME / CONTROLLER

6.1 The programmer / controller shall be microprocessor based and shall be furnished with all the equipments necessary to properly control the analysis cycle, the automatic zero adjustment circuit, the calibration of the analyser and programmer systems and the transition of data to a DCS or digital computer and any require peripheral equipment.

6.2 Visual read out using a digital indicator shall be provided to identify each component being analysed and each step in the program as well as displaying the latest readings.

6.3 Peak peakers and long term memory circuit boards shall be provided for each component of the interest.

6.4. All program data tables shall be capable of field modification without user knowledge of higher level programming. A key lock switch or field alter able password shall be provided to limit access to system software by unauthorized personnel.

6.5. The application program in the analyser shall be retained for a minimum of six months without external power by the use of EEPROM or Battery back-Up. An EEPROM program cartridge interface shall be provided for program loading.

6.6. Maintenance diagnostics shall be included in the software system to allow rapid trouble shooting in the event of system mal-function. Alarms in the English language shall be provided to notify the operator in the event of the mal-function. Allow carrier flow alarm shall be included.

6.7. The stream number shall be printed-out on each analysis report.
7. ELECTRIC WIRING- SIGNAL CONTROL AND POWER:

7.1. Contractor's scope of supply and work shall include all cabling and wiring inside the analyser shelter.

7.2. Contractor shall provide an explosion proof (Exd) power distribution box for power supply to various analyzers. This box shall be certified by a statutory body for use in hazardous area. The box shall have copper bus bars for distribution of power supply to various consumers.

7.3. Power supply to individual consumer shall be by dual pole, dual element circuit breakers. These circuit breakers shall be in explosion proof (Exd) construction certified by a statutory body for use in hazardous area and shall be mounted near the equipment served and shall have engraved plastic tag plates.

7.4. All cabling and wiring shall conform to API-RP-550. Signal and power cabling / wiring shall be segregated and run in separate raceways with separation distances as recommended per API-RP-550.

7.5. All cables shall be armoured, flame. Retardant PVC insulated, 600 Volt grade, stranded copper conductor. Signal cables shall be twisted pair shielded.

7.6. Conductor size for power cables shall be 2.5 sq.mm (min.) and for signal cable it shall be 1.5 sq.mm.

7.7. Colour coding for power supply wiring shall be red for phase, black for neutral and green for earth.

7.8. Contractor shall provide junction boxes for signal and control cables separately which shall serve as interfaces for cables going to remote control room. These junction boxes shall be explosion proof (Exd) certified by statutory body for use in hazardous area.

7.9. Wire termination shall be done using self insulating crimping lugs.

7.10. All cables, wires shall be provided with identification ferrule (one piece ferrule / cylindrical ferrules for proper identification.

7.11. Terminal strips shall be provided with identifying terminal numbers, as required. Terminals shall be screw and strap compression type.

7.12. 20% spare terminals, cable entries with cable glands, relays and other components wired up to terminals shall be provided..

8. COMPRESSED GAS CYLINDERS AND THEIR HANDLING:
8.1 Each analyser shall be provided with the following compressed gas steel cylinders.
   
   a. Carrier gas and fuel gas (wherever required) with dual manifold cylinders configuration.
   
   b. Calibration gas sample bottles.

8.2 Fuel gas and Carrier gas cylinders and as sociated manifolds shall be located on a
concrete pad outside the analyser building. The gas cylinder manifold shall be arranged
so that one cylinder may be replaced while the analyser remain in operation on the other
cylinder.

Cylinders shall be sized 1A (225 mm diameter x 1300 mm long) and shall be supplied
with auxiliaries such as fittings and two stage regulators.

8.3 Calibration gas cylinders shall be located outside the analyser shelter. Contractor shall
include a drawing showing the layout of cylinders.

8.4. Racks shall be provided to support cylinders, piping, valves and pressure regulators
associated with high pressure gas cylinder manifold system. Each cylinder in the system
shall be secured to the rack by a separate chain or clamp.

8.5. A pressure relief valve, vented to a safe location outside the building shall be installed on
the low pressure side of the pressure reducing regulator of each cylinder. Vent piping
shall be installed in a manner to prevent the entry of bugs or moisture into the outlet of th
event. This vent shall be in addition to the analyser vent.

8.6. All pressure regulators shall be two stage type. A sign identifying the type of gas applied
to a manifold shall be placed above each cylinder rack.

8.7. The location and separation of hydrogen manifold from other flammable gas manifolds
shall be in accordance with NFP A50A-1973 section 52 and 61.

8.8. All tubing between the cylinders to the analysers shall be complete and easily removable
from each and either end .

8.9. Contractor’s quote shall include fuel, carrier and calibration gas cylinders as necessary,
as a minimum, for:

   i) the field testing, commissioning and final acceptance
   
   ii) One year from the date of acceptance.
8.10. The calibration gases shall be of high purity, at least better than the specified accuracy and precision values for analysers. It's preferable to prepare calibration gases by Gravimetric method.

8.11. The concentration of calibration gases must remain constant for a period of at least one year.

8.12. The material of construction of cylinders shall be suitable for maintaining stability of the calibration gas mixture for the specified time. Contract or may quote for the staggered' deliveries wherever calibration mixture is not stable.

8.13. The contract or must submit the following certificates from any recognized certifying agency / laboratory;

i) Accuracy / Precision of the calibration gas.

ii) Stability of sample for at least one year.

8.14. Contractor shall forward all the details including the source of supply, certifying agency, cylinder size and volume, sample pressure, dew point, regulator type and make etc.

In addition contract or must furnish calculations for number of cylinders quoted of each type. For calibration gas cylinders, consider calibration once in every 8 hours.

9.0 SAFETY REQUIREMENTS:

9.1. Hazardous Area Protection:

a The analyser shelter shall be an unclassified area. Positive pressure and ventilation from a clean air source shall be provided to achieve this classification.

b It is intended to operate the analysers even during the ventilation failure, hence it is required that all analysers shall be suitable for hazardous area.

c All the electrical fittings provided in the analyser shelter shall be explosion proof type. However, a safety system shall be provided by the contractor to switch off power supply to all electrical equipments and accessories not suitable for hazardous area in case of ventilation failure. To do this it shall be ensured that all analysers continue to work safely even under these conditions.

d All junction boxes, power distribution cabinets, LEL detectors and their panel and other safety devices shall be suitable for the hazardous area certified by a statutory body.

9.2. Grounding:
REQUIREMENTS FOR ANALYSER SYSTEM

a All electrical equipment in the analyser house / shelter and outside shall be grounded properly.

b Cylinder racks, sample conditioning enclosures, analyser racks, shall also be grounded directly to the AC ground bus.

c All necessary grounding bus requirement for Equipment grounding and signal shields shall be provided by the contract or in the analyser shelter. Contractor shall also provide all earthing arrangements inside the analyser shelter.

9.3. **Combustible Gas Detection System (LEL Detectors):**

a Contractor's scope includes of supply and installation of combustible gas detectors with associated monitoring system for the analyser shelter.

b Combustible gas detectors shall monitor all inlet air in take points. The detectors shall be calibrated to give alarm and high alarm at 20% and 40% respectively of the component with the lowest LEL in the area. On the occurrence of high alarm the ventilation system shall be shut-off. Contractor shall provide potential free DPDT contacts rated at 230 V AC 5 Amp for connection to ventilation system.

c Shutoff of ventilation system shall be based on 2 out of 3 voting, which means that only if two detectors out of the three provided indicate a high LEL, trip shall provided.

d Additionally, combustible gas detectors shall monitor the analyser shelter interior and exhaust air. These detectors shall give alarm and high alarm as mentioned above, however no shut off of ventilation system shall be required.

e Contractor shall calculate total requirement of combustible gas detectors along with their location.

f The monitors for LEL detectors shall be provided with malfunction, warning and danger lights and a 0 to 100% indicator.

g Contractor shall provide grouped high alarm and high-high alarm SPOT contacts rated for 230 V AC 5 Amp for repeat alarms in remote control room.

h The monitors for LEL detection system shall be installed in a panel which shall be pressurised as per NFPA 496 type ‘Z’ purge.

9.4 **Fire / Smoke detection**
REQUIREMENTS FOR ANALYSER SYSTEM

a Contractor's scope shall include supply and integration of fire detectors / smoke detectors (Ionisation type) within the analyser shelter. The no. of shelters shall be decided by the contractor based on the shelter size and coverage of area with in the shelter.

b The monitors for the fire detection shall be installed in a pressurized / purged panel as per NFPA 496 type Z purge. This may be shared with LEL monitor panel.

C The signals from the fires system monitor shall be provided for :

- One contact for alarm on the warning panel.
- One contact each for repeat alarm in the control room DCS and fire panel of Electrical section.

9.5 Oxygen gas monitoring

a Contractor shall provide a maximum of two nos. of oxygen gas monitoring system for sensing deficiency of oxygen within the shelter.

b In case the monitors show low concentration of oxygen within the analyser shelter, an alarm shall be initiated on the warning panel. The repeat alarm shall also be provided for DCS in the Main control room.

c Oxygen monitors should be located in purged panel as per NFPA 496 type Z purge. These may be located in the same panel where LEL detectors are installed.

9.6 Warning Panels:

a Contractor shall provide warning panels for audio visual alarming of hazardous conditions inside the analyser shelter. One such panel shall be installed by contract or on each of the external walls of the analyser shelter where entrance doors are provided.

b The warning panel shall provide the following audio-visual alarms:

i Presence of combustible gases inside the analyser house / shelter.

ii Loss of analyser house / shelter pressurization

iii Ventilation system failure

iv Fire / smoke within the shelter
v Oxygen deficient within the shelter

c For alarming of analyser shelter pressurization failure contractor shall provide an explosion proof pressures switch for sensing analyser shelter inside pressure.

d These warning panels shall be of explosion proof (Exd) construction certified by a statutory body for use in hazardous area.

10.0 FACTORY TESTING AND ACCEPTANCE:

10.1. The analyser systems shall be thoroughly checked and tested prior to shipment to assure correct design, construction and proper operation.

10.2. The Owner / Consultant reserves the right to be involved and satisfy himself a teach and every stage of inspection and testing.

10.3. During the final testing vendor shall test and demonstrate to the Owner / Consultant, the functional integrity of all analysers, sampling systems and all other hardware. Repeatability test shall be performed on all analysers for a test period of 24 hours. No material or equipment shall be transported until all required tests are successfully completed and certified. Ready for shipment 'by the Owner / Consultant. Softwares, if involved, shall also be tested.

10.4. Contractor shall submit schedule of factory testing and inspection.

10.5. After placement of order vendor shall submit his factory testing and customer acceptance procedure for Owner's / Consultant approval. This document shall contain the information related to each test e.g. purpose of test, definition, test procedure, results expected and acceptence.

10.6. Owner / Consultant has every right to add or delete any test in vendor's test procedure and acceptance criteria. The system shall be tested and accepted as per the approved testing procedures and acceptance criteria. The cost of performing all tests shall be borne by the vendor.

10.7. Contractor shall notify the Owner / Consultant atleast three weeks prior to final system testing at vendor's works. In the event that representatives of Owner / Consultant arrive and the system is not ready for testing, the contractor shall be liable for back charging for any extra time and expenses incurred by the Owner.

10.8. It shall be contractor's responsibility to modify and / or replace any hardware, equipment or analyser if the specified functions are not completely achieved satisfactorily during factory testing and acceptance.
11.0 INSTALLATION, TESTING AND COMMISSIONING:

11.1. Contractor shall provide the services of his installation team which would install the equipment in the analyser house / shelter and in the field, lay the tubing from sample probe to analyser house / shelter, lay the interconnecting cabling tubing inside the analyser house / shelter, perform system check outs, test and commission the entire system.

11.2. All technical personnel assigned to the site by the vendor shall be fully conversant with the system supplied and shall have capability to bring the system on-line quickly and efficiently with a minimum of interference with other concurrent construction and commissioning activities.

11.3. Contractor's responsibility at site shall include all activities necessary to be performed to complete the job including:

a. Receipt of all analysers and related hardware, and checking of completeness of supply. In case of shelters, verification of all analysers and accessories duly installed tubed and wired.

b. Installation of all analysers, and other associated equipment including all safety equipment like LEL detectors, annunciators, panels etc., all auxiliaries like power supply distribution boxes, all interconnecting tubing / piping etc. so as to complete the job in case of analyser room (not shelter).

c. Installation of sample probes, pressure reducing stations, sample conditioning systems, interconnecting tubing, heat tracing etc.

d. All analyser sample stream bypass, vent and drain tubing/piping.

e. Termination of all field cables or cables to control room, ferruling} tagging of interconnecting cables in analyser house/shelter.

f. Interconnection cabling inside the analyser house/shelter.

g. All civil works like grouting, fixing etc and patch up work where vendor is likely to remove the plaster and shall make holes in the walls, floor or ceiling.

h. Checking of interconnections, hardware configuration, overall system functioning. Leakage rate test. J Liaison with vendor's home office.

k. Field testing.

l. Commissioning of the complete analyser system.
11.4 System Check-outs:

a. Checking of all interconnections, configuration and overall system functioning.

b. Any discrepancy found during checking shall be brought to the notice of Engineer-in-Charge.

c. All the check-outs shall be performed in the presence of Owner! PMC authorized representative. All readings shall be recorded on a suitable format and shall be submitted for approval.

d. After system checking is completed, contractor shall connect back any terminal or tubing or connection removed for loop checking.

e. All the equipment shall be checked thoroughly after its receipt at site. The tests, as a minimum, shall include;

i. Visual and mechanical testing

ii. Complete system configuration loading

iii. Calibration of all analysers, and other related equipment.

iv. Demonstration of all system functions.

V. Demonstration of all system diagnostics.

vi. Checking of correct change of redundant devices.

vii. Demonstration of analyser accuracies, linearities, repeatabilities, response time etc.

viii. Demonstration of proper operation of system at specified voltage supply specifications.

ix. A leakage test shall be conducted on entire system. Maximum permissible leakage rates shall not exceed 5% per hour of specified designed pressure.

12.0 TRAINING:
Contractor shall be responsible to train the Owner / Consultant personnel in the field for
maintenance of hardware and software. The outline of each course including the course
contents and the duration shall be forwarded by the vendor alongwith the offer.

13.0 DOCUMENTATION:

Contractor shall furnish all the manuals, including for maintenance and operation,
necessary to test, operate and maintain etc the analysers and other related equipment,
hardware and software.

14.0 ENGINEERING DRAWINGS:

14.1 Contractor shall provide a complete set of drawings covering each part of supply for
Owner / Consultant record. The contract or is required to include Owner's project number
on each of his drawing.

14.2 All field modifications shall be carefully recorded by the contractor's installation and
commissioning personnel and changes shall be incorporated into the final drawings.

15.0 FINAL ACCEPTANCE TEST:

The Owner. Will take over the system from the contractor after the final acceptance test,
which is defined as successful uninterrupted operation of the integrated system for three
weeks with desired accuracy and repeatability. Contractor's personnel shall be present
during the test. Any malfunctioning of the system components shall be replaced / repaired
as required. Once the system failure is detected, the acceptance test shall start all over
again from the beginning.

16.0 TESTING AND CALIBRATION EQUIPMENT:

Contractor shall make available all consumables including calibration gas cylinders,
instruments and equipments necessary for testing, calibration, maintenance etc. as
defined by the ' scope of work'. All instruments and equipments used for the above
purpose shall be of standard make with accuracy better than the accuracy expected from

the calibrated / tested equipments and shall be certified by National Physical Laboratory
or other equivalent agencies.

17.0 SPARE PARTS:

Contractor shall quote separately for spare parts required for a two year period of
operation for the complete analyser system and the associated auxiliaries offered.
Contractor shall enclose a list of spare parts quoted along with the offer.
18.0 MAINTENANCE CONTRACT:

Contractor shall quote separately for maintenance contract after warranty period for two years based on per day rate for each category of personnel required. The personnel deployed shall have thorough knowledge of the system and at least two years of experience as maintenance of similar system.

19.0 PACKING AND SHIPPING INSTRUCTIONS:

19.1. All materials used for packing, wrapping, sealers, moisture resistant barriers and corrosion preventers shall be recognized brands and shall conform to the best standards in the areas for the articles which are being packaged.

19.2. Workmanship shall be in accordance with best commercial practice with the requirement of applicable specifications. There shall be no defect; imperfections or omissions which would tend to impair the protection of the package as a whole.

19.3. The package shall be suitable for storing in tropicalised climate as per specified ambient conditions.

19.4. Shipment shall be thor oughly checked for completeness before final packing and shipment. Contractor shall be fully responsible for any delay in installation or commissioning schedule because of incomplete supply of equipment.

1.0 GENERAL

1.1 Scope

1.1.1 This specification, together with the data sheets, covers the requirements for the complete design, materials, nameplate marking, and inspection, testing and shipping of stack gas analysers.

1.1.2 The related standards referred to herein and mentioned below shall be of the latest editions prior to the date of the purchaser’s enquiry:

- ANSI/ASME American National Standards Institute/ American Society of Mechanical Engineers.
- B 1.20.1 Pipe Threads. General Purpose (Inch)
- B 16.5 Steel Pipe Flanges and Flanged Fittings. NPS ½ through NPS 24.
- B 16.20 Metallic Gaskets for Pipe Fittings, Ring Joints, Spiral and Gasketed.

API American Petroleum Institute
- Manual on Installation of Refining Instruments and Control System
- RP 551 Process Measurement Instrumentation
- RP 552 Transmission System
- RP 554 Process Instrumentation and Control
- RP 555 Process Analysers

ASTM 693 Standard Practice for cleaning methods and cleanliness levels for material and equipment used in oxygen-enriched environment.

EN 50020 Electrical Apparatus for potentially explosive atmospheres-Intrinsic safety ‘i’

EN 10204 Inspection Documents for Metallic Products.

IEC-60079 Electrical Apparatus for Explosive Gas Atmosphere.

IEC-60529 Degree of Protection Provided by Enclosures. (IP Code)

1.1.2 Bids

1.2.1 Vendor’s quotation shall be strictly as per the bidding instruction to vendor attached with the material requisition.
1.2.2 Whenever a detailed technical offer is required, vendor's quotation shall include the following:

a) Compliance to the specifications.

b) A detailed specification sheet for each analyser, which shall provide information regarding type, materials of construction, performance specification and accessories of analyser. The material specification and units of measurement for various parts in vendor’s specification sheets shall be to the same standards as those indicated in purchaser’s data sheets.

c) A detailed drawing showing various components of sample conditioning system and their piping/tubing hook-up arrangement including sample return, vent, utilities connection and requirement of heat tracing (i.e. electrical or steam tracing), as necessary.

d) Sample transportation time calculations for the specified distance between sample point and analyser indicating sample flow rate and the recommended size of the sampling tube.

e) Calibration gas cylinder calculations considering six months of continuous operation with once in a fortnight calibration. The calculation sheet shall indicate the rate of gas consumption and specification of gas es including composition, concentration, accuracy and shelf life of calibration blend.

f) Proven references for each offered model of analyser inline with clause 1.2.3 of this specification.

g) A copy of approval for intrinsically safe/flameproof enclosure, whenever specified, from local statutory authority, as applicable, such as Chief Controller of Explosives (CCE), Nagpur or Director general of Mines Safety (DGMS) in India, along with:

i) Test certificate from recognised house CMRI/ERTL etc. for flameproof enclosure as per relevant Indian Standard for all Indian manufactured equipments.

ii) Certificate of conformity from agencies like CSA, BASEEFA, PTB, LCIE, FM, UL etc. for compliance to ATEX directives or other equivalent standards for all equipments manufactured outside India.

h) Utility requirements and their consumption i.e. instrument air, cooling water, steam etc. along with their process conditions like flow, pressure and temperature.

i) Power consumption for each analyser and its accessories.

j) HVAC requirements i.e. heat load, humidity particulate/chemical filtration etc.

k) Deviations on technical requirements shall not be entertained. In case vendor has any valid technical reason, they must include a list of deviations tag number wise, summing up all the deviations from the purchaser’s data sheets and other technical specifications along with the technical reasons for each of these deviations.

l) Catalogues giving detailed technical specifications, model decoding details and other related information for each type of analyser and accessories covered in the bid.
1.2.3 All items, as offered, shall be field proven and should have been operating satisfactorily individually for a period of minimum 4000 hours on the bid due date for the analysis as specified in the purchaser’s data sheet. Items with proto-type design or items not meeting provenness criteria specified above shall not be offered.

1.2.4 All documentation submitted by the vendor including the quotation, catalogues, drawings, installation, operation and maintenance manuals, etc shall be in English language only.

1.2.5 Vendor shall also quote for the following:

   a) Complete calibration kit consisting of calibration gas cylinders, pressure regulators, gauges, cylinder gas piping manifolds and driers, (as required) etc. as a minimum for each analyser. In case of dual range analyser, separate calibration standards shall be provided for each range. For the purpose of calculating requirement of zero and span calibration samples/gases, consider calibration time of 30 minutes every fortnight for each analyser for a period of six (6) months of continuous operation.

   b) Consumable spares for the duration of six months with list of items as per vendor recommendations for each analyser system, unless otherwise specified in job specification.

   d) Start up and commissioning spare parts for each analyser/analyser system as per vendor recommendations. However this list of spare parts must include 5% or minimum one of each type of following spare parts:

   - Solenoid valve
     - Pressure regulator
     - Filters
     - Temperature controller
   - IR/UV Source (lamp)
     - Peristaltic pump
     - Set of fuses
     - Set of o-rings
     - Tubing and tube fittings (sizes smaller than 6 mm or ¼”).

Additional spare parts, if required, during start-up and commissioning, even though not listed in the list of start-up and commissioning spares mentioned above, shall be supplied by the vendor without any implication.

   d) Any special instrument or tool needed for testing, calibration and maintenance of the analyser such as spanner set (for tubes smaller than 6 m m or ¼”), non-magnetic tools, bubble rotameter etc.

   e) Training at vendor works and at site as specified in job specifications.
f) Two years operational and maintenance spares for each analyser and its accessories as per vendor recommendations, which shall include spare parts like electronic modules, temperature controller, power supply module, flow meter, solenoid valve, pressure regulator, local indicator, tubes, fan assembly, sample cell, detector assembly, UV/IR source/lamps, set of o-rings, set of fuses etc.

1.3 Drawing and Data

1.3.1 Detailed drawing, data, catalogues and manuals required from the vendor are indicated by the purchaser in the vendor data requirement sheets attached with the enquiry. The required number of reproducible, prints, and soft copies shall be despatched to the address mentioned, adhering to the time limits indicated.

1.3.2 Final documentation consisting of design data, installation, operation and maintenance manual etc., submitted by the vendor after placement of purchase order shall include the following, as a minimum;

a) Specification sheet for each analyser and its accessories.

b) Certified drawings for each analyser and its accessories, tag number wise, which shall provide the following information:

i) Overall dimensions in millimetres.

ii) Sampling system details identifying each component with make and model number, process connection, utility connection, calibration sample/gas connection, heat tracing requirements, sample vent and fast loop details etc. The flow, pressure and temperature at interface and other appropriate location must be shown in the sampling system drawing.

iii) Detailed interconnection drawing of each analyser identifying each component with terminal number, cable type, and cable size and cable entry details. The interface details shall be clearly identified in the drawing.

iv) Grounding details.

v) Power supply distribution details.

c) Programming/configuration data for each analyser, as applicable.

d) Serial interface specification including its configuration data (addresses) for host communication.

e) Power consumptions and utility requirements.

f) Calibration curves and calibration data for each analyser.

g) Zero and span calibration gas specification including composition, shelf life time and accuracy.
h) Copy of type test certificates.
   i) Copy of the test certificates of all the tests indicated in clause 4.0 of this specification.

j) Installation procedure for each analyser and their accessories.
k) Calibration and maintenance procedures including replacement of its parts/Internals wherever applicable.

1.4 Definitions

1.4.1 The following definitions shall apply for analysers and their accessories:

a) **Transportation time**
   Transportation time is the time interval between a step change in the process fluid composition in the process line and the initial analyser response (excluding analyser response time).

b) **Response Time**
   The time interval between the Initial response of the analyser and the time required for the analyser output to reach a value of 90% of the final output value for a step change in sample quality.

c) **Time Constant**
   The analyser response to reach a value of 63% of the final output value for a step change in sample quality is called the analyser time constant.

d) **Repeatability**
   Repeatability of a measurement is the band of values within which an analyser repeats its measurement when the same sample is applied to it. The short termed repeatability is generally determined by multiple readings of a sample during calibration and is usually true random error over short period of time if external influences like pressure and temperature etc remain constant.

   It is also defined as the difference between two successive analyser results that would be exceeded in the long run in only one (1) case in twenty (20) when a single analyser system is operated on a flowing sample of uniform quality.

e) **Sensitivity**
   The sensitivity of an analyser is a measure of an analyser's ability to detect a least change in concentration of a measured component that is not masked by the background noise.

f) **Accuracy**
   Accuracy of a measurement is the measure of how close the measured value is to the true value of the sample. For all type of analysers, accuracy is primarily a function of the accuracy of the standards used for calibration.

g) **Analyser Rack**
An open analyser mounting structure with/without canopy used for mounting analysers, sample handling system and their accessories individually or together in combination.

h) **Analysers Cabinet**

Small housing, in which analysers are installed individually or grouped together. Maintenance is performed from outside the cabinet with door(s) open.

### 2.0 DESIGN AND CONSTRUCTION

#### 2.1 Analyser Requirements

2.1.1 The type of analyser and its measuring principle is specified in the purchaser’s data sheet. Accessories and equipments as required to make online analysis complete are also specified in the data sheet. In general, the scope shall include the following:

a) Sample probe and sampling system, as applicable

b) Analyzer complete with all hardware and software consisting of detector, transmitter and associated equipments.

c) Fast loop and Sample return system, as applicable

d) Calibration and maintenance equipment.

e) Gas cylinders for zero and span calibration.

Unless otherwise specified the scope shall also include supply of all interconnecting tubing, piping, fittings, heat tracing equipment etc., excluding sample return piping from analyser battery limit to sample return header.

In-situ analysers when specified may not include sampling system.

2.1.2 Analysers and its related equipments directly connected to process line and In-situ analysers shall be capable of withstanding line pressure/vacuum and temperature conditions specified in the purchaser’s data sheet.

2.1.3 The analyser design and design of sample handling system shall be such that components or any sub-assembly that requires removal, shall be possible without any need to disassemble any other component. Such components shall include items like stream selector valves, (when applicable) filters, pressure regulators, flow-indicator, detector, electronic modules etc.

2.1.4 Analyser shall be microprocessor based with state-of-the-art technology and shall be capable of being configured from analyser front panel locally using built-in keyboard. When specified, it shall also be possible to configure the analyser from remote through a separate terminal.

2.1.4.1 The programmer/controller shall be microprocessor based and shall be furnished with all the equipments necessary to properly control the analysis cycle, the automatic zero adjustment circuit, the calibration of the analyser and programmer systems and the transition of data to ADSU or DCS and any require peripheral equipment.

2.1.4.2 Visual readout using a digital indicator shall be provided to identify each component
being analysed and each step in the program as well as displaying the latest readings.

2.1.4.3 Peak peaker and long term memory circuit boards shall be provided for each component of the interest.

2.1.4.4 All program data tables shall be capable of field modification without user knowledge of higher level programming. A key lock switch or field alterable password shall be provided to limit access to system software by unauthorized personnel.

2.1.5 The configuration related data of the analyser including set range shall be stored in a nonvolatile memory such that this data remains unaffected by power fluctuations or power off condition. In case vendor’s standard product stores configuration data in battery backed RAM, analyser shall have facility to provide battery drain alarm as diagnostic maintenance message.

2.1.6 The span of the analyser shall be field adjustable from the analyser front without opening the analyser enclosure. In case, separate device is required to make such a change, the same shall be included by vendor in their scope of supply.

2.1.7 Analyser shall run diagnostic subroutines on continuous basis and shall be able to provide diagnostic alarms related to analyser optics, detector and electronics, as and when any failure/malfunction is detected.

2.1.8 Analyser shall have an integral output meter with digital readout in engineering units.

2.1.9 All interconnecting wiring shall be colour coded / numbered and terminal blocks be clearly identified.

2.1.10 The analyser shall be capable of providing the following outputs:

a) Isolated 4-20 mA DC current output for each analysed component. Smart or field bus output shall be provided when specifically indicated in the purchaser’s data sheet.

b) RS485 serial output with MODBUS (RTU) protocol, whenever serial output is specifically indicated in the purchaser’s data sheet. The serial output signal shall contain analyser data of component of interest and diagnostic alarms, as a minimum.

c) SPDT contact outputs for various diagnostic alarms (as applicable) such as:

   i) High or low set point alarm as measurement
   ii) Analyser failure
   iii) Low sample flow
   iv) Temperature control failure

Any other alarm contact, either specifically indicated in purchaser’s data sheet or available as standard with the analyser, shall also be provided.

Unless specified otherwise, all contacts shall be normally closed type (contact open in alarm) and shall be rated for 110V AC 5 Amperes.

2.1.11 Statutory Regulatory Compliance
The design of analysers shall be in compliance with the electromagnetic compatibility requirements as per IEC-61000-4-X.

2.1.13 **Material of Construction**

2.1.13.1 Unless otherwise specified, the material of construction of all components wetted by the sample shall be SS 316, as a minimum. Vendor must ensure the compatibility of material of each component with the process fluid.

2.1.13.2 Material of all soft parts like diaphragms and o-rings shall be of PTFE. Other vendor standard materials can also be acceptable provided these are compatible with the specified process conditions.

2.1.13.3 The material of construction of all non-wetted parts shall be as per manufacturer’s standard. However, non-metallic materials for casings, enclosures and instrument covers shall be avoided.

2.1.14 **Power Supply**

2.1.14.1 Unless indicated otherwise, the analyser including the sample handling system shall operate at 110V 50Hz power supply.

2.1.14.2 The analyser performance shall be within the specified limits when the supply voltage varies by ±10% of specified value and supply frequency varies by ±3 Hz of specified value.

2.1.14.3 Electrical tracing when specified, shall operate at 230V 50 Hz supply. 230V 50Hz power supply shall also be used for analyser cabinet/panel lighting and air conditioning unit, when specified.

2.1.15 **End Connection**

2.1.15.1 Unless otherwise specified, the following shall govern:

a) Threaded connections shall be NPT to ANSI/ASME B 1.20.1.

b) Flanged connection shall be as per ANSI/ASME B16.5.

c) Flange face finish shall be serrated concentric to clauses 6.4.4.1, 6.4.4.2, and 6.4.4.3 of ANSI/ASME B 16.5. The face finish shall be as follows:

\[
\begin{align*}
125 \text{ AARH} & : 125 \text{ to } 250 \text{ AARH} \\
63 \text{ AARH} & : 32 \text{ to } 63 \text{ AARH}
\end{align*}
\]

d) Ring type joint flanges shall have octagonal grooves as per ANSI/ASTM B16.20.

2.1.15.2 End connection of sizes 6 mm or below shall be suitably protected against damage.
2.1.15.3 All end connections shall be clearly identified by attaching labels or stainless steel plate of suitable size.

2.1.16 **Enclosure Type**

2.1.16.1 Analyzer enclosure and related accessories shall be suitable for the electrical area classification indicated in purchaser's data sheets. Unless otherwise specified, the enclosures shall comply with the following standards:

- **Weather proof housing**: IP 65 as per IEC-60529 / IS-13947
- **Flame proof housing**: Flame proof Ex (d) as per IEC-60079 / IS-2148
- **Purged Enclosure**: NFPA 496

Flameproof and purged equipment shall also be made weatherproof.

2.1.16.2 In addition to meeting weatherproof requirements specified in clause 2.1.15.1 of this specification, intrinsically safe analysers shall meet the requirements specified in EN 50020 and shall be certified for the area classification specified in the purchaser's data sheet.

2.1.16.3 Analyser where air/nitrogen purge is provided, purge shall be as per NFPA 496 Type X. Analyser power shall cut off in case of purge failure. Purge failure alarm shall be provided for purchaser use.

2.1.16.4 Separate cable entries shall be available in the analyser/enclosure for power and signal cable.

Unless otherwise specified, following shall apply:

a) Cable entry and terminal size for power cable shall be ¾” NPT(F) cable entry other than ¾” NPT (F) shall be provided when specified.

b) Cable entry for Serial cable/signal cables (Signal output) shall be ½” NPT (F).

c) Cable entry for multi-pair signal cables (Multiple output) shall be 1½” NPT (F).

Reducer fitting may be provided when the analyzer standard cable enters are different than those specified.

2.1.16.5 All enclosure entries including sample, utilities, cables etc. shall be clearly identified by attaching label or stainless steel plate of suitable size.

2.2 **Sample Handling System**

2.2.1 The sample handling system shall consist of primary sample conditioning near sample take off point, sample transportation line, secondary sample conditioning near the analyser, sample return, sample/analyser vent and sample drain/recovering system, as applicable.

The primary sample-conditioning unit shall be a fabricated assembly and shall be mounted on a stainless steel plate suitable for surface mounting.
Secondary sample conditioning shall also be a fabricated assembly and shall be mounted either on a stainless steel plate or within an enclosed cabinet/box with a viewing window.

2.2.2 Stream sampling shall be continuous and analyser shall be located as near as possible to the sample take-off point. Where the analyser is located away from the sample take-off point, vendor shall design the sample fast loop (bypass loop) as part of sampling system. Design shall ensure that the sample drawn is true representative of the stream to be analysed.

2.2.3 In general, sampling systems shall be designed and constructed in accordance with API-RP-555. The design of sampling handling system shall consider the following factors, as a minimum:

a) The pressure/vacuum-temperature conditions required for the analyser.
b) Interfering components in the process sample.
c) Normal and abnormal sample compositions.
d) Fouling sample conditions e.g. polymer formation or presence of solids etc.
e) Transportation time requirements.
f) Utilities available and their process conditions.

2.2.4 Unless otherwise specified, material of all components wetted by sample shall be suitable for the process fluid and sample process conditions specified in the purchaser’s data sheet. The material of construction for all wetted parts shall be, 316 SS, as a minimum.

2.2.5 Sampling system shall include all elements as necessitated by the process conditions indicated in the purchaser’s data sheets, to make the sample suitable for the analysis. This shall include but not limited to filters (coarse and fine), pressure regulators, relief valves, flow indicators, flow controllers, temperature indicators, scrubbers, heaters, coolers, dryers, sample pumps, aspirators etc.

Each sampling system element shall be capable of being removed without disassembling the entire system.

2.2.6 Sample probe shall be provided by the vendor to obtain representative sample from the stack. The sample probe shall be inserted in the stack through an isolation valve (ball or gate valve), which shall be part of vendor’s scope of supply. The probe design shall ensure the following:

a) On-line removal and insertion of the probe with non-fly-off design.
b) Unless otherwise specified, end connection for installation in the line shall be 4” flanged with type and rating as specified in purchaser’s data sheet. The line isolation valve shall also be of the same size and rating as probe end connection.
c) The probe diameter shall be such that it can be easily inserted or removed through the line isolation valve when in fully open condition.
d) The length of the probe shall be selected considering its insertionupto the middle third of the stack. For the purpose of calculating probe length, consider nozzle length as 200 mm.

2.2.7 Sampling system shall include a sample block valve on all process sample line. The block valve shall be provided meeting the following requirements:
a) The block valve shall be located immediately after the sample probe.

b) Where purchaser’s data sheets do not indicate the requirement of sample probe, the block valve shall be provided in the sample line as a part of primary sample conditioning unit.

c) The size of the sample block valve shall be as per the sample line size while the rating shall be as specified in the purchaser’s data sheet.

2.2.8 The size of the sample tubing shall be decided by the vendor considering:

a) The distance between sample take off and analyser specified in purchaser’s data sheet.

b) The specified sample transportation time.

c) Pressure at the sample take off point.

Where no transportation time is specified in the purchaser’s data sheets, vendor shall consider the sample transportation time as 60 seconds.

2.2.9 Where sample is required to be transported in hot condition, sample shall be drawn using prefabricated heated tubes. The heated medium shall be either steam or electric power as specified in purchaser’s data sheet.

Heating shall be controlled such that the sample temperature is maintained typically around +20°C above the sample dew point.

2.2.10 When fast loop is specified or recommended by vendor, vendor shall provide flow meter for sample bypass flow. Sample return line to process shall be provided with isolation valve and check valve. Vendor shall ensure that return pressure of the sample shall be higher than the pressure of the process return point specified in purchaser’s data sheet.

2.2.11 Sampling system shall include provision for connecting calibration sample/gases in auto or in manual configuration as specified in purchaser’s data sheet. When no specific requirement is indicated, the provision shall be made for manual configuration only.

2.2.12 Whenever auto-calibration requirement is specified in the purchaser’s data sheet, it shall be possible to initiate auto calibration cycle at preset time interval defined by user either manually via the analyser keyboard or remotely through an external contact.

The sample handling system shall be designed to include all hardware and/or software to meet this requirement. The analysed component concentration output shall remain at the last good measured value during auto calibration cycle.

2.2.13 Unless specified otherwise, analysers with common take off shall have separate sample handling system for each analyser.

2.2.14 Filters shall always be provided in dual configuration. It shall be possible to replace the filter without upsetting the operation of the analyser.
2.2.15 Unless specified otherwise, sample lines used for carrying samples for more than one analyser shall be provided with sample pumps in dual configuration. It shall be possible to remove or insert the pump without upsetting the sampling system.

2.2.16 A suitable restriction orifice shall be provided in each sample line to limit the sample flow exceeding thrice the normal flow in the event of tube rupture or opening of tube down the line.

2.2.17 Sample Extraction Techniques:

Sample extraction shall be any one of the following unless otherwise specified in the Data sheet.

2.2.17.1 Dilution Technique.

a) Instrument air shall be provided by the purchaser and the specification shall be as specified elsewhere. Vendor shall consider the minimum pressure condition for the system design.

b) Vendor scope shall include all items/elements like dilution probe, pneumatic control module, instrument air pressure/flow controller, pressure gauge, etc. as necessary for proper system design. Additional dew point suppression of instrument air (Beyond that is specified) shall be taken care of by vendor.

c) Vendor shall select the dilution ratio depending upon their system design. Calculations for the same shall be furnished by vendor.

d) For dilution type technique, vendor must select the range of analyzers based on the dilution ratio selected.

e) Vendor shall be fully responsible to select the dilution probe with critical orifice. The material of orifice shall be ‘QUARTZ’ as a minimum. Vendor’s scope shall include supply of one spare orifice along with each sample probe clearly marking the dilution Ratio.

2.2.17.2 Hot Extraction Technique.

Vendor shall select heated sample lines (Prefabricated tubes with tracer and insulation) with electrical tracing. The temperature of the sample line shall be controlled at a temperature so as to avoid condensation in the sample lines. The temperature control unit shall also form part of vendor’s scope of supply. The sample lines shall be prefabricated tubes with electrical traces fully insulated with overall sheath of low smoke grade PVC. All such tubes should have undergone services life performance test as per IEEE 515. The electrical tracing line with temperature controller shall be suitable for the specified area classification.

2.2.18 The sample handling system shall be designed to,

Avoid plugging of sample probe and sample line even in case of;

- Failure of electrical tracing
- Failure of instrument air
- Excessive solid particles during start up or process upset condition.
Vendor shall clearly study each of these scenarios and provide automatic sample shut off and blow back facility in line with the requirements of the specified application.

2.2.19 The routing of sample transfer lines shall be done in such a way that the total length between the sampling point and the analyser sample conditioning system is minimum. Short radius bends shall be avoided to avoid excessive pressure drop.

2.2.20 Where sample pumps are used, moisture sensor shall be provided in sample handling system to cut off pumps in case of high moisture level.

2.2.21 Analyser rack and cabinet

(a) Whenever specified in the purchaser's data sheet, the analyser shall be supplied in pre-assembled, pre-tubed and pre-wired condition complete with sample handling system. The primary sample-conditioning unit i.e. conditioning at sample tap-off point, shall be supplied separately.

(b) When open rack mounted installation is specified in purchaser’s data sheet, the analyser and sample handling system shall be supplied installed in an open rack with canopy to protect the analyser from direct sunlight and rain. The open rack shall be fabricated using channels/pipes of suitable size. The material of construction shall be stainless steel. The canopy shall also be fabricated out of SS plate of 1.2 mm thick.

(c) Whenever closed cubical mounted installation is specifically indicated in the purchaser’s data sheets, analyser and sample handling system shall be supplied preinstalled in freestanding closed analyser cabinet. The analyser cabinet shall be suitable for outdoor installation and shall be provided with a key lock. Cabinet shall be fabricated out of 2.0mm SS sheet reinforced with angles of suitable sizes. Fittings and hinges shall be of stainless steel. Anchor bolts required for installation of cabinet shall also be supplied by vendor. A power isolation switch with suitable circuit breaker or fuse shall be provided for the incoming power supply. All items including analyser installed within the cabinet shall be suitable for the maximum possible temperature likely to be attained within the cabinet (i.e. with all items fully powered-on within the cabinet) and area classification specified in the purchaser’s data sheet. Heating/cooling of analyser cabinet shall be provided either when purchaser’s data sheets specify the requirement of heating and/or cooling or recommended by the analyser manufacturer or found necessary by the manufacturer to meet following requirements:

(i) The temperature induced measurement error exceeds ± 1% of full scale in the worst temperature conditions.

(ii) The maximum allowable ambient temperature condition of any component within the cabinet exceeds its limits.

Whenever cooling is specified or found necessary, vendor may select one of the following cooling methodology, unless specifically indicated otherwise:

(a) Cabinet mounted air conditioner certified for the specified area classification.
2.3 CARBON MONOXIDE, CARBON DIOXIDE ANALYSERS

2.3.1 Unless specified otherwise the CO/CO2 analysers shall be of Infra Red type.

2.3.2 IR/UV analyser shall preferably be non-dispersive type.

2.3.3 Analyser cell length shall be selected as per specified analyser component range. In case of dual range analysers, the selected cell length shall be suitable for both the ranges.

2.3.4 The analyser cell material and window material shall be suitable for the specified service. Unless otherwise specified or required otherwise by pressure-temperature conditions, the oring material shall be Teflon.

2.3.5 The analyser design shall be such that it is insensitive to source fluctuations or cell window degradation/partial cloudiness.

2.3.6 The analyser shall have built-in indicator with digital display.

2.3.7 Unless otherwise specified, analyser shall meet the following performance requirements:

- Repeatability : ± 1% of full scale or better
- Zero drift : ± 1% full span/week.
- Speed of response : less than 90 seconds for 90% of final reading.
- Linearity : ± 1% of full scale or better.

2.4 SOx ANALYSER

2.4.1 Unless specified otherwise the analyser measurement principle shall be based on UV Fluorescence. The UV source lamp shall be highly energizing, monochromatic with minimum source life of 5 years.

2.4.2 Analyser cell length shall be selected as per specified analyser component range. In case of dual range analysers, the selected cell length shall be suitable for both the ranges. The analyser cell material and window material shall be suitable for the specified service.

2.4.3 Unless otherwise specified or required otherwise by pressure-temperature conditions, the oring material shall be Teflon.

2.4.4 The analyser design shall be such that it is insensitive to source fluctuations or cell window degradation/partial cloudiness.

2.4.5 Special filters shall be offered to minimize the interference of background components.
2.4.6 Where IR type analysers are specified, the same shall meet the specification as per clause 2.3 above.

2.4.7 Unless otherwise specified, analysers shall meet the following performance requirements:

Zero/span Drift : ± 1% of full span/week
Repeatability : ± 0.5% full scale or better.
Response time overall : less than 90 seconds for 90% of final reading.
Linearity : ± 1% of full scale or better.

2.4.8 Analyzer for incinerator stack for sulphur plant (SRU)

The analyzer system design and analyzer selected for incinerator stack are suitable for the sample containing high sulphur contents. The sample handling system shall be designed for such eventuality which is likely to occur during start up or under plant upset condition.

Any one of the following techniques shall be considered meeting other requirements:

a) Dilution technique with sample handling system designed considering the worst conditions of sulphur.

b) Hot extraction technique with heated analysers.

2.5 NOx Analysers

2.5.1 Unless otherwise specified the NOx analyser measurement principle shall be Chemiluminescence type.

2.5.2 The analyser shall be complete with ozonator, mode selection chamber for NO, NO-NO2, reaction chamber and detection unit.

2.5.3 Special filters shall be offered to minimise the interference of background components, which are of least interest in process stream.

2.5.4 The analyser shall have built in indicator with digital display for measurement & instrument opacity parameters indications.

2.5.5 Unless otherwise specified the analyser shall meet the following performance requirements

Zero/span Drift : ± 1% of full span/week
Repeatability : ± 0.5% full scale or better.
Response time overall : less than 90 seconds for 90% of final reading.
Linearity : ± 1% of full scale or better.

2.6 HC Analyser

2.6.1 Unless specified otherwise the analyser measurement principle shall be based on the Flame Ionisation Detection (FID) for HC Analysers.
2.6.2 Probe length shall be provided such that 30% insertion in heater stack and shall be calculated based on the nozzle projection and shall be based on the Stack ID given.

2.6.3 Probe & Filter material shall be selected to suit the stack process condition.

2.6.4 Unless otherwise specified the analyser shall meet the following performance requirements.

- Zero/span Drift: ± 1% of full span/week
- Repeatability: ± 1% full scale or better.
- Response time overall: less than 30 seconds.
- Linearity: ± 1% of full scale or better.

2.7 Analyser Data storage Unit

2.7.1 The central analyser data storage unit (ADSU) shall be provided for the storage of data and diagnostic alarms of analysers and analyser shelter/analyser room as applicable.

2.7.2 Unless specified otherwise a common ADSU shall be provided for all the stack analysers and related analyser shelters/rooms:

2.7.2.1 Processor/Hardware for data acquisition and communication including network switches, fibre optic cables etc.

2.7.2.2 Shelter analyser console located at each shelter.

2.7.2.3 Common stack analyser system console located at control room.

2.7.3 ADSU Data Acquisition System:

2.7.3.1 The Data acquisition & Communication Hard Ware of ADSU shall be located in shelter.

2.7.3.2 Each stack Analyser shall be connected to the ADSU through serial link in multi drop configuration. The serial link shall be MODBUS RTU protocol. Necessary hardware required at analyser side for protocol conversion shall be provided by vendor.

2.7.3.3 In addition to the analyser serial link, the above shall also accept all alarms from shelter equipments/items such as Detector alarms, power failure alarm, purge failure alarm etc.

2.7.3.4 Any alarm inputs from analyser sample handling system and calibration commands etc. shall also be provided at ADSU.

2.7.3.5 The ADSU data acquisition system shall be connected to shelter analyser and common stack analyser system console at control room.

2.7.3.6 The ADSU system cabinet shall be a free standing cabinet and shall be located at each shelter. The construction shall be similar to analyser cabinets as per clause with minimum dimension of 600W X 600D X 2100H.

2.7.4 Shelter Analyser Console:
2.7.4.1 Shelter Analyser console located at each analyser shelter shall be provided for complete analyser measurement and diagnostic data and other shelter measurement data for monitoring, calibration and maintenance.

2.7.5 Common Stack Analyser console:

2.7.5.1 The common stack analyser system console at control room shall store the complete analysis data of analysers and present this in a predefined format. The console shall be common for one or more stack analyser system in the plant and shall receive data from each ADSU data acquisition subsystem at shelter/Analyser room. The data from each shelter/ analyser room shall be provided independently and no multi dropping at field shall be considered.

2.7.5.2 The console shall be provided with stack analyser system software and shall have the following features.

a) Display of all analysis data stack wise, component wise and exception wise.
b) Alarm display & printing.
c) Report generation as per statutory requirements such as USEPA, TUV etc.
d) Freely formatted report generation.
e) Report generation as per local pollution control board requirements
f) Data storage and data compaction facilities.
g) System alarms, display & printing.
h) Predictive maintenance packages, if any.
i) Hourly shiftly, daily, weekly, monthly reports shelter wise.
j) Command for auto calibration for each analyser.
k) System shall store the analysis data and reports upto 1 year period.

2.7.5.3 The report generation as per statutory requirements shall have the following reports as minimum.

a) Data of each analyser with sample interval of 1 sec., 1 minute.
b) Performance report, period as defined by statutory regulation authority. 30 day s, quarterly, biannual, and annual as minimum.
c) Magnitude of excess emission for each analyser.
d) Specific identification of periods of excess emissions , s tart up, s hut down or other periods, cause of malfunction and corrective action.
e) Report of malfunctions or operative maintenance of each analyser along with period.
f) Summary report in case of excess emission period less than 1 % of time of reporting period, in predefined formats.

2.7.5.4 The software provided for common stack analysers shall be certified compliance to USEPA or TUV or any other statutory regulations.

2.7.6 The consoles at shelter and at control room shall access data independently from analysers. In case of failure of one console the other console shall continue to receive data. Upon resumption of failed console, the stored data from other console shall be transferred by command.
2.7.7 Each console shall have the following minimum configuration.

a) Consoles shall be PC based, Pentium latest processor with retentive memory of 512K RAM, 80GB Hard disk with 19" TFT monitor.

b) No. of background colours and foreground colours for the monitor will be seven, as a minimum. These colours shall be used to distinguish parameters such as control, information, process and alarms etc.

c) No. of display characters is 80 character X 40 lines and No. of character type is min 96 ASCII characters with character construction of 5X7 dots and pattern of 7X8 dots.

d) Length of tag no is nine alpha numeric characters.

e) Length of description is fifteen alpha numeric characters.

f) Monitor data display update rate shall not be more than two (2) seconds.

g) Dynamic graphics shall be provided with control.

h) Windowing facility is required with 4 No. of windows/Display.

i) Zooming facility is required.

j) The real time clock of each operator console shall be crystal controlled one which shall be independent of line frequency.

k) A minimum of two cursor control devices must be available with monitor of console. For example cursor control could be used for monitoring the data and engineering of the complete system.

l) Key board shall preferably be touch sensitive membrane type. Each key board entry shall be registered with an audio beep. However, if press type keyboard is provided it shall be ensured that the key board is not susceptible to dust and moisture.

m) The self diagnostic message for a subsystem failure shall appear on the anal yser console irrespective of display selected. The choice of the detailed self diagnostic displays shall be made by a key lock switch.

n) The offered printer shall be HP laser jet colour printer.

2.7.8 The communication between ADSU at analyser shelter and the common stack analyser console at control room shall be through fibre optic cable with necessary converters and the same shall be provided by vendor.

2.7.8.1 All fiber optical cables shall be routed through hard HDPE conduits and shall be totally
enclosed within using HDPE matching fittings. The HDPE conduits shall be as per IS-4984 or equivalent IEC standard. The outer Colour of the conduit shall be orange with black fittings throughout the run. Individual fiber optic cable shall have minimum one pair of spare fiber. All fiber optical cables shall be rodent resistant and armored type only.

3.0 NAMEPLATE

3.1 Each analyser and its accessory shall have a stainless steel nameplate firmly attached to it at a visible place, furnishing the following information as applicable:

a) Tag number as per purchaser’s data sheets.

b) Manufacturer’s serial number and model number.

c) Manufacturer’s name/trade mark.

d) Component being analysed and its range.

e) Area classification in which the equipment can be used.

f) Power supply requirements.

g) Analyser Outputs

4.0 INSPECTION AND TESTING

4.1 Unless otherwise specified, purchaser reserves the right to test and inspect all the items at the vendor's works in line with the inspection test plan for process stream analysers. Vendor shall provide necessary facilities, utilities, competent manpower and consumables required for carrying out the inspection.

4.2 Vendor shall submit the following test certificates and test reports for purchaser's review for each of the analyser:

a) Dimensional verification certificate for each analyser.

b) Material test report as per clause 2.2 of EN10204 for all wetted parts.

c) Manufacturer’s test reports as per clause 3.1B of EN 10204 for various bought out components.

d) Leak test report for complete analyser system including sample handling system using Nitrogen or instrument air at 1.5 times the maximum working pressure.

e) Calibration report for each analyser as per clause 4.3 of this specification.

f) Repeatability test for each analyser as per clause 4.4 of this specification.

g) Power supply variation check.

h) Test certificates for zero, span, carrier and fuel gases as applicable.

i) Certificates from statutory body for flameproof/intrinsic safety and weatherproof enclosures as applicable.

4.3 Analyser Calibration
4.3.1 Analyser along with sample handling system shall be calibrated using zero and span calibration gas samples in the following sequence:

a) Check/adjust zero by connecting zero gas and span by connecting span gas.

b) Check again zero by connecting zero gas after (a) above. Also repeat span gas check.

c) If either or both zero and span are adjusted in step (b), repeat (b) again to verify the calibration until no further adjustments are made in zero and span.

4.4 Repeatability Testing

4.4.1 Repeatability of the analyser shall be checked by connecting either span gas (if it is approximately 70% of analyser span) or any other gas sample on continuous basis for the following time period.

a) 24 hours by manufacturer and report to be submitted for review.

b) 8 hours during witness inspection.

4.5 Witness Inspection

4.5.1 All the analysers shall be offered for pre-dispatch inspection by the purchaser at vendor works. Following tests/checks shall be carried out on each analyser as a minimum:

a) Physical dimensional verification and workmanship.

b) Bill of material check for each analyser system including sample handling system.

c) Leakage testing of complete system using nitrogen or instrument air.

d) Calibration check as per clause 4.3 above.

e) Repeatability check as per clause 4.4.

f) Power supply variation check. Analyser must function satisfactorily on specified variation of power supply voltage.

g) Review of all test certificates and test reports indicated in clause 4.2 above.

4.5.2 In the event when the witness inspection is not carried out by purchaser, the tests shall any way be completed by the vendor and documents for same shall be submitted to purchaser for scrutiny.

5.0 SHIPPING

5.1 All threaded and flanged openings shall be suitably covered to prevent entry of foreign material.

5.2 Each major part shall be sealed in thick plastic bag. Suitable moisture absorbent shall be provided for electronic components.

6.0 REJECTION
6.1 Vendor shall prepare their offer strictly as per clause 1.2 of this specification and shall attach only those documents, which are specifically indicated in the material requisition.

6.2 Any offer not conforming to the above requirements, shall be summarily rejected.

1.0 GENERAL

1.1 This specification defines the minimum requirements of Analyser System/systems designed for
reliable and effective analysis of various process streams.

1.2 All analysers along with their associated equipments shall be installed by the vendor inside the
analyser shelter.

1.3 All analyser shelter shall be ventilated, pressurized and air-conditioned. However, all analysers
and other associated equipments shall be so designed and selected that these will continue to
operate even in case of ventilation/pressurization failure.

1.4 Vendor shall provide all installation material including consumables to install the analysers,
sample conditioning systems, sample transfer lines, vent lines and all other accessories. All
instruments shall be completely accessible to permit adjustments, calibration and maintenance.

1.5 The components to be furnished for each sample system will depend upon the sample stream
conditions. The vendor shall select and provide all the necessary components for each of these
systems accordingly.

2.0 SAMPLE HANDLING SYSTEM

2.1 The sampling system shall consist of necessary components, including sample probes, sample
filters, pressure reducers, safety relief valves, pressure and temperature gauges, moisture
separators, flow regulators, flow meters, isolation valves etc. necessary to prepare the sample for
proper analysis.

2.2 All components shall be sized and coupled so as to keep the sample volume to a minimum.

2.3 Calibration zero and span gas connections shall be provided for each analyser.

2.4 The sampling system shall have various sub-assemblies as required. The minimum requirements
of each sub-assembly shall be as given below.

2.5 Sample Probe Assembly

a) Sampling probe shall be designed to extract true representative sample from the process
line. The design shall prevent particulates from entering into the sample system.

b) The design of probe assembly shall facilitate on line removal of the probe without
shutting off the process. Suitable mounting adapters shall be provided with the probe.

c) Probes shall be of Inconel 600 material unless specified otherwise.

d) The length of tubing between the sample probe and the sample stream pressure
reducing station shall be kept minimum by close coupling various components in between
2.6. Sample Stream Pressure reducing stations:

a) Vendor shall design and provide sample stream pressure reducing stations to minimize sample transfer time maintaining the integrity of the sample. Sample stream pressure reducing stations shall consist of pressure regulators, relief valves, pressure gauges, temperature gauges etc as required.

b) These stations will be located at the sample process connection to minimize transport time lag from the sample point to the analyser.

2.7. Sample Transfer Line

a) The sample transfer line shall transport the fluid sample from the sample stream pressure reducing stations to sample conditioning system located at the analyser shelter.

b) Vendor shall provide heat tracing for sample line wherever necessary, in order to maintain the sample integrity.

c) The routing of sample transfer lines shall be done in such a way that the total length between the sampling point and the analyser sample conditioning system is minimum. Short radius bends shall be avoided to avoid excessive pressure drop.

2.8. Sample Conditioning System:

a) Sample conditioning system shall be provided by the vendor at the analyser house/shelter.

b) Multi-stream analyser system shall have a separate sample handling sub assembly for each stream.

c) Sample conditioning system shall include, but not limited to, moisture separators, filters, rotameters, pressure gauges, flow switches, solenoid valves etc. as necessary for proper analysis of each sample stream. Isolating valves shall be provided as required.

d) Stream selecting valves shall be located as close as possible to the analyser to minimize connecting tubing length and to minimize the possibility of cross contamination of samples.

e) Stream selecting valves shall be double block and bleed and shall fail closed so as to block the sample from the analyser on loss of motive power.

f) Block valves shall be provided on all process sample lines.

g) Rotameters for measuring all sample flows shall be included.

h) Special precautions may be necessary where catalyst fines and coking material, and other difficult stream conditions are present.

i) Wherever it is necessary to maintain the handling system at elevated temperature to properly condition the sample, it shall be enclosed in a ther mally insulated,
thermostatically controller heated enclosure. Enclosure heating shall be with steam heater unless specified otherwise. Sample stream flow adjustments and analyser shutoff valves shall be operable from the front of the enclosure without opening the enclosure door. Sample stream flow, pressure and temperature indication shall be visible from the front of the enclosure.

j) Sample tubing between the sample conditioning system and the analyser shall be kept as short as possible.

2.9. Sample Stream Bypass/Fast loop:
   a) Sample stream bypass/fast loop shall be provided for the sample streams to meet the required sample transport time.
   b) Flow meters shall be provided by vendor for sample bypass/fast loop flow.

2.10. Analyser Vent:
   a) Analysers shall be vented to atmosphere individually or through a common vent system.
   b) In case common vent header is provided, the pipe diameter shall be big enough to prevent build up of back pressure.
   c) The venting of the analyser shall be done to atmosphere at a minimum height of 3 meters above the highest walkway of the structure over the analyser shelter away from any working area or any ventilation system.
   d) The vent lines or header shall be provided with low point drains.

3.0 PIPING AND TUBING:

3.1. All tubing runs shall be either horizontal or vertical, with 90° tubing bends of stainless steel tubing. The tubing shall be run and arranged such that quick visual tracing is possible. All valves, gauges and flowmeters must be visible and accessible.

3.2. Sample and vent tubing, piping, fittings, valves, traps, rotameters and other components shall be of SS 316 material, unless otherwise specified.

3.3. All tube fitting used shall be of SS 316 and shall be non-flare type of Swagelok/Parker/Hamlet make.

3.4. Sample tubing from the field shall terminate at a bulk head union plate using tube to tube bulk head fittings located at the top of the cabinet, in case sample conditioning system is enclosed in a cabinet.

3.5. Sampling line shall be arranged to be free draining without any pockets.
3.6. Vendor shall provide suitable connections for periodic flushing of sample tubing, with Nitrogen and steam, between sampling point and analyser inlet filter. Flushing connections shall be provided at both ends of each sample line.

4.0 ANALYSER

4.1 The analyser shall be furnished with all the necessary equipment to properly analyse the sample.

4.2 Material of construction for the components in contact with the sample stream shall be SS 316 except where the stream composition requires other material.

4.3 The detector cells shall be of a type that will provide adequate separation of components, minimize analysis time, minimize maintenance time and meet the performance requirements of this specification.

4.4 The analyser system temperature shall be controlled by an accurate electric heating system to ensure the proper sample separation and minimize the analysis time.

4.5 A shutdown switch shall be provided to protect the analyser from the loss of carrier gas or loss of fuel gas.

4.6 Solenoid operated multi function valves for sample inlet and column switching shall be provided.

5.0 PROGRAMMER/CONTROLLER

5.1. The programmer / controller shall be microprocessor based and shall be furnished with all the equipments necessary to properly control the analysis cycle, the automatic zero adjustment circuit, the calibration of the analyser and programmer systems and the transition of data to a DCS or digital computer and any require peripheral equipment.

5.2. Visual readout using a digital indicator shall be provided to identify each component being analysed and each step in the program as well as displaying the latest readings.

5.3. Peak peaker and long term memory circuit boards shall be provided for each component of the interest.

5.4. All program data tables shall be capable of field modification without user knowledge of higher level programming. A key lock switch or field alterable password shall be provided to limit access to system software by unauthorized personnel.

5.5. The application program in the analyser shall be retained for a minimum of six months with out external power by the use of EEPROM or Battery back-up. An EEPROM programme cartridge interface shall be provided for program loading.

5.6. Maintenance diagnostics shall be included in the software system to allow rapid trouble shooting in the event of system mal-function. Alarms in the English language shall be provided to notify the operator in the event of the mal-function. A low carrier flow alarm shall be included.

5.7. The stream number shall be printed-out on each analysis report.
6.0 ELECTRIC WIRING - SIGNAL CONTROL AND POWER:

6.1. Vendor's scope of supply and work shall include all cabling and wiring inside the analyser shelter.

6.2. Vendor shall provide an explosion proof (Exd) power distribution box for power supply to various analysers. This box shall be certified by a statutory body for use in specified hazardous area. The box shall have copper bus bars for distribution of power supply to various consumers.

6.3. Power supply to individual consumer shall be by dual pole, dual element circuit breakers. These circuit breakers shall be in explosion proof (Exd) construction certified by a statutory body for use in hazardous area and shall be mounted near the equipment served and shall have engraved plastic tag plates.

6.4. All cabling and wiring shall conform to API-RP-550. Signal and power cabling/wiring shall be segregated and run in separate raceways with separation distances as recommended per API-RP-550.

6.5. All cables shall be armoured, flame retardant PVC insulated, 600 Volt grade, stranded copper conductor. Signal cables shall be twisted pair shielded.

6.6. Conductor size for power cables shall be 2.5 sq. mm (min.) and for signal cables it shall be 1.5 sq. mm.

6.7. Colour coding for power supply wiring shall be red for phase, black for neutral and green for earth.

6.8. Vendor shall provide junction boxes for signal and control cables separately which shall serve as interfaces for cables going to remote control room. These junction boxes shall be explosion proof (Exd) certified by statutory body for use in specified hazardous area.

6.9. Wire termination shall be done using self insulating crimping lugs.

6.10. All cables, wires shall be provided with identification ferrule (one piece ferrule/ cylindrical ferrules_ for proper identification.

6.11. Terminal strips shall be provided with identifying terminal numbers, as required. Terminals shall be screw less clamp type.

6.12. 20% spare terminals, cable entries with cable glands, relays and other components wired up to terminals shall be provided.

7.0 COMPRESSED GAS CYLINDERS AND THEIR HANDLING:

7.1. Each analyser shall be provided with the following compressed gas steel cylinders.

a) Carrier gas and fuel gas (wherever required) with dual manifold cylinders configuration.

b) Calibration gas sample bottles.
7.2. Fuel gas and Carrier gas cylinders and associated manifolds shall be located on a concrete pad outside the analyser building. The gas cylinder manifold shall be arranged so that one cylinder may be replaced while the analyser remains in operation on the other cylinder. Cylinders shall be sized 1A (225mm diameter x 1300mm long) and shall be supplied with auxiliaries such as fittings and two stage regulators.

7.3. Calibration gas cylinders shall be located outside the analyser shelter. Vendor shall include a drawing showing the layout of cylinders.

7.4. Racks shall be provided to support cylinders, piping, valves and pressure regulators associated with high pressure gas cylinder manifold system. Each cylinder in the system shall be secured to the rack by a separate chain or clamp.

7.5. A pressure relief valve, vented to a safe location outside the building shall be installed on the low pressure side of the pressure reducing regulator of each cylinder. Vent piping shall be installed in a manner to prevent the entry of bugs or moisture into the outlet of the vent. This vent shall be in addition to the analyser vent.

7.6. All pressure regulators shall be two stage type. A sign identifying the type of gas applied to a manifold shall be placed above each cylinder rack.

7.7. The location and separation of hydrogen manifold from other flammable gas manifolds shall be in accordance with NFPA 50A-1973 section 52 and 61.

7.8. All tubing between the cylinders to the analysers shall be complete and easily removable from each and either end.

7.9. Vendor's quote shall include fuel, carrier and calibration gas cylinders as necessary, as a minimum, for:

i) The field testing, commissioning and final acceptance

ii) Six months from the date of acceptance.

7.10. The calibration gases shall be of high purity, at least better than the specified accuracy and precision values for analysers. It is preferable to prepare calibration gases by Gravimetric method.

7.11. The concentration of calibration gases must remain constant for a period of at least one year.

7.12. The material of construction of cylinders shall be suitable for maintaining stability of the calibration gas mixture for the specified time. Vendor may quote for staggered deliveries wherever calibration mixture is not stable.

7.13. The vendor must submit the following certificates from any recognised certifying agency/laboratory;

i) Accuracy/Precision of the calibration gas.
ii) Stability of sample for at least one year.

7.14. Vendor shall forward all the details including the source of supply, certifying agency, cylinder size and volume, sample pressure, dew point, regulator type and make etc.

In addition, vendor must furnish calculations for number of cylinders quoted of each type. For calibration gas cylinders, consider calibration frequency as once in every fortnight.

8.0 SAFETY REQUIREMENTS:

8.1. Hazardous Area Protection:

a) The analyser shelter shall be in hazardous classified area. Positive pressure and ventilation from a clean air source shall be provided to achieve this classification.

b) It is intended to operate the analysers even during the ventilation failure, hence it required that all analysers shall be suitable for hazardous area.

c) All the electrical fittings provided in the analyser shelter shall be explosion proof type. However, a safety system shall be provided by the vendor to switch off power supply to all electrical equipments and accessories not suitable for hazardous area in case of ventilation failure. To do this it shall be ensured that all analysers continue to work safely even under these conditions.

d) All junction boxes, power distribution cabinets, LEL detectors and their panel and other safety devices shall be suitable for the hazardous area certified by a statutory body.

8.2. Grounding:

a) All electrical equipment in the analyser shelter and outside shall be grounded properly.

b) Cylinder racks, sample conditioning enclosures, analyser racks, shall also be grounded directly to the AC ground bus.

c) All necessary grounding bus requirement for Equipment grounding and signal shields shall be provided by the vendor in the analyser shelter. Vendor shall also provide all earthing arrangements inside the analyser shelter.

8.3. Combustible Gas Detection System (LEL Detectors):

a) Vendor's scope includes of supply and installation of combustible gas detectors with associated monitoring system for the analyser shelter.

b) Combustible gas detectors shall monitor all inlet air intake points. The detectors shall be calibrated to give alarm and high alarm at 20% and 40% respectively of the LEL of the component with the lowest LEL in the area. On the occurrence of high alarm the ventilation system shall be shut-off. Vendor shall provide potential free DPDT contacts rated at 230 VAC 5 Amp for connection to ventilation system.
c) Shutoff of ventilation system shall be based on 2 out of 3 voting, which means that only if two detectors out of the three provided indicate a high LEL, trip shall provided.

d) Additionally, combustible gas detectors shall monitor the analyser house/shelter interior and exhaust air. These detectors shall give alarm and high alarm as mentioned above, however no shutoff of ventilation system shall be required.

e) Vendor shall calculate total requirement of combustible gas detectors along with their location.

f) The monitors for LEL detectors shall be provided with malfunction, warning and danger lights and 0 to 100% indicator.

g) Vendor shall provide grouped high alarm and high - high alarm SPDT contacts rated for 230 V AC 5 Amp for repeat alarms in remote control room.

h) The monitors for LEL detection system shall be installed in a panel which shall be pressurized as per NFPA 496 type `X' purge.

8.4. Fire/Smoke detection

a) Vendor’s scope shall include supply and integration of fire detectors/smoke detectors (ionisation type) within the analyser shelter. The no. of shelters shall be decided by the vendor based on the shelter size and coverage of area within the shelter.

b) The monitors for the fire detection shall be installed in a pressurised/ purged panel as per NFPA 496 type X purge. This may be shared with LEL monitor panel.

c) The signals from the fire system monitor shall be provided for:

- One contact for alarm on the warning panel.
- One contact each for repeat alarm in the control room DCS and fire panel of Electrical section.

8.5. Oxygen gas monitoring

a) Vendor shall provide a maximum of two nos. of oxygen gas monitoring system for sensing deficiency of oxygen within the shelter.

b) In case the monitors show low concentration of oxygen within the analyser shelter, an alarm shall be initiated on the warning panel. The repeat alarm shall also be provided for DCS in the Main control room.

c) Oxygen monitors should be located in purged panel as per NFPA 496 type X purge. These may be located in the same panel where LEL detectors are installed.

8.6. Warning Panels:
a) Vendor shall provide warning panels for audio visual alarming of hazardous conditions inside the analyser shelter. One such panel shall be installed by vendor on each of the external walls of the analyser shelter where entrance doors are provided.

b) The warning panel shall provide the following audio - visual alarms:
   
   i) Presence of combustible gases inside the analyser shelter.
   ii) Loss of analyser shelter pressurisation
   iii) Ventilation system failure
   iv) Fire/smoke within the shelter
   v) Oxygen deficient within the shelter

c) For alarming of analyser shelter pressurisation failure vendor shall provide an explosion proof pressure switch for sensing analyser shelter inside pressure.

d) These warning panels shall be of explosion proof (Exd) construction certified by a statutory body for use in hazardous area.

8.7 Minimum two no beacon assembly and 1 no. hooter suitable for specified hazardous area shall be provided on the shelter to warn the operator of presence of hazardous area inside the shelter.

9.0 FACTORY TESTING AND ACCEPTANCE:

9.1. The analyser systems shall be thoroughly checked and tested prior to shipment to assure correct design, construction and proper operation.

9.2. The Owner/Consultant reserves the right to be involved and satisfy himself at each and every stage of inspection and testing.

9.3. During the final testing vendor shall test and demonstrate to the Owner/Consultant, the functional integrity of all analysers, sampling systems and all other hardware. Repeatability test shall be performed on all analysers for a test period of 24 hours. No material or equipment shall be transported until all required tests are successfully completed and certified `Ready for shipment' by the Purchaser/Consultant. Software’s, if involved, shall also be tested.

9.4. Vendor shall submit schedule of factory testing and inspection.

9.5. After placement of order vendor shall submit his factory testing and customer acceptance procedure for Purchaser / Consultant approval. This document shall contain the information related to each test e.g. purpose of test, definition, test procedure, results expected and acceptance.

9.6. Purchaser / Consultant has every right to add or delete any test in vendor's test procedure and acceptance criteria. The system shall be tested and accepted as per the approved testing procedures and acceptance criteria. The cost of performing all tests shall be borne by the vendor.

9.7. Vendor shall notify the Purchaser / Consultant at least three weeks prior to final system testing at vendor's works. In the event that representatives of Purchaser / Consultant arrive and the system
is not ready for testing, the vendor shall be liable for back charging for any extra time and expenses incurred by the Owner.

9.8. It shall be vendor's responsibility to modify and/or replace any hardware, equipment or analyser if the specified functions are not completely achieved satisfactorily during factory testing and acceptance.

10.0 INSTALLATION, TESTING AND COMMISSIONING:

10.1. Vendor shall provide the services of his installation team which would install the equipment in the analyser shelter and in the field, lay the tubing from sample probe to analyser shelter, lay the interconnecting cabling tubing inside the analyser shelter, perform system checkouts, test and commission the entire system.

10.2. All technical personnel assigned to the site by the vendor shall be fully conversant with the system supplied and shall have capability to bring the system on-line quickly and efficiently with a minimum of interference with other concurrent construction and commissioning activities.

10.3. Vendor's responsibility at site shall include all activities necessary to be performed to complete the job including;

a) Receipt of all analysers and related hardware, and checking of completeness of supply. In case of shelters, verification of all analysers and accessories duly installed tubed and wired

b) Installation of all analysers, and other associated equipment including all safety equipment like LEL detectors, annunciators, panels etc., all auxiliaries like power supply distribution boxes, all interconnecting tubing/piping etc. so as to complete the job in case of analyser shelter.

c) Installation of sample probes, pressure reducing stations, sample conditioning systems, interconnecting tubing, heat tracing etc.

d) All analyser sample stream bypass, vent and drain tubing/piping.

e) Termination of all field cables or cables to control room, ferruling/ tagging of interconnecting cables in analyser shelter.

f) Interconnection cabling inside the analyser shelter

g) All civil works like grouting, fixing etc and patch up work where vendor is likely to remove the plaster and shall make holes in the walls, floor or ceiling.

h) Checking of interconnections, hardware configuration, overall system functioning.

i) Leakage rate test.

j) Liaison with vendor's home office.
k) Field testing.
l) Commissioning of the complete analyser system.
m) Final acceptance testing.

10.4. System Check-outs:

a) Checking of all interconnections, configuration and overall system functioning.
b) Any discrepancy found during checking shall be brought to the notice of Engineer-in-Charge.
c) All the check-outs shall be performed in the presence of Owner/PMC authorised representative. All headings shall be recorded on a suitable format and shall be submitted for approval.
d) After system checking is completed, vendor shall connect back any terminal or tubing or connection removed for loop checking.
e) All the equipment shall be checked thoroughly after its receipt at site. The tests, as a minimum, shall include;

i) Visual and mechanical testing
ii) Complete system configuration loading
iii) Calibration of all analysers, and other related equipment.
iv) Demonstration of all system functions.
v) Demonstration of all system diagnostics.
vi) Checking of correct change of redundant devices.
vii) Demonstration of analyser accuracies, linearities, repeatabilities, response time etc.
viii) Demonstration of proper operation of system at specified voltage supply specifications.
ix) A leakage test shall be conducted on entire system. Maximum permissible leakage rates shall not exceed 5% per hour of specified designed pressure.

11.0 TRAINING:

Vendor shall be responsible to train the Purchaser/Consultant personnel in the field for maintenance of hardware and software. The outline of each course including the course contents and the duration shall be forwarded by the vendor along with the offer.

12.0 DOCUMENTATION:
Vendor shall furnish all the manuals, including for maintenance and operation, necessary to test, operate and maintain etc the analysers and other related equipment, hardware and software.

13.0 ENGINEERING DRAWINGS:

13.1. Vendor shall provide a complete set of drawings covering each part of supply for Purchaser/Consultant record. The vendor is required to include Purchaser's project number on each of his drawing.

13.2. All field modifications shall be carefully recorded by the vendor's installation and commissioning personnel and changes shall be incorporated into the final drawings.

14.0 FINAL ACCEPTANCE TEST:

The Owner will take over the system from the vendor after the final acceptance test, which is defined as successful uninterrupted operation of the integrated system for three weeks with desired accuracy and repeatability. Vendor's personnel shall be present during the test. Any malfunctioning of the system components shall be replaced/repair as required. Once the system failure is detected, the acceptance test shall start all over again from the beginning.

15.0 TESTING AND CALIBRATION EQUIPMENT:

Vendor shall make available all consumables including calibration gas cylinders, instruments and equipments necessary for testing, calibration, maintenance etc. as defined by the 'scope of work'. All instruments and equipments used for the above purpose shall be of standard make with accuracy better than the accuracy expected from the calibrated/tested equipments and shall be certified by National Physical Laboratory or other equivalent agencies.

16.0 SPARE PARTS:

Vendor shall quote separately for spare parts required for a two year period of operation for the complete analyser system and the associated auxiliaries offered. Vendor shall enclose a list of spare parts quoted along with the offer.

17.0 MAINTENANCE CONTRACT:

Vendor shall quote separately for maintenance contract after warranty period for two years as per job requirements. The personnel deployed shall have thorough knowledge of the system and at least two years of experience as maintenance of similar system.

18.0 PACKING AND SHIPPING INSTRUCTIONS:

18.1. All materials used for packing, wrapping, sealers, moisture resistant barriers and corrosion preventers shall be of recognised brands and shall conform to the best standards in the areas for the articles which are being packaged.
18.2. Workmanship shall be in accordance with best commercial practice with the requirement of applicable specifications. There shall be no defects; imperfections or omissions which would tend to impair the protection of the package as a whole.

18.3. The package shall be suitable for storing in tropicalised climate as per specified ambient conditions.

18.4. Shipment shall be thoroughly checked for completeness before final packing and shipment. Vendor shall be fully responsible for any delay in installation or commissioning schedule because of incomplete supply of equipment.
STANDARD SPECIFICATION

1.0 GENERAL

1.1 Scope

1.1.1 This specification, together with the data sheets, covers the requirements for the complete design, materials, nameplate marking, inspection, testing and shipping of process stream analysers. This standard specification shall be applicable for all types of process stream analysers irrespective of whether separate specifications are included or not included in this specification.

1.1.2 The related standards referred to herein and mentioned below shall be of the latest editions prior to the date of the purchaser's enquiry:

ANSI/ASME American National Standards Institute! American Society of Mechanical Engineers.

B 1.20.1 Pipe Threads. General Purpose (Inch)

B 16.5 Steel Pipe Flanges and Flanged Fittings. NPS 1'2 through NPS24.

B 16.20 Metallic Gaskets for Pipe Fittings, Ring Joints, Spiral wound and Gasketed.

API American Petroleum Institute

Manual on Installation of Refining Instruments and Control System

RP 551 Process Measurement Instrumentation

RP 552 Transmission System

RP 554 Process Instrumentation and Control

RP 555 Process Analysers

ASTM693 Standard Practice for cleaning methods and cleanliness levels for material and equipment used in oxygen-enriched environment.

EN 50020 Electrical Apparatus for potentially explosive atmospheres-Intrinsic safety 'i'

EN 10204 Inspection Documents for Metallic Products.

IEC-60079 Electrical Apparatus for Explosive Gas Atmosphere.

IEC-60529 Degree of Protection Provided by Enclosures. (IP Code)

IS-13947 Specification for Low Voltage Switchgear and Control gears.

IS-2148 Electrical Apparatus for Explosive Gas Atmosphere-Flameproof enclosures ‘d’.

NFPA 496 National Fire Protection Association

1.1.3 In the event of any conflict between this standard specification, job specification/data sheets, statutory regulations, related standards, codes etc., the following order of priority shall govern:

a) Statutory Regulations

b) Data Sheets

c) Standard Specification

d) Codes and Standards

1.1.4 In addition to meeting the purchaser’s specification in totality, vendor’s extent of responsibility shall include the following:

a) Purchaser’s data sheet indicates the type of analyser and the minimum sample conditioning system requirements. Vendor shall be responsible for the selection of proper analyser and design of the sample conditioning system to analyse the component/components of interest within the stated performance requirements.

b) Carry out complete application engineering of the process gas analyser so as to achieve the desired analysis within stated performance requirements.

c) Provide all hardware and software, as necessary, to meet the functional requirements specified in the purchaser's specifications.

d) Provide complete data to purchaser for successfully proving serial communication with purchaser’s host system i.e. DCS when specified in the job specification.

e) Purchaser’s data sheets indicate the minimum requirements of material of construction for the analyser and its sample conditioning system. Alternate superior material of construction shall also be acceptable provided vendor assumes complete responsibility for all the parts of the analyser system so as to be compatible with the process stream and surrounding atmosphere as specified in purchaser's data sheet.

1.2 Bids

1.2.1 Vendor’s quotation shall be strictly as per the bidding instruction to vendor attached with the material requisition.

1.2.2 Whenever a detailed technical offer IS required, vendor’s quotation shall include the following:

a) Compliance to the specifications.
b) A detailed specification sheet for each analyser, which shall provide information regarding type, materials of construction, performance specification and accessories of analyser. The material specification and units of measurement for various parts in vendor's specification sheets shall be to the same standards as those indicated in purchaser's data sheets. All the relevant terminology used in purchaser's data sheets and standard specifications shall be as per ISA RP 31.1.

c) A detailed drawing showing various components of sample conditioning system and piping/tubing hook-up arrangement including sample return, vent, utilities in connection and requirement of heat tracing (i.e. electrical or steam tracing), as necessary.

d) Sample transportation time calculations for the specified distance between sample point and analyser indicating sample flow rate and the recommended size of the sampling tube.

e) Calibration gas cylinder calculations considering six months of continuous operation with once a week calibration. The calculation sheet shall indicate the rate of gas consumption and specification of gases including composition, concentration, accuracy and shelf life of calibration blend.

f) References gas cylinder calculations considering six months of continuous operation. The calculation sheet shall indicate the rate of gas consumption and specifications of the reference gas.

g) Proven references for each offered model inline with clause 1.2.3 of this specification.

h) A copy of approval for intrinsically safe/flameproof enclosure, whenever specified, from local statutory authority, as applicable, such as Petroleum and Explosives Safety Organisation/Chief Controller of Explosives (CCE), Nagpur or Director general of Mines Safety (DGMS) in India, along with:

i) Test certificate from recognised house CMRI/ERTL etc. for flameproof enclosure as per relevant Indian Standard for all Indian manufactured equipments.

ii) Certificate of conformity from agencies like CSA, BASEEFA, PTB, LCIE, FM, UL etc. for compliance to ATEX directives or other equivalent standards for all equipments manufactured outside India.

i) Utility requirements and their consumption i.e. instrument air, cooling water, steam etc. along with their process conditions like flow, pressure and temperature.

j) Power consumption for each analyser and its accessories.

k) HVAC requirements i.e. heat load, humidity particulate/chemical filtration etc.

l) Deviations on technical requirements shall not be entertained. In case vendor has any valid technical reason, they must include a list of deviations tag number wise, summing up all the deviations from the purchaser's data sheets and other technical specifications along with the technical reasons for each of these deviations.

m) Catalogues giving detailed technical specifications, model decoding details and other related information for each type of analyser and accessories covered in the bid.
1.2.3 All items, as offered, shall be field proven and should have been operating satisfactorily individually for a period of minimum 4000 hours on the bid due date for the similar analysis as specified in the purchaser's data sheet. Items with proto-type design or items not meeting provenness criteria specified above shall not be offered.

1.2.4 Whenever specified, vendor must furnish certified values of failure rates, probability of failure on demand and test interval for the safety integrity level analysis.

1.2.5 All documentation submitted by the vendor including their quotation, catalogues, drawings, installation, operation and maintenance manuals, etc shall be in English language only.

1.2.6 Vendor shall also quote for the following: -

a) Complete calibration kit consisting of calibration gas cylinders, pressure regulators, gauges, cylinder gas piping manifolds and driers, (as required) etc. as a minimum, for each analyser. In case of dual range analyser, separate calibration standards shall be provided for each range. For the purpose of calculating requirement of zero and span calibration samples/gases, consider calibration time of 30 minutes every week for each analyser for a period of six (6) months of continuous operation.

b) Complete reference gas kit consisting of Reference gas cylinders, pressure regulators, gauges, cylinder gas piping manifold and drier etc as a minimum separately for each analyser as applicable. The reference gas cylinders shall be supplied for a period of six (6) months of continuous operation.

c) Consumable spares for the duration of six months with list of items as per vendor recommendations for each analyser system, unless otherwise specified in job specification.

d) Start up and commissioning spare parts for each analyser/analyser system as per vendor recommendations. However this list of spare parts must include 5% or minimum one of each type of following spare parts:

- Solenoid valve
- Pressure regulator
- Filters
- Temperature controller
- IRIUV Source (lamp)
- Peristaltic pump
- Set of fuses
- Set of o-rings
- Tubing and tube fittings (sizes smaller than 6 mm or y”).

Additional spare parts, if required, during start-up and commissioning, even though not listed in the list of start-up and commissioning spares, shall be supplied by the vendor without any implication.
e) Any special instrument or tool needed for testing, calibration and maintenance of the analyser such as spanner set (for tubes smaller than 6 mm or 1/4”), non-magnetic tools, bubble rotameter etc.

f) Training at vendor works and at site as specified in job specifications.

g) Two years operational and maintenance spares for each analyser and its accessories as per vendor recommendations, which shall include spare parts like electronic modules, temperature controller, power supply module, flow meter, solenoid valve, pressure regulator, local indicator, tubes, fan assembly, sample cell, detector assembly, UV/IR source/lamps, set of o-rings, set of fuses etc.

1.3 Drawing and Data

1.3.1 Detailed drawing, data, catalogues and manuals required from the vendor are indicated by the purchaser in the vendor data requirement sheet attached with the enquiry. The required number of reproducible, prints, and soft copies shall be despatched to the address mentioned, adhering to the time limits indicated.

1.3.2 Final documentation consisting of design data, installation, operation and maintenance manual etc., submitted by the vendor after placement of purchase order shall include the following, as a minimum;

a) Specification sheet for each analyser and its accessories.

b) Certified drawings for each analyser and its accessories, tag number wise, which shall provide the following information:

i) Overall dimensions in millimetres.

ii) Sampling system details identifying each component with make and model number, process connection, utility connection, calibration sample/gas connection, heat tracing requirements, sample vent and fast loop details etc.

The flow, pressure and temperature at interface and other appropriate location must be shown in the sampling system drawing.

iii) Detailed interconnection drawing of each analyser identifying each component with terminal number, cable type, cable size and cable entry details. The interface details shall be clearly identified in the drawing.

iv) Grounding details.
v) Power supply distribution details.

c) Programming/configuration data for each analyser, as applicable.

d) Serial interface specification including its configurational data (addresses) for host communication.

e) Power consumptions and utility requirements.

f) Calibration curves and calibration data for each analyser.

g) Zero and span calibration gas specification including composition, shelf life time and accuracy.

h) Copy of type test certificates.

i) Copy of the test certificates of all the tests indicated in clause 4.0 of this specification

j) Installation procedure for each analyser and their accessories.

k) Calibration and maintenance procedures including replacement of its parts/internals wherever applicable.

1.4 Definitions

1.4.1 The following definitions shall apply for analysers and their accessories:

a) Transportation time

Transportation time is the time interval between a step change in the process fluid composition in the process line and the initial analyser response (excluding analyser response time).

b) ResponseTime

The time interval between the initial response of the analyser and the time required for the analyser output to reach a value of 90% of the final output value for a step change in sample quality.

c) Time Constant

The analyser response to reach a value of 63% of the final output value for a step change in sample quality is called the analyser time constant.

d) Repeatability

Repeatability of a measurement is the band of values within which an analyser repeats its measurement when the same sample is applied to it. The short term repeatability is generally determined by multiple readings of a sample during calibration and is usually true random error over short period of time if external influences like pressure and temperature etc remain constant.
It is also defined as the difference between two successive analyser results that would be exceeded in the long run in only one (1) case in twenty (20) when a single analyser system is operated on a flowing sample of uniform quality.

e) Sensitivity

The sensitivity of an analyser is a measure of an analyser's ability to detect a least change in concentration of a measured component that is not masked by the background noise.

f) Accuracy

Accuracy of a measurement is the measure of how close the measured value is to the true value of the sample. For all type of analysers, accuracy is primarily a function of the accuracy of the standards used for calibration.

g) Analyser Rack

An open analyser mounting structure with/without canopy used for mounting analysers, sample handling system and their accessories individually or together in combination.

h) Analyser Cabinet

Small housing in which analysers are installed individually or grouped together. Maintenance is performed from outside the cabinet with door(s) open.

2.0 DESIGN AND CONSTRUCTION

2.1 Analyser Requirements

2.1.1 The type of analyser and its measuring principle is specified in the purchaser's data sheet. Accessories and equipments as required to make online analysis complete are also specified in the data sheet. In general, the scope shall include the following:

a) Sample probe and sampling system, as applicable

b) Analyser complete with all hardware and software consisting of detector, transmitter and associated equipments.

c) Fast loop and Sample return system, as applicable

d) Calibration and maintenance equipment.

e) Gas cylinders for zero and span calibration.

Unless otherwise specified the scope shall also include supply of all interconnecting tubing, piping, fittings, heat tracing equipment etc., excluding sample return piping from analyser battery limit to sample return header.

In-situ analysers when specified may not include items 2.1.1(a) and (c)
2.1.2 Analysers and its related equipments directly connected to process line and In-situ analysers shall be capable of withstanding line pressure and temperature conditions specified in the purchaser's data sheet.

2.1.3 The analyser design and design of sample handling system shall be such that components or any sub-assembly that requires removal shall be possible without any need to disassemble any other component. Such components shall include items like stream selector valves, filters, pressure regulators, flow-indicator, detector, electronic modules etc.

2.1.4 Analyser shall be microprocessor based with state-of-the-art technology and shall be capable of being configured from analyser front panel locally using built-in keyboard. When specified, it shall also be possible to configure the analyser from remote through a separate terminal.

2.1.5 The configuration related data of the analyser including set range shall be stored in a nonvolatile memory such that this data remains unaffected by power fluctuations or power off condition. In case vendor's standard product stores configuration data in battery backed RAM, analyser shall have facility to provide battery drain alarm as diagnostic maintenance message.

2.1.6 The span of the analyser shall be field adjustable from the analyser front without opening the analyser enclosure. In case, separate device is required to make such a change, the same shall be included, by vendor in their scope of supply.

2.1.7 Analyser shall run diagnostic subroutines on continuous basis and shall be able to provide diagnostic alarms related to analyser optics, detector and electronics, as and when any failure/malfunction is detected.

2.1.8 Analyser shall have an integral output meter with digital readout in engineering units.

2.1.9 All interconnecting wiring shall be colour coded/numbered and terminal blocks be clearly identified.

2.1.10 The analyser shall be capable of providing the following outputs:

a) Isolated 4-20 mA DC current output for each analysed component. Smart or field bus output shall be provided when specifically indicated in the purchaser's data sheet.

b) RS485 serial output with MODBUS (RTU) protocol, whenever serial output is specifically indicated in the purchaser's data sheet. The serial output signal shall contain analyser data of component of interest and diagnostic alarms, as a minimum.

c) SPDT contact outputs for various diagnostic alarms (as applicable) such as:

i) High or low set point alarm as measurement
ii) analyser failure
iii) low sample flow
iv) temperature control failure
v) purge failure

Any other alarm contact, either specifically indicated in purchaser's data sheet or available as standard with the analyser, shall also be provided.
2.1.11 The design of analyser system shall be in compliance with the electromagnetic compatibility requirements as per IEC-61000-4-X.

2.1.12 Material of Construction

2.1.12.1 Unless otherwise specified, the material of construction of all components wetted by the sample shall be SS316, as a minimum. Vendor must ensure the compatibility of material of each component with the process fluid.

2.1.12.2 Material of all soft parts like diaphragms and o-rings shall be of PTFE. Other vendor standard materials can also be acceptable provided these are compatible with the specified process condition.

2.1.12.3 The material of construction of all non-wetted parts shall be as per manufacturer's standard. However non-metallic materials for casings, enclosures and instrument covers shall be avoided.

2.1.13 Power Supply

2.1.13.1 Unless indicated otherwise, the analyser including the sample handling system shall operate at 110V 50Hz power supply.

2.1.13.2 The analyser performance shall be within the specified limits when the supply voltage varies by ±10% of specified value and supply frequency varies by ±3 Hz of specified value.

2.1.13.3 Electrical tracing when specified, shall operate at 230V 50 Hz supply. 230V 50Hz power supply shall also be used for analyser cabinet/panel lighting and air conditioning unit, when specified.

2.1.14.1 Unless otherwise specified, the following shall govern;

a) Threaded connections shall be NPT to ANSI/ASMEB 1.20.1.

b) Flanged connection shall be as per ANSI/ASME B16.5.

c) Flange face finish shall be smooth concentric to clauses 6.4.4.1, 6.4.4.2, and 6.4.4.3 of ANSI/ASMEB 16.5. The face finish shall be as follows:

\[
\begin{align*}
125AARH &: 125\text{ to }250\text{ AARH} \\
63AARH &: 32\text{ to }63\text{ AARH}
\end{align*}
\]

d) Ring type joint flanges shall have octagonal grooves as per ANSI/ASTMB16.20.

2.1.14.2 End connection of sizes 6 mm or below shall be suitably protected against damage.
2.1.14.3 All end connections shall be clearly identified by attaching labels or stainless steel plate of suitable size.

2.1.15 Enclosure Type

2.1.15.1 Analyser enclosures and related accessories shall be suitable for the electrical area classification indicated in purchaser’s data sheets. Unless otherwise specified, the enclosures shall comply to the following standards:

Weather proof housing : IP 55 as per IEC-60529 / IS-13947
Flame proof housing : Flame proofEx (d) as per IEC-60079 / IS-2148
Purged Enclosure : NFPA 496

Flameproof and purged equipment shall also be made weatherproof.

2.1.15.2 In addition to meeting weatherproof requirements specified in clause 2.1.15.1 of this specification, intrinsically safe analysers shall meet the requirements specified in EN 50020 and shall be certified for the area classification specified in the purchaser’s data sheet.

2.1.15.3 Analyser where air/nitrogen purge is provided, purge shall be as per NFPA 496 Type X. Analyser power shall cut off in case of purge failure. Purge failure alarm shall be provided for purchaser use.

2.1.15.4 Separate cable entries shall be available in the analyser/enclosure for power and signal cable. Unless otherwise specified, following shall apply:

a) Cable entry and terminal size for power cable shall be informed during detail engineering. Explosion proof 3 way junction box with cable glands shall be supplied, if required.

b) Cable entry for Serial cable/signal cables (Signal output) shall be 1/2" NPT (F).

c) Cable entry for multi-pair signal cables (Multiple output) shall be 1\1/1," NPT (F).

2.1.15.5 All enclosure entries including sample, utilities, cables etc. shall be clearly identified by attaching label or stainless steel plate of suitable size.

2.2 Sample Handling System

2.2.1 The sample handling system shall consist of primary sample conditioning near sample take off point, sample transportation line, secondary sample conditioning near the analyser, sample return, sample/analyser vent and sample drain/recouping system, as applicable. The primary sample-conditioning unit shall be a fabricated assembly and shall be mounted on a stainless steel plate suitable for surface mounting.

Secondary sample conditioning shall also be a fabricated assembly and shall be either
mounted on a stainless steel plate or within an enclosed cabinet box with a viewing window. In case the temperature is required to be maintained at primary and secondary sample conditioning, both these conditioning units shall be installed in the heated box/cabinet.

2.2.2 Process Stream sampling shall be continuous and analyser shall be located as near as possible to the sample take-off point. Where the analyser is located away from the sample take-off point, vendor shall design the sample fast loop (bypass loop) as part of sampling system. Design shall ensure that the sample drawn is true representative of the process stream to be analysed.

2.2.3 In general, sampling systems shall be designed and constructed in accordance with API-RP555. The design of sample handling system shall consider the following factors, as a minimum:

a) The pressure-temperature conditions required for the analyser.
b) Interfering components in the process sample.
c) Normal and abnormal sample compositions.
d) Sample return pressure-temperature conditions.
e) Fouling sample conditions e.g. polymer formation or presence of solids etc.
f) Transportation time requirements.
g) Utilities available and their process conditions.

2.2.4 Unless otherwise specified, material of all components wetted by sample shall be suitable for the process fluid and sample process conditions specified in the purchaser's data sheet. The material of construction for all wetted parts shall be, 316 SS, as a minimum.

2.2.5 Sampling system shall include all elements as necessitated by the process conditions indicated in the purchaser's data sheets, to make the sample suitable for the analysis. This shall include but not limited to filters (coarse and fine), pressure regulators, relief valves, flow indicators, flow controllers, temperature indicators, scrubbers, heaters, coolers, dryers, sample pumps, aspirators etc.

Each sampling system element shall be capable of being removed without disassembling the entire system.

2.2.6 Sample probe shall be provided by the vendor to obtain representative sample from the line. The sample probe shall be inserted in the pipe through a line isolation valve (ball or gate valve), which shall be part of vendor's scope of supply. The probe design shall ensure the following:

a) On-line removal and insertion of the probe with non-fly-off design

b) Unless otherwise specified, end connection for installation in the line shall be 1 1/2" flanged with type and rating as specified in purchaser's data sheet. The line isolation valve shall also be of the same size and rating as probe end connection.

c) The probe diameter shall be such that it can be easily inserted or removed through the line isolation valve when in fully open condition.

d) The length of the probe shall be selected considering its insertion upto the middle of the pipe. For the purpose of calculating probe length, consider nozzle length as 200 mm.

2.2.7 Sampling system shall include a sample block valve on all process sample line. The block valve
shall be provided meeting the following requirements:

a) The block valve shall be located immediately after the sample probe.

b) Where purchaser's data sheet do not indicate the requirement of sample probe, the block valve shall be provided in the sample line as a part of primary sample conditioning unit.

c) The size of the sample block valve shall be as per the sample line size while the rating shall be as specified in the purchaser's data sheet.

2.2.8 The size of the sample tubing shall be decided by the vendor considering:

a) The distance between sample take off and analyser specified in purchaser's data sheet.

d) The specified sample transportation time.

e) Pressure at the sample take off point.

Where no transportation time is specified in the purchaser's data sheets, vendor shall consider the sample transportation time as 60 seconds.

2.2.9 Where sample is required to be transported in hot condition, sample shall be drawn using pre-fabricated heated tubes. The heated medium shall be either steam or electric power as specified in purchaser's data sheet. Heating shall be controlled such that the sample temperature is maintained typically around +200°C above the sample dew point.

2.2.10 When fast loop is specified or recommended by vendor, vendor shall provide flow meter for sample bypass flow. Sample return line to process shall be provided with isolation valve and check valve. Vendor shall ensure that return pressure of the sample shall be higher than the pressure of the process return point specified in purchaser's data sheet.

2.2.11 Sampling system shall include provision for connecting calibration sample/gases in auto or in manual configuration as specified in purchaser's data sheet. When no specific requirement is indicated, the provision shall be made for manual configuration only.

2.2.12 In case of multi stream analyser, the sample handling system shall utilize double block and bleed configuration to prevent cross-contamination of samples. All stream selection valves shall have bubble tight shut off. The block valves shall be fail-close type while bleed valve shall be fail-open type.

2.2.13 Filters shall always be provided in dual configuration. It shall be possible to replace the filter without upsetting the operation of the analyser.

2.2.14 The sampling system shall be designed to consider plugging of sample lines under following conditions, if applicable:

a) Failure of heat tracing
b) Failure of sample pump
c) Failure of instrument air, particularly when sample dilution technique is adopted for sample.

d) Upset of short up conditions, if excessive solids/solid particles are expected under these operating conditions.

2.2.15 Unless specified otherwise, sample lines used for carrying samples for more than one analyser shall be provided with sample pumps in dual configuration. It shall be possible to remove or insert the pump without upsetting the sampling system.

2.2.16 A suitable restriction orifice shall be provided in each sample line to limit the sample flow exceeding thrice the normal flow in the event of tube rupture or opening of tube down the line.

2.2.17 Whenever auto-calibration requirement is specified in the purchaser's data sheet, it shall be possible to initiate auto calibration cycle at preset time interval defined by user either manually via the analyser keyboard or remotely through an external contact.

The sample handling system shall be designed to include all hardware and/or software to meet this requirement. The analysed component concentration output shall remain at the last good measured value during auto calibration cycle.

2.2.18 Analyser rack and cabinet

a) Whenever specified in the purchaser's data sheet, the analyser shall be supplied in pre-assembled, pre-tubed and pre-wired condition complete with sample handling system. The primary sample conditioning unit i.e. conditioning at sample tap off point shall be supplied separately.

b) When open rack mounted installation is specified in purchaser's data sheet, the analyser and sample handling system shall be supplied installed in an open rack with canopy to protect the analyser from direct sunlight and rain. The open rack shall be fabricated using channels/pipes of suitable size. The material of construction shall be stainless steel. The canopy shall also be fabricated out of SS plate of 1.2mm thick.

c) Whenever closed cubical mounted installation is specifically indicated in the purchaser's data sheets, analyser and sample handling system shall be supplied preinstalled in tree standing closed analyser cabinet:-The analyser-cabinet-shall-be suitable for outdoor installation and shall be provided with a key lock.

Cabinet shall be fabricated out of 2.0mmSS sheet reinforced with angles of suitable sizes. Fittings and hinges shall be of stainless steel. Anchor bolts required for installation of cabinet shall also be supplied by vendor.

A power isolation switch with suitable circuit breaker or fuse shall be provided for the incoming power supply.

All items including analyser installed within the cabinet shall be suitable for the maximum possible temperature likely to be attained within the cabinet (i.e. with all items fully powered-on within the cabinet) and area classification specified in the purchaser's data sheet.
Heating/cooling of analyser cabinet shall be provided either when purchaser's data sheet specify the requirement of heating and/or cooling or recommended by the analyser manufacturer or found necessary by the manufacturer to meet following requirements:

i) The temperature induced measurement error exceeds ± 1% of full scale in the worst temperature conditions.

ii) The maximum allowable ambient temperature condition of any component within the cabinet exceeds its limits.

Whenever cooling is specified or found necessary, vendor may select one of the following cooling methodologies, unless specifically indicated otherwise:

a) Cabinet mounted air conditioner certified for the specified area classification.

b) Vortex cooler with compressed air system and air dryer of suitable size and capacity. No separate instrument air shall be provided by purchaser for vortex cooler.

c) The maximum height of rack/cabinet shall be limited to 2100 mm. Cabinet shall be suitable for side and bottom cable entry.

d) Power supply cable entry and terminal size shall be as defined during detail engineering by purchaser.

2.3 **Infra-Red/Ultra-Violet (IRIUV) Analysers**

2.3.1 IR/UV analyser shall preferably be non-dispersive type.

2.3.2 Analyser cell length shall be selected as per specified analyser component range. In case of dual range analysers, the selected cell length shall be suitable for both the ranges.

2.3.3 The analyser cell material and window material shall be suitable for the specified process condition. Unless otherwise specified or required otherwise by pressure-temperature conditions, the o-ring material shall be Teflon.

2.3.4 The analyser design shall be such that it is insensitive to source fluctuations or degradation or partial cloudiness of cell window.

2.3.5 Special filters shall be offered to minimise the interference of background components, which are of least interest in process stream.

2.3.6 Unless otherwise specified, analyser shall meet the following performance requirements:

<table>
<thead>
<tr>
<th>Repeatability</th>
<th>± 1% of full scale</th>
</tr>
</thead>
<tbody>
<tr>
<td>Zero drift</td>
<td>± 1% full scale per 24 hours.</td>
</tr>
<tr>
<td>Response Time</td>
<td>5 seconds for 90% of final reading</td>
</tr>
</tbody>
</table>

2.4 **Thermal Conductivity Analyser**
2.4.1 Thermal conductivity analyser shall be suitable for measuring hydrogen/hydrocarbon in binary gas mixture or in a multi component gas mixture.

2.4.2 Analyser shall have precise temperature controller which shall be able to maintain temperature within ± 0.1°C to ensure stable detector operation.

2.4.3 Analyser cell shall have flowing reference gas or sealed in (non-flowing) reference as per manufacturer's standard product.

2.4.4 The analyser sensor cell material shall be suitable for the specified process conditions, unless otherwise specified or required by temperature condition, o-ring material shall be PTFE.

2.4.5 Performance specification

Unless otherwise specified, Analyser shall meet the following performance specifications:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accuracy</td>
<td>± 1% of FSR</td>
</tr>
<tr>
<td>Repeatability</td>
<td>± 1% of FSR in 24 hours</td>
</tr>
<tr>
<td>Response time</td>
<td>Maximum 20 seconds for 90% response</td>
</tr>
</tbody>
</table>

2.5 Moisture Analyser

2.5.1 The requirements of moisture analyser for corrosive as well as non-corrosive for application are specified in this clause. Vendor shall offer the type of analyser as specified in the purchaser's data sheet.

Whenever, the type of analyser is not indicated in the purchaser's data sheet, vendor shall select the type of moisture analyser as per the specified process conditions.

2.5.2 Moisture analyzer for non-corrosive application.

2.5.2.1 The probe shall be in-line mounted (i.e. shall be located at the point of measurement) in general and shall not be damaged by severe shock and line abrasion conditions.

2.5.2.2 The pressure and temperature rating of the probe shall be suitable for the process condition specified in the data sheet.

2.5.2.3 When mounted remote, the probe shall be installed in a sample cell. The connections of sample cell shall be flanged with ANSI rating as specified in the purchaser's data sheets.

2.5.2.4 Unless otherwise specified or found necessary by vendor, no sample handling system shall be required. However, whenever the sample handling system is specified, the design shall ensure the integrity of sample i.e. moisture contents integrity shall be maintained.

2.5.2.5 The probe shall have Aluminum oxide moisture sensor. Alternate type moisture probe shall also be acceptable, if this meets the performance requirements specified in the purchaser's data sheet.
2.5.2.6 Each probe shall be supplied as pre-calibrated and shall be supplied with its own calibration curve. The calibration shall be valid for a period of minimum six (6) months from the date of supply, as a minimum.

2.5.2.7 Performance specification.

The moisture probe shall meet the following requirements as a minimum:

**Accuracy**: ±2°C within a range of 60°C to 65°C (Dew point)
± 3°C within a range of -66°C to -110°C

**Repeatability**: ± 0.5°C in range of 60°C to 65°C
± 1.0°C in range of -60°C to -110°C

**Life time**: One year

**Time Constant**: 5 seconds for 63% of steady state value.

2.5.3 Moisture analyser for corrosive application

2.5.3.1 The moisture probe shall be hygroscopic ally sensitized quartz crystal or equivalent suitable for the specified process samples containing unsaturated hydrocarbon, chlorides, oils etc.

2.5.3.2 Sample shall be conditioned in a sample handling system which shall include filters, condensate trap, dryer, pressure regulator (with or without heating as required) etc., however the design shall ensure that moisture integrity is maintained by the sample handling system.

2.5.3.3 The system shall incorporate a dried reference gas cycle after each sample gas measurement in order to strip volatile contaminants from the detector during reference gas cycle.

2.5.3.4 In order to ensure accuracy and reliability of the moisture analyser, the system shall incorporate a moisture generator, consisting of temperature controlled water reservoir and a permeation tube. The moisture generator shall generate a known moisture sample against which calibration of the analyser can be verified.

2.5.3.5 Performance Specification

The moisture probe shall meet the following performance requirements, as a minimum:

**Accuracy**: ± 5% of reading
**Repeatability**: ± 1% of reading
**Response time**: max. 60 seconds for 90 % of steady state value

2.5.4 Analyser Monitor/Controller

2.5.4.1 The analyser monitor/controller shall be microprocessor based and shall be programmable type.

2.5.4.2 The monitor/controller shall be remote mounted type with built-in display with keyboard for data display. The cable between analyser and monitor/controller shall be supplied by the vendor.
2.5.4.3 The monitor/controller shall be able to provide sequential display for various parameters and shall be selectable from the display keyboard.

2.6 Oxygen Analyser

2.6.1 The type of oxygen analyser shall be offered as specified in the purchaser's data sheet. Where purchaser's data sheet does not specify the type of oxygen analyser, vendor shall select the type meeting all functional and performance requirements indicated in purchaser's data sheets.

2.6.2 The analyser design shall ensure that the analysis is not affected by other sample constituents present in the sample.

2.6.3 Paramagnetic Type Oxygen Analyser

2.6.3.1 Unless otherwise specified, the paramagnetic type of oxygen analyser shall have magneto dynamic type measuring cell.

2.6.3.2. The analyser shall either have integral or split transducer unit containing the measuring cell and control unit containing the analyser electronics. The control unit facia shall have with LCD/LED display.

2.6.3.3 Whenever the control unit is remote mounted, cable between control unit and measuring cell shall be supplied by vendor.

2.6.3.4 Whenever paramagnetic type analyser is specified for pressurized or variable pressure application, the offered analyser shall have required pressure compensation to ensure that the measurement is not affected by changes in sample pressure and sample vent pressure.

The analyser design shall be such that the measurement shall not be affected by changes in ambient temperature and sample flow rate.

2.6.3.5 Paramagnetic analyser shall meet the following performance characteristics as a minimum:

- Accuracy : ±1% of full scale.
- Repeatability : ±0.5% of full scale.
- Response time : 6 seconds for 90% response

2.6.4 Electrochemical (Electrolytic) Type Oxygen Analyser.

2.6.4.1 The electrochemical type of oxygen analyser shall have either aqueous or non-aqueous measuring cell and shall meet the following requirement;

a) The analyser shall be self or auto-calibrating type. The calibration cycle shall be initiated either after a pre-defined time or whenever analyser senses excessive drop/drift in the output.
b) Analyser shall provide a suitable alarm for excessive drift. This information may be available as part of HART output signal.

2.6.4.2 In case, in those analysers where cell need to be replaced after the depletion of electrolyte, the analyser shall, in addition, meet the following requirements;

a) The electro-chemical cell shall be easily replaceable.

b) The analyser shall provide a warning for maintenance i.e. expiration of sensor well in advance (Typically 2 weeks). In addition analyser shall also provide an alarm in case output drops below the minimum reliable calibration level.

c) One spare cell shall be supplied as part of consumable spare.

2.6.4.3 The analyser shall have integral electronics with built in LCDILED display. Electrochemical analyser shall meet the following performance characteristics as a minimum:

- **Accuracy**: ±1% of full scale.
- **Repeatability**: ±1% of full scale.
- **Response time**: Less than 15 seconds for 90% response

2.6.5 Zirconia Type Oxygen Analyser

2.6.5.1 The Zirconia type oxygen analyser shall be either in-situ type or extractive type as specified in the purchaser's data sheet.

2.6.5.2 In case of in-situ type of analyser, vendor shall ensure that the analyser as offered is suitable for the pressure-temperature specified in the data sheet and the measurement shall not be effected by changes in sample pressure and flow rate. In case of variable pressure application, vendor shall ensure that offered analyser has the provision for pressure compensation and/or pressure balancing arrangement.

2.6.5.3 Zirconia type of oxygen analyser shall be provided with auto-calibration facility to take care of zero-drift of cell.

2.6.5.4 The zirconia analyser shall consist of the following sub-assemblies;

2.6.5.4.1 Sensor Assembly

a) The sensor assembly shall consist of the measuring cell, heater assembly, temperature sensor and connections for reference and calibration gases.

b) The measuring cell shall be a zirconia sensor specific for oxygen measurement.

c) The sensor shall be suitable for operating sample temperature up to 700°C.
2.6.5.4.2 Control Electronics

a) The control electronics shall have capability to execute all required controls, indications, temperature control for normal operation and output signals as specified in purchaser's data sheet.

b) Sensor temperature shall be maintained through temperature controller. Temperature sensor shall preferably be ISA type K thermocouple.

c) Temperature controller shall cut-off power to heater in case of thermocouple burns out.

d) Control electronics shall preferably be remote mounted type. Cable between control electronics and sensor assembly shall be supplied by vendor.

2.6.5.4.3 Reference Gas Control

Reference gas shall be flow and pressure controlled. Flow shall be controlled by rotameter With needle valve while pressure shall be controlled by self-actuated pressure control valve provided with pressure gauge.

2.6.5.5 Zirconia type oxygen analyzer shall meet the following performance characteristics as a minimum:

2.7 Calibration Gas and Reference Gas Cylinders

2.7.1 Each analyser shall be supplied with following gases with stainless steel or Aluminum Cylinders:

a) Reference gas dual cylinder with manifold where required. The reference gas system shall be dedicated one for each analysers, where required along with automatic switchover to standby cylinder when the first cylinder is exhausted.

b) Certified calibration gases. In case of dual range of measurement, separate calibration gas for each range shall be provided.

2.7.2 Each of the gas cylinders shall be provided with two stage pressure regulator. Manifold shall be provided for reference gas with dual cylinder configuration.

2.7.3 All gas cylinders shall be located near the analyser and shall be supplied with gas cylinder rack with free standing support.

2.7.4 In case the calibration gas deteriorates or depletes with time, vendor may either supply calibration gas cylinders with deferred delivery or supply alternate devices for preparing calibration blend.
3.0 NAMEPLATE

3.1 Each analyser and its accessory shall have a stainless steel nameplate firmly attached to it at a visible place, furnishing the following information as applicable:

   a) Tag number as per purchaser's data sheets.
   b) Manufacturer's serial number and model number.
   c) Manufacturer's name/trade mark.
   d) Component being analysed and its range.
   e) Area classification in which the equipment can be used.
   f) Power supply requirements.
   g) Analyser Outputs

4.0 INSPECTION AND TESTING

4.1 Unless otherwise specified, purchaser reserves the right to test and inspect all the items at the vendor's works in line with the inspection test plan for process stream analysers. Vendor shall provide necessary facilities, utilities, competent manpower and consumables required for carrying out the inspection.
4.2 Vendor shall submit the following test certificates and test reports for purchaser's review for each of the analyser:

   a) Dimensional verification certificate for each analyser.

   b) Material test report as per clause 2.2 of EN 10204 for all wetted part

   c) Manufacturer's test reports as per clause 3.1B of EN 10204 for various bought out components.

   d) Leak test report for complete analyser system including sample handling system using Nitrogen or instrument air at 1.5 times the maximum working pressure.

   e) Calibration report for each analyser as per clause 4.3 of this specification.

   f) Repeatability test for each analyser as per clause 4.4 of this specification.

   g) Power supply variation check.

   h) Test certificates for zero, span, carrier and fuel gases as applicable.

   i) Certificates from statutory body for flameproof/intrinsic safety and weatherproof enclosures as applicable.

4.3 Analyser Calibration

4.3.1 Analyser along with sample handling system shall be calibrated using zero and span calibration gas samples in the following sequence:

   a) Check/adjust zero by connecting zero gas and span by connecting span gas.

   b) Check again zero by connecting zero gas after (a) above. Also repeat span gas check.

   c) If either or both zero and span are adjusted in step (b), repeat (b) again to verify the calibration until no further adjustments are made in zero and span.

4.4 Repeatability Testing

4.4.1 Repeatability of the analyser shall be checked by connecting either span gas (if it is approximately 70% of analyser span) or any other gas sample on continuous basis for the following time period.

   a) 24 hours by manufacturer and report to be submitted for review.

   b) 8 hours during witness inspection.

4.5 Witness Inspection

4.5.1 All the analysers shall be offered for pre-dispatch inspection by the purchaser at vendor works. Following tests/ checks shall be carried out on each analyser as a minimum:

   a) Physical dimensional verification and workmanship.

   b) Bill of material check for each analyser system including sample handling system...
c) Leakage testing of complete system using nitrogen or instrument air.
d) Calibration check as per clause 4.3 above.
e) Repeatability check as per clause 4.4.
f) Power supply variation check. Analyser must function satisfactorily on specified variation of power supply voltage.
g) Review of all test certificates and test reports indicated in clause 4.2 above.

4.5.2 In the event when the witness inspection is not carried out by purchaser, the tests shall any way be completed by the vendor and documents for same shall be submitted to purchaser for scrutiny.

5.0 SHIPPING

5.1 All threaded and flanged openings shall be suitably covered to prevent entry of foreign material.

5.2 Each major part shall be sealed in thick plastic bag. Suitable moisture absorbent shall be provided for electronic components.

6.0 REJECTION

6.1 Vendor shall prepare their offer strictly as per clause 1.2 of this specification and shall attach only those documents, which are specifically indicated in the material requisition.

6.2 Any offer not conforming to the above requirements, shall be summarily rejected.

**Note 1: Vendor to Provide the Tag and Analyzer Type**

1) Vendor shall supply calibration sample cylinders for zero and span calibration for each analyser. Quantity of total cylinders for each analyser shall be calculated by vendor with following basis:

   a) Calibration gases are required for six months of normal operation.

   b) These calibration gas cylinders for six-month operation shall be supplied in two sets. One set these cylinders shall be connected to the analyser and another set of cylinders shall be kept in store.

   c) Calibration gas accuracy shall be adequate to demonstrate the repeatability of the analysers.

   D) Calibration / Zero gas quantity shall be calculated based on a frequency of one calibration / fortnight interval as a minimum.

   e) Calibration gas cylinders shall be preferably of SS316 material. Aluminium gas cylinders are all: acceptable in place of SS316.

* - Vendor to offer total no. of cylinders accordingly and indicate the same in the offer.

1.1.3 In the event of any conflict between this standard specification, job specification/ data sheets, statutory regulations, related standards, codes etc. the following order of priority shall govern:

a) Statutory Regulations
b) Data Sheets
c) Standard Specification

1.1.4 In addition to compliance to purchaser's specifications in totality, vendor's extent of responsibility shall include the following:

a) Purchaser's data sheets specify the minimum acceptable material for the body and sensor tube of mass flow meter. Alternate superior material of construction shall also be acceptable provided, vendor assumes full responsibility for the selected material for the indicated fluid and its operating conditions.

b) Sizing and selection of mass flow meter suitable to measure the specified fluid flow rate with the stated accuracy.

1.2 Bids

1.2.1 Vendor's quotation shall be strictly as per the bidding instructions to the vendor attached with the material requisition.

1.2.2 Whenever a detailed technical offer IS required, vendor's quotation shall include the following:

a) Compliance to the specifications.

b) A detailed specification sheet for each item, which shall provide information, described as under. The material specifications and the units of measurement for various parts in vendor's specification sheet shall be to the same standard as those indicated in purchaser's data sheets.

i) Type of element and material of construction of various parts and its accessories.

ii) Accuracy of flow measurement at the specified minimum, normal and maximum flows with pressure drop not exceeding the maximum allowable pressure drop indicated in the purchaser's data sheet.

iii) Pressure drop across the mass flow meter at the maximum now specified in the data sheet.

iv) Special cable required, if any, cable specification and the maximum permissible cable length between the flow meter and its associated receiver instruments and unit rate.

c) Mass flow meter sizing calculations for each meter considering accuracy and pressure drop requirements specified in the purchaser's data sheets.

d) Effects of variations in density, viscosity, temperature and pressure on the measurement.

e) Proven reference for each offered model number in line with clause 1.2.3 of this specification, whenever specifically indicated in purchaser's data sheets.
f) A copy of approval from local statutory authority, as applicable, such as Chief of Controller of Explosive (CCE), Nagpur or Director General of Mines Safety (DGMS) in India for the mass flow meters installed in electrically hazardous area along with;

i) Test certificate from recognised house CMRI I ERTL etc. for flameproof enclosure / intrinsic safety, as per relevant standard for all Indian manufactured equipment or items requiring DGMS approval.

ii) Certificate of conformity from agencies like LCIE, BASEEFA, PTB, CSA, UL etc. for compliance to ATEX or any other recognised standard for all equipment manufactured outside India.

h) Deviation on technical requirements shall not be entertained. In case vendor has some valid technical reason to deviate from the specified requirements, they must include a list of mass flow meters tag number wise, summing up all the deviations from the purchaser's data sheets along with the technical reasons for these deviations.

i) Catalogues giving detailed technical specifications, model decoding details and other related information for each type of mass flow meter covered in the bid.

1.2.3 All items, as offered shall be field proven and should have been operating satisfactorily individually for a period of minimum 4000 hours on the bid due date in the process conditions similar to those as specified in the purchaser's data sheet. Items with proto-type design or items not meeting provenness criteria specified above shall not be offered.

1.2.4 Whenever specified, vendor must furnish tested values of failure rates, probability of failure detection and test intervals for the safety integrity level analysis.

1.2.5 All documentation submitted by the vendor including their quotation, catalogues, drawings, installation manual, operation and maintenance manuals etc shall be in English language only.

1.2.6 Vendor shall also quote for the following:

a) Universal hand held configurator / terminal (HHT) for the configuration and maintenance of instruments with HART output.

b) Field bus hand held tester for configuration and maintenance of field bus network.

c) Field bus configurator with hardware and software for configuration and maintenance of field bus instruments.

d) Safety barriers whenever offered meters are certified intrinsically safe with external barriers.

e) Two year's operation spares for each mass flow meter and its accessories covered in the bid, which shall include the sensor, pre-amplifier, and converter electronics etc. as a minimum.
1.3 Drawings and Data

1.3.1 Detailed drawings, data, and catalogues required from the vendor are indicated by the purchaser in vendor data requirement sheets. The required number of reproducible, prints and soft copies should be dispatched to the address mentioned, adhering to the time limits indicated.

1.3.2 Final documentation consisting of design data, installation manual, operation and maintenance manual submitted by the vendor after placement of purchase order, vendor shall include the following as a minimum:

a) Specification sheet for each mass flow meter.

b) Certified drawing for each mass flow meter, which shall provide:
   i) Dimensional details in mm.
   ii) Weight of the flow meter in kilogram.
   iii) Material of construction.
   iv) Installation requirements.

c) Curves for flow measurement vs, accuracy and rangeability.

d) Maximum and minimum supply voltage required for the instrument to function within the stated performance characteristics.

e) Clearance required for maintenance work

f) Copy of type test certification

g) Calibration procedures for mass flow meter.

h) Copy of test certification for all the tests indicated 111 clause 4.0 of this specification.

i) Installation procedures for mass flow meter.

2.0 DESIGN AND CONSTRUCTION

2.1 Flow Meter

2.1.1 Flow meter shall be of in-line mounting design with flow direction clearly marked on the flow meter body to ensure correct installation.

2.1.2 Flow meter design shall ensure that the location and orientation of installation of mass flow meter in the line shall not affect the calibration, accuracy and performance of the meter.
2.1.3 The material of construction of mass flow internals and body shall be as specified in the respective data sheets, as a minimum.

2.1.4 The mass flow meter shall be provided with the external flow tube housing wherever specifically indicated in the data sheet. In all such cases, the now tube housing shall have provision to monitor housing pressure continuously.

2.1.5 The mass flow meter shall have high vibration immunity. The meter output shall not be effected by the pipeline vibration where the meter is installed.

2.1.6 End Connection

2.1.6.1 Flow meter shall be of flanged body construction with material if construction as specified in purchaser's data sheet. In case meter design where end flanges are welded to the meter body all weld joints shall be of radiography quality.

2.1.6.2 Flow meter shall be of flanged body construction with material of construction as specified in the purchaser's data sheet. In case of meter design where end flanges are "welded to the meter body all weld joints shall be of radiography quality.

2.1.6.3 Unless otherwise specified, the following shall govern:

a) Threaded end connections shall be to NPT as per ANSI/ASME B 1.20.1.

b) Flanged end connections shall be as per ANSI/ASME B 16.5.

c) Flange face finish shall be as per clauses 6.4.4.1,6.4.4.2 and 6.4.4.3 of ANSI/ASME B16.5. The face finish as specified in data sheets shall be as follows:

   125 AARH : 125 TO 200 AARH

   63 AARH : 32 TO 63 AARH

2.1.7 Terminal Housing

2.1.7.1 Following shall apply for both integral as well as for remote meter electronics:

a) All connections shall be terminated on the terminals brought out in the terminal housing located on the flow meter body. Flying leads shall not be provided.

b) All intrinsically safe terminals shall be properly identified and shall be separate from the non-intrinsically safe terminals.

c) Separate cable entry shall be provided in the terminal housing for power and intrinsically safe signals.
d) The flow meter enclosure, housing the electrical parts shall be suitable for the area classification indicated in the purchaser's data sheets. Unless otherwise specified, the enclosure shall conform to the following standards, as a minimum:

Weatherproof housing - IP 55 to IEC-60529/IS-13947.
Flameproof housing - Flame proof / Ex (d) as per IEC-60079/1S-2I48.

Flameproof housing shall also be made weatherproof.

2.2 Meter Electronics

2.2.1 Flow meter electronics shall be microprocessor based and shall include pre-amplifier, converter, transmitter electronics and integral output meter. The indication on the output meter shall be digital with engineering units.

2.2.2 The mass flow meter transmitter shall be smart type and shall provide 4-20mA analog output superimposed with digital signal for meter diagnostics (HART Output). When specified, flow meter shall provide field-bus output conforming to the standard specified in the purchaser's specification sheets.

2.2.3 The mass flow meter shall be capable of computing field density and shall incorporate temperature sensor flow fluid temperature measurement. Whenever specified in the purchaser's data sheets, the flow meter electronics shall have capability to compute volumetric flow rates.

2.2.4 The meter electronics shall be protected against transients induced by lightning and power supply surges. Transient protection electronics shall preferably be provided in the terminal block. The transient protection shall meet the requirements specified in IEC-60537.

2.2.5 The configurational data of the instrument shall be stored in a non-volatile memory such that this remains unchanged because of power fluctuations or power off condition. In case, vendor standard instrument has battery backed RAM vendor to ensure that battery drain alarm is provided as diagnostic maintenance message.

2.2.6 For smart transmitters or for field bus based transmitter the following features must be ensured;

i) It shall allow multi master (primary and secondary) for configuration, calibration, diagnosis and maintenance. The primary could be the control system or host computer, and the secondary could be the hand held communicator.

ii) It should be capable of implementing universal command.

2.2.7 In addition to the requirements specified above, field bus based transmitter requirements;
a) All instruments must satisfy the requirements of the field bus registration laboratory with applicable checkmark like foundation field bus, profibus PA, or as specified in the purchaser's data sheets.

b) All instruments shall have two analog input blocks, as a minimum. In addition, when specified the transmitter shall also have PID controller block.

c) All instruments must be interoperable and shall have valid interoperability test clearance like ITK 4.6 for foundation field bus or equivalent for profibus PA, as applicable.

d) The field bus instruments shall support peer-to-peer communication.

e) Field bus instruments as offered shall not be polarity sensitive.

f) The field bus instruments in hazardous area shall be certified as per entity concept or shall be FISCO approved as per the requirements specified in the purchaser's specification.

2.2.8 Meter electronics shall also be provided with security lockout feature to disable access to configuration modification features.

2.2.9 Flow meter electronics shall be either integral to flow meter or shall be remote mounted type. Where remote mounted electronics is offered a minimum of 10 metres of interconnecting cable shall be included.

2.2.10 Flow meter electronics shall have enclosures suitable for the hazardous area classification indicated in purchaser's data sheets. When area classification is specified as electrically hazardous flow meter shall have flameproof enclosure with intrinsically safe circuitry for sensor connectivity. Safety barrier if required for the sensors shall be part of transmitter enclosure.

2.2.11 The meter electronics along with flow meter shall be pre-calibrated at vendor's works with calibration factor duly established for the flow meter.

2.2.12 The meter electronics shall be immune to RFI and EMI radiation and shall be in compliance with the electromagnetic compatibility requirement as per IEC 61000-4.

2.2.13 Purchaser will provide one no. of feeder for 110 V AC ± 10%, 50 Hz power supply at the transmitter. Further distribution if any shall be taken care of by vendor. Accessory like cable gland, conduit and junction box as required to interconnect sensor, transmitter signal cable etc., shall be supplied by the vendor.

Supply voltage fluctuation of ± 10 per cent from the specified value and supply frequency fluctuation of ± 3 Hz from the specified value shall not affect the meter performance.

2.2.14 Meter electronics housing shall meet the terminal housing requirements specified in Clause 2.1.7 of this specification.

2.3 Meter Sizing
2.3.1 The meter shall be sized considering the following guidelines:

a) Minimum flow, maximum flow and meter maximum as specified in the purchaser's data sheet.

b) Flow accuracy between the minimum and maximum flow specified in the data sheet. Where only normal flow is specified, the maximum and minimum flows considered for the purpose of sizing shall be;

   Maximum flow = 1.4 times the normal flow

   Minimum flow = 0.4 times the normal flow

   When only maximum flow is specified minimum flow shall be considered as 0.2 times the maximum flow for sizing the meter.

   a) The maximum pressure drop at meter maximum shall not exceed the allowable pressure drop across the meter specified in the data sheet.

   b) The meter shall be selected such that both accuracy and allowable pressure differential across the meter are complied.

2.4 Performance Requirements

2.4.1 Unless specified otherwise in the purchaser's data sheets, the performance requirements for the mass flow meter shall be as follows;

   a) Flow meter repeatability: ± 0.2% of mass flow rate for liquid service.
   ± 0.5% of mass flow rate for gas / vapour service

   b) Flow meter accuracy: ± 0.1% of mass flow rate for liquid service
   ± 0.25% of mass flow rate for gas / vapour service

   The performance requirements specified above excludes the effect of zero stability of the flow meter on these parameters.

2.5 Accessories

2.5.1 Hand held configurator for Smart Instruments

Hand Held configurator shall be universal type and shall be able to communicate with all make and models of smart instruments with HART output like transmitters, smart positioners etc., and shall be capable of carrying out all engineering like calibration, configuration and diagnostics. The hand held configurator shall be certified intrinsically safe when used in hazardous area. Carrying case shall be supplied with each configurator.

2.5.2 Field bus hand held tester
The field bus hand held tester shall be able to communicate with the specified field bus instrument and shall be capable of calibrating and configuring field bus devices. The field bus hand held tester shall be certified intrinsically safe when used in hazardous area. Carrying case shall be supplied with each tester.

2.5.3 Field bus configurator

The field bus configurator shall be a centralised device like personal computer with hardware and software suitable for configuration and maintenance of field bus instruments.

2.5.4 Battery charger

Both field bus hand held tester and hand held configurator for smart instruments with HART output shall be supplied with battery charger for battery charging of hand held configurator / field bus tester. Unless otherwise specified, battery charger shall operate at 220V 50Hz supply.

3.0 NAME PLATE

3.1 Each mass flow meter and its accessories shall have a stainless steel nameplate attached firmly to it at a visible place, furnishing the following details as applicable.

a) Tag number as per purchaser's data sheets.
b) Manufacturer's model number and serial number.
c) Manufacturer's name/trade mark.
d) Nominal end connection size in inches and rating in lbs (#).
e) Body and trim material.
f) Area classification in which the equipment can be used.
g) Standard for body/trim materials (eg. ASTM)
h) Enclosure type

i) Calibrated range and unit of measurement of flow.

4.0 INSPECTION AND TESTING

4.1 Unless otherwise specified, purchaser reserves the right to test and inspect all the items at the vendor's works, in line with the inspection test plan for mass flow meters.

4.2 Vendor shall submit the following test certificates and test reports for the purchaser's review:

a) Material test certificate as per clause 3.1B of ENI 10204.
b) Certificate from statutory body for intrinsic safety and explosion proof enclosures.
c) Type test certificate for weatherproof enclosures.
d) Certificate of radiography/X-ray for weld joints, wherever specified. Dye penetration check shall also be carried out for all weld joints.

e) Hydrostatic test reports as per clause 4.3 of this specification.

f) Flow calibration and performance test report including calibration factors for each meter as per clause 4.4 of this specification.

g) Capability of smart and field bus based transmitters to accept multimasters for configuration, calibration, diagnostics and maintenance.

h) Configuration, calibration and diagnostics check through hand held configurator / field bus tester for smart / field bus based instruments.

i) Configuration, calibration and diagnostics check through field bus configurator for Field bus based instruments.

j) Interoperability test certificate as per clause 2.2.7 c) of this specification.

k) Dimensional test report for each mass flow meter.

4.3 Hydrostatic Test

4.3.1 Each mass flow meter shall be subjected to hydrostatic test at test pressure equal to 1.5 times the maximum allowable working pressure at ambient temperature in accordance with ANSI B 16.34. There shall not be any visible leakage during the test.

4.4 Calibration

4.4.1 Each mass flow meter shall be calibrated with the fluid for which it is expected to be used. Else, vendor must indicate;

a) Fluid used for calibration

b) The correction factor / adjustment required for the actual process fluid.

4.5 Witness Inspection

4.5.1 All mass flow meter shall be offered for pre-dispatch inspection, for the following as a minimum:

a) Physical dimensional verification and workmanship.

b) Hydrostatic test as per clause 4.3 of this specification on representative sample.
c) Performance testing including establishing accuracy and repeatability over the entire range and calibration testing, on the representative samples.

d) Capability of smart and field bus based transmitters to accept multimasters for configuration, calibration, diagnostics and maintenance.

e) Configuration, calibration and diagnostics check through hand held configurator / field bus tester for smart / field bus based instruments.

f) Configuration, calibration and diagnostics check through field bus configurator for field bus based instruments.

g) Review of all certificates and test reports as indicated-in clause 4.2 of this specification.

4.5.2 In the event when witness inspection is not carried out by purchaser, the tests shall be any way completed by the vendor and the documents for the same shall be submitted to purchaser for scrutiny.

5.0 SHIPPING

5.1 All threaded and flanged openings shall be suitably protected to prevent entry of foreign material.

5.2 The mass flow meter remote electronics and its accessories shall be packed separately.

6.0 REJECTION

6.1 Vendor shall prepare their offer strictly as per clause 1.2 of this specification and shall attach only those documents, which are specifically indicated in the material requisition.

6.2 Any offer not conforming to the above requirements, shall be summarily rejected.

ANNEXURE- 2 : LOOP CHECK / LOGIC CHECK PUNCH POINTS
1.0 GENERAL

1.1 This technical specification covers in general the scope of work, scope of supply, execution methodology and criteria for handling scrap and excess material and various other requirements, which are required to be met during the course of execution of instrumentation works.

1.2 Instrumentation works shall be performed in accordance with this technical specification and various other drawings and documents supplied during the execution of work and instructions of Engineer-in-charge or his authorised representative(s) from time to time during the progress of the work.

1.3 Standards

The instrumentation erection and calibration works shall be carried out in accordance with various national, international and Indian Standards in instrumentation listed below but not limited to the following. The standards referred to herein and mentioned below shall be of the latest editions prior to the date of the purchaser's enquiry.

API American Petroleum Institute
MPMS - Manual of Petroleum Measuring Standards
RP - Recommended Practices
BS-6739 Instrumentation in process control systems: Installation design and practice
ISA Instrumentation, Systems and Automation Society Standards, Recommended Practices, and Technical Reports
RP 7.1 Pneumatic Control Circuit Pressure Test
IS-5 Colours for ready mixed paints and enamels
IS-2074 Ready mixed paint, air drying, red oxide-zinc chrome priming
IES 60529 Degree of Protection Provided by Enclosures (IP Code)
IEC 60079 Electrical Apparatus for Explosive Gas Atmospheres
IS-13947 Specification for Low Voltage Switch gears and Control gears
IS-2148 Electrical Apparatus for Explosive Gas Atmosphere-Flame proof Enclosures 'd'
Duct Fabrication - Welded Construction Detail
Duct Fabrication - Bolted Construction Detail

Manufacturer's standards and practices
Welding specification for fabrication of piping
Welding specification for piping classes

Specification for Non-Destructive examination of Piping

2.0 DEFINITIONS

2.1 Close coupled Installation

The installations where the distance of the instrument is within 600 mm from the primary tapping are termed as close coupled installations.

2.2 Remote Installation

The installations where the distance of the instrument is more than 600 mm from the primary tapping are termed as remote installations.

2.3 Manifold

2.3.1 For close coupled installation, 'Manifold' shall mean complete piping of instruments from first block valve upto the instruments.

2.3.2 For remote installation, 'Manifold' shall mean the assembly of nipples, valves and fittings around the instrument to form a block and bleed or bypass or drain, as the case may be. These shall be generally according to the installation standards enclosed with the tender. Wherever the instruments are installed with pre-fabricated 2-way, 3-way or 5-way valve manifold, the definition shall not be applicable as they are considered part of the instrument.

2.4 Instrument Impulse Line

Instrument impulse line shall mean piping and/or tubing from the first block valve upto the instrument including for drains and vent as applicable for an installation.

2.5 First Block Valve

First block valve shall mean the valve/values, which are generally mounted directly on equipments, columns, vessels, pipes, standpipes etc. and shall be operated to isolate the instrument and interconnected instrument impulse lines.

2.6 Supports

Supports shall mean the Mild Steel angles, flats, channels which are generally provided to support the main cable trays, cable ducts, junction boxes, angle trays, perforated trays, instrument piping, signal tubing, instrument air supply lines etc., at specified intervals from the instruments, concrete columns etc., to keep all items firmly secured against vibration, warping, bending etc.

2.7 Instrument Stanchion
Instrument stanchion shall mean the mounting arrangement necessary for the installation of one or more instruments and junction boxes. These shall consist of pipes, supports, clamps and fasteners as per applicable standards.

2.8 Scrap

2.8.1 Salvageable Scraps

Salvageable scrap shall mean the cut piece lengths recovered after consumption of tubes, pipes, multicables, other cables etc. that can be used one time or the other at a later date.

2.8.2 Non Salvageable Scrap

Non-salvageable scrap shall mean the cut piece lengths recovered after consumption of tubes, pipes, multi cables, cables etc. that cannot be used at all, at any time.

3.0 SCOPE OF WORK

3.1 Contractor's scope of work shall include the following:

a) Complete instrument erection work with details as listed under schedule of quantities attached elsewhere in the tender document.

b) Supply of all hardware such as lugs, ferrules, LI-clamps, washers, nuts, sealant, sealing tape, anchor fasteners, welding electrodes/filler wires, NDT test materials / Dye penetrant spray etc and carry out all residual activities not listed specifically in schedule of quantities but are necessary to ensure proper execution and completeness of instrumentation work.

c) Supply of all items specifically listed in the schedule of quantities as per specifications attached elsewhere in the tender document.

d) As-built construction drawings and documents as detailed out in this specification.

e) Arranging all necessary test and calibration equipments as per the details provided in this specification.

f) Any other work, not specifically listed, but necessary for the successful completion of instrumentation erection work defined in this specification or the schedule of quantities.

3.2 Work Included

The various jobs covered under instrumentation erection work are detailed out in the schedule of quantities. However to ensure proper execution and completeness of works any or all of the following activities, as necessary, shall also form part of the contractor's scope of work.

The price of all such activities shall be covered in the rates quoted against the various activities covered under schedule of rates.

3.2.1 Fabrication of pipe nipples, as necessary, from the running pipe including cutting of pipes and making threads as necessary, as per installation standards.
3.2.2 Drilling of holes in blind flanges including threading, as necessary, as per installation 
Standards, wherever required.

3.2.3 Filling of seal pots and/or impulse lines, as applicable, with filling liquids as per the 
instructions of engineer-in-charge including supply of seal fill liquid.

3.2.4 Back/seal welding of screwed fittings and screwed connections as required by standards or as 
per the instructions of Engineer-in-charge. This may involve welding of dissimilar materials using 
appropriate electrodes/filler wires.

3.2.5 Dye penetration/magnetic particle test shall be carried out for all weld joints irrespective of their 
pipe classes and the charges for the same shall be included in the quoted rates of instrument 
installation.

3.2.6 Installation of devices like purge rotameter, restriction orifice plate, pressure gauge etc, as 
Applicable for purged installation, for instruments, instrument systems and pipelines as per 
installation standards.

3.2.7 Civil works including casting of foundation as required for instrument supports, stanchions etc, 
where paved surfaces do not exist.

3.2.8 Minor civil works like chipping of pavement, grouting of instrument panels/supports/stanchions on 
the pavement, laying of conduits below pavement after 
chipping and refinishinof pavement as necessary.

3.2.9 Sealing of cables/tubes entries into the control room after laying and testing of all cables/ 
tubes by filling with sealing compound including supply of sealing compound. Wherever the 
sealing of cables/tubes entries into the control room is by MCT frame/blocks, fixing of MCT 
frame and blocks shall be carried out by contractor as covered in the schedule of quantities.

3.2.10 Degreasing of hand wheels of control valves, stud bolts, nuts of side and bottom flange of control 
valves, stud bolts and nuts of orifice flanges/ or other primary elements and 
degreasing of any other instrument as per manufacturer's instructions or as required by 
Engineer-in-charge.

3.2.11 Degreasing of impulse lines, instrument valves, instruments and other instrument items in 
oxygen and chlorine service as per manufacturer's instructions or as required by engineer-
incharge.

3.2.12 Rotation of top works of displacer type level instruments, wherever required.

3.2.13 Rotation of control valve bonnet etc, wherever required.

3.2.14 Reversing the action of control valves either by replacement of actuator springs and 
accessories or positioner, wherever required, as per manufacturer's instructions.

3.2.15 Minor modifications/repairs required to be carried out on the instruments namely, 
replacement of dial and/or glass for pressure gauges/temperature gauges or any other similar 
instrument, replacement of rotameter tubes and level gauge glasses, replacement of damaged
signal tubes on control valves, tapping of damaged threads on couplings, tees and other fittings, cleaning of nozzles and relays in pneumatic instruments.

3.2.16 Painting of all structural supports required for trays, pipes, junction boxes, instruments, ducts as per painting specification or as instructed by Engineer-in-charge.

3.2.17 Identification of instruments/impulse lines/manifold connected with trip circuit in red color of paint.

3.2.18 Punching of tag num bers and supply of stainless steel tag plates wherever required as per instructions of Engineer-in-charge.

3.2.19 Fabrication and installation of pipe stanchion as per instrument support standards including casting of concrete pedestal, grouting, welding etc. as necessary. The type of instrument stanchions shall be at the discretion of Engineer-in-charge.

3.2.20 Drilling holes in the gland plate for providing glands/grommets on panels, shut down cabinets, power supply cabinets, local control panels, pneumatic enclosures, junction boxes etc., wherever required for cables/multi tubes entry.

3.2.21 Grounding of shields of shielded cables to respective instrument earth bus provided in the control room/local control room/local panel/analyser shelter/thermocouple head etc. as required and instructed by Engineer-in-charge.

3.2.22 Laying and termination of earth cable at both ends between instrument earth bus provided in the control room/local control room/local panel to instrument earth pits provided by other contractors unless specified otherwise.

3.2.23 Grounding of one of the thermocouple lead in the head using 10K ohm resistance including supply of resistance for grounded thermocouples.

3.2.24 Loop validation of all temperature elements (Thermocouples/RTDs) upto control room Including verification of element integrity, i.e. element open or element short.

3.2.25 Supply of all types of consumables required for the execution of the job without any exception.

3.2.26 Sealing of safety valves with standard lead seals after final setting and fixing of blind tapes in inlet/outlet of safety valves to prevent dust, in the presence of Engineer-in-charge.

3.2.27 Coordination during installation, pre-commissioning and commissioning with mechanical and other sub-contractors for proper installation of line mounted instruments like control valves, orifice assemblies, turbine meters, positive displacement meters, magnetic flow meters, mass flow meters, ultrasonic flow meters etc., which involve removal of instruments, disconnection of tubes/ables, reconnection of the same for alignment and proper installation.

3.2.28 Coordination during pre-commissioning/commissioning with mechanical and other subcontractor for proper installation of vessels/equipment mounted instruments like level transmitters, level gauges, level switches etc. which involves removal of instruments, disconnection of tubes/cables, reconnection of the same for alignment and proper installation.
3.2.29 Coordination with control system vendors (Distributed Control System/Programmable Logic Controller/Analyser system/Tank farm automation/Fire and G as detection system/Machine Monitoring System/Terminal Automation etc.), as necessary, during installation, loop checking and commissioning as per instructions of Engineer-in-charge. Contractor shall also coordinate with Des vendor for all arrangements and facilities required in the field during the testing of field bus instruments like signal level, noise, waveform etc., including mobilization of necessary test equipments in field.

3.2.30 Coordination with tank fabricator during installation of mechanical float type and Servo type of Tank Level instruments.

3.2.31 Removal of false floor slabs and re-fixing, as required, for laying of cables below false floor inside control room/rack room.

3.2.32 Shifting of instruments and materials from owner' warehouse/designated place to the work spot, providing suitable storage space and keeping the materials in safe custody and identification of special materials like alloy steel with proper color coding as per instructions of engineer-in-charge. Contractor shall also return the un-used materials including scrap to the owner's warehouse/designated place as per instruction of Engineer-in-charge.

3.2.33 Coordination with mechanical contractor during fire insulation of cable duct and cable trays.

3.2.34 Submission of monthly material appropriation statements for cables, tubes, piping materials and fittings, indicating the quantity issued and consumed in standard performa.

3.2.35 Incorporation of all information in owner's drawings/documents, as per actual execution of work at site including preparation and submission of as-built drawings.

3.2.36 Start-up and commissioning assistance as required and agreed upon with Engineer-in-charge.

3.2.37 Submission of final material appropriation statements for all the materials issued by the owner.

3.2.38 Any other work not specifically mentioned above, but required for the proper execution of the instrumentation erection work.

3.2.39 Where requested by owner/engineer-in-charge or his authorized representatives, all or any of the works detailed above and in schedule of quantities shall also be performed on package units, local panels/cabinets/gauge board installed by owner or by others.

3.3 Work Excluded

3.3.1 Installation of main panels, cabinets and consoles supplied by control system vendor inside control room unless specified otherwise.

3.3.2 Installation of line mounted instruments like control valves, orifice plates and flanges.
3.3.3 Mechanical installation of tank level instruments except radar gauges.

3.3.4 Installation of safety valves, breather valves, flame arresters, rupture dises.

3.3.5 First block valve for instrument tapping points on piping and equipments.

3.3.6 Insulation of steam traced instrument primary impulse lines.

3.3.7 Insulation of cable duct and cable trays for fire safety.

3.3.8 Painting of impulse lines.

4.0 EXECUTION METHODOLOGY

4.1 Instrument Impulse lines

4.1.1 All impulse lines shall be installed in the best workman like manner and shall follow installation standards in each case Where there is no installation standard, the instruction of the Engineer-in-charge shall be followed.

4.1.2 Horizontal and vertical lines shall be installed using levels and plumb bobs.

4.1.3 Unless otherwise specified in the drawings, impulse lines shall have a slope of not less than in 12 on the horizontal runs.

4.1.4 All welding shall be carried out as per codes and after approval of welding procedures and electrodes by Engineer-in-charge. Only qualified welders approved by Engineer-in-charge shall carryout welding. The following activities shall be part of contractor’s scope of work.

4.1.4.1 Welder qualification including supply of any materials required like electrodes, equipments, consumables, testing charges for various tests etc., required for initial qualification and subsequent validation till the completion of the job.

4.1.4.2 Welding procedure qualification including supply of any materials required for the qualification like electrodes, equipments, consumables, testing charges for tests etc. Contractor scope includes welding procedure qualification for welding of dissimilar materials as envisaged for any process hookup, wherever applicable.

4.1.4.3 The charges towards Positive Material Identification (PMI) shall be quoted as per the schedule of quantities attached elsewhere in this tender document. The equipment required for PMI testing shall be arranged by the contractor.

4.1.4.4 The charges towards non-destructive testing like radiography and post weld heat treatment shall be quoted as per the schedule of quantities attached elsewhere in this tender document.
The contractor is required to carry out 100% radiography of all the butt weld joints covered in the indicated installation standards.

For all other installations involving butt weld joints, not covered under 100% radiography requirement above, 10% radiography shall be carried out by the contractor. The charges for these shall be included in the quoted rates of installation of instrument, covered under schedule of quantities.

4.1.5 Welding and Non-Destructive testing shall be carried out by the contractor as per the following specifications or their respective job specifications.

4.1.5.1 Welding Specification for Piping Classes

4.1.5.2 Welding Specification for fabrication of piping

4.1.5.3 Specification of Non-Destructive Examination Requirement of piping to carry out the radiography, stress relieving, dye penetration test, magnetic particle test, wet fluorescent magnetic particle test etc.

4.1.6 Impulse pipes shall be bent using pipe benders only and hot bending will be totally rejected.

Pipes shall be cut using pipe cutting device. Hot cutting shall not be allowed.

4.1.7 Piping/tubing for steam tracing shall be installed according to the standards without any pocket so as to avoid formation of the condensate pockets.

4.1.8 All threaded joints shall be jointed with PTFE tape only. No other pipe jointing compound shall be used except on high temperature service where graphite sealing compounds shall be used.

4.1.9 All impulse lines shall be properly supported at regular intervals of 1 meter. Wherever insert plates are not available, supports on concrete structures or on ceilings shall be fixed with a minimum of 10 mm expansion bolts. Angle supports shall be fabricated from 40 mm x 40 mm x 5 mm MS angles, as a minimum.

4.2 PVC Covered/Bare Tube (Copper/SS/Aluminium)

4.2.1 Single copper/SS/A1uminium tubes shall be laid as per standards on perforated trays. The width of the trays shall be selected as per the number of tubes laid. Tubes shall be clamped to the trays at every 300 mm using clamps made of galvanised steel/aluminium strips. The practice of flattening tubes for clamping purposes shall not be permitted. In case of PVC covered tubes, any exposed portion at ends and connection shall be neatly taped to appropriate thickness. Open ends shall be covered to prevent ingress of moisture, dust, vermin etc. Plugs should be removed only when final connection is made.

4.2.2 Trays shall be properly supported either from any rigid steel structure or concrete member as detailed in clause 4.7.4 of this specification under trays and supports.

4.2.3 All threaded ends of male/female tube connectors shall be installed with PTFE tape only. Identification tag plates/ferrules shall be provided on either side of copper tubing as per
4.3 Installation of Multitubes And Multicore Cables

4.3.1 Multicore cables/multitubes shall always be installed on ducts/trays and shall be properly clamped. At every vertical drop to junction boxes, they shall be clamped at more frequent intervals (maximum of 300 mm). They shall be connected inside junction boxes strictly according to the number system as mentioned in cable schedule. At bends minimum radius shall be maintained as per manufacturer's standard. The angle tray supports shall be fabricated from 40 mm x 40 mm x 5 mm angles, as a minimum.

4.3.2 Identification tags shall be provided on either end of multitube/multicore cables as per tubing/cable schedules. Engraved tag plates or PVC ferrules shall be used for identification of tubes/cables.

4.3.3 All multitubes/multicore cables shall be cut after the exact site measurement are taken between ends. The tube/cable drums shall be selected before cutting the lengths so as to avoid any wastage.

4.3.4 All multicables and multitubes laid in ducts shall be properly dressed and tied with nylon wires of 3 mm diameter.

4.3.5 In the field, the cables and tubes shall be laid in ducts and trays as per layout drawings. Cables shall also be buried underground or taken in concrete trenches wherever required.

4.3.6 The grounding of shields for shielded cables shall not be carried out at field instrument and junction box end. The shields at these ends shall be suitably insulated from the body of the instruments/junction boxes.

4.3.7 In side the control room, all cables shall be laid in concrete trenches or below false flooring. When laid below the false floor, the cables shall be properly dressed and tied as per the instructions of Engineer-in-charge.

In other plant rooms like analyser room or local control rooms, the cables shall be laid in concrete trenches, unless specified otherwise.

4.4 Installation of Instruments

4.4.1 All instruments shall be generally installed on supports as per installation standards, instrument location plan and instructions of Engineer-in-charge. All the instruments installed shall be accessible for easy maintenance.

4.4.2 Receiver gauges shall be mounted on instrument support itself, as far as possible, as per tubing hookup standards.

4.4.3 Filter regulators shall be mounted on the instrument support below the instruments or on the control valve yoke, as far as possible.

4.5 Instrument Air Supply
4.5.1 The main instrument air header in each area is laid by other contractor. Air supply from the main air header take off valve to individual instruments shall be through either galvanized steel pipe or PVC covered copper tube or stainless steel tubes. The connections shall be screwed through out and no welding is permitted. The threading in galvanized pipes/nipples shall be carried out by contractor as per requirement.

4.5.2 Individual take off valves shall generally be located on top of the main air header. Unions shall be provided at convenient locations. There shall be one isolation valve at each instrument end. The galvanised pipe shall be supported at a minimum interval of 1.5 meters with 40 mm x 40 mm x 5 mm MS angles. Final connection to the instrument shall be copper/stainless steel tubing as per tubing hookup standards.

4.6 Instrument Steam Tracing

4.6.1 The main steam header in each area is laid by other contractor. From the main steam header take off valve, steam to individual instruments shall be taken through carbon steel pipes supported at regular intervals. Steam tracing around individual instruments shall be by copper tubes/stainless steel tubes, in general. After steam tracing, the line is connected to the drain funnel through individual steam trap/condensate return header/tapping point as the case may be.

4.6.2 Electrical tracing shall be done by others. Assistance, if required, shall be provided by the contractor as per instructions of Engineer-in-charge.

4.7 Cables Ducts/Ladder trays/perforated trays/angle trays and supports

4.7.1 Galvanised main cable trays are generally prefabricated ladder type trays and shall be laid as per layout drawing.

4.7.2 Closed ducts and ladder type MS angle type trays are generally fabricated as per the drawings and shall be laid as per layout drawings.

4.7.3 Generally heavy structural supports for cable ducts, ladder trays are provided by other agency. However, in critical areas, where additional supports are required to be provided in the opinion of the Engineer-in-charge, the same shall be provided by the contractor.

4.7.4 The perforated trays/angle trays shall be properly supported at a regular interval of maximum of 1 metre from insert plates or steel structures. Wherever insert plates are not available, supports on concrete structures and ceiling shall be fixed with minimum 10 mm diameter expansion bolts. Angle supports for perforated trays/angle trays shall be fabricated from 40 mm x 40 mm x 5 mm MS angles as a minimum.

4.7.5 All supports shall be cut with hacksaw only. Any work executed by gas cutting for making holes and cutting pieces will be totally rejected. Free ends of angle support shall not have sharp edges and shall be properly rounded off.

4.7.6 Perforated trays/angle trays shall be used for branch cables and tube from main trays. Width of trays shall be selected according to number of tubes and cables. Trays shall be laid generally as per site conditions with the approval of Engineer-in-charge.
4.7.7 No welding on galvanised trays/perforated trays shall be allowed in general. In specific cases where welding is unavoidable, this shall be carried out as per instructions from engineer-in-charge. For welding, if required, following procedure shall be followed as a minimum:

   a) Remove galvanisation thoroughly from the portion to be welded.
   b) After welding, clean the welded portion for any slug, sharp edge.
   c) Welded portion shall be painted as per procedure described under clause 4.10.

4.7.8 Main cable ducts, fabricated ladder type angle trays, MS perforated trays and their supports shall be painted as per painting specification detailed in clause 4.10.

4.8 **Laying of Cables**

4.8.1 All cables shall be laid in accordance with installation drawings and cable schedules. Before laying, cable/multicable on drums shall be meagre and tested to ascertain the transit damages. In case of field bus cables, the loop resistance and capacitance shall be checked by the contractor after the completion of cable laying.

4.8.2 All cables routes shall be carefully measured and cables cut to the required lengths, leaving sufficient amount for the final connection of the cable to the terminals on either end. The various cable lengths cut from the cable reels shall be carefully selected to prevent undue wastage of cables. Sufficient extra length of cable shall be kept at the termination points.

4.8.3 A detailed planning shall be submitted prior to cable laying, giving drum number, cable number, lengths which shall be approved by Engineer-in-charge.

4.8.4 Cables shall have complete uncut lengths from one termination to the other.

4.8.5 All cables shall be indicated close to their termination point by cable number as per cable schedules/junction boxes schedules. PVC ferrule/tag plate shall be used and these identification tags shall be securely fastened to the cables.

4.8.6 All temporary ends of cables shall be protected against dirt and moisture. For this purpose, ends of all cables shall be taped with an approved PVC or rubber insulating tape or end caps.

4.8.7 All cores of electrical cables shall be identified by their wire numbers by means of the PVC ferrules. Wire numbers shall be as per cable schedules and control room termination drawings. The terminal numbers shall be screen printed on single ferrule to identify the source and or destination as per the instruction of Engineer-in-charge.

4.8.8 The cores shall be terminated at the termination points using proper lugs. However, lugs shall not be used for compensating cables.

4.8.9 The bending radius of cables shall be maintained as per manufacturers' recommendation.

Cables installed above ground shall be run exposed on walls, ceilings, structures and shall run parallel or at right angles with beams, walls or columns.
4.8.10 Cables shall be rigidly supported on structural steel and masonry individually or in groups as required using PVC covered galvanised clips, multiple cable supports or cable trays. If drilling of steel must be resorted to, approval must be obtained and steel must be drilled where the minimum weakening of the structured wall results. Cable shall be supported at every 500 mm on vertical runs and every 100 mm on horizontal runs.

4.8.11 All special cables and power supply cables shall be laid direct to the field instrument without any junction boxes, unless otherwise specified.

4.8.12 While laying cables in ducts/trenches or burying them, care shall be taken to ensure that low signal cables like alarm, analyser cables, special cables from turbine meters, compensating cable etc. are separated from other power supply cables.

4.8.13 Each underground cable (either in concrete trenches or buried) shall be provided with identifying tag of lead securely fastened every 30 m of its underground length with at least one tag at each end before the cable leaves/enters the ground.

4.8.14 Directly buried cables shall be laid underground in excavated cable trench wherever specified in layout drawings. Trenches shall have sufficient depth and width to accommodate all cables correctly spaced. Pipe sleeves, if required, for cross overs other than roads like drains etc. shall be provided by the contractor as per the instructions of Engineer-in-charge. Before cables are placed, the trench bottom shall be filled with 100 mm layer of sand and leveled.

Each layer of cables shall be covered with 150 mm of sand on top and sand shall be lightly pressed. A protective covering of 75 mm thick second class red bricks shall be placed flat on the final layer of sand and cable. The remaining portion of the trench shall be then back filled with soil compacted and levelled. On completion of every group of cable laying and before sand filling, every cable shall be given insulation test in the presence of Engineer-in-charge.

Any cable proved to be defective shall be replaced before the next group of cables are laid. Cable route markers indicating number of cables, depth and direction will be placed enroute, on crossovers/turnings etc. to mark the cable route.

4.8.15 At each road crossings and other places, where cables enter pipe sleeves, adequate bed of sand shall be given so that the cables do not lack and get damaged by pipe ends after back filling. After laying, the pipe sleeves shall be sealed using sealing compounds.

4.8.16 At the entry into concrete blocks at road crossings, cable loops shall be provided at either ends to prevent any damage to cables. Each cable shall have one tag at each end before the cable enters/leaves conduit pipes.

4.8.17 After laying of all the cables and multi tubes, the cable entry to control room shall be suitably filled and sealed using sealing compound or by installing MCT including fixing of MCT Frame/blocks, routing cables, so as to achieve a positive seal against the entry of gas/water.

4.8.18 On completion of cable laying in concrete trenches, the trenches shall be filled with sand and pre-cast concrete slabs / chequered plates shall be placed on the trench.
4.9 **Earthing**

4.9.1 Earthing of instruments, analysers, junction boxes, local panels/cabinets and shelters shall be carried out as per the documents and instructions from Engineer-in-charge.

4.10 **Painting**

4.10.1 This part of the specification is applicable to cable ducts, MS cable trays, angle trays, instrument supports/perforated trays, all structural supports for the above items, etc.

4.10.2 The surface to be painted shall be thoroughly cleaned with wire brush, sand paper to remove all scales. After cleaning, the surface is painted with one coat of red oxide zinc chromate primer conforming to IS-2074 and allowed to dry completely.

4.10.3 Primer coated surface is painted with one coat of paint to the colour nearest to the final paint and allowed to dry. The colour number shall be specified by Engineer-in-charge as per IS-5.

4.10.4 Final second coating shall be with the paint of desired colours and shall also be specified by Engineer-in-charge as per IS-5.

4.10.5 It shall be noted that final second coating of external surfaces not covered by cables, copper tubes etc. shall be applied just before handing over the plant or commissioning of the plant whichever is earlier.

4.10.6 The name of manufacturer, colour and quality of all types of primer and final paint shall be subject to approval of Engineer-in-charge.

4.11 **Testing**

4.11.1 Electrical cables for signal, power supply, alarms and shutdown shall be checked for megger values and continuity before final termination and ferruling.

4.11.2 Testing shall be carried out after the installation of instrument with primary piping/tubing complete in all respects and approved by engineer-in-charge.

4.11.3 Primary piping/tubing shall be tested hydraulically or pneumatically to 1.5 or 1.1 times respectively, of the operating pressure after isolating the instruments. Flushing of piping shall be carried out as per instructions of Engineer-in-charge. Lines shall be blown after hydro-testing. All external displacement/float type level instruments and level gauges shall also be tested as per instructions of Engineer-in-charge.

4.11.4 Tubes and air line shall be tested with compressed air to 7 Kg/ern- up to the filter regulator.

The downstream side of the filter regulator shall be tested for 1.5 Kg/em'. The lines shall be blown with the instrument air upto the regulator for 15 minutes to remove any traces of oil, dust and moisture. All lines shall be checked with soap solution and bubbler unit for possible leak at joints. After pressurising, source shall be cut off and rate of fall in pressure shall be less than 1 PSI (Pounds per Square Inch) for each 100 ft. of copper tubing for a test period of 2 minutes as per ISA RP 7-1 'Pneumatic control circuit pressure test'.

4.11.5 All the test results shall be recorded in the approved format.
4.12 Calibration

4.12.1 All instruments shall be calibrated strictly as per manufacturer's instructions prior to installation. The scope of calibration includes all field and control room instruments of all types namely, pneumatic, electronic, electrical etc.

4.12.2 Contractor shall use his own oil free instruments air compressor for calibration purposes.

4.12.3 Conversion from one unit to another for the purpose of calibration is not allowed.

4.12.4 The procedures for calibration of different items are as outlined below. However, the detailed procedure shall be submitted to Engineer-in-charge for approval before proceeding with calibration.

4.12.5 All types of transmitters, including SMART/FIELDBUS type, shall be calibrated to the ranges specified in the respective instrument data/specification sheets using suitable test equipments/kits including the verification of the configuration parameters.

4.12.6 All pressure and differential pressure transmitters shall be calibrated to the ranges as per instrument data/specification sheets and instructions of Engineer-in-charge.

4.12.7 All thermocouple receiver instruments shall be calibrated by generating millivolt signals suitable for span and the type of thermocouple specified.

4.12.8 Receiver instruments programmed shall be calibrated and aligned using test hook-up as per instructions from manufacturer/engineer-in-charge.

4.12.9 All indicating type pressure, differential pressure and temperature switches shall be calibrated for 0%, 25%, 50%, and 100% of range. These shall be set finally at the required values indicated on the data sheet.

4.12.10 Filled type temperature instruments/temperature gauges shall be calibrated for 0%, 25%, 50%, 75% and 100% of the range using standard theromo-oil.

4.12.11 Pressure transmitters shall be calibrated at 0%, 25%, 50%, 75% and 100% and vice versa of range using dead weight tester/hydraulic pumps with master gauges/pressure calibrators.

4.12.12 DP transmitters shall be calibrated at 0%, 25%, 50%, 75% and 100% and vice versa of range using water column monometers, standard gauges or squeeze bulb type of flow calibrators.

4.12.13 Rotameter transmitters shall be calibrated by moving pointer 0%, 25%, 50%, 75%, 100% and vice versa of the range and monitoring the output at the respective flow range.

4.12.14 The external displacer type of level instruments shall be dry calibrated as per manufacturer's instructions or wet calibrated by filling the displacer chamber with water for level 0%, 25%, 50%, 75% and 100% and draining the water at IOq%, 75%, 50%, 25% and 0% of the ranges after applying suitable specific gravity corrections of the process fluid as per data sheets.

4.12.15 The internal displacer/float type level instruments shall be dry calibrated as per...
manufacturer's instruction or using calibration chamber fabricated out of steel pipes and filling the same with water after applying specific gravity corrections of process fluid as per data sheets.

4.12.16 The level switches (external cage type) shall be set by filling the cage with water to the desired alarm/trip level. While setting the switches, it shall be ensured that the micro switches do not reset for full rated travel of the float.

4.12.17 Tank level indicators shall be calibrated by manually lifting the float at 0%, 25%, 50%, 75% and 100% and vice versa of the ranges.

4.12.18 Control valves and positioners of all types (Pneumatic / SMART / Field bus) shall be checked for hysteresis and linearity and shall be calibrated for rated strokes. Prior to calibration, the valves shall be cleaned externally. The stem is then lubricated if required, and stroked few times to extreme positions of plug to ensure that movement is free from friction. The valves shall then be calibrated for rated stroke and linearity also. Subsequently the valves shall be checked for hysteresis to the accuracy of 1% full scale with Field bus / SMART / Pneumatic positioner and 5% full scale without positioners. Stroke speed has to be evaluated for trip/shutdown valves as per safety requirements identified by Engineer-in-charge.

4.12.19 All calibration readings shall be recorded in the enclosed format and submitted to engineer-incharge for approval. Where significant deviations from specifications are obtained, the matter shall be brought to the immediate notice of the Engineer-in-charge for corrective action.

4.12.20 Furnished hereunder is a list of recommended calibration and test equipments required as a minimum for calibration work. The contractor shall clearly state in his offer, the complete list of calibration and test equipments along with the range, accuracy and quantity which he proposes to use for this job. Contractor should also ensure that any equipment not listed below but required at the time of calibration shall be made available at his own cost. All the instruments are to be calibrated using the test equipments and kits approved by NPL/IDEMI/ERTL authorities or by any laboratory accredited by NABL having valid calibration report at the time of calibration. In the event, any test equipment is sent to a laboratory for enhancing validity, it shall be contractor's responsibility to arrange alternate test equipments, duly meeting the above criteria, to carry out calibration/loop checking activities.

a) Controller test stands Mfr. Standard
b) Indicator/Recorder test stands Mfr. Standard
c) Squeeze bulb (Flow calibrator) Range; 0 to -10,000 mm wg. -
d) Dead weight testers (Budenberg or equivalent for ranges upto 350 kg/em" ± 0.05 %
e) Gauge comparator for pressure gauges Rating: upto 350 kg/ern" ± 0.02 %
f) Oil bath for temperature instrument calibrations Max. temperature 350 C Mfr. Standard
g) Standard mercury in glass thermometers
   Range; -50 to +50 c., 0 to 100 c
   (NPL certified) 0-250 c.
   ± 0.25 %

h) Standard gauges for Ranges upto
   350 kg/ern²
   ± 0.1 %

i) U-tube differential manometers/inclined
   tube monometer Static Pr. rating.Zkg/cm².
   ± 1 mm

j) Single leg manometers
   Scale; -1500mm water 1500mm hg.
   Static Pr. rating: 7kg/cm²
   ± 1 mm

k) Decade resistance box
   Mfr.s Standard

l) Multimeters

m) Potentiometer/Direct digital calibrator
   (capable of generating and measuring mV)
   ± 0.05 mV

n) Meggers 500v/1000 ν
   -

o) Air hydro pump/hydraulic pump
   -

p) Vacuum pump
   -

q) Instrument air compressor with filters
   and regulators and deoilers.
   -

r) Current generator (Instrument checker)
   -

s) Field bus calibrator (Beamex Make MC5 or equivalent)

h) Safety valve test jig for sizes from %" to 10" (upto 600#)

4.13 Loop Checking

4.13.1 Loop checking shall be performed after calibration, installation, interconnection, continuity check
and leak testing of instrument impulse lines for all instruments. Loop checking is conducted to
verify the functional performance of all elements comprising the loop, thereby ensuring proper
interconnections and operation. The results of various activities completed like calibration,
installation, interconnection, loop checking and logic checking shall be recorded in the loop
checking report format, which is attached as Annexure I (4 sheets).
Any punch points observed while carrying out loop checking or activities required as prerequisite to loop checking shall be recorded in the loop checking report format attached as Annexure 2. The loop checking shall be performed only after the resolution of the punch points.

4.13.2 Before proceeding for loop checking, the calibration results of individual elements shall be separately recorded on the calibration reports and shall be approved by Engineer-in-charge for correctness of calibration results.

4.13.3 Loop checking of various types of loops shall be performed as follows, however, detailed procedure shall be submitted to the engineer-in-charge for approval before proceeding with the loop checking;

a) The loop checking of all the open loops with smart or field bus shall be performed using hand held communicator / field bus calibrator by simulating 0%, 25%, 50%, 75% and 100% of full scale input in the field. The tests shall also include the verification of tag configuration parameters e.g. ranges etc as per instrument data sheet.

However loop checking of conventional (non-SMART & non-FIELDBUS) transmitter in open loop shall be performed by physically applying 0%, 25%, 50%, 75% and 100% of process parameters as per instrument data sheet in the field.

b) The loop checking of all close loops with conventional (non-SMART & nonFIELDBUS) / SMART / Fieldbus transmitters shall be carried out by physically simulating the process conditions for at least 0%, 25%, 50%, 75% and 100% of full scale input and verifying the values in receiver instruments/operator station in the control room. Similarly, the control valves operation shall be verified by feeding 0%, 25%, 50%, 75% and 100% output from the operator stations/controllers in the control room.

c) In case of shutdown systems, field switches/receiver switches/field transmitters shall be simulated for abnormality by disconnecting the wires at terminals in case of switches and physically simulating the process for the corresponding trip point signal in case of transmitters and the function of all the associated systems are checked including performance of solenoid valves, on-off type control/shutdown valves including proper functioning of limit switches and other accessories. Adjustment of limit switches wherever necessary shall also form part of checking of the loop.

4.13.4 Performance of individual loops shall be accepted for an overall accuracy of ± 1.5%. Where deviation is found to exist more than the specified limit, contractor shall recalibrate the instruments which shall also form part of loop testing wherever required, at no extra cost.

4.13.5 After the loop test is complete, the contractor shall connect back any terminations and connections removed for loop checking.

4.13.6 A loop shall be considered as handed over only when the loop checking of that particular loop is complete in all respects and the loop checking report is completely filled in all respects, approved and accepted by Engineer-in-charge and Client. In case of loops in which certain instruments of the loops are calibrated by other agency, loop checking shall be performed in coordination with the agency involved. If a defect in the calibration of the instruments in contractor's scope is observed, same shall be rectified to the satisfaction of the Engineer-in-charge. However, if defect
is detected in the calibration of the instruments in the scope of other agency, same shall be rectified by the agency involved. After the calibration has been rechecked by other agency/agencies, the loop checking would be performed to the satisfaction of Engineer-in-charge. This is part of the contractor’s scope of work.

4.13.7 The loop checking results shall be recorded in Annexure I referred at clause 4.13.1 above.

4.13.8 Whenever the installation of central control system like Distributed Control System/Programmable Logic Controllers/Terminal automation system etc in control room is carried out by any other agency, contractor's scope of work for the loops connected to these systems shall include the following:

a) Laying of all related cables upto the designated panels/cabinets/consoles, dressing of cables including inside control room, identification of cables and cores/pairs of each cable, coordination with control system vendor during glancing and termination.

b) Calibration of all field instruments independently.

c) Providing all assistance to control system vendor during loop checking. This shall include physical simulation of signals from the field instruments through approved test equipments and checking the control valve operation with the output provided from control system to enable control system vendor to verify loop performance.

d) Coordination with control system vendor to meet loop-checking schedule. It shall be contractor's responsibility to demonstrate/prove measuring signal levels of field instrument output in control room in the respective identified pair in case of any problem.

e) Rectification/recalibration of field instruments if found defective during loop checking.

However, the glancing and termination of field cables, checking of interconnection between instrument/equipments within control room, ferruling/tagging of interconnecting cables inside control room shall all be in the scope of control system vendor.

4.13.9 It shall be contractor's responsibility to complete all entries in the 'Loop Checking Report' attached as Annexure I, related to field instrumentation and loop checking results, including calibration, installation checks, interconnection of tubing and cabling, hydrotest etc. and get it duly signed by the Engineer-in-charge. The final certified loop sheets shall be submitted in hard copies (4 sets) and soft copies (in CD) to the Engineer-in-charge.

5.0 DRAWINGS AND DOCUMENTS TO BE SUPPLIED FOR EXECUTION BY OWNER/ENGINEER-IN-CHARGE

5.1 General layout plan for all units, showing all information like location of field instruments, junction boxes, indicative routes of cables, main duct/cable trays.

5.2 Cable schedules for alarm/signal/shutdown/power supply and pneumatic tubes, earthing guidelines etc.

5.3 Termination details/drawings for connecting at control room end.
5.4 Individual instrument specifications/Data sheets.

5.5 Bill of Materials

5.6 Installation standards/hook up.

5.7 Manufacturer’s hand books with instruction for installation and calibration wherever necessary, for reverence.

6.0 DRAWINGS AND DOCUMENTS TO BE PROVIDED BY CONTRACTOR

6.1 The drawings for materials that are included in contractor’s scope of supply namely local control panel, junction boxes and local cabinets, as applicable.

6.2 The detailed engineering drawings wherever such work is assigned.

6.3 Two sets of as-built with originals consisting of instrument layout drawings, instrument index, installation standards, bill of material, cable schedules etc. duly incorporating the changes/modification carried out during the course of execution of works. The drawings/documents shall be provided by the owner for the above purpose.

6.4 Final material appropriation statement for all the free issue materials as well as materials issued on chargeable basis, indicating shortages if any, in the P erformed duly approved by Engineer-in-charge.

7.0 SCOPE OF SUPPLY FOR MATERIALS

7.1 Materials To Be Supplied By The Owner Free Of Cost-

7.1.1 All-pipes, tubes and piping materials such as fittings, steam traps, valves, flanges, gaskets, bolts- and nuts for flanges necessary for primary piping, air supply and steam tracing.

7.1.2 Tubes, tube fittings, polyethylene tubes and fittings.

7.1.3 All field mounted instruments like pneumatic, electronic and analyser instruments, pressure gauges, temperature elements, dial thermometers, thermowells, switches and accessories like air filter regulators, receiver pressure gauges, solenoid valves etc.

7.1.4 Pneumatic and electric junction boxes for field mounting.

7.1.5 Single pair/multi pair/multi triad/shielded cables/thermocouple extension cables for signal/alarm/temperature signals and any other special cable specifically indicated in Schedule of Quantities.

7.1.6 Two core/three core power cable.

7.1.7 All electrical conduits, fittings, cable glands and cable accessories unless otherwise specifically indicated.

7.1.8 Local panels.
7.2 Materials to be supplied by the contractor at his own cost, as part of this specification.

7.2.1 The procurement and supply in sequence and at the appropriate time of all materials and consumables except for the materials specifically enlisted under owner's scope of supply shall be entirely the contractor's responsibility and his rates for execution shall be inclusive for all these items. These are as, but not limited to, the following:

a) All industrial gases like oxygen, acetylene or inert gases, compressed air and all types of electrodes, filler wires, brazing rods, flux etc. for welding purpose, with necessary facilities for testing the welded joints.

b) PTFE tape and other pipe jointing compounds for threads and material for sealing of cable entries to control room, local panels, insulation tapes, sealing compounds for flame proof conduit fittings.

c) Bolts and nuts for supports, U-bolts with nuts, clamps for tubes and pipes, anchor bolts for panels, expansion bolts (pinch anchor/raw bolts) of various sizes for fixing to concrete structures.

d) Polythene bags for protection of instruments against rain.

e) Paints, primers and solvents.

f) Plastic tags for identifications of tubes/wires at panel/junction boxes.

g) All materials for minor civil works like grouting etc.

h) Structural steel, MS Plates, GI plates, flats, pipe etc. required for fabrication of instruments supports and tray supports wherever required.

i) All accessories for electrical wiring like cable lugs, ferrules for identification etc.

7.2.2 Prefabricated main cable ducts and perforated/ladder trays with necessary accessories like tees, bends, crosses etc. as specified in schedule of quantities.

7.2.3 Mounting accessories for the above like bolts, supports etc.

7.2.4 Speool pieces and blinds for testing wherever required.

7.2.5 Any other item not specified, but required for the completion of the job.

Note: The contractor shall submit in sealed cellophane packets samples of all consumables like bolts, nuts, lubricants, ferrules, lugs and any other material included in their scope of supply for approval of engineer-in-charge which then forms the standards for erection work.

8.0 SCRAP AND EXCESS MATERIAL

8.1 Every month, the contractor shall submit an account for all the materials issued to him by the owner in the standard Performa prescribed for this purpose by the engineer-in-charge.
8.2 On completion of the work, the contractor shall submit ‘material appropriation’ statements for all the materials issued by the owner in the Performa prescribed by the Engineer-in-charge.

8.3 The following scrap allowances are permissible:

<table>
<thead>
<tr>
<th>Length below 0.5 metres</th>
<th>Non salvageable</th>
<th>Unaccountable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Steel pipes, SS tubes</td>
<td>2%</td>
<td>0.5%</td>
</tr>
</tbody>
</table>

Length below 2.0 metres

| Single pair, Single triad, two core/ three core cables | 2% | 0.5% |

Length below 20 metres

| Multitube, Multicables | 2% | 0.5% |

8.4 All excess materials and scrap shall be returned after duly accounting for, to the storage points designated by the owner. Where materials are to be weighed before return, the contractor shall be responsible for making the necessary arrangements for weighing etc. The contractor shall not use scrap section obtained during the course of construction for fabricating temporary supports or other items without prior permission of the Engineer-in-charge.

8.5 If the contractor fails to return the surplus material as aforesaid, the owner will charge the contractor for such unreturned material at penal rates, which will be deducted from whatever amount is due to the contractor. In case any material issued by the owner deteriorates during storage by the contractor, new material will be issued to him at penal rates, but the delay in procuring such materials will be to the contractor’s account only.

1.0 GENERAL

2.0 DESIGN PHILOSOPHY

3.0 SPARES PHILOSOPHY

4.0 SPECIFICATIONS OF INSTRUMENTS

5.0 DISTRIBUTED CONTROL SYSTEM

6.0 PROGRAMMABLE LOGIC CONTROLLER

7.0 LIST OF DOCUMENTS ATTACHED
1.0 GENERAL

1.1 Scope

1.1.1 This specification together with the attachments covers the design and engineering of instruments and control systems, complete with all accessories and materials, along with special test equipments, where the supply of such instruments or systems is part of a package being supplied by bidder. This specification is general and all instruments/systems included may not be required for the package in question. Only the portion related to the instruments/systems included in the scope of supply of packager for a particular package.

1.1.2 The detailed scope of work, specific job requirements, exclusions, deviations, additions etc. if any, will be indicated in the material requisition, equipment or plant specifications and addendum to this specification.

1.1.3 This specification provides only the qualitative specifications of commonly used instruments. Instruments not covered in this specification shall be submitted by the bidder for approval.

1.1.4 Vendor shall be fully responsible for design, material selection, sizing and selection of the proper instruments for their system. The compliance to this specification does not absolve the vendor of the responsibility towards contractual obligations with regards to completeness, proper selection, satisfactory operation and easy maintenance of the unit.

1.1.5 All equipments supplied shall be of field proven quality both with respect to design and materials. Prototype instruments or instruments of an experimental nature shall not be offered or supplied.

All instruments and control systems (Programmable Logic Controller (PLC), Distributed Control System (DCS), Analyser systems etc.) and system oriented items like machine monitoring system, Speed governor control, Antisurge / Performance control system, Analyser system etc. offered by vendor shall have a well proven performance record of operating satisfactorily in a similar unit or in an hydro carbon processing industry for a minimum of 4000 running hours.

No instrument requiring special maintenance or operating facilities shall be offered or supplied as far as possible.

1.1.6 In the event of any conflict between this specifications, data sheets, related standards, codes etc., the vendor shall refer the matter to the purchaser for clarification and only after obtaining the same should proceed with the manufacture/engineering of the item in question.

1.2 Bids

1.2.1 Vendor shall clearly define the operational philosophy proposed by them, which shall be in line with requirements specified in the job specifications. Vendor shall also clearly indicate the provision of control panels and control systems required for their package along with their offer.

1.2.2 Vendor shall furnish complete process data and operation displays to the purchaser for those instruments, and control systems which do not form part of vendor’s scope of supply but are an integral part of the control of the package.
1.2.3 Bidder shall provide the following information along with their offer.
   a) Complete scope of work.
   b) Utility requirements including Power consumption and Instrument air supply consumption. The offer shall indicate the power requirement for Uninterrupted Power Supply (UPS), Non-UPS and DC power clearly indicating the locations for each.
   c) Estimated heat load for the equipment located in control room.
   d) Control room size and layout (Tentative)
   e) Compliance to specifications and list of deviations, if any, from purchasers specifications clause number wise with reasons thereof, wherever applicable.

1.2.4 Documents like Instrument list and typical specifications and any other details if supplied by vendor in their bid, shall be retained for records only. All such details shall be submitted only after the finalisation of P&ID (Piping and Instrument Diagram). No implication shall be admissible on the basis of these documents.

1.2.5 Bidder shall enclose catalogues giving detailed technical specifications and other information for Control system and other special instruments.

1.2.6 Bidder's offer, catalogues, drawings, instrument manuals etc. shall be in English.

1.2.7 In addition to mandatory spares and consumable spares indicated elsewhere in this specification, bidder shall also quote for two years operational spares for the complete instrument and control system package offered.

1.3 Applicable national/international standards.

1.3.1 Design and terminology shall comply, as a minimum, with the latest edition prior to the date of purchaser's enquiry of following codes, standard practices and publications:

- AGA American Gas Association, Gas Measurement Committee
  - Report No. 3 - National Gas Fluid Measurement- Orifice Metering of Natural Gas.
- AG181 Foundation Fieldbus system engineering guidelines
- ANSI/ASME American National Standards Institute/ American Society of Mechanical Engineers.
  B 1.20.1 Pipe Threads.
  B 16.5 Steel Pipe Flanges and Flanged Fittings.
  B 16.47-B Large diameter Steel Flanges
  B 16.20 Ring Joint Gaskets and Grooves for Steel Pipe Flanges.
- ANSI/FCI American National Standards Institute/Fluid Controls Institute
70.2 Control valve seat leakage classification.

API American Petroleum Institute

RP 520 Sizing, selection and installation of pressure relieving system in refineries.

- Part-I -Sizing and selection
- Part-II -Installation

RP 521 Guide for pressure relieving and depressurising systems.
RP 526 Flanged steel safety relief valves.
RP 527 Seat tightness of pressure relief valves.

MPMS Manual of Petroleum measurement standards.

IS-1554    PVC insulated (heavy duty) electric cables-working Part I voltage upto and including 1100V.

IS-2074    Ready mixed paints, air drying, red oxide- zinc chrome.

IS-2147    Degree of Protection provided by enclosures for low voltage switchgear and control gear.

IS-2148    Flame proof enclosures for electrical apparatus.

IS-3624    Specification for pressure and vacuum gauges
1.4 Drawing and Data

1.4.1 Detailed drawings, data and catalogues required from the Bidder are indicated by the purchaser in Vendor data requirement sheets. The required number of soft copies and hard copies should be dispatched to the address mentioned, adhering to the time limits indicated.

1.4.2 Bidder shall furnish all documents in A4 Size (210mm x 297 mm) paper or folded in A4 size unless otherwise specified. All drawings and sketches shall be in multiples of A4 size like A3 (297 mm x 420 mm) or A2 (420 mm x 594 mm) etc., but folded to 'A4' size. Final documentation shall be submitted in bound volumes. The soft copies of final documentation shall be submitted in 2 sets of DVDs.

1.4.3 The minimum requirements expected from the various documents listed in Vendor Data Requirement attached as 'Annexure I' to this specifications, shall be as follows:

1.4.3.1 Drawing and Document Schedule

This document lists out all drawings and documents prepared and/or submitted by vendor to purchaser either during engineering or as a part of final documentation. Following information shall be available in this document:
a) Name and number of each drawing and document listed.

b) Expected and Actual date of submission to purchaser.

1.4.3.2 Instrument Index

Instrument Index lists out all instruments appearing on the P&ID without any exception. It is a basic instrument document which is necessary for the smooth execution of a job and is also a reference document after the completion of job. Instrument Index shall be prepared in Excel.

1.4.3.3 Sub Vendor List (for Instruments and Accessories)

This document shall list all instrument items and accessories including control system along with the name of the sub-vendors from whom Bidder is likely to procure these items. Sub-vendors suggested shall be manufacturer of repute and shall be as per suggested subvendor list enclosed with the bid document.

1.4.3.4 Instrument sizing calculations

Instrument sizing calculations provide information regarding sizing (as per standards specified elsewhere in this document), type, selection and other related information.

Following sizing calculations shall be applicable, in general, duly approved by the authority indicated in Vendor's Standard Quality Plan;

a) Control valve including noise and velocity.

b) Safety valves/pressure relief valves/pilot operated pressure relief valves/rupture disc.

c) Flow element including orifice plates, averaging pitot tubes, venturi, flow nozzle etc.

d) Utility consumption calculation including power supply (UPS/Non UPS), Instrument air, steam for tracing etc.

e) Cable sizing calculations for Power cables.

f) Intrinsically safe loop calculation for proper selection considering various entity parameters.

g) Calculations for no of instruments in a segment.

1.4.3.5 Utility Requirements

This document lists out the following information regarding utilities required by the Bidder;

a) List of utilities required i.e. Power (UPS, Non UPS), Instrument air, Cooling water, steam for tracing, Nitrogen etc.

b) Location and estimated/actual requirement at each location. The requirement shall be listed as minimum/normal/maximum.

c) Incase of AC power, the In-rush current with duration and power factor shall also be indicated for each location.
1.4.3.6 Nozzle Elevation for Level Instruments

Nozzle elevation for level Instruments represent the nozzle elevation, nozzle sizes and rating, requirement of stand-pipes, type of level instrument etc. for all the vessels, columns, exchangers and tanks.

1.4.3.7 Purchase Requisition (PR)

Purchase Requisition shall contain following information as a minimum but updated in line with the finally accepted offer of the successful bidder including:-

a) Instrument specifications including detailed instrument data sheet and special requirements, if any.

b) Testing and Inspection requirements

c) Vendor data requirements

d) Other related documents like Standard Specifications, Quality Assurance requirements etc.

1.4.3.8 Functional Schematics

Functional Schematics details out the functionality of all the loops shown on the P&ID including their co-relation. The schematic shows all the hardware necessary to configure a loop including their physical location, their interconnection and important software blocks as applicable to make a loop complete. Similar loops may be combined under the same functional schematic.

1.4.3.9 Logic Diagrams

Logic diagram is a logic representation of process interlock and shutdown system and details out the functionality, in a schematic form, as either process cause and effect table shown on the P&ID or in a separate write-up. The schematic shall be prepared based on ISA S5.2 – A Binary Logic Diagrams for Process Operations@ and shall show the physical location of Input/output devices, their interconnection with functional blocks, bench status of all electrical devices etc. The schematic shall also be supplemented with operational requirements like startup and process bypasses, reset and shut down push buttons, selector switches, status lamp etc.

1.4.3.10 Segment Drawing

The FF segment drawing provides the complete segment design details indicating all the devices of a segment, the Tag names, device control/monitoring functional requirements, spur length, FF Junction box barriers connectivity, termination details, location of JB etc. 1.4.3.11 Instrument Loop drawings Each loop shall have a separate Instrument Loop drawing which shall show each component from field device to final receiver including physical location; initiating device, its terminal number; junction box with its terminal number; cable number with pair number/polarity; receiver instrument terminals/cabinet terminals; system functional blocks of loop in simplified manner (without configuration details).

1.4.3.12 Control Room Layout

Control room layout drawing shall show the location of control panels, system cabinets, marshalling racks and other auxiliary cabinets, consoles with monitors, hard wired consoles,
printers, non-system panels/cabinets including panels/cabinets for packages, LEL panel, fire alarms panels or any other equipment required to be installed in control room. The layout shall be prepared on control room architectural drawing and shall also show layout of equipment in engineering room/computer room etc.

1.4.3.13 Panel Front Arrangement

This drawing shall show the arrangement of Panel mounted instruments like indicating instruments, alarm annunciator, indicating lamps, push buttons/switches etc. including their approximate sizes and their mounting locations.

1.4.3.14 Configuration Diagram

This drawing is a graphical representation of all major hardwares required in a configurable control system which are necessary to meet all the expected functional requirements.

1.4.3.15 Dynamic Graphic Display Drawings

These drawings provide a graphic representation of P&ID's arranged in a sequence which when displayed on the VDU, shall provide easy and logical operational views.

1.4.3.16 Input/Output Assignment

This document indicates the physical assignment of various I/O modules and their respective channels to various physical inputs and outputs.

1.4.3.17 Instrument Duct/Tray/Trench Layout

Instrument duct/tray trench drawing shows the routing of main instrument duct/tray trench in the unit/plant. The drawing shall be prepared on plot-plan and shall show the size, cross-section at various locations, general notes, symbols, reference drawings and the control room entry.

1.4.3.18 Instrument Location Plans

Instrument Location Plans shall show the location of instruments, location of tapping points, location of local panels, junction boxes, main cable trenches, instrument air distribution scheme etc. These drawings are prepared on equipment layout drawings preferably in 1:50 scale.

1.4.3.19 Instrument Cable Schedule

The instrument cable schedule shall show all instrument and power cables required for complete instrumentation. The document shall show tag number, cable number, type, length and size of cables, type of junction box, identity of local panel, control room panel/cabinet location etc. The cable schedule document shall include all single & multi pair cables indicating terminations of instruments, field junction boxes and respective termination in satellite rack room cabinets. The instrument cable schedule shall be prepared on format No. 1651-594, 595, 596 and 1851.

2.0 DESIGN PHILOSOPHY

2.1 Instrumentation shall be complete in every respect and liberal to the extent of providing data on all operations and variables sufficient for the safe, efficient and easy operation, start up and shut down of the plant.
2.2 The design and installation of instruments shall be generally in accordance with ISA/API recommended practices and other applicable standards like BIS, IBR etc. Material specifications and practices shall, in general, conform to appropriate ASTM or equivalent standards. All standards and code of practices referred to herein shall be of the latest edition prior to the date of purchaser's enquiry.

2.3 All instruments and equipments shall be suitable for use in a hot, humid and tropical industrial climate in which corrosive gases and/or chemicals may be present. As a minimum, all instruments and enclosures in field shall be metallic construction, dust proof and weatherproof to IP-55 as per IEC-60529/IS-13947 and secure against the ingress of fumes, dampness, insects and vermin. All external surfaces shall be suitably treated to provide protection against corrosive plant atmosphere.

2.4 The design of electronic instruments shall be in compliance with the electromagnetic compatibility requirements as per IEC 801 'Electromagnetic compatibility for Industrial Process measurement and Control equipment.

2.5 Instrument Requirements for classified area:

   a) All electronic/electrical instruments and equipments shall be suitable for area classification as per IEC codes and shall be tested by any recognised authority like BASEEFA, FM, PTB, CMRI etc. and shall be certified by Petroleum And Explosives Safety Organisation (PESO)/ Chief Controller of Explosives (CCE), Nagpur or Director General of Mines Safety (DGMS) in India.

   b) Certified Intrinsically Safe (IS) equipment as per IEC-60079-11 shall be used, in general, in hazardous area, for conventional loops.

   c) Field instruments in fieldbus loops shall be designed and FISCO certified with FISCO marking as per IEC 60079-27 for hazardous area application. Wherever FISCO certified field instruments is not available, intrinsically safe entity based field instruments shall be used with suitable accessories to per mit IS device in FISCO installations as per AG181.

   d) In case intrinsically safe equipment is not available, flameproof enclosures as per IEC-60079.01 may be considered.

   e) Junction boxes and accessories required for flameproof instruments shall also be certified flameproof.

   f) All non flameproof panels and cabinets installed in classified area shall be purged as per requirements specified in NFPA-496, as a minimum.

   e) Other type of protection as specified in IEC-60079 shall not be used.

2.6 Statutory Approvals

   a) Contractor shall be responsible for obtaining all statutory approvals, as applicable for all instruments and control systems.

   b) In addition, equipments/instruments/systems located in the hazardous area shall be certified by the local statutory authorities for their use in the area of their installation. In general following certification shall be given:
- For all intrinsically safe/ FISCO/FINICO/ explosion proof/flameproof equipments/instruments/systems or equipments with any other type of protection allowable as per this package which are manufactured abroad and certified by any statutory authority like BASEEFA, FM, UL, PTB, LCIE etc. should also have the approval of Petroleum And Explosives Safety Organisation (PESO)/ Chief Controller of Explosives (CCE), Nagpur.

- For all flame proof equipments manufactured locally (indigenously), the testing shall be carried out by any of the approved test house like CMRI/ERTL etc. The equipment shall in addition bear the valid approval from Petroleum and Explosives Safety Organisation (PESO)/ Chief Controller of Explosives, Nagpur and a valid BIS license.

- For all intrinsically safe equipment manufactured locally (indigenously), the testing shall be carried out by any of the approved test house like CMRI/ERTL etc. The equipment shall in addition bear the valid approval from Petroleum and Explosives Safety Organisation (PESO)/ Chief Controller of Explosives, Nagpur.

c) Approvals other than above shall neither be offered nor these will be acceptable.

2.7 Following units of measurement shall be applicable, unless indicated specifically otherwise;

- Flow
  - Liquid: m³/h
  - Steam: kg/h

- Gas & Vapour: Nm³/h

- Pressure/Vacuum
  - Gauge: kg/cm²/g
  - : mm of H₂O
  - Vacuum: kg/cm²
  - : mm of H₂O

- Temperature: °C

- Level: %

- Analysis: %
  - : ppm

- Conductivity: micro Siemens

- Viscosity: mPa.s (cP)

2.8 Local control loops shall be avoided. In case these are unavoidable, these shall be electronic field mounted manual loading station only.

2.9 Ranges for instruments shall be selected in general, such that in normal process operation the indication is between 40% to 60% of span for linear and 60% to 80% of span for square root inputs.

2.10 Ranges for process switches shall be selected, in general, such that the set point falls preferably in the middle 30% of full adjustable range i.e. the set point shall fall between 35% and 65% of adjustable range.
2.11 All controllers shall have facility for bumpless auto-manual and manual-auto transfer and set point adjustment. Flow, pressure and level controller shall be provided with proportional plus integral action, while temperature controller with proportional plus integral plus derivative action.

2.12 Field mounted direct actuated Flow and Temperature switches shall not be used. Instead, receiver switch/trip amplifier shall be used along with flow element/temperature element.

2.13 Intrinsically Safe System Requirements

Following points must be considered while designing an intrinsically safe system;

a) All intrinsic safety barriers shall be active type isolating barriers only, with three port isolation is required. Zener barriers shall only be used if unavoidable. Prior approval of purchaser shall be taken in such case with justifications.

b) Barriers must be selected based on entity concept. Cable parameters shall also be considered while matching entity parameters.

c) Each instrument in the hazardous area and the intrinsic barrier shall be certified for intrinsic safety by any statutory authority.

d) Each input and output in a loop shall have separate barrier. No barrier shall be shared between two loops or input/outputs.

e) Any device required to be connected to any intrinsically safe loop in the hazardous side permanently or temporarily shall also be certified intrinsically safe.

f) Configuration tools whenever required for any intrinsically safe item, which forms part of the intrinsically safe item shall also be certified intrinsically safe.

2.14 Power Supplies and their Distribution

a) Power supply shall be made available at the following voltage levels, unless otherwise specified:

° For Instruments, Control Systems, Analyzers 110V ac ± 10% (UPS)

°(*) Solenoid Valves, Relays, lamps 110V dc ±10%

°(*) Input interrogation voltage 110V dc ±10%

° Panel/cabinets lighting 240V ac ± 10%

(*) When specified in job specification for Ex proof switches/ SOV/ Lamp/ PB Design cases.

In case 24 V dc is required for Input interrogation, relays and lamps etc same shall be generally by the bidder using dual Redundant power packs (110 V dc to 24 V dc converter). No 24 V dc feeders shall be supplied unless indicated specifically in the job specifications. refer Note 1

b) All instruments, control systems (PLC and DCS) and analyser system shall be able to operate at the following UPS specification:

Voltage level : 110V ac ± 10%

---

Note 1: 24V DC Control Power supply in DCS & PLC system shall be with Mosfet O-Ring With Balanced Current. The same Shall be For reverse Polarity Protection
STANDARD SPECIFICATION FOR
PACKAGE UNITS

Frequency : 50 Hz ±3 Hz
Switch over time : 5 milli seconds.

c) Power feeders shall be supplied to the bidder at one location. All further distribution within the package shall be taken care of by the bidder. Number and size of Power feeders shall be informed during detail engineering. Vendor shall provide adequate number and size of terminals and cable glands required.

d) Instrument power circuits shall be individually protected from fault with the help of fuses. Power supply to the individual instrument shall be disconnected with the help of DPST switch and protected with the help of fuses. Miniature circuit breakers (MCB's) may be selected in place of switch fuse unit in case protection is provided for overload protection.

2.15 Alarm Philosophy

a) Adequate alarms shall be provided to give audible and visual warning of any process and machine malfunction in the package.

b) All trips shall have a pre-trip warning alarm in addition to alarm at the trip condition.

c) All package alarms including pre-trip warning alarms and trip alarms (shutdown alarms) shall be annunciated on the local panel

d) All rotating equipments shall have the status indication provided on the local panel.

e) Common pre-warning alarm and common trip alarm contacts for the package shall be provided for remote annunciation. Additional alarm contacts shall be provided when specified.

f) ‘Fail-safe’ type with normally closed alarm contacts shall be used.

2.16 All line or equipment mounted instruments like control valves, pressure relief valves, thermo-wells, orifice flanges, level instruments etc., installed on pipes and vessels under IBR shall be certified by IBR or their authorized representative.

2.17 Location of process connections shall be from the side or from the top of the process equipment but not from the bottom. This requirement is applicable to both pipes and vessels. The location of lower side connection when necessary shall be high enough to prevent plugging due to dirt or other suspended solids. In addition, the connections shall be short, vertical or horizontal and without any pockets.

2.18 Material of construction of instruments shall be as per the material selection chart, refer 'Annexure II', attached as part of this specification, as a minimum. However vendor is responsible to ensure that the selected material is consistent with temperature, pressure, corrosion conditions and other process requirements.

In case where suitable material of construction is not feasible/possible, diaphragm seal shall be considered.
2.19 All process switches shall be provided with sealed micro switch contacts rated for the specified application. Contacts shall be SPDT type unless otherwise specified. Contacts used in intrinsically safe applications shall be Alloy plated.

2.20 Field transmitters

2.20.1 The field transmitters in all conventional loops shall be smart type only unless specified otherwise. All field transmitters shall have 10 year stability.

2.20.1.1 Field transmitters for flow, pressure, differential pressure and level applications shall be yoke mounted type unless specified otherwise. Meter electronics is used for flow measurement, etc. and shall include all the associated items like pre-amplifier, converter, transmitter, integrator, integral output meter etc.

2.20.1.2 Field transmitter shall be intrinsically safe and meter electronics shall be intrinsically safe, in general. In case, intrinsically safe is not available from the approved vendor list enclosed with this MR, flameproof enclosure is acceptable. In case sensor/ pick up coil is intrinsically safe, suitable barrier shall be provided and installed in flameproof enclosure.

2.20.1.3 These transmitters shall be 2 wire system having 4 - 20 mA DC output with superimposed digital signal having simultaneous analog and digital communication with HART communication protocol, unless otherwise specified.

2.20.1.4 The transmitter shall be microprocessor based and it shall incorporate a non-volatile memory which shall store complete configuration data of transmitter and its sensor characterization. All necessary signal conversions, including conversion to produce output with the required protocol shall be carried out in the transmitter electronics. The configurationally data of the instruments shall be stored in a non-volatile memory such that this remains unchanged because of power fluctuations or power off condition. In case vendor standard instrument has battery backed RAM, contractor to ensure that battery drain alarm is provided as diagnostic maintenance message.

2.20.1.5 Transmitter shall also run complete diagnostic subroutines and shall provide diagnostic alarm messages for sensor as well as transmitter healthiness. In the event of detection failure, the output shall be driven to a predefined value, which shall be field configurable.

2.20.1.6 Universal hand held configurator / terminal for the configuration and maintenance of instruments with HART output shall be provided for all HART based smart instruments.

2.20.2 Fieldbus Field Transmitter and devices:

2.20.2.1 Fieldbus transmitters / devices shall be provided, if specified, in fieldbus loops.

2.20.2.2 Fieldbus based transmitter/ devices shall meet the following requirements;

1) All instruments must satisfy the requirements of the field bus registration laboratory with applicable checkmark of foundation field bus.

2) All instruments shall be polarity in-sensitive. Also transmitter shall have LAS capable and line plugging detection, whenever specified in data sheet.

3) All instruments shall have Analog Input (AI) block and Proportional, Integration and differential (PID) control block, as a minimum.
4) All instruments must be interoperable and shall have valid interoperability test clearance like ITK latest version for foundation field bus or equivalent for profibus PA, as applicable.

5) The field bus instruments shall support peer to peer communication with two wire communication and bus powered supply.

6) The field bus instruments in hazardous area shall be certified as per entity concept or shall be FISCO approved as per the requirements specified in the purchaser’s specification.

7) All instruments shall support to EDDL or FTD/DTM requirements, as specified in data sheets.

8) Internal software shall be configured by the vendor including the following information such as serial number, Device Tag (Tag Number) and Process description

9) All instruments shall be capable of supporting incremental Device descriptor (DD) for extra functionality and/or software revisions in device memory.

10) Fieldbus based field indicator shall be able to indicate all signals available in the fieldbus segment, selectively.

2.20.2.3 The field bus / devices provided shall be able to communicate with fieldbus communicator Fisher 375F. In case the same is not confirmed for any device, bidder shall supply suitable FF configurator.

2.20.3 Accuracy of transmitters, smart as well as field bus based shall be as follows:

<table>
<thead>
<tr>
<th>Type of Transmitter</th>
<th>Range of Transmitter</th>
<th>Accuracy for the rangeability of 1:10</th>
</tr>
</thead>
<tbody>
<tr>
<td>Direct</td>
<td>760 mm WC and above</td>
<td>Equal to or better than ±0.075%</td>
</tr>
<tr>
<td>Direct</td>
<td>Less than 760 mm WC</td>
<td>Equal to or better than ±0.15%</td>
</tr>
<tr>
<td>Diaphragm seal</td>
<td>500 mm WC and above</td>
<td>Equal to or better than ±0.25%</td>
</tr>
<tr>
<td>Diaphragm seal</td>
<td>Less than 500 mm WC</td>
<td>Equal to or better than ±0.5%</td>
</tr>
</tbody>
</table>

The accuracy is defined as the combined effect of repeatability, linearity and hysteresis.

2.20.4 Transmitter shall update the output at least 8 times a second unless otherwise specified. Unless specified otherwise in purchaser’s specification, transmitter response time shall be as follows:

a) For transmitter range of 760 mm WC and above, the response time shall be equal to or better than 500 milliseconds.

b) For transmitter range below 760mm WC, the response shall be equal to or better than 1 second.

The response time of the transmitter shall be considered as the sum of dead time and 63.2% step response time of the transmitter.
2.20.5 Unless specified otherwise, the over-range/static pressure protection of the transmitter shall be as follows:

<table>
<thead>
<tr>
<th>Range of Transmitter</th>
<th>Over range / static pressure &lt;N1&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>0&lt;Ω&lt;250 mm WC</td>
<td>Pressure Transmitter (kg/cm²)</td>
</tr>
<tr>
<td></td>
<td>Differential Pressure Transmitter (kg/cm²)</td>
</tr>
<tr>
<td>250&lt;Ω&lt;1000 mm WC</td>
<td>45</td>
</tr>
<tr>
<td>1000 &lt; Ω &lt; 5000 mm WC</td>
<td>45</td>
</tr>
<tr>
<td>5000 &lt; Ω &lt; 10000 mm WC</td>
<td>45</td>
</tr>
<tr>
<td>1 &lt; Ω &lt; 10 kg/cm²</td>
<td>52</td>
</tr>
<tr>
<td>10 &lt; Ω &lt; 100 kg/cm²</td>
<td>160</td>
</tr>
<tr>
<td>&gt; 100 kg/cm²</td>
<td>210</td>
</tr>
</tbody>
</table>

<N1> However if the Over range/ static pressure value specified above is less than the maximum/ design pressure of service conditions, offered instrument shall be suitable for the maximum/ design pressure.

2.21 Instrument Connections

2.21.1 The connections of instruments installed on vessels, tanks, standpipes and piping shall be as per following Standards.

a) STD-7-52-001 Instrument Connections on Vessels and tanks.

b) STD-7-52-002 Instrument connection on Piping.

2.21.2 Pneumatic instrument connections for signal and air supply shall be 1/4" NPT (F).

2.21.3 Electrical cable entry connection shall be 1/2" NPT (F). Suitable cable gland shall be used.

2.21.4 End connections shall meet the following, unless, otherwise specified:

a) Threaded end connection shall be NPT as per ANSI/ASME B1.20.1.

b) Flanged end connection shall be as per ANSI/ASME B16.5.

c) Flange face finish shall be per paragraphs 6.4.4.1, 6.4.4.2 and 6.4.4.3 of ANSI/ ASME B 16.5. The face finish wherever specified in data sheets shall have serrations as follows:

   125 AARH : 125 to 200 AARH

   63 AARH : 32 to 63 AARH
d) Grooves of ring type joint flanges shall be octagonal as per ANSI/ASME B 16.20 2.22
Air supply at pressure specified elsewhere shall be made available to the vendor at the battery limit for distribution to the instruments.

2.23 Interface with Main Control Room

2.23.1 Wherever applicable, instrument junction boxes shall be provided as interface. Marshalling details between purchaser -vendor tubing and cabling shall be shown with corresponding junction box termination number allocated against appropriate purchaser's/vendor's instrument tag number. Drawing shall be furnished separately for wiring and tubing for showing all instrument interface details between purchaser -vendors.

2.23.2 Direct signals from package/package skid
All signals from package/package skid to purchaser’s remote control room/MCC shall be terminated in the junctions boxes located at the battery limit. Separate junction boxes shall be used for the following type of signals:
- Intrinsically Safe Analog Inputs/Outputs (4-20mA)
- Non -intrinsically Safe Analog Inputs/Outputs (4-20 mA)
- Intrinsically Safe Thermocouple Inputs
- Intrinsically Safe RTD Inputs
- Intrinsically Safe contact Inputs
- Non Intrinsically Safe contact Inputs.
- Non Intrinsically Safe contact Outputs.
- Intrinsically safe contact Outputs.
- DCS and PLC signals shall be further segregated.

2.23.3 Repeat Signals from Package Local Panel
a) Where signals as indicated in Para 2.22.2 is less in number and do not justify separate junction boxes, all such signals may be routed via local control panel.

b) All such signals shall be terminated on separate terminal strips in the local control panel. The terminal strips shall be segregated as per Para 2.22.2.

c) Intrinsically safe barriers for all such signals, wherever required, shall be provided.

The above shall only be considered with prior approval from purchaser.

3.0 SPARES PHILOSOPHY

3.1 Mandatory Spares

Unless specified otherwise, the following mandatory spares shall be provided by bidder.

3.1.1 Predefined Mandatory Spares:
Mandatory spares shall be ware-house spares and shall be supplied as loose items. 

3.1.1.1 Higher of 10% or minimum one of each type (range, type, material) of complete instruments except control valve, safety valve, displacer, radar, servo level instruments, analyser, PLC, DCS.

3.1.1.2 For Control valve each control valve shall include one set of packing and bonnet with tag, one set of stem seal o-ring for each actuator and piston o-ring additionally for each piston actuated valve, line bolting (set of studs and nut) and set of gasket with each tag no.

3.1.2 Commissioning Spares:

Bidder shall be responsible to supply all spares which are found necessary to replace while performing pre-commissioning and commissioning activities and this includes system oriented items (Hardware / software).

3.1.3 Consumable spares:

Bidder shall supply consumable spares for six months of normal operation.

3.1.4 Engineering Spares:

3.1.4.1 For Control system installed spare module of higher of 10% or minimum one of input/output modules (including termination panels, if applicable) to enhance the system functional requirements of DCS and PLC.

3.1.4.2 For Hardwired console / Local control panel,

   a) A minimum of 20% spare windows with alarm modules shall be provided in alarm annunciator.

   b) A minimum of 20% spare status lamps / switches / pushbuttons / terminals or one no of each type, whichever is higher, shall be provided.

   c) For pneumatic panels, 10% spare instrument air header branch lines and 15% spare bulkheads and tapping points shall be provided in each panel.

   d) Control panels shall have additional spare-space as per clause 4.3.8 of this specification.

3.2 Normal Operational Spares

Vendor shall supply a list of spare parts for each instrument and system required for 2 years of continuous operation. These spares shall be quoted separately.

4.0 GENERAL SPECIFICATION OF INSTRUMENTS

4.1 Instrument Concept

4.1.1 Major instrumentation shall be electronic type SMART with final control elements as pneumatic.

4.1.2 Electronic Instruments

   a) All electronic instruments requiring separate power supply shall generally operate on 110 V 50 Hz. Instruments operating at 24 V dc shall also be acceptable.
b) Electronic transmitters shall generally be two-wire type. These shall have transmission/output signal of 4-20 mA dc and shall be capable of delivering rated current into external load of at least 600 ohms when powered with 24 V dc nominal voltage.

c) Smart transmitter, shall be used in analog output mode, unless specified otherwise in job specification.

d) All receiver instruments shall be microprocessor based and shall operate on voltage input of 0.25 to 1.25 V, 1 to 5 V, or 0 to 10 V dc, in general.

e) The design of electronic instruments shall be in compliance with the electromagnetic compatibility requirements as per IEC-61000-4.

e) Field bus instruments when specified shall be tick marked as per IEC-61158.

4.1.3 Pneumatic Instruments shall operate on air supply of 1.4 kg/cm² g and shall have transmission and output signal of 0.2 to 1.0 kg/cm² g.

4.1.4 Instrument air quality shall be as per ISA-S7.3 and free from corrosive, hazardous and toxic contaminants.

4.2 Panel Board Instruments:

4.2.1 Panel board instruments shall generally be multibin subminiature 6” x 3”, except recorders, which shall preferably be 6” x 6”. Instruments like microprocessor based recorders, temperature scanners etc., shall be as per manufacturer standards.

4.2.2 Panel board instruments shall have the following graduations, in general;

Differential Pressure flow meters 0 to 10 square root
Variable area Flow meter 1 to 10 linear
Pressure Direct Reading
Level 0 to 100 Linear
Temperature Direct Reading.

Multiplying factors for flow scales shall be specified on manufacturer's nameplate.

Recorder charts shall be dual graduated, in general, in 0 to 10 square roots and in 0 to 100 linear.

4.2.3 Subminiature recorders shall have 100 mm strip chart with chart speed of 25 mm/h. Microprocessor based recorders shall have strip chart of 250 mm approx. and chart speed of 50 mm/h with a provision to change speed at site.

4.2.4 Alarm Annunciator, shall either be solid state type or microprocessor based programmable type with plug in modules, in a cabinet with window display with back lighted incandescent lamps or cluster LED type integral power supply. For window display with back lighted incandescent lamps two numbers of incandescent lamps of minimum 5 watt each shall be provided for each window. For cluster type LED display, the number of LED’s in the cluster matrix windows shall be sufficient to provide illumination level of a last 150 lumens. The circuit shall be designed in such a
any that removal/failure of one lamp or LED from a window/cluster shall not hamper functioning of that particular window/display. The annunciator lamps shall be replaceable from the front of the enclosure panel. In general, dedicated alarm logic module shall be used for each alarm input. However, when micro processor based alarm Annunciator is offered failure of one microprocessor shall not affect more than four alarm windows.

Intrinsically safe annunciator circuit, when used, shall have power supply unit in a safe area. Annunciator alarm sequence shall be as per F3A of ISA.

The design of the alarm annunciator system shall be such that transient alarms of less than 330 milliseconds duration shall be automatically rejected.

4.3 Control Panel

4.3.1 All control panels shall be supplied in pre-tubed/pre-wired condition and shall be completely tested at manufacturer's works prior to dispatch.

4.3.2 Control panels shall be freestanding type and fabricated preferably from 3 mm thick cold rolled steel sheet. If the same is not available, 4 mm thick hot rolled steel sheet shall be used. Angle iron framework shall use a minimum section of 50 x 50 x 4 mm angle. The finish shall include sand blasting, grinding, chemical cleaning, and surface finishing by suitable filler and two coats of high-grade lacquer with wet sanding between coats. Two coats of paint in panel colour shall be given for non-glossy high stain finish. Panel face final colour can be any of the following shades as per IS -5:

- Opaline green : ISC No.- 275
- Light Admiralty Grey: ISC No.- 697
- Sky blue: ISC No.- 101

Panel rear surface, framework and mounting plates shall have a finish colour of pale cream to IS-5 ISC No.- 352 or Beige to IS-5 ISC No. -388 or white. A final coat of paint shall be given at site. Equivalent colour shade according to BS/RAL are also acceptable.

4.3.3 Control panel shall be open back type with each section of typically 2100 mm high, 1200 mm wide and 800 mm deep, when mounted inside the control room on 100 m m channel base covering wall to wall, else these shall be totally enclosed cubicule type. The panel width may be increased if necessary.

4.3.4 Enclosed cubicule panels shall have removable hinged doors, generally at the side or back for easy maintenance and accessibility of the instruments. Doors shall be double leaved type with handle and shall be provided with lock and key. Adequate illumination shall be provided inside the panel. All light fittings shall be suitable for 230 V, 50 Hz ac.

4.3.5 No process fluid of any kind, except instrument air shall enter the control panel. Also power supply greater than 230 V shall not enter the local panel.

4.3.6 All cable entries to the local panel shall be from panel bottom only using cable glands of adequate size. Cable gland plate thickness shall be a minimum of 3 mm cold rolled cold annealed (CRCA) as a minimum. All unused cable entries must be plugged.

4.3.7 Space heater shall be provided where condensation is expected. The space heater provided shall be with space heater with temperature cut off and manual control.
4.3.8 The design of control panel shall incorporate provision for expansion by installing adequate spare capacity. Each panel shall be designed to accommodate the following additional equipment, as a minimum

   a) 20% of panel front/inside mounted instruments including lamps, push buttons, switches, relays etc.
   b) 20% additional power feeders each provided with switch fuse assembly.
   c) 20% additional spare windows in alarm annunciators.
   d) 20% spare cable entry points.

4.3.9 Panel layout shall be designed considering ease of operation. No push button or hand switch shall be located below 600 mm. Instrument Mounting heights, in general, shall be as follows:

   a) Miniature and subminiature instruments (3 rows) Bottom row 1100 mm
      Top row 1600 mm
   b) Annunciators - 1950 mm
   c) Electric push buttons/ Switches, lamps etc.
      - 700 mm

4.3.10 The internal panel layout shall be designed considering proper approach for instruments, terminals and other accessories for maintenance, easy removal and on-line calibration. No instrument, terminals, power distribution box etc shall be mounted on the panel side plates inside the panel.

4.3.11 All lamps, status as well as alarm, shall be provided with lamp test facility. One single lamp test push button shall be used for each panel.

4.3.12 Colour Scheme

   a) Status Lamps
      On/Open/Permissive : Green
      Off/Close/Emergency : Red
   b) Alarms
      Normal/Pre-trip alarms : White
      Shutdown alarms : Red
   c) Push/Pull buttons
      On/Open : Green
      Off/Close : Red
      Emergency shut-down (ESD) : Red
      (Push-button with cover/
      Mushroom push button)
4.3.13  Panel Piping and Tubing

4.3.13.1  The instrument air header shall be adequately sized with 1/2" branches, with brass packless isolation valves and shall be complete with suitable dual filter-cum-air reducing station.

4.3.13.2  Panel tubing from the bulk head to the panel instruments and instrument air supply to the panel instruments shall be of 6 mm x 0.038" SS 316L tubing.

4.3.13.3  The tubing shall be laid in plastic slotted ducts. Panel air header and tube fittings shall be of brass, suitably protected against corrosion.

4.3.13.4  Shut off valves shall be installed in all branch lines taking off the transmission and output signal. Each tube shall be identified at both the terminating ends.

4.3.14  Panel Wiring

4.3.14.1  Open terminals shall generally be avoided. Terminal strips shall be of Phoenix / Klippon/ Elmex or equivalent type and shall preferably be mounted in an enclosure. Fused terminal may be used wherever necessary.

4.3.14.2  A minimum of 1 mm² multi stranded PVC insulated copper conductor shall be used in general. All wiring shall be laid in the PVC troughs. No trough shall be more than 70% full.

4.3.14.3  Wires carrying measurement signals associated with thermocouples, resistance thermometers, pH instruments and other low level signals shall be routed in separate troughs/wire ways and not alongside power cables. Power wiring and control wiring shall be separated by not less than 150 mm. The crossing, if unavoidable, shall be as close to right angles as possible.

4.3.14.4  Compensating cables/wires shall be used for all thermocouple inputs. These wires shall be routed in separate troughs/wire-ways.

4.3.14.5  All intrinsically safe wires shall be routed in separate wire ways from non-intrinsically safe and power wiring. Intrinsically safe wiring and terminals shall be light blue in colour and shall be separated from non-intrinsically safe terminals atleast by 50 mm.

4.3.14.6  All incoming power feeders shall be terminated on separate terminals suitable for the incoming feeder size. These shall be located at the bottom of the panel and shall be suitably covered for protection against accidental shorting and for human safety.

4.3.14.7  Following design philosophy shall be followed while deciding the internal layout of panels, as a minimum;

   a) Distance between terminal strip and side of the panel upto 50 terminals : 100 mm (min.)+ trough width

   b) Distance between two adjacent terminal strips : 100mm (min.)+trough width

   c) Distance between gland plate and bottom of the strip : 300mm (min.)

   d) Distance of terminal strip from instrument/trough/panel top : 100mm (min.)
4.4 Local Control Panel

4.4.1 Local control panel for the package units shall be installed within the battery limit of the package considering operational and maintenance requirements and accessibility. In case of skid mounted packages, panel shall be located away from the skid. In case local control panel is housed outdoor i.e. not in a local control room, it shall be designed to meet IP-55 requirements. In addition, panel must be provided with a rain cum sun shade canopy/shed.

4.4.2 Local control panel/panels shall be totally enclosed cubicles. Panel sizing shall be carried out based on equipment being installed keeping in view the maintenance clearances and easiness. Although the panel dimensions shall be guided by the actual requirements, typical dimensions of 2100 mm operational (height) x 1200 mm (width) x 1000 mm (depth) shall be kept in mind while finalizing the panel size. In any case, vendor shall not proceed with panel manufacturing before getting prior approval from the purchaser.

4.4.3 Local control panels located in the hazardous area shall either be purged type or flame proof Ex’d’ as specified in job specification. In case pressurized panels are specified the same shall be purged and pressurized as pr NFPA 496 requirements to render space within the panel non hazardous. For panels located in IEC Zone 2, hazardous area type Z purging shall be used with a purge fail alarm in main control room. In case, panels are located in Zone 1, the power shall be cut off on pressurisation on as per x-purse requirements of N FPA-426. An alarm shall be provided on local panel and a contact shall be provided for remote annunciation, whenever the panel pressurization falls below 2.5 mm of H2O. A protective device to protect the panel from over pressure must be provided.

4.4.4 Panel pressurisation with start-up panel purging scheme shall be fully automatic however it shall be started manually from a push button. Solenoid valves and differential pressure switch required for panel purging shall be flameproof, however other items like relays, switches/pushbuttons, timers etc. shall be located in a flameproof housing. Other items like valves, restriction orifice plates, dual filter regulators, pressure gauges, rotameters etc required for pressurization shall also be located in the non-pressurized section of the panel 4.4.5 It shall be possible to switch off incoming power to panel from panel front. All such power on/off switches shall be flameproof type. In addition, all those devices and terminals, which can't be powered off from on/off switches shall also be located inside flameproof enclosures.

4.4.6 All hinges, screws and other non-painted metallic parts shall be of stainless steel material.

4.4.7 All other requirements as specified in clause 4.3 of this specification shall also be applicable for local control panels.

4.5 Local Gauge Board

4.5.1 Local gauge board shall be used to install skid mounted instruments like pressure gauges, temperature gauges, process switch and transmitters.

4.5.2 Location of local gauge boards, when provided, shall be decided to allow easy access at the rear and front for all instruments and accessories for maintenance and operation.

4.5.3 Gauge board shall be constructed from 3 mm cold rolled cold annealed steel sheet with other necessary steel supporting structure and shall be painted sky blue shade No. ISC-101 as per IS-5.
4.5.4 Local gauge board shall be supplied with all instruments installed and completely in tubed/wired condition before shipment.

4.5.5 All pressure gauges shall be provided with block and bleed valves securely fastened. Identification tags shall be securely fastened for easy identification.

4.6 Temperature Instruments

4.6.1 Thermowells

a) All temperature elements shall be provided with Thermowells fabricated out of bar stock of minimum SS 304 material as per Standard STD-7-52-35. The base of the thermowells shall be chosen to fit the instrument without air gap for minimizing measuring lag.

b) Built-up thermowells shall be used in low pressure and low velocity services like in fired heaters and also where thermowell immersion lengths greater than 500 m are required.

c) Immersion length of thermowells shall be as follows:

<table>
<thead>
<tr>
<th>Line Size</th>
<th>Immersion length</th>
</tr>
</thead>
<tbody>
<tr>
<td>From 4&quot; to 6&quot;</td>
<td>280 mm</td>
</tr>
<tr>
<td>From 8&quot; onwards</td>
<td>320 mm</td>
</tr>
<tr>
<td>Vessels / columns</td>
<td>400 mm</td>
</tr>
</tbody>
</table>

In special applications, not covered above, vendor shall decide the immersion length based on actual requirements. Immersion length is based on 200 mm length between flange face and inner wall of pipe.

d) Any pipe line less than 4" nominal bore shall be blown to 4" size to install thermowell.

e) Thermowell flange and well material shall be as per material selection chart.

f) The vibration analysis shall be carried out as per ASTM PTC 19.3 and corrective measures shall be taken as necessary.

4.6.2 Temperature Gauges

a) Local temperature gauges shall be in general bimetallic type. The temperature bulb shall be of stainless steel construction. The gauge connection shall be all angles adjustable. Gas filled type shall be used when thermowell length exceeds 550 mm, Mercury filled type temperature gauge shall not be used.

b) All local temperature gauges shall have 150 mm dial size. The bulb size shall be selected to suit the thermowell.

c) All gauges shall be of weatherproof construction to IP 55 as a minimum.

d) Temperature gauges shall have accuracy of "1% URV (upper range value).

e) Bimetallic type dial thermometers shall be avoided where excessive vibrations are encountered, such as compressors. Only filled type with capillary extension shall be
used in such cases. Capillary tubing shall be minimum of 304SS with stainless steel flexible armouring, and PVC covering over armour. Filled type gauges shall be manufactured as per relevant SAMA class.

f) Thermometer stem adjustable gland with union connection and bushing shall be suitable for 1/2" NPTF connection.

4.6.3 Temperature Elements

a) For remote temperature indication/recording/control/switch etc., thermocouples or resistance temperature detector (RTD) shall be used depending on the process requirements. Elements shall be spring loaded, mineral insulated and shall have stainless steel sheath as a minimum.

b) Thermocouple assemblies shall be furnished with weatherproof screw type heads as per Standard STD-7-52-36.

c) Thermocouples shall be as per IEC-60-584-2/IS -7358 and shall have a wire size of 18 AWG for single and 20 A WG for duplex thermocouples. These shall be magnesium oxide (MgO) filled grounded type, unless necessary otherwise. The type of thermocouple shall be selected based on temperature. The selection of type shall be as per following guidelines:

Copper-Constantan (ISA-Type-T) : (-) 200 to 200°C
Chromel-Constantan (ISA-Type-E) : (-) 200 to 600°C
Iron- Constantan (ISA-Type-J) : 0 to 600°C
Chromel-Alumel (ISA-Type-K) : 600 to 1200°C
Platinum Rhodium-Platinum (ISA Type-S) : 600 to 1600°C

d) The design of thermocouple assemblies shall be such that replacement on line is possible.

e) RTD (Resistance Temperature Detector) shall be platinum element 3 wire type with 100 ohms resistance at 0°C calibrated as per IEC 60651//DIN 43760. RTD shall be used within a temperature range of -200 to 650°C. Three-wire system shall be adopted in connecting the element.

f) RTD shall be used where accuracies of the order of 0.25% or better and smaller measuring spans are required.

g) Twin element sensors, if used, shall have two separate cable entries.

4.6.4 Temperature Transmitter

a) Temperature transmitters shall have a built-in line arising function to produce an output linear to temperature range.

b) Temperature transmitters shall have an accuracy of 0.075% of URV as a minimum. The accuracy shall be 0.25% for a calibrates range upto 0-100°C only.

4.6.5 Burn out protection must be provided with temperature transmitters and trip amplifiers. Upscale or downscale protection shall be decided based on its application to ensure fail-safe operation.
4.7 Pressure Instruments

Pressure instruments fall into three groups, direct reading instruments, transmitters and pressure switches.

4.7.1 Pressure Gauges

a) Pressure gauge dial shall be white, non-rusting plastic with black figures. The dial face shall be marked with pressure element material. Pointers shall have micrometer adjustment.

b) Pressure gauges shall be weatherproof with dial size of 150 mm and shall have features like screwed bezels, externally adjustable zero, over range protection (at least 130% of max. operating pressure) and blowout discs. Shatter proof glass Pressure gauge sensing element shall be of SS 316 and movement of SS 304, as a minimum.

c) Pressure gauges shall have an accuracy of "1% of URV as a minimum. Differential pressures gauges may have an accuracy of "2% of URV.

d) Over range protector and pulsation dampener, whenever used, shall be of SS 304, as a minimum. Pulsation dampener shall be used for all pulsating services. It shall be floating pin type, externally mounted and externally adjustable.

e) Pressure gauges with range as 0-60 kg/cm²g shall have safety type solid front case.

f) Connection shall normally be 1/2" NPTM bottom.

g) Cases shall normally be minimum SS-304 and weatherproof to IP -55 as per IEC-529/IS-2147. Blowout discs shall be provided.

h) Ranges shall be so specified that the gauge normally operates in the middle third of the scale and shall conform to IS -3624 standard dials, wherever possible.

i) Diaphragm seals, filled type or mechanical type shall be furnished where plugging of the element may occur or where suitable material is not available in highly corrosive services. When chemical seals are required, they shall be of the clean out type with flushing connection.

j) Where vibrations and pressure fluctuations are expected, glycerin filled type shall be used. Incase of vibrating service like pump outlets, flexible armored hoses shall be used in place of impulse piping and gauges shall be mounted separate stanchion.

k) Receiver pressure gauges for local transmitter output indication shall have 100 mm dial with stainless steel element and 1/4" NPTM connection.

l) The pressure element shall be Bandon, diaphragm or bellows depending upon process condition.

4.7.2 Pressure/Differential Pressure Transmitters

a) Pressure/differential pressure transmitter shall have electronic state-of-art capacitance or any other type of sensor meeting all functional specifications. Element material for transmitters shall be SS316, as a minimum, and shall be able to withstand over pressure of at least 30% of range or maximum working pressure which ever is higher.
b) All transmitters shall have an integral output meter. Remote mounted meters may be provided if required in addition.

c) Daphragm seal element with capillary shall be used for congealing, corrosive and highly viscous services.

d) D/P cells with one side open to atm osphere shall be us ed for low pressure at near atmosphere pressure.

4.7.3 Pressure Switches

a) Pressure switches shall have either diaphragm or bellow type of process element with SS 316 material of construction as a minimum. Switch type shall be sealed micro-type with contact rating suitable for specific application.

b) Pressure switches shall be blind type with 1/2 NPTF process connection and shall be operative in full-specified range. The switch differential shall be selected as per operating conditions.

c) Pressure switches shall have repeatability of "0.5% of URV, as a minimum pressure switch shall have over range protection of at least 130% of max. working pressure. The set pressure shall fall in the middle third (between 35% to 65%) of the adjustable range in general. Set point shall be field adjustable.

d) Receiver pressure switches shall have SS316 bellows as measuring element with 1/4" NPTF connection.

e) Pressure switch shall be provided with noble metal plated DPDT contacts and all have internally adjustable set point.

4.8 Level Instruments

4.8.1 Level gauges

a) All gauge glasses shall be steel armoured reflex or transparent type with body and cover material of forged carbon steel as a minimum and shall have tempered borosilicate glass with asbestos or other suitable gasket. Transparent type of gauges shall be provided with integral illuminators operating at 230 V 50 Hz supply and suitable for electrical area classification specified. All gauge glasses must have a rating equal to or more than the vessel design pressure and temperature.

b) Reflex type will be used for clean and colourless liquids, except liquids level interface. For low temperature, low boiling point service, large chamber type will be used. Transparent type will be used on acid, caustic, dirty or viscous, coloured liquids and liquid interface. Transparent type with Mica or Kel-F shields shall be used for treated water, boiler and condensate services, and for corrosive liquids, which will attack glass. Tubular gauge glasses shall, in general, not be used.

They may be used for non-hazardous services at ambient temperature and low pressures.

c) Large chamber gauges with frost shields shall be provided for cold services below 0°C. Heating jacket shall be provided for viscous liquids.
d) All gauges shall have top and bottom chamber connections, unless otherwise specified. In addition each gauge shall be provided with ball check valves and pipe union.

e) The visible range of level gauge shall be selected to cover the complete operating level as well as measuring range of the other level instruments provided for the same purpose. In general, the visible length of the level gauges shall be selected from the following:

<table>
<thead>
<tr>
<th>Visible length</th>
<th>Centre to Centre Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>220</td>
<td>470</td>
</tr>
<tr>
<td>470</td>
<td>720</td>
</tr>
<tr>
<td>720</td>
<td>970</td>
</tr>
<tr>
<td>980</td>
<td>1230</td>
</tr>
</tbody>
</table>

In any case, the maximum visibility length shall not exceed 1500 mm for a single gauge.

f) For level gauging in very viscous liquids and liquids with crystals, float operated magnetic gauges with 2" (50 mm) flanged end connections, shall be used.

4.8.2 Level Transmitter

a) Guided Wave Radar type instruments with side-side connections shall normally be used for level measurement upto 1219 mm. Ext display level instrument with side side connection. For interface Internal displacer type of level transmitters shall be avoided unless application necessitates its use.

b) All displacer type of level transmitters shall be of torque tube type with torque tube material of inconel, as a minimum.

c) Guided wave radar inst shall be + 3mm accuracy.

d) In general, guided wave Radar and displacer type instruments shall be used with displacer lengths of 356 mm, 813 mm and 1219 mm. For interface level measurement, displacer type instruments shall only be used.

e) Differential pressure transmitter shall be used for level measurement above 1219 mm, for services requiring purge or where liquid might boil in external portion.

f) Differential Pressure transmitters for use on corrosive or fouling service shall generally be diaphragm wafer with extended filled capillary type. Flush or extended diaphragm type differential pressure transmitter shall be considered for special applications only. Diaphragm material shall normally be stainless steel or any other special alloy.

4.8.3 Level Switch

a) Level switches shall generally be external ball float type with flanged head. Internal float/displacer type level switches shall only be used if ball float type is not possible, like in viscous services and in underground tanks.
b) Switch shall be sealed micro type with contact rating suitable for the specific application.

c) Level switch shall be furnished with SPDT contacts with adjustable differential, unless otherwise specified.

4.8.4 Tank Level Instruments

a) Each tank shall be provided with minimum 2 type of Tank level indication operating different principles one servo and other radar (Antenna) type..

b) Radar type transmitter shall be provided with + 5 mm accuracy for storage tanks and 1mm for custody transfer. Radar gauge shall be with 8” still well and 8” process connection.

c) Servo type instruments shall have 6” process connection with 12” dia still well, Servo accuracy + 5 mm is for storage tanks and 1mm for custody transfer.

d) The wetted material like float, displacer, tape, wire etc. shall generally be 316 SS.

d) The accessories for servo-controlled level gauge shall include calibration chamber and isolation ball valves for pressurized tanks.

e) Signal transmission shall be digital.

f) For Servo and Radar type instruments shall be capable of providing serial output as per vendor standard protocol or field bus protocol as per IEC-61158 in addition to analogue 4-20 mA DC current output. Also these instruments shall be capable of accepting input from multi element tank temperature sensors (thermocouple/ RTD) and transmit the same as a part of serial signal from the transmitter.

4.8.5 Other Special type of level instruments like ultrasonic, hydrostatic, nuleonic, capacitance, conductivity type shall be used as necessitated by application requirements.

4.8.6 For high pressure steam drum application conductivity type (Hydro a step or equivalent) level instrument along with GWR an DP type Level Transmitter shall be provided.

4.8.7 For solid level measurement, type of instrument shall be ul trasonic/radio frequency/ electromechanical/capacitance/nuleonic. The actual type selection shall be carried out based on the provenness of the selected type for the similar type of application.

4.9 Flow Instruments

The selection of flow measurement instruments shall be based on the requirement of accuracy, repeatability, location, physical properties of the flowing fluids handled, pressure drop, ease of maintenance and instrument cost.

In-line flow instruments shall have a direction of flow indication clearly marked and easily visible in the final installed position.

Flow switches shall not be used without prior approval from the purchaser.

Integral orifice meters, when used, shall be installed with block and bypass valves.
4.9.1 Orifice Plates

a) Flow measurement shall normally be carried out using thin square edged concentric orifice plate mounted between a pair of weld neck flanges of minimum 300 pounds ANSI rating for line size 2" and above. Flange taps shall be used for line sizes upto 12" while D-D/2 taps shall be used for line sizes 14" and above. The material of the orifice plates shall be normally SS 316, as a minimum.

Quadrant edge or quarter circle orifice plates shall be used for highly viscous liquids and for pipe Reynolds number below 10,000.

Conical entrance type of orifice plates shall preferably be used for very highly viscous liquids up to throat Reynolds number of 250. These plates shall be fabricated as per Flow Measurement Hand Book by R.W. Miller.

Vent and Drain holes shall be provided wherever necessary.

b) Sizing of orifice plate shall be carried out in accordance with ISO-5167 (Latest Edition). For orifice plates that are out of ISO 5167, sizing methods shall be ASME MFC-14M (latest Edition) or AGA Report No. 3 or ‘Flow measurement-Engineering Handbook’ by R.W. Miller.

c) Orifice plates shall be fabricated in accordance with standard STD-7-52-41 'Orifice Plates and Flanges Dimensional Details'.

d) Honed metering runs or integral orifice type transmitter shall be used in lines with 12" (40 mm) nominal diameter or below.

e) Upstream and downstream straight length shall be provided based on maximum d/D ratio of 0.75, in general. Where it is difficult to meet this requirement, the actual d/D ratio can be considered for reducing the straight length as permitted by the codes. The recommended practice shall be as per API-MPMS, Recommended Practices and AGA Report No.3. Flow straighteners should be considered, where straight runs are difficult to achieve, otherwise.

f) Meter taps shall be horizontal for liquids, condensible vapours and steam. The taps shall be on top for gas, non-condensible vapour, or liquids which boil at or below the maximum design ambient temperature at operating pressure. Where piping clearances are a factor, taps may be located up to 45E below the horizontal center line for condensible vapour, liquid and steam. The taps may be located up to 60E from vertical for gas and non-condensible vapour.

4.9.2 Venturi

Venturi shall as per ISO 5167 (Latest Edition) or ASME MFC-3M. Ventury throat shall be SS 304 minimum with divergent and convergent section as per Piping Material specification attached elsewhere in MR document. 100% radiography shall be considered where dissimilar welding.

4.9.3 Averaging Pitot Tube

Averaging pitot tube shall be considered for low pressure loss, high velocity steam, large diameter lines and air ducts.
a) The flow sensor shall be continuous averaging velocity head producing type of pitot tube with four or more equal averaging pitot tube sensing ports or continuous slots to suit line velocity profile. The sensor shall also incorporate a rear port for the measurement of line static pressure.

b) Averaging Pitot tube shall be of 3” flanged construction with isolation ball valve.

c) The insert retract mechanism shall be provide to allow on line removal and insertion of the average pitot tube under full pressure condition within the line.

d) Vibration analysis for each averaging pitot tube element shall be done for the indicated flow condition to ensure that the averaging pitot tube is of sufficient thickness and strength to withstand the vibration effects created due to Karman vortex shedding in the fluid stream.

e) The free end of the averaging pitot tube shall be pressure supported at the pipe wall. However, for the large pipe sizes and where vibration analysis recommends the requirement of end support, the end support/weld cap support shall be provided.

f) The offered averaging pitot tubes shall meet the following performance requirements

(i) Accuracy inclusive of repeatability and hysteresis shall be + 1% of actual value

(ii) Repeatability of averaging pitot tube shall be + 0.1% of actual value.

4.9.4 Variable area flow meters:

Variable area flow meters or rotameters shall be as per ISA-RP 16.1, 16.2, 16.3, 16.4, 16.5 and 16.6 and shall be used for viscous or corrosive services or where range ability in flow precludes the use of an orifice. Metal tube rotameters shall be used for all process fluids.

External devices for indicating or transmitting shall be magnetically coupled to the float or extension.

Glass tube rotameters shall be used for low pressure utility services for local indication and where line size is 1-1/2" (40mm) or less. Glass tube rotameters shall not be used if outlet line is connected to a line or vessel containing hazardous or toxic fluid unless a check valve is installed at the downstream side of rotameter.

4.9.5 Turbine Meters

Turbine meters shall be used for accurate flow integration for blending application, custody transfer etc.

Meter selection based on meter sizing shall be carried out in such a way that the maximum flow and normal flow shall not exceed the 90% and 70% respectively of the published normal metering range of the turbine flowmeter. Extended range shall not be referred for the meter selection.

When specified, the meter electronics shall be protected against transients induced by lighting and power supply surges. Transient protection electronics shall preferably be provided in the terminal block. The transient protection shall meet the requirements specified in IEC-60587.
a) Turbine flow meter shall be inline-mounting design type with flow direction clearly marked on the flow meter body to ensure correct installation. Insertion type turbine flow meter shall not be offered.

b) Flow meter design shall ensure that the location and/or orientation of installation i.e. mounting in horizontal and vertical line of turbine flow meter shall not affect the calibration, accuracy and performance of turbine flow meter of the meter.

c) The flow meter shall have an over range protection of at least 130% of specified range. Suitable protection shall be provide against over speeding.

d) The meter design shall also ensure protection against damage due

4.9.6 Target meters shall be considered for highly viscous hydrocarbon streams such as asphalt, tar, polymers etc.

4.9.7 Vortex meter shall be considered where high rangeability is the prime requirement.

4.9.8 Ultrasonic flow measurement shall be considered where non-intrusive flow measuring is required.

4.9.9 Differential Pressure type flow transmitter shall meet all the requirements specified in para.

4.10 Control Valves

4.10.1 Control valves shall normally be globe type, single seated or double seated. Other valve types like butterfly, ball, rotary plug, angle or 3 way etc., shall be selected as per service requirements.

4.10.2 Control valve sizing shall be carried out as per ISA S75-01. The valve shall permit upto 150% of normal flow or 110% of maximum flow, whichever is higher. In general, control valves shall be sized so that the valve opening is as noted below:

At max. flow : about 90% open
At normal flow : about 75% open
At minimum flow : about 20% open.

4.10.3 Flanged control valves shall be used. Body material, body rating and flange rating, shall be as per piping specifications as a minimum.

4.10.4 Minimum control valve body size shall be 1" in general. Reduced trims can also be considered. Body size shall be limited to 1", 1-1/2", 2", 3", 4", 6", 8", 10", and 12". Higher sizes may be used wherever necessary.

4.10.5 Material used for trim shall be SS 316, as a minimum. For higher pressure drops (greater than 10kg/cm²g), flashing, cavitation, erosive and slurry services and, in general, all steam services, trim shall be stellite. (wetted parts like seat ring, valve plug, plug guide, plug stem, guide busing and cage are being termed as trim).

4.10.6 Trim characteristics shall be equal percentage type unless required otherwise. Control valve plugs shall be top and bottom guided for double-seated valves and heavy top guided for single seated valves.

4.10.7 Anti-cavitation trim shall be selected wherever cavitation is expected in the valve.
4.10.8 Noise from control valve during operation shall be limited to OSHA specified level or better. The maximum allowable noise is 90 dBA SPL (Sound Pressure Level). Source treatment for noise shall be preferred by using special trims like anti-noise trims, in case noise exceeds the specified level. Other methods based on merit is permissible.

4.10.9 Valve seat leakage shall be as per ANSI/FCI 70.2 and shall be selected with due consideration to meet the requirement.

4.10.10 Flanged bolted type gland packing boxes shall be used. Packing shall normally be PTFE on liquid and gas service up to 200°C. PTFE impregnated asbestos shall be used above 200°C and up to 260°C with lubricator preferably. Graphite impregnated asbestos or equal, with lubricator, shall be used on steam service and temperature above 260°C.

4.10.11 Bellows seal shall be used where it is required to isolate the packing from the process fluid or where no leakage to atmosphere can be tolerated like toxic, explosive and precious fluids.

4.10.12 Material used for trim shall be minimum 316 SS, with guide bushing of hardened stainless steel like 440 C, 17-4 PH, all upto a pressure drop of 10 kg/cm². For higher pressure drops or erosive and slurry services and in general for all steam services, flashing services, hard surfacing of plug seat rings and seating area of inner valve with stellite shall be used. Special cases may require 17-4 PH seat ring and 440 C solid plugs or other materials like Hastelloy, Durimet, Monel etc.

For temperature above 300°C satellite facing shall be used for guide posts. Guide bushing shall always be harder by a minimum of 125 Brinell than the guide post.

4.10.13 In general, block and by pass valves shall be installed with all control valves upto and including 2" size except for butterfly valves, 3 way valves and slurry and freezing service. Hand wheel shall be provided for all other sizes and services. No by-pass valve or hand wheel shall be used for shutdown valves.

4.10.14 Valve actuator shall be pneumatic spring opposed diaphragm type, in general. Piston type actuators may be used for very high shut off pressure requirements. Additional equipment necessary to meet fail safe condition shall also be included in case double acting piston type actuator is selected. In either case, actuator shall be able to withstand maximum shut-off pressure with the minimum instrument air pressure specified.

4.10.15 Valve positioners wherever used shall be side mounted force balance pneumatic type or electronic instrumentation, I/P converter shall be used along with pneumatic positioners. Separate air filter regulator shall be used for each valve positioner.

4.10.16 Smart type and field bus type positioners

Digital smart positioners or field bus type of positioners with diagnostic capabilities shall be provided whenever specified in the purchaser’s data sheets. These shall meet the following minimum requirements:

a) The positioner sensor and sensing mechanism shall be rugged and shall not be effected by the line/valve vibration. The performance of the positions shall be immune to above vibration.

b) The positioner’s output and input range shall be field adjustable without any hardware modification. The output from the positioners shall be available for both single acting as well as double acting actuator.
c) Each positioner shall be operable, configurable and accessible through HART compatible hand held configurator/field bus configurator as applicable. Smart positioners shall also have a dedicated operating panel for the above functions.

d) Contractor shall provide the valve’s operating signatures in the form of hard copy and soft copy for each control valve provided with smart positioners. The necessary software for advanced control valve diagnostics like seat ring condition, gland packing condition, actuator leakage etc. shall also be included.

e) Fieldbus positioner shall have the capability to perform functions like PID etc.

f) All positioners shall have metallic casing and cover either of stainless steel or of anodized Aluminium.

4.10.17 Whenever limit switches are specified as inductive proximity type, these shall meet NAMUR (DIN-19234) requirements.

4.10.18 Solenoid valves, wherever used, shall be universal type and shall be continuous rated type with class F coil insulation as per IEC 85/IS 1271. These shall be of brass body with SS316 trim, as a minimum.

4.10.19 Self-actuating regulators for flow, pressure and temperature shall be used where loads are constant and requirements of precision and accurate controls are not stringent.

4.11 Pressure Relief Valves And Rupture Discs:

4.11.1 Pressure Relief Valves

4.11.1.1 All pressure relieving devices shall be designed in accordance with ASME code for 'Boilers and Pressure Vessels', API-521 and Indian Boiler Regulations.

4.11.1.2 Pressure relief valves shall be full nozzle full lift type except for thermal relief valves.

4.11.1.3 Conventional valves shall be specified for constant back pressure while bellows seal type valves shall be specified for variable back pressure more than 10% of set pressure. Pilot operated pressure relief valves shall be used for special services and where set pressure is closer than 10% of the operating pressure, in general.

4.11.1.4 Lifting lever shall be specified for steam and air service. Open bonnet shall be used for steam service.

4.11.1.5 The percentage accumulation in case of pressure relief valves/safety valves shall be as follows:

   a) Steam Service
       - ASME SEC I 3%
       - IBR (Before steam let-down station) 5%

       - IBR (Distribution & utilities) and 10%
ASME Section VIII

b) Gas, Vapour or liquid except in para 10%
   4.12.1.5(c) & (d)
   c) Liquid for thermal Relief 25%
   d) Fire exposure on unfired vessels 21%

4.11.1.6 3/4" x 1" threaded (NPT) modified nozzle type valves with typically 0.38 cm² orifice size shall be specified for thermal relief.

4.11.1.7 The body material shall, as a minimum, be as per piping specifications. Nozzle and disc material shall be SS316 as a minimum with machined stainless steel guide and spindle. Whenever semi nozzle designs are unavoidable, body material shall be at least same as nozzle material.

4.11.1.8 The spring material of pressure relief valves shall be as follows unless otherwise necessary because of process conditions:

<table>
<thead>
<tr>
<th>Temperature Range</th>
<th>Spring Material</th>
</tr>
</thead>
<tbody>
<tr>
<td>29°C to 250°C</td>
<td>Cadmium/nickel plated carbon steel.</td>
</tr>
<tr>
<td>above 250°C</td>
<td>Tungsten alloy steel.</td>
</tr>
<tr>
<td>below – 29°C</td>
<td>Stainless steel 316</td>
</tr>
</tbody>
</table>

4.11.1.9 Flanged connection shall be for standard sizes 1" or larger. Minimum flange rating shall be 150 pounds ANSI.

4.11.1.10 Where permissible, screwed connections shall be used on sizes 3/4" and below.

4.11.2 Rupture Disc

4.11.2.1 Rupture discs shall be reverse buckling type, in general and shall be supplied in pre-torqued holder assembly, which shall fit inside the inner diameter of the bolt circle of standard flanges. Disc material shall be compatible with the vessel contents and shall be consistent with the bursting requirements. Inconel discs shall be used above 100°C if compatible with the process fluid.

4.11.2.2 When rupture disc is used upstream of a pressure relief valve, a pressure gauge shall be provided on the downstream of the disc to indicate any rupture of the disc in addition to an excess flow check valve. In addition combination capacity factor of 0.9 shall be used for sizing unless the combination has been tested and approved for any other combination capacity factor.

4.11.2.3 The bursting tolerance of the rupture disc shall be *5% of the specified bursting pressure or less, unless otherwise specified.

4.12 Interlock And Shutdown System

4.12.1 Interlock and Shutdown System shall be an independent system with its own dedicated primary element except for orifice flow measurement. For orifice flow element separate flow
transmitter for shut down / interlock shall be considered. In no case the initiating signal / contacts shall be derived from indicators, controllers, recorders, scanners, alarm annunciator or any such instrument.

4.12.2 The system shall be designed fail safe and shall meet the following requirements, as a minimum:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>a)</td>
<td>All initiating contacts shall be close under normal conditions and shall open under abnormal conditions.</td>
</tr>
<tr>
<td>b)</td>
<td>All relays and solenoid valves shall be energised under normal conditions and shall de-energize under abnormal conditions.</td>
</tr>
<tr>
<td>c)</td>
<td>Emergency shut down switch contacts shall be wired in series with the final actuating device to ensure positive shutdown.</td>
</tr>
<tr>
<td>d)</td>
<td>If desired, because of operational or maintenance requirements, adequate trip by-pass facilities are to be provided with warning lights to indicate that the trip has been bypassed. Trip bypass alarms shall be provided in local as well as in remote location. All such by-pass switches shall be key-operated type.</td>
</tr>
</tbody>
</table>

4.12.3 The system when designed using electromagnetic relays as per job specification shall be located locally or remotely as per the operational requirements. The system shall meet the following requirements as a minimum:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>a)</td>
<td>The electromagnetic relays shall be low power continuously rated type and shall have LED for status indication.</td>
</tr>
<tr>
<td>b)</td>
<td>The relays shall be plug-in-type and their plug-in-bases shall have screwed terminals for interconnection. Lug type soldered connection shall not be acceptable.</td>
</tr>
<tr>
<td>c)</td>
<td>Each relay shall have three numbers of ‘NO’ and three number of ‘NC’ contacts, as a minimum each suitable to drive the connected load. Out of these, one ‘NO’ and one ‘NC’ contacts shall not be used.</td>
</tr>
<tr>
<td>d)</td>
<td>Each shutdown/interlock logic shall be individually protected using separate switch fuse unit and shall have a lamp for indicating power healthy status.</td>
</tr>
</tbody>
</table>

4.12.4 Each shutdown circuit and solenoid valve shall be provided with a switch-fuse unit separately.

4.12.5 The system shall be designed using Programmable Logic Controller (PLC) located in environmentally controlled remote control room. Unless specified otherwise. This shall meet the following minimum requirements:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>a)</td>
<td>PLC shall have dual redundant processor configuration as a minimum. Additional redundancy for I/O's/Power Supply/Communication network shall be provided whenever specified.</td>
</tr>
<tr>
<td>b)</td>
<td>The software shall include the operating system and application program. The application program shall include software for performing functions like interlock and shutdown logic, programming/program modification, documentation etc. Two copies of application program and two set of licensed system software shall be supplied.</td>
</tr>
<tr>
<td>c)</td>
<td>The system shall be supplied with programming tools and related accessories.</td>
</tr>
</tbody>
</table>
d) No two shut down circuits shall be shared by same I/O module, unless specified otherwise.

e) PLC specifications shall be as per clause 6.0 of this specification.

4.13 Compressor Instrumentation

4.13.1 Compressor vendor shall be completely responsible for providing adequate instrumentation for safe and efficient operation of the machine. The commonly used instruments are being detailed out in the following clauses, however this does not absolve the vendor of providing additional instrumentation, if required.

4.13.2 Anti surge and performance control system (ASC).

   a) Vendor shall be fully responsible for the complete design of Anti surge/performance control system (ASC) including selection of type of flow element, controller Algorithm, type of explosion protection, type and operating timings of final control element. Vendor shall guarantee the performance of machine with the offered ASC system. Wherever required, ASC system shall be designed in such a way that it is capable of correcting the compressor operating point so as to avoid surge in order to protect machine from possible damage, to minimize process upsets and to minimize recirculation.

   b) ASC system shall typically consist of but not limited to flow element, flow transmitter, differential pressure transmitter, ASC controller, control valve and other accessories as felt necessary by the Vendor.

   c) Vendor shall supply all the hardware and software related to the operation and safety of the compressor. This shall include but not limited to the following:
      ▪ Design and operation of surge control loop scheme based on offered compressor, performance.
      ▪ Supply of all hardwares in antisurge control loop including dedicated controller, transmitters, measuring elements, final control element etc.
      ▪ Fast response transmitter and control valve etc. as required.
      ▪ Algorithm required for antisurge/Performance control application.

   d) The ASC shall be a dedicated single loop controller on proprietary Hardware Platform or single/multi loop controllers of common hardware platform such as PLC. The single loop controller shall be dedicated controller for each Anti-surge or Performance control application/Tag. Dedicated panel mounted facia shall be provided. The ASC system when provided on common hardware platform shall be with redundant configuration as minimum viz-dual processor, dual input/output, redundant communication & dual power supply system. The multiloop controller/system shall be dedicated for Antisurge/Performance applications/Tags of each machine/each machine tag. Unless specified otherwise dedicated panel facia for each application shall be provided to mount on hardwired console in control room.

   e) It should be able to accept 4-20 mA signal from field or from HIC at purchaser DCS or at LCP as a manual override to anti-surge control system with bump less transfer.

   f) Auto-manual operation with bump less transfer shall be provided.

   g) The controller response time (total time to read input, processing time and output) shall be as per the machine dynamics and safety and shall be of the order of max. 40-milisec. Any faster response required based on machine dynamics shall be considered.
by vendor. The input sampling interval shall be as per machine dynamics within the controller response time as above. The processor cycle time shall be considered to meet the overall response time.

h) The ASC shall be field proven, specific to the make of machine and for the similar application in hydrocarbon industries. Bidder shall provide the proven track record for the offered ASC meeting the above.

i) The Anti surge/Performance control algorithm shall be implemented using standard firmware in the controller/Processor system.

j) The Algorithm developed by vendor shall be specific for given application, surge control, performance, load sharing etc. and shall be field proven for the compressor make.

k) The algorithm implemented in the system shall be protected against any modifications/changes.

l) The configuration shall be stored in non-volatile memory or battery back-up for configuration shall be provided (min 72 hours) in case of volatile memory along with battery drain indication.

m) In case of ASC on common hardwired platform separate configurator with necessary hard ware/ soft ware shall be provided for application programming.

n) Anti surge controller shall not be used for performing any other machine related inter locks/logics.

o) All the instruments (transmitters, I/P converters and temperature elements and / or transmitters) connected with anti-surge control loop shall be flame proof "EEExd" type suitable for the area as specified. The suitability of smart transmitter shall be confirmed by vendor and to be provided accordingly.

4.13.3 Machine Monitoring System (MMS):

Machine Monitoring system shall be provided for continuous monitoring and indicator of machine parameters like vibration & axial displacement, bearing and winding temperature, keyphasor etc.

4.13.3.1 Vibration and Axial Displacement Monitoring

4.13.3.1.1 The machine monitoring system shall be Bently Nevada 3500 or equivalent, the system shall be provided with built in intrinsically safe barrier and shall be duly mounted in separate panel. No external barrier shall be provided for the same.

4.13.3.1.2 For MMS the display unit shall be provided at local control panel with necessary statutory certification. Alternately purged enclosure is also acceptable with necessary certification.

4.13.3.1.3 Vibration and displacement monitoring system shall be as per API-670. The extent and type of monitoring shall be as defined elsewhere. However, vendor shall furnish any additional requirements for monitoring deemed essential by them with reasons. Two probes at 90 degree apart for each location shall be provided and connected to same dual channel monitor for vibration monitoring.
4.13.3.1.4 The sensing probe shall be accessible for adjustment, repair and replacement without dismantling the machine.

4.13.3.1.5 Vendor shall provide continuous 4-20 mA dc isolated output for each channel of measurement for remote indication and potential free contacts for alarm/shutdown setting from the monitors.

4.13.3.1.6 In addition to this, it shall be provided with necessary hardware (communication Gateway Module) (including the cable for serial data communication from monitoring system to purchaser’s DCS) for machine monitoring through purchaser’s DCS via redundant serial data interface between this system and purchaser’s DCS. Bidder shall furnish all details like pin configuration and tag number wise MODBUS address mapping list etc. for smooth interfacing of this communication link with DCS.

4.13.3.1.7 Bidder shall also supply one common laptop based configuration unit for the package unit with required configuration software and hardware for configuration of MMS system including the serial communication cable required between configuration unit (laptop) & MMS monitors.

4.13.3.1.8 Monitors shall be dual channel type and shall meet the following specifications as a minimum:

   a) Continuous two channel monitoring with each channel input from one probe. Readout scale shall read higher of the two sensors.

   b) Each channel shall have two independent alarm levels one for pre trip alarm and one for each trip, settable continuously over measurement range. Two relay contacts for each pre trip alarm and trip alarm per channel shall be provided.

   c) Broken sensor failure detection without causing shut down.

   d) LED lamps on monitor front for each channel to indicate pre-trip alarm, trip-alarm and circuit not OK conditions.

   e) Selector switches on monitor front to read vibration/ displacement pre-trip alarm and trip set points for each channel shall be provided.

   f) Analog output 4-20 mA dc isolated signals shall be provided for each channel for remote indication.

4.13.3.2 Bearing & Winding Temperature Monitoring

4.13.3.2.1 In general, bearing temperature shall be measured at the points which are under maximum loading.

4.13.3.2.2 Sensor shall be three wires RTD element of platinum having 100 ohms resistance at 0°C. Calibration shall be to DIN 43760 standards.

4.13.3.2.3 The temperature sensor, cables, terminal heads, junction boxes etc. should be capable of withstanding the mechanical vibration and environment of a rotating machinery atmosphere.

4.13.3.2.4 Bearing and Winding temperature shall be monitored by means of a temperature monitor. The temperature monitors shall be mounted on the local control panel in hazardous area and shall meet following requirements:
a) Accept RTD inputs (platinum, 100ohm at 0°C calibrated to DIN 43760 standards).

b) Continuous six channel monitoring with each channel input from one RTD. Read out scale shall read higher of the six temperatures.

c) Each channel shall have two independent alarm levels one for pre-trip alarm and one for trip alarm, settable continuously over measurement range.

d) Broken sensor failure detection without causing shut down.

e) Selector switches on monitor front, to read temperature, pre-trip alarm and trip set points for each channel shall be provided.

f) Analog output 4 - 20 mA dc isolated signals shall be provided for each channel for remote indication.

g) Monitor shall be Bentley Nevada 3500 series or better.

4.13.3.2.5 Separate temperature monitors shall be provided for motor winding and bearings temperature monitoring.

4.13.3.3 Key Phasor

4.13.3.3.1 Key phasor system shall be provided by vendor for performing analysis of vibration signals to determine machine malfunctions. It shall consist of a proximity probe and transmitter, extension cable etc. and other accessories to make the system complete. Vendor shall provide necessary reference on the shaft to determine one-per-turn occurrence.

4.13.4 Speed Governor System

Digital microprocessor based fault tolerant triple modular redundant governing system of mounted in standalone cabinet and located in rack room.

4.13.4.1 HMI for operator interface shall be supplied loose with all mounting accessories for mounting this HMI in purchaser’s hardwired console in general. This shall include all basic features of governor to enable operator to do all control and monitoring operations from console itself. 4.13.4.2 This shall include features like assignable speed range, adjustable speed set point, remote speed set point input, digital speed indication, adjustable speed ramp, override for testing the external over speed trip system etc.

4.13.4.3 It should be able to accept 4-20 mA signal from HIC at purchaser’s DCS or LCP as a manual override to governor and pass on the same, after a bump less auto / manual selection & local / remote selector switches configured in woodward governor (shall be possible through HMI) to governor valve as manual control.

4.13.4.4 Bidder shall provide all hardware & software in the system (including the cable for serial data communication from system to purchaser’s DCS ) for serial communication link for all data transfer from governor to purchaser’s DCS. This serial link shall be RS 422 / RS 485 with MODBUS RTU protocol, bidder shall furnish all details like pin configuration and tag number wise MODBUS address mapping list etc. For smooth interfacing of this communication link with DCS.

4.13.4.5 The Governor Control System shall be Woodward or equivalent.
4.13.5 Accumulator of Lube Oil System

4.13.5.1 If accumulators are used with nitrogen for lube oil dampening at the desired pressure to meet the system requirement the following instrumentation with the accumulator to be provided by vendor:

a) Accumulator shall have charge kit with isolation valves and connection hoses.

b) Standard Nitrogen cylinders available in India are at pressure of 140 k g/cm² with standard connection sizes. Vendor shall provide the complete regulator system with protection for charging Nitrogen from Nitrogen cylinder to accumulator at the desired pressure. Regulator shall be suitable for the inlet pressure variation of 140 to 150 kg/cm² while charging with suitable inlet connection to match the Nitrogen cylinder connection. Regulator system shall have pressure indicator, regulator, relief valve, needle valve etc. as a minimum. Material of construction shall be stainless steel.

4.13.6 The compressor loading-unloading scheme for reciprocating compressors shall be provided as per the minimum requirements specified in the job specifications. Manual as well as automatic schemes shall be provided.

4.13.7 Emergency switch shall be provided in the local panel/local. All such switches shall have a protective cover to avoid inadvertent shutdown.

4.13.8 Vendor shall provide the following common alarms for purchaser:

a) Common machine pre-trip alarms.

b) Common machine trip alarm.

4.14 System Cabinets, Racks And Consoles

4.14.1 All system cabinets, marshalling racks and hardwired consoles shall be free standing and enclosed cubicles type. All these items shall have bottom cable entry.

4.14.2 Cabinets shall be fabricated from cold rolled steel sheet (CRCA) of minimum 2.0mm thickness suitably reinforced to prevent warping and buckling. Doors shall be fabricated out of 1.6 mm thick CRCA sheet. Cabinets having modular construction and with basic frame structure of heavy duty aluminium shall also be acceptable.

4.14.3 Cabinet/Console finish shall include sand blasting, grinding, chemical cleaning, surface finishing by suitable filler and two coats of high-grade lacquer with sanding between coats. Two coats of paint in the cabinet colour and a final coat after assembly at site, shall be given for non-glossy high satin finish.

4.14.4 In order to remove dissipated heat effectively vent louvers backed by wire fly screen shall be provided. Further, ventilation fans shall be provided wherever required. High temperature annunciation shall be provided on operator console.

4.14.5 Illumination shall be provided for all cabinets by LED lamps, which shall be operated by door switch.

4.14.6 All cabinets/racks/consoles shall be adequately sized to avoid any congestion. Wiring shall be done as per guidelines provided in clause 4.3.14 of this specification.
4.14.7 The height and colour of the cabinets shall be inline with other equipments being installed in the control room.

5.0 DISTRIBUTED CONTROL SYSTEM

5.1 General

5.1.1 The system shall be a microprocessor based having functional distribution and data base distribution sub-system wise. The system shall be of modular construction and expandable in future by adding additional modules.

5.1.2 On-line replacement of any module shall be possible in such a way that removal and addition of a module shall be possible without de-energizing the system. Further, there should not be any interruption in the system while replacing a faulty module wherever redundant modules are provided.

5.1.3 Galvanic isolation shall be provided for all field signals.

5.1.4 All sub-systems of this system shall be able to operate satisfactorily from 15°C to 30°C and 20 to 80% of non-condensing humidity.

5.1.5 The system shall have the capability of detecting open sensors.

5.1.6 DCS should be provided with licence free of cost with eXpandability

5.2 Spares Philosophy

5.2.1 Vendor shall provide installed spares of 10% for each type of input/output modules to enhance the system functional requirements. The system shall also have the software capability to take care of these installed spares.

5.2.2 Vendor shall also provide the following spares in addition:

a) 5% mandatory spare or one of each type of module used in the system including all processor, memory communication and power supply modules but shall not include TFT printers, disc drives etc.

b) Consumables spares for a minimum of six months duration after system acceptance which shall includes paper, ink, cartridges etc for printers., assignable recorders, video copier etc.

c) Commissioning spares

d) 2 years of continuous operational spares (to be quoted separately).

5.3 Functional Specifications

5.3.1 Functional Requirements

The system, as a minimum, shall meet the following requirements without any supervisory computer:

a) Control, data acquisition and monitoring

b) Alarming
| c) | Historical data storage, archival and retrieval |
| d) | Logging and report generation |
| e) | System configuration and builder facility. |

### 5.3.2 Controller and Data Acquisition Sub-system

a) The control function shall be executed by microprocessor based multiloop controllers. Each multiloop controller along with its related I/O's shall be backed up by a similar redundant controller which shall take over on the failure of the main controller. The switch over time shall be of the order of 1 second.

b) Redundancy shall be provided for all data acquisition points also if a single module handles more than 16 analog I/Os or 32 digital I/Os at any stage.

c) Controller and data acquisition sub-system shall be able to scan close loops in less than 500 milliseconds and an open loop in 2 seconds.

d) It must be ensured that processor and memory loading shall not exceed 60% under the worst loaded conditions.

e) Controller and data acquisition sub-system shall be able to implement required control and data acquisition strategies like signal conditioning, linearisation, compensation, square root extraction, summation, subtraction, logic functions, high-low selection etc. as a minimum. Other algorithms shall also be possible to be executed if required for the package unit control.

### 5.3.3 Operator Interface Sub-System:

a) Operator interface sub-system shall provide the centralized information to the package unit operator/engineer in the following fields:

- Indication of all analog and digital process variables.
- Manipulation of control loops.
- Alarm displays and annunciation.
- Graphic displays.
- Logging and trending.
- Self diagnostic messages.
- System configuration and display building.

b) Operator interface sub-system shall consist of operator console each with three 19" colour TFTs, three set of keyboards, alarm and event printer and logging printer.

c) Each TFT keyboard of operator console shall either be driven by independent electronics or common redundant electronics.

d) All the functions of TFT's and keyboards of an operator console shall be fully interchangeable. Further any change made in the database of one TFT's shall automatically update the data base of other TFTs of the same console.
e) TFT data display update rate shall not be more than two seconds.

f) A minimum of 8 digits shall be required for tag number and 15 digits for process description.

g) Keyboard shall preferably be touch sensitive type, spill proof and shall have a key lock to restrict engineering functions. Functions like data base configuration, alarm settings, graphic compilation, real time clock setting, alarm inhibiting etc shall be restricted through key lock.

h) Process Displays:

System shall be able to display adequate number of hierarchical views like overview, group and loop display easily accessible through keyboard.

i) It shall also be possible to display and control process package through dynamic graphics. System shall have enough capacity to display complete package through dynamic graphics.

j) Real time trend and Historical trends shall be possible. Real time trend shall have sample time of 10 second and shall be available for minimum 1 hour. Historical trend shall be possible with a minimum sample time of 1 minute and shall be available for 25 hours.

k) Tuning trend shall also be possible with sample time of at least 1 second.

l) Facility shall be available in the system for archival of historical data either on tape or on floppies.

m) Alarms shall be displayed as and when they appear irrespective of type of display distinguished by flashing and colour change. Alarm summary and alarm history shall also be possible in the system.

n) System alarms shall also be annunciated as reported by self-diagnostic routines. Status of various sub-systems connected on the communication sub-system shall be provided on configuration display.

o) Various log reports shall be generated and printed on the logging printer. The log reports required shall be shiftly (8 hourly) report, daily report, daily production report, shutdown report, on-demand report etc. Various alarms process or system and events shall be printed on the alarm and event printers as and when they appear. Formats for log reports shall be user definable.

p) Data archival and retrieval facilities shall be available in the system.

q) Deleted

5.3.4 Communication Sub-system:

a) The communication sub-system shall be dual redundant serial communication bus for connecting various sub-systems. Each sub-system shall be connected to bus using redundant communication interfaces.

b) Suitable methods shall be used for error checking on all data transfer. The mechanism used shall be transparent to the user.

c) Any redundant Fibre optic cable coming from Field to DCS/PLC shall be through Separate route , separate cableduct/tray
6.0 PROGRAMMABLE LOGIC CONTROLLER

6.1 General

6.1.1 The programmable logic controller shall be micro processor based system. The system shall be in addition be of modular in construction and expandable in future by adding additional modules.

6.1.2 On-line replacement of any module shall be possible in such a way that the removal and addition of any module shall be possible without de-energizing the system. Further there shall not be any interruption in the system while replacing a faulty module except for the inputs/outputs, which are being handled by the module.

6.1.3 Programmable logic controller shall be able to operate satisfactorily from 15OC to 30OC and 20% to 80% non-condensing humidity. The system shall be installed in environmentally controlled control room unless specifically indicated otherwise.

6.1.4 The system shall have extensive set of self diagnostics hardware and software for easy and fast maintenance. Diagnostics shall be required at local as well as a console level.

6.1.5 Separate power supply unit shall be provided for individual I/O rack and processor unless otherwise specified. Suitable battery (Note 1) back-up shall be provided for volatile memory protection.

6.1.6 Operation of PLC shall be completely unaffected by a momentary power loss of the order of 20 milli seconds.

6.1.7 The system shall be programmed in general as per the logic diagram or ladder diagram.

6.1.8 No single mode failure shall affect the system whenever redundant system configuration is specified.

6.2 System Configuration

6.2.1 Vendor shall offer system configuration as per the respective job specifications. However, each sub-system offered shall meet the minimum requirements specified in the following paragraph.

6.2.2 Input/output Sub System

6.2.2.1 The maximum number of input/output per I/O module shall not exceed the following:

<table>
<thead>
<tr>
<th>S.No.</th>
<th>Type of Configuration</th>
<th>No. of I/Os</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Single I/O system</td>
<td>8</td>
</tr>
<tr>
<td>2</td>
<td>Dual I/O</td>
<td>16</td>
</tr>
<tr>
<td>3</td>
<td>Triple Redundant System</td>
<td>32</td>
</tr>
</tbody>
</table>

6.2.2.2 Each I/O shall be electrically isolated from external control circuit by suitable means. The minimum isolation level between I/O and logic circuit shall be 1000 V dc.

6.2.2.3 Each I/O shall be protected against the reversal of polarity of the power supply voltage to I/O.

6.2.2.4 Each module shall have a LED for each I/O per channel to indicate the status of each Input/output.

6.2.2.5 The output control rating shall be as follows:

<table>
<thead>
<tr>
<th>S.No.</th>
<th>Application</th>
<th>Voltage Rating</th>
<th>Current Rating</th>
</tr>
</thead>
</table>

Note: 1 Spare Battery Shall be provided
1. All output cards for driving solenoid valves  110 V dc  0.5 A Inductive  
2. All output cards for alarm annunciators  24 V dc  2.0 A Inductive  
3. All LT motors/pumps/compressors output cards unless otherwise specified  240 V ac  5 A Inductive  
4. All HT motors/pumps/compressor (6.6 kV and above) unless otherwise specified.  220 V dc.  2.0 A Inductive

6.2.2.6 Each output shall be short circuit proof and protected by using fuse. Visual indication of fuse blown must be provided for each output.

6.2.3 Processor Sub-System

6.2.3.1 The processor shall have capability to implement all the control functions required to execute the logic schemes. The size of the memory shall be sufficient for the storage of the programme instructions required by the logic schemes.

6.2.3.2 Memory shall be non-volatile. In case volatile memory is provided, battery backup shall be provided for a minimum of three months to keep the storage intact. A battery drain indication shall be provided at least one week before the battery gets drained.

6.2.3.3 Whenever dual processor is specified, redundancy shall be provided such that in case of failure of main processor the standby processor shall take over automatically without any bumps. Redundancy shall be provided for complete processor sub-system including CPU, memory and power supply. In case of failure of complete processor system, output shall take fail-safe state automatically.

6.2.3.4 In case of triple redundant system, all the three processors shall execute the same instruction / programme and check their results and majority vote to correct any faulty result.

6.2.3.5 It shall be possible to generate the first out alarm output by the PLC.

6.2.4 PLC Console

6.2.4.1 The PLC console shall be used for programming, programme storage, fault diagnostics and alarm monitoring. It shall also be possible to use this for plant operation, whenever specified.

6.2.4.2 It shall consist of a single colour 19" size TFT screen, one programming keyboard and operating keyboard, whenever specified.

6.2.4.3 The keyboard shall preferably be touch sensitive sealed type, easy to operate with each key clearly identified. It shall be provided with a lock and key to prevent any unintentional programme modification.

6.2.4.4 It shall be possible to modify, add or delete the application programme online without affecting the output.

6.2.4.5 Whenever PLC TFT’s is used for plant operation, it shall be 19" colour TFT and shall be able to display process dynamic graphics, overview and group displays.
6.2.4.6 It shall be possible to printout the Ladder/logic diagram on the PLC printer. In addition printer shall also print the diagnostic messages and reports, shut down report, I/O map, process alarms etc.

6.2.4.7 PC based console when offered must be of current release and state-of-the art.

6.2.5 System Power Supplies

6.2.5.1 Programmable logic controller shall operate on uninterrupted power supply with following specifications:

- Voltage: 110V "10%
- Frequency: 50 Hz " 3 Hz
- Switchover time: 5 millisecond

6.2.5.2 Each I/O rack shall be provided with a separate power supply.

6.2.5.3 Each processor unit shall be provided with separate power supply.

6.3 Self Diagnostics

6.3.1 The system shall have extensive set of self-diagnostic sub-routines which shall be able to identify the system failure at least up to module level. At local level, failure of a module shall be identified by an individual LED.

6.3.2 Whenever auto-testing of I/O modules is specified, the testing software must be capable of detecting faults in case of normally open as well as normally close system.

submitted by them during the course of execution of the job. The schedule shall list all drawings and documents along with their number and expected date of submission.

ANNEXURE - II

MATERIAL SELECTION CHART

(INSTRUMENTATION)
MATERIAL SELECTION CHART

1.0 All materials shall be as per PMS attached elsewhere.

2.0 For all instruments in sour service, all materials of construction shall meet the requirements specified in NACE MR01-75 latest edition. In addition, any other requirements if specified in respective piping class, shall also be complied.

3.0 For testing requirements like Radiography, IBR, NACE, Hydrogen testing, Post weld heat treatment, etc shall be followed as per piping material specification for the respective piping class.

**PART II**

SPECIFICATION FOR MATERIAL, INSTALLATION, TESTING AND COMMISSIONING.
CONTENTS

1.0 INSTALLATION MATERIALS

2.0 INSTALLATION

3.0 TESTING AND CALIBRATION

4.0 COMMISSIONING
1.0 INSTALLATION MATERIALS

1.1 Vendor shall ensure and supply all erection hardware required for the installation of complete instrumentation which form a part of the package unit. This includes items like cables, cable glands, junction boxes, instrument valves and manifolds, mounting accessories, impulse piping/tubing, pipe/tube fittings, pneumatic signal tubes, air line pipes and fittings, filter regulators, steam/electrical tracing, insulation materials, cable duct and trays, conduits, identification tags, structural material required for instrument supports and trays etc.

1.2 Clause 1.1 above broadly covers the items required for any typical plant, however the vendor shall supply all necessary items to make the installation and commissioning work complete in all respects, irrespective of whether these have been explicitly included in their scope or not.

1.3 Salient features and minimum requirements for some of the main installation materials is being described in the following paragraphs. For items for which no specification have been provided, vendor may follow their own specifications and prevailing international standards.

1.4 Cables

1.4.1 All cables shall have PVC insulated primary insulation of 85OC PVC as per IS-5831 Type C and inner and outer jacket shall be 90OC PVC to IS-5831 Type ST-2. Oxygen index of PVC shall be over 30% and temperature index shall be over 250OC.

1.4.2 When cables are required to be fire retardant, they shall be as per standard IEC 332 Part III Cat. A.

1.4.3 The insulation grade shall be 600 V/1100 V as a minimum and shall meet insulation resistance, voltage and spark test requirements as per BS -5308 Part-II.

1.4.4 All cables shall be twisted and armoured. Armour over inner jacket shall be of galvanized steel wire/flat as per IS-1554 part I.

1.4.5 For signal and control cables, inner jacket colour shall be black. Outer jacket colour shall be light blue for intrinsically safe application and black for others. For thermocouple extension cables the inner and outer jacket colour shall be as per IS-8784.

1.4.6 Maximum dc resistance of the conductor of the completed cable shall not exceed the following:

   a) 12.3 ohms/km at 20°C for cables with 1.5 mm² conductor.

   b) 39.7 ohms/km at 20°C for cables with 0.5 mm² conductor.

1.4.7 The mutual capacitance of the pair or adjacent cores shall not exceed 250 pF/m at a frequency of 1 kHz. The capacitance between any core and screen shall not exceed 400 pF/ m at a frequency of 1 kHz.

1.4.8 L/R ratio of adjacent cores shall not exceed 40 m microhenry/ohms for cables with 1.5 mm² conductor and 25 μH / 0 for cables with 0.5 mm² conductor.

1.4.9 The drain wire resistance including shield shall not exceed 30 ohms/km.
1.4.10 A pair of communication wire shall be provided for multipair cables. Each wire shall be 0.5 mm² of plain annealed single or multi-strand copper conductor with 0.4 mm thick 85°C PVC insulation. Insulation shall be green and red colour coded.

1.4.11 Vendor shall ensure a minimum of 20% of quantity of each type of cables supplied as spare including any special cable. And in each multipair cables 20% pairs shall be kept as spare.

1.4.12 Running length of the cable shall be printed at least at every 5 metre interval.

1.4.13 Signal Cables

a) Single pair shielded signal/alarm cables shall be used between field instruments/ switches and junction boxes/local control panels.

b) Multipair individually and overall shielded signal/alarm cables shall be used between junction boxes/local control panels and control room, in general.

c) The single pair shall be 0.5 m² conductor size, triad cables shall be 1.5 m² conductor size made of electrolytic copper conductor of 7’s strands with each strand of 0.53 mm diameter, multipair cables with 0.5 mm² conductor size shall have 16 strands of annealed electrolytic grade copper conductor with each strand of 0.2 mm diameter, multi triad cable or multi pair cable with 1.5 m² conductor shall have 7 strand with each strand of 0.53 mm diameter.

d) Shield shall be aluminium backed mylar/polyester tape bonded together with the metallic side down helically applied with either side having 25% overlap and 100% coverage. The minimum shield thickness shall be 0.05 m in case of single pair/triad and 0.075 mm incase of multipair/triad cable.

e) Drain wire shall be provided for individual pair and overall shield which shall be 0.5 mm² multi stranded bare tinned annealed copper conductor. The drain wire shall be in continuous contact with aluminium side of the shield.

f) All multi pair cables shall have 6 pair/12 pairs only while multitriad cable shall have 6 triads/8 triads only.

1.4.14 Control Cables

a) Single pair control cables shall be used between field mounted solenoid valves and junction boxes/local control panels and shall meet the requirements specified in para 1.4.13 above.

b) Multipair control cables shall be used between junction boxes/local control panel and control room mounted devices in general. These cables shall have only overall shielding.

c) These control cables shall have 1.5 sq mm conductor size with 7 stranded conductors of annealed electrolytic grade copper, with each strand of 0.53 mm diameter.

1.4.15 Fieldbus Cables

a) Fieldbus cables shall be 0.8 mm² twisted in pair individually and overall shielded with aluminium mylar tape with drain wire and armoured. Other parameters shall be as per Type A defined in IEC-61158-2.
b) Fieldbus cables shall be single pair, two pairs, three pairs and four pairs.

c) The field bus cable shall be field proven for FF applications.

1.4.16 Thermocouple Extension Cables

a) Single pair shielded thermocouple extension cables shall be used between thermocouple head and junction boxes transmitters/local control panel mounted instruments.

b) Multipair individually and overall shielded thermocouple extension cables shall be used between junction boxes and control room mounted devices.

c) The type of thermocouple extension cables shall be compatible with thermocouple used. In addition the colour coding of the primary insulation shall be as per IS-8784-1987 Table 5.

d) The cable shall have 16 AWG and 20AWG solid conductors for single and multipairs respectively.

e) All thermocouple extension cable shall be matched and calibrated in accordance with IEC-584-2.

f) Shield shall be aluminium backed by mylar/polyester tape bonded together helically applied with the metallic side down with either side having 25% overlap and 100% surface. Minimum shield thickness shall be 0.05 mm for single pair and 0.075 m m for multipair cable. Drain wire shall be 0.5 mm 2 multi-strand bare tinned annealed copper conductor. The drain wire shall be in continuous contact with the aluminium side of the shield.

g) Inductance shall not exceed 4 mH/Km. However for J-type thermocouple inductance could be 8 mH/km.

h) All multi-pair cables shall have 6 pairs/12 pairs only.

1.4.17 Power Supply and Other Cables

a) All power supply cables shall be as per IS-1554 Part I and shall have copper/aluminium conductors depending on conductor size. Minimum conductor size shall be 2.5 mm 5 of copper conductor. For higher sizes, aluminium conductor can be considered. All these cables shall be PVC insulated and armoured.

b) Any other special cable required for instruments shall also be supplied as per requirements. Vendor shall ensure that these cables are armoured type and shall meet all other requirements specified in para 1.4.1 through 1.4.12, as applicable.

1.5 Cable Glands

a) Vendor shall supply all cable glands required for glancing the above mentioned cables both at field instrument and local control panel side, junction boxes side and at control room side.

b) All cables glands shall be of nickel-plated brass and they shall be double compression type suitable for armoured cables.
c) Flame proof glands wherever required shall be supplied with Ex (d) certification.

d) Vendor shall supply a minimum of 20% of cable glands as spare.

1.6 Junction Boxes

a) Vendor shall supply junction boxes as per the cables selected, wherever required. These shall be of die cast aluminium alloy (LM-6) body and shall be weather proof, as a minimum.

b) These boxes shall have terminals suitable for minimum or 4mm² or less cable termination mounted on rails. 20% spare terminals shall be supplied in each junction box.

c) Telephone sockets and plugs shall be provided in junction boxes.

d) Flame proof junction boxes wherever required shall be supplied with Ex (d) certification. All such boxes shall be weatherproof also.

e) Each junction box shall have a minimum of 10% or 2 Nos., whichever is higher, spare entries. All spare entries shall be provided with plugs.

1.7 Junction Boxes for Fieldbus loops

1.7.1 For Fieldbus segment, junction box which is used for mounting the wiring/ terminal blocks to terminate the trunk and spurs in the fieldbus networks.

Unless otherwise specified, bidder must use the following type of terminal blocks:

For all FISCO signals : Weatherproof terminal blocks
For all FNICO signals : Non-incendive terminal blocks
For all safe signals : Weather proof terminal blocks
For all Explosion proof signals: Explosion proof/Flameproof terminal blocks

1.7.2 Junction box for Fieldbus field barrier concept:

Fieldbus junction boxes with field barrier assembly/ assemblies shall be provided. Housing shall be of SS316. Not more than 3 field barrier assemblies shall be considered in one segment. Field barrier assemblies in a segment shall be multidropped (shall not be daisy chained in a trunk). For multi field barrier assembly in a junction box. Field barrier assemblies shall be DIN rail mounted. Also bidder shall terminate the spare pair of trunk cable in DIN rail mounted terminal in junction box. One field barrier assembly shall contain:

- Isolation switch (EEEx de) for isolating the field barrier assembly from fieldbus trunk.
- Clamp on terminals (screw less type)
- Not more than 4 barriers / spur connections.
- Not more than one field device in each barrier / spur connection.
- Internal short circuit protection for each spur (short circuit current <= 50 mA)
- LED indicator for each spur short circuit.
- Each spur shall be galvanically isolated from trunk.
- Fieldbus terminator for each segment shall be inside junction box.
Each FF barrier junction box shall have provision to terminate addition part of trunk cable.

1.7.3 Not more than 3 wiring/terminal blocks shall be provided in each Fieldbus Junction Box.

1.7.4 The Fieldbus Junction Boxes shall be SS.

1.7.5 Sufficient spacing shall be provided inside the Junction Boxes for mounting of Megablocks, termination & routing of Trunk/Spur cables to the Megablocks, sufficient space shall be provided for installing terminator etc. inside the Junction Box.

1.7.6 For spur and trunk cables, 20% addition cable entries must be provided. Unused entries shall be plugged.

1.7.7 The cable entry shall be 1/2" NPTF. Each junction box shall be provided with sufficient entries with weatherproof, flameproof plugs, as required. Trunk entry shall be from the bottom whereas spur connection from the side.

1.8 Instrument Valves And Manifolds

a) Vendor shall supply instrument valves (miniature type) and valve manifolds wherever required.

b) Body rating shall be as per piping class or better. However trim material shall be SS304, as a minimum. All valves and manifolds shall be forged type only

c) Valve body and trim material shall be 316 SS unless otherwise specified. Superior trim material shall be selected as required by process conditions. Packing material in general shall be of PTFE.

d) Vendor shall supply a minimum of 20% instrument valves and manifolds as spare.

1.9 Impulse Piping/Tubing

a) Vendor shall supply 1/2" OD x 0.065" thick ASTM A 269 TP 316 L stainless steel seamless tubes as a minimum for impulse lines.

b) Where the pressure (operating) exceeds 70kg/cm²g or if piping is specified as impulse line, seamless pipes of size ½” NB of required thickness shall be supplied with material as per piping class.

c) Seamless tubes shall have a hardness of max 80 RB as typical.

d) Steam tracing shall be 10 mm OD copper tubes of electrolytic grade copper.

e) Vendor shall supply a minimum of 20% of pipe/tubes as spare.

1.10 Pipes And Tube Fittings

a) Vendor shall supply flareless compression type of tube fitting and of three piece construction with design similar to s wage lock/Parker Hannifen/Ermeto etc.b) The fitting/ferrule hardness shall be in the range of RB 85-90 so as to ensure a minimum hardness difference of 5 to 10 between tube and fittings. The ferrule shall be of stainless steel material, in general.
c) Socket-weld type forged pipe fittings of suitable material and rating shall be supplied for pipe fittings. The minimum rating shall be 3000 Lbs. Weld neck fittings shall be used where socket weld type are not allowed by piping class.

d) Instrument air brass fittings shall be suitable for use on copper tubes conforming to ASTM B 68/B 68 M hardness not exceeding RB 50. All fitting parts shall be manufactured from Brass as per IS -319 bar stock or equivalent and shall be nickel plated.

e) All threaded fittings shall have NPT threads as per ANSI/ASME B16.11 only.

f) Vendor shall supply a minimum of 20% of each type of pipe/tube fittings as spare.

1.11 Pneumatic Signal Tubes

a) Vendor shall supply 6mm OD x 1mm thick PVC covered fully annealed electrolytic grade copper tubes as per ASTM B68.74A Cu. No.122 (DH) for pneumatic signal tubes.

b) Vendor shall avoid use of intermediate connections and shall estimate single length for each instrument location.

c) Vendor shall supply a minimum of 20% length of these tubes as spares.

1.12 Instrument Air Lines Fittings And Valves

a) Seamless galvanised, inside and outside, carbon steel pipes used for instrument air distribution shall be as per IS 1239 class Heavy.

b) Galvanised forged screwed carbon steel screwed fittings of 2000 lbs rating fittings shall be used.

c) Isolation valves on instrument air service shall be packless gland type full bore ball valves.

d) Vendor shall supply a minimum of 20% of air pipe, fittings and valves as spare.

1.13 Air Filter Regulators

a) Instrument air filter regulator of suitable size, range and capacity shall be supplied for each pneumatic instrument.

b) The body of the filter shall be anodised aluminium.

c) The filter shall have 5 m micron sintered bronze/ceramic filter element and shall be provided with manual drain and 2” nominal size pressure gauge.

d) Vendor shall supply a minimum of 20% of air filter regulators of each size and range as spare.

1.14 Cable Trays and Cable Ducts
a) All cables on the main pipe rack shall be laid in cable duct. Cable ducts shall be fabricated as per 'Duct Fabrication Details' standard No. 7-52-253.

b) All branch cables/tubes shall run on cable trays

c) These cable trays shall be made out of galvanised mild steel sheets of 2.5 m thickness. Ladder trays shall be of mild structural steel and shall be painted with redoxide primer. 50 mm x 50 mm angle shall be used as a minimum.

d) The width shall be so selected that 50% of tray space is available for future use.

e) Suitable cable clamps shall be supplied for binding the cables/tubes at every 500 mm.

1.15 Instrument Support/Structural Steel

a) Vendor shall supply instrument stands, stanchions and other structural steel material required for supporting the cable trays, impulse lines and instruments.

1.16 HEAT TRACING AND INSULATION

a) Heat tracing and insulation of line mounted instrument, instrument impulse lines shall be carried out as per line specifications. Similar philosophy shall also be followed for equipment mounted instruments.

b) Instruments mounted on jacketed lines and jacketed equipments shall be jacketed only. In case the jacketing of any particular instrument item is not possible, heat tracing may be selected after intimation to Owner/Owner Representative before proceeding ahead.

c) For all steam traced lines and steam jackets, a suitable type of steam trap must be provided for proper and efficient tracing. Separate dedicated steam trap shall be used for each instrument. Steam trap shall preferably be located on ground level with its outlet connected to drain funnel or as advised elsewhere in the package.

d) Wherever electric tracing is shown in the approved P&ID and selected for instruments and instrument lines, this must be suitable for the line temperature rating.

e) Steam tracing shall be avoided inside any room/ or shelter. The heat tracing required for analyzers shall be carried out by electrical tracing using prefabricated tube tracers.

f) Insulation of all in-line instruments like control valves, safety valves etc. shall be done as per the line requirements. Also all direct equipment mounted instruments like level gauge, displacer/float type instruments etc. shall be properly insulated as per insulation requirements of the equipment on which these are installed.

g) The insulation with 25 mm dia. Sodium silicate inhibited ceramic fiber rope (fiber glass / SS wire braided) by spiral winding in position, wrapping the rope around piping so as to cover the piping completely without leaving any gap, application of two layers of self adhesive aluminum foil tape (min 0.1 mm thick) spirally wound over the rope surface with the joints in two layers staggered. Ceramic fibre rope shall be of minimum density 250 kg/m³ shall be made up of ceramic fibre insulation with other properties of ceramic fibre rope confirming to 3.2.3 (1) of specification “6-44-0002 for hot insulation” work.

2.0 INSTALLATION
2.1 Vendor shall be completely responsible for installation of all instruments within their battery limit, in line with the installation standards (typical) furnished alongwith this specification. 2.2 Whenever installation is beyond the scope of vendor/contractor, purchaser shall install the instruments as per the detail ls/documents/drawings provided by the vendor/contractor. However, in such a case it must be ensured that complete installation materials shall be supplied.

2.3 All direct mounted instruments like thermocouples thermowells, temperature gauges, pressure gauges, pressure switches etc. shall be installed in such a way that they have good readability and accessibility.

2.4 The capillary of all capillary type instruments shall be supported properly and shall be protected against mechanical damage.

2.5 All pressure/differential pressure instruments shall be provided with block and bleed/bypass, drain/vent valves etc as per the installation standards, and shall have accessibility.

2.6 All primary piping/tubing (impulse lines) shall have a slope of 1 in 12 on the horizontal run.

2.7 All welding shall be carried out as per the relevant codes with proper electrodes. Any testing (non destructive) like D.P. test and radiography on root weld and final weld shall be carried out as applicable. All consumables shall be par 1 of vendor's scope of supply. Any pre/post weld treatment as required by the relevant codes shall be carried out.

2.8 All threaded joints shall be joined by PTFE tapes only.

2.9 All impulse lines shall be supported at regular intervals.

2.10 Instrument drain/vent connections shall be piped to safe area like oily water sewer or above pipe racks to avoid accumulation of hazardous fluid in the plant atmosphere.

2.11 Steam tracing wherever required shall be carried out by 10 mm OD x 1 mm thick copper tubes and condensate traps shall be provided to collect all the condensate and shall be piped to the nearest pipe drain funnels.

2.12 All tubes/cables shall be properly laid on cable trays, which shall be supported at regular intervals.

2.13 Separate routing or physical separation shall be maintained between signal cables, shut down and power cables.

2.14 Wherever intrinsically safe system cabling is employed, the minimum separation of 150 mm shall be adhered between IS (intrinsically safe) and non IS signal cables.

2.15 The cases of instruments shall be earthed by earthing wire to the nearest earth bus bar for safety reasons.

2.16 In case the cables are to be buried or laid in concrete trench the same shall be carried out by vendor. In case civil work is carried out by purchaser, requirement of trenches shall be provided with prior intimation to client.

2.17 Painting of cable trays/ducts, mild steel cable trays, angle trays, instrument supports and all structural supports shall be painted as under :-
a) The surface to be painted shall be thoroughly cleaned with brush sand paper to remove all scales. After cleaning, one coat of red oxide zinc chromate primer shall be given conforming to IS -2074 and allowed to dry. One coat of final when paint shall be applied.

Second and final coats of paint of final colour shall be given before handing over the plant/commissioning.

2.18 Installation of Systems (DCS, PLC, Analysers etc.)

2.18.1 The system shall be installed by the system vendor who would be responsible for installation and termination of interconnecting cables in the system racks/cabinets. All interconnecting cables shall be identified and the individual cores/wires shall be properly identified using ferrules. Direct-cross ferruling method shall be used for identification.

2.18.2 All system communication cables shall be layed in covered GI (galvanised iron) trays away from power cables. Prefabricated cables shall be avoided for interconnection if these are to be routed outside the cabinets. If unavoidable these should be laid in covered GI trays.

2.18.3 All panels/cabinets shall be properly levelled and secured firmly with the base supporting structure. However, the consoles and printer stands need not be secured to base structure.

2.18.4 Grounding

a) Each cabinet, console and other equipment supplied as a part of system shall have earthing lugs which shall be secured to the 'AC mains earthing bus'.

b) All circuit grounds, shields and drain wires shall be connected to the 'system ground' bus which is isolated from 'AC mains earth'. This bus shall typically be 25 mm wide and 6 mm thick of copper. The total resistance of system ground shall be less than 5 ohms unless otherwise recommended by system manufacturer.

c) Safety barriers, if used, shall be secured to 'Safety ground' which shall have typically ground resistance of less than 1 ohm. The bus shall be designed considering a fault level of 0.5 A at 250V r.m.s. per barrier.

2.18.5 All other installation guidelines as recommended by system manufacturer shall be followed.

3.0 TESTING AND CALIBRATION

3.1 All impulse lines shall be tested hydrostatically at 1.5 times the maximum operating pressure. Ensure that instrument and vessel/piping is isolated during this test.

3.2 In case of special instruments/items where hydrotesting is not permitted due to service conditions, the impulse lines testing shall be carried out by using air or nitrogen.

3.3 All external cage type level instruments shall be tested upto 1.5 times operating pressure by using nitrogen only.

3.4 After pressure testing, all these impulse lines shall be drained and dried with dry air to remove any traces of moisture, oil and dust.

3.5 Instrument air lines shall be duly tested for any leak after pressurising and isolating the main root valve by soap solution. After isolation, the rate of fall in pressure shall be less than 1 kPa for every 4.4 metre (1 psi for each 100 feet) of copper tubing for a test period of 2 minutes.
3.6 Pneumatic signal tubes shall be flushed and tested with instrument air for any leak at a pressure of 1.5 kg/cm² g. After pressurising the line, the source of pressure is cut off and rate of fall in pressure shall be less than 1 kPa for every 4.4 metre (1 psi for each 100 feet) of tubing for a period of 2 minutes.

3.7 All instrument cables shall be tested for continuity and insulation. While meggering the cables for insulation testing, ensure that all instruments and barriers are isolated at both ends.

3.8 All instruments supplied by the vendor shall be calibrated using proper test equipment.

3.9 All instruments shall be calibrated for 0%, 25%, 50%, 75%, 100% and vice versa (Refer Note).

3.10 All temperature gauges shall be calibrated using temperature baths.

3.11 All thermocouple activated instruments shall be calibrated by generating millivolts by a potentiometer.

3.12 All transmitters shall be calibrated as per instrument ranges.

3.13 All displacer type level transmitters shall be calibrated with water or suitable fluids and corrected for specific gravity.

3.14 All alarm and trip switches shall be calibrated over the entire range and finally set and checked for alarm/trip points and reset points as per the alarm/trip set point schedule. After setting, these shall be sealed.

3.15 All control valves, prior to stroke checking, shall be externally cleaned thoroughly. The full stroke of valve shall be checked for opening and closing. Any adjustment required for obtaining full stroke and reducing hysteresis shall be carried out. The hysteresis shall not be more than 1% URV (upper range value) with positioners and 5% URV without positioners.

3.16 Bubble tight shut-off control valves and shut down valves shall be checked for seat leak test and gland leak test.

3.17 Solenoid valve shall be checked functionally for its operation.

3.18 Safety valves and relief valves shall be set/tested by using dry air/nitrogen. Leakage if any shall be removed by proper lapping of seat and disc.

3.19 All electronic/pneumatic receiver instruments shall be calibrated as per the manufacturer's instructions. Controllers shall be aligned properly.

3.20 All special instruments like analyzer shall be checked and calibrated as per manufacturer's instructions. Prior to testing, all analyzer sample lines shall be thoroughly cleaned by carbon tetrachloride or any other cleaning liquid. After cleaning, these lines shall be thoroughly purged with dry nitrogen.

3.21 No oil should be used in oxygen and chlorine service lines.

3.22 The accuracy of overall loop shall be within "1% for electronic and "1.5% for pneumatic loops.

3.23 After performing the calibration of all instruments, the entire loop shall be checked for proper operation.

Note: Calibration sheet for each calibrated instrument to be duly filled, signed & counter signed by PMC.
3.24 The entire shutdown scheme shall be simulated from the process trip switches and the scheme shall be tested for its proper operation prior to start up of the unit.

3.25 If no instrument air is available vendor shall provide necessary N2 cylinders to carry out the above activity.

3.26 Testing Of Systems (DCS, PLC etc.)

3.26.1 All the system functions shall be checked thoroughly for proper functioning. These shall include but not limited to the following tests:

   a) Visual and mechanical.
   b) Complete system configuration loading.
   c) Demonstration of all system functions.
   d) Checking of all systems displays.
   e) Checking of correct functioning of all keyboards.
   f) Demonstration of all system diagnostics.
   g) Checking of proper functioning of all printers, hardcopy unit, and printing of all reports.
   h) Checking of all disc drives.
   i) Complete checking of logic system, loading of user's program and checkout of results.
   j) Checking of correct changeover of the back-up/redundant units in case of failure of main units.

3.26.2 The input signals shall be simulated by disconnecting the field wires for all inputs. Wherever control room mounted Transmitters/Converters/Receiver switches are used, the functioning of same shall also be checked.

3.27 Loop Checking

3.27.1 Loop checking shall be carried out by vendor, which shall include proper functioning and interconnection of all items in the loop.

3.27.2 All input signals shall be generated in the field and corresponding reading shall be checked at all corresponding displays. All the outputs shall be checked in the field, by physical verification of valve stroke or operation of solenoid valve/pick-up of electrical contactor.

3.27.3 After loop checking is completed vendor shall connect back any terminals and connections removed during loop checking.

3.27.4 For fieldbus loops the segment verification shall be carried out by DCS vendor. Any field side modifications required shall be carried out by bidder

4.0 COMMISSIONING

4.1 This activity shall be carried out in a systematic manner so as to avoid any accident to plant and operating personnel.
4.2 During the plant start up all the instruments calibration, controller alignment, trip point settings shall be trimmed so as to meet the operation requirements.

4.3 Prior to guarantee run of any package unit, the vital instruments as required by vendor have to be recalibrated and the results recorded.

1. GENERAL

1.1.1 Scope

This specification together with the attachments covers the design, engineering, supply, factory inspection and testing, field testing and calibration, installation and commissioning of instrumentation and control systems on a turnkey basis for its successful operation.

1.1.2 The detailed scope of work, specific job requirements, design basis, exclusions, deviations, additions etc. are indicated elsewhere in the bid document.

1.1.3 This specification provides only the qualitative specifications of commonly used instruments and systems, but by no means covers the specification of each and every item covered in the bid document. Instruments specification for those items not covered in this specification shall be submitted by the contractor for approval.

1.1.4 Contractor shall be fully responsible for design, material selection, sizing and proper selection of the instruments and systems being supplied by them. Any approval or comment on any document or guideline issued to contractor before or after placement of contract or during execution of the contract shall not absolve the contractor of their contractual obligations and responsibility with regards to completeness, proper selection, satisfactory operation and easy maintenance of the unit.

1.1.5 All equipments supplied shall be of field proven quality both with respect to design and materials: Prototype instruments or instruments of an experimental nature shall not be offered or supplied.

In general, all instruments and instrument control systems, like Programmable Logic Controller (PLC), Distributed Control System (DCS), Analyser Systems, Gas Detection Systems, etc. offered by contractor shall have a well proven performance record of operating satisfactorily in the hydrocarbon industry like refinery, petrochemical, gas processing etc. for a minimum of 4000 running hours.

No instrument requiring special maintenance or operating facilities shall be offered or supplied as far as possible.

In the event of any conflict between this specifications, data sheets, related standards, codes etc., the contractor shall refer the matter to the purchase/purchaser's representative for clarification and only after obtaining the same should proceed with the manufacture/engineering of the item in question.

1.2 Bids

Bidder shall clearly define the operational philosophy suggested by them, in line with requirements specified in the tender specifications. Bidder shall also clearly indicate the provision of control panels, and control systems required for their sub packages offered by them.

1.2.2 Bidder shall provide the following information alongwith their offer as a minimum:

a) Compliance statement as given in bid document

b) Configuration diagram and details of the offer ed. control systems like Distributed Control System, Programmable Logic Controller, Analyser system, CCTV, Gas Detection System etc.
c) Details of special instruments and control systems if any.

d) List of deviations, if any, from bid package clause number wise with reasons thereof, wherever applicable.

1.2.3 Information like Instrument list and typical specifications if enclosed by bidder in their bid, shall be retained for information only and shall not be referred by bidder as contractual agreement No implication shall be admissible on the basis of these documents. Contractor shall submit details only after the finalisation of P&ID (piping and Instrument Diagram).

1.2.4 In addition to mandatory spares and consumable spares indicated elsewhere in the tender document, bidder shall also quote for two years operational spares’ for all the instruments and control systems including those required for sub packages being offered by them.

1.3 Applicable national/international standards.

Design and terminology shall comply, as a minimum, with the latest edition prior to the date of purchaser's enquiry with following codes, standard practices and publications:-

1.4 Drawing and Data

1.4.1 Detailed drawings, documents, data and catalogues etc. as required from the Contractor have been indicated separately in the Contractor Data Requisition. The required number of reproducible and prints should be despatched to the address mentioned, adhering to the time limits indicated.

1.4.2 Bidder shall furnish all documents in A4: Size (210 mm x 297 mm) paper or folded in A4 size unless otherwise specified. All drawings and sketches shall be in multiples of A4 size like A3 (297mm x 420 mm) or A2 (420 mm x 594 mm) etc., but folded to 'A4' size. Final documentation shall be submitted in bound volumes.

1.4.3 Definitions of Deliverable Documents

1.4.3.1 Instrument work Specifications

This document details out the procedures and methodologies adopted by the contractor to carry out complete instrumentation work. The document- apart from others shall include:

a) Agencies involved for carrying out design, detailing, engineering, procurement, installation, loop checking and commissioning of Instrumentation with specific reference to various systems.

b) Scope of work and responsibilities of various agencies involved.

c) Interface requirement and co-ordination between various agencies.

e) Experience of various agencies in carrying out respective jobs.

f) Inspection & testing requirements and co-ordination procedures for the same.

g) Co-ordination requirements & procedures for co-ordination, with outside/ statutory authorities.
h) Quality control and assurance procedures to ensure proper quality.

1.4.3.2 Drawing and Document Schedule

This document lists out drawings and documents prepared and/or submitted by contractor to owner either during engineering or as a part of final documentation. Following information shall be available in this document:

a) Name and number of each drawing and document listed.
b) The schedule for the document submission, contractor shall follow as per the overall schedule.

1.4.3.3 Instrument Index

Instrument Index lists out all instruments those appear on the P&ID without any exception. It is a basic instrument document which is necessary for the smooth execution of a job and is also a reference document after the completion of job. Instrument Index shall be prepared in blank format attached. In case, any other format is used, it must contain all information as listed in this format.

1.4.3.4 Sub Vendor List (for Instruments and Accessories)

Separate sub-vendor list is included elsewhere for instrumentation item. The list provided are for make only and not for model number. It is contractor's responsibility to select correct model number to suit the requirements and has requisite proven track record. It may be possible that make and/or model number of some instruments are identified in licensor's process package or in P&IDs, in such cases licensor process package or P&ID shall be guiding. In case for certain instruments vendor list is not included, suggested vendor list will have to be got approved from the purchaser/purchaser's representative.

1.4.3.5 Instrument sizing calculations, selection requirements

Instrument sizing calculations provide information regarding sizing (as per standards specified elsewhere in this document), type, selection and other related information.

Following sizing calculations shall be applicable, in general duly approved by the authority indicated in Vendor's Standard Quality Plant

a) Control valve and desuperheater sizing including noise calculations.
b) Safety valves/pressure relief valves/pilot operated pressure. relief valves/rupture disc sizing.
c) Flow element sizing including orifice plates, averaging pitot-tubes. venturi, flow nozzle etc. and selection.
d) Sizing for self actuated control valve.
e) Utility consumption calculation including power supply (UPS (Uninterrupted Power Supply/ Non UPS) Instrument air, stream for tracing etc.
f) Cable size calculations for power cables.
g) Calculation for intrinsically safe loop for proper selection considering various entity parameters.

h) Analyser sample transportation time calculations.

i) Control system calculations, like scan time, communication bus loading, response time etc.

1.4.3.6 Utility Requirements

This document lists out the following information regarding utilities required by the contractor:

a) List of utilities required i.e. Power (UPS, Non UPS). Instrument air, Cooling water, Steam for tracing, Nitrogen etc.

b) Location and estimated/actual requirement at each location. The requirement shall be listed as minimum/normal/maximum.

c). In case of AC power, the In-rush current with duration and power factor shall also be indicated for each location.

1.4.3.7 Nozzle Elevation Drawings for Level Instruments

These drawings represent the nozzle elevation, nozzle sizes and rating, requirement of stand-pipes, type of level instrument etc. for all the vessels, columns, exchangers and tanks.

1.4.3.8 Purchase Requisition (PR)

Purchase Requisition contains all information which form part of material requisition but updated in line with the finally accepted offer of the successful bidder. Typically purchase requisition shall contain

a) Instrumentation specification, detailed instrument data sheets

b) Standard specification, quality assurance requirements

c) Testing (shop and field). inspection and shipping requirements

d) Drawing document requirement

e) Training requirements, if applicable

f) Make and Model number of selected vendor.

1.4.3.9 Functional Schematics (FS)

Functional Schematics details out the functionality of all the loop’s shown on the P&ID including their correlation. The schematic shows all the hardware necessary to configure a loop including their physical location, their interconnection and important software blocks as applicable to make a loop complete. Similar loops may be combined under the same - functional schematic.

1.4.3.10 Logic Diagrams

Logic diagram is a logic representation of process interlock and shutdown system and details out the functionality, in a schematic form, based on either process cause and effect table shown on the P&ID or in a separate write-up. The schematic shall be prepared based on ISA S5.2 - "Binary Logic
Diagrams for Process Operations* and shall show the physical location of Input / Output devices, their interconnection with functional blocks, bench status of all electrical devices etc. The schematic shall also be supplemented with operational requirements like startup and process bypasses, reset and shut down push buttons, selector switches, status lamp etc.

1.4.3.11 Instrument Loop drawings

Each loop shall have a separate Instrument Loop drawing which shall show each component from field device to final receiver including physical location, initiating device, its terminal number, junction box with its terminal number, cable number with pair number/polarity, receiver instrument terminals/cabinet terminals, system functional blocks of loop in simplified manner (without configuration details).

1.4.3.12 Control Room Layout

Control room layout drawing shall show the location of control panels: system cabinets, marshalling racks and other auxiliary/ cabinets, consoles with monitors, hard wired, consoles, printers, non-system panels/cabinets including panels/cabinets for packages, LEL panel, fire alarms panels or any other equipment required to be installed in control room. The layout shall be prepared on control room architectural drawing, and shall also show layout of equipment in engineering room/computer room etc. CCTV layout shall also be shown. In case of satellite rack room, a separate drawing shall be prepared.

1.4.3.13 Analyser Room / Shelter Layout

Analyser Room / Shelter drawing shall show the location of all analyzers, sample handling systems, junction boxes, HVAC system warning panel, CRTs / analyser consoles, if any and any auxiliary rack / panel / cabinet to be located in the analyser room / shelter along with complete dimensions. The drawing shall also show location of light fittings (inside and outside the shelter/room), LEL detector and fire detectors as applicable. A separate drawing with dimensions shall be issued for each analyser room/shelter.

1.4.3.14 Panel Front Arrangement

This drawing shall show the arrangement of panel mounted instruments like indicating instruments, alarm annunciator, indicating lamps, push buttons/switches etc. including their approximate sizes and their mounting locations.

1.4.3.15 Configuration Diagram

This drawing is a graphical representation of all major hardware required in a configurable control system which are necessary to meet all the expected functional requirements.

1.4.3.16 Dynamic Graphic Display Drawings

These drawings provide a graphic representation of P&ID's arranged in a sequence which when displayed on the CRT, shall provide easy and logical operational views.

1.4.3.17 Input / Output Assignment

This document indicates the physical assignment of various I/O modules 0 and their respective channels to various physical inputs and outputs.
1.4.3.18 Instrument Duct/Tray /Trench Layout

Instrument duct/tray layout drawing show the routing of main instrument duct/tray o layout in the unit/plant. The drawing shall be prepared on plot-plan and shall show the size, cross-section at various locations, general notes, symbols, reference drawings and the control room entry.

1.4.3.19 Instrument Location Plans

Instrument Location Plans shall show the location of instruments, location of tapping points, location of local panels, junction boxes, main cable routes (cable duct / trenches), instrument air distribution scheme etc. These drawings are prepared on equipment layout drawings preferably in 1:50 scale.

1.4.3.20 Instrument Cable Schedule

The instrument cable schedule shall show all instrument and power cables required for complete instrumentation. The document shall show, tag number, cable number, type, length and size of cables, type of junction box, identity of local panel, control room panel/cabinet location etc.

2. DESIGN PHILOSOPHY

2.1 Instrumentation shall be complete in every respect and liberal to the extent of providing data on all operations and variables sufficient for the state, efficient and easy operation, start up and shut down of the plant.

2.2 The design and installation of instruments shall be generally in accordance with ISA / API recommended practices and other applicable standards like BIS, IBR etc. Material specifications and practices shall, in general, conform to appropriate ASTM or equivalent standards. All standards and code of practice d o herein shall be of the latest edition prior to the date of purchaser’s enquiry.

2.3 All instruments and equipments shall be suitable for use in a hot, humid and tropical industrial climate in which corrosive gases and chemicals may be present. As a minimum, all instruments and enclosures in field shall be dust proof *and weatherproof to IP-55 as per IEC-529/IS-2147 and secure against the ingress of fumes, dampness, insects and vermin. All external surfaces shall be suitably treated to provide protection against corrosive plant atmosphere.

2.4 Instrument Requirements for classified area

2.4.1 a) All electronic/electrical instruments and equipments shall be suitable for area classification as per IEC codes and shall be tested by any recognised authority like BASEEFA, FM, PTB, CMRI etc. and shall be certified by CCE.

b) Certified Intrinsically Safe (IS) equipment as per IEC-79-11** shall be used, in general, in hazardous area. In case intrinsically safe equipment is not available, flameproof enclosures as per IEC-79.01 may be considered.

c) Junction boxes and accessories required for flameproof instruments shall also be certified flameproof.

d) All non flameproof panels and cabinets installed in classified area shall be purged as per requirements specified in NPPA-496, as a minimum.

e) Other type of protection as specified in IEC-79 shall not be used.
2.4.2. Statutory Approvals

a) Contractor shall be responsible for obtaining all statutory approvals, as applicable for all instruments and control systems.

b) In addition, equipments/instruments/systems located in the hazardous area shall be certified by the local statutory authorities for their use in the area of their installation. In general following certification shall be given:

- For all intrinsically safe/explosion proof/flameproof equipments/instruments/systems or equipments with any other type of protection allowable as per this package which are manufactured abroad and certified by any statutory authority like BASEEFA, FM, UL, PTB, LCIE etc. should also have the approval of Chief Controller of Explosives (CCE), Nagpur.

- For all flame proof equipments manufactured locally (indigenously), the testing shall be carried out by any of the approved test house like CMRI/ERTL etc. The equipment shall in addition bear the valid approval from Chief Controller of Explosives, Nagpur and a valid BIS license.

- For all intrinsically safe equipment manufactured locally (indigenously), the testing shall be carried out by any of the approved test house like CMRI/ERTL etc. The equipment shall in addition bear the valid approval from Chief Controller of Explosives, Nagpur.

c) Approvals other than above shall neither be offered nor these will be acceptable.

2.5 Sizing for control valves, desuperheaters and safety valves is contractor's responsibility. In the P&ID and some cases in data sheets, valve sizes are identified. Contractor shall size these valves also. It is contractor's responsibility to supply the items as per approved sizes. For orifice-the sizing shall be carried out by contractor and in case due to these sizing the line sizes need to be increased or decreased the same shall be carried out by the contractor as part of his contract.

b) The type of flow instruments shall be decided by the contractor based on technical specifications and shall be approved by the purchaser/purchaser's representative.

In general type as indicated in P&ID/by licensor shall be followed.

2.6 Following units of measurement shall be applicable, unless indicated specifically otherwise:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Unit</th>

</table>
Conductivity : $\mu$S (micron Siemens)

Viscosity : mPa.s (cP)

2.7 Local control loops shall not be provided, unless it is specifically required as per P&ID.

2.8 Instrument Sizing

a) Contractor shall be responsible for sizing of all instrument items like control valves, pressure relief valves, desuperheaters, orifice plates, other flow elements etc.

b) The control valve and pressure relief valve sizes as indicated in the P&ID or in data sheets (whenever indicated) is tentative only and need to be resized by contractor after due verification of the process data. Whenever the sizes differ from those indicated in the tender document, the same should be brought to the purchaser's notice. Contractor, in such cases shall proceed only after approval from purchaser.

c) In case line sizes are required to be increased or reduced because of valve or flow element sizing, the same shall be taken care of by the contractor.

d) Sizing guidelines as indicated in the tender document shall be followed. In case no guidelines are provided, contractor may use national/international standards / standard practices for sizing.

2.9 Ranges for instruments shall be selected in general, such that in normal process operation the indication is between 40% to 60% of span for linear and 60% to 80% of span for square root inputs.

2.10 Ranges for process switches' shall be selected, in general, such that the set point falls preferably in the middle 30% of full adjustable range i.e. the set Point shall fall between 35% and 65% of adjustable range.

2.11 All controllers shall have facility for bumpless auto-manual and manual-auto transfer and set point adjustment. Flow, pressured level controller shall be provided with proportional plus integral action while temperature controller with proportional plus 'integral plus derivative' action.

2.12 Field mounted direct actuated flow and temperature switches shall not be used. Instead receiver/ switch/trip amplifier shall be used along with flow element/temperature element. Whenever specified in job specification, flow and temperature transmitters may be directly connected to control system to achieve switch action.

2.13 Intrinsically Safe System Requirements

Following points must be considered while designing an intrinsically safe system:

a) All intrinsic safety barriers shall be active isolating type only and shall have isolation between input output and power supply.

b) Barriers must be selected based on entity concept. Cable parameters shall also be considered while matching entity parameters.

c) The signal transfer accuracy of barrier shall be at least equal to or better than the transmitter selected.
d) Each instrument in the hazardous area and the intrinsic barrier shall be certified for intrinsic safety by a statutory authority.

e) Each input and output in a loop shall have separate barrier. No barrier shall be shared between two loops or input/outputs.

f) Any intrinsically safe loop requiring any device to be connected in the hazardous side permanently or temporarily, shall also be intrinsically safe.

g) Configuration tools whenever required for any intrinsically safe item which forms part of the intrinsically safe item shall also be certified intrinsically safe.

h) Universal barrier with programmable capability shall be used for temperature inputs i.e. for thermo couple/RTD inputs.

i) It is desirable to use one make of barrier for entire plant. The series' shall be of MTL / P&F.

2.14 Power Supplies and their Distribution

a) Following power supply voltage levels shall be used, unless otherwise specified:
   - For Instruments, Control Systems 110VAC ±10%(UPS)
   - Analyzers 50 Hz ± 3 Hz
   - Solenoid Valves, Relays, lamps 110 V DC ±10%
   - Input interrogation voltage 110 V DC ± 10%
   - Panel/cabinets lighting 240 V AC ± 10%

Any voltage level other than 110VAC UPS (including 24 V DC) if required for powering any subsystem, input interrogation, relays and lamps etc same shall be generated by the bidder using dual redundant power packs. (110 V AC to 24 V DC convertor).

b) All instruments; control systems (PLC and DCS) and analyser system shall be able to operate at the following power supply specification:
   - Voltage level : 110 V AC ± 10%
   - Frequency : 50 Hz ±3 Hz
   - Switch over time : 5 mili seconds

c) Power feeders if specifically indicated, shall be supplied to the bidder at only one location. All further distribution within the package shall be taken care of by the bidder.
d) Instrument power circuits shall be individually protected from fault with the help of fuses. Power supply to the individual instrument shall be disconnected with the help of Double Pole Single Throw (DPST) switch and protected with the help of fuses. Miniature circuit breakers (MCB's) may be selected in place of switch fuse unit in case protection is provided for overload protection.

2.14.1 110V AC UPS

2.14.1.1 Power from UPS shall be distributed to individual consumer with the switch -Fuse/Miniature Circuit Breaker (MCB) of appropriate ratings. Completely isolated feeders with isolating transformer shall be provided for DCS, free issue control room mounted panels/equipments, package items in the field etc.

2.14.1.2 20% feeder or minimum of one number of each feeder shall be provided as spare. UPS shall be sized accordingly.

2.14.1.3 The main isolator shall be DPST type to isolate AC line and neutral. Likewise individual distribution feeders to have isolators of DPST type to isolate line and neutral.

2.14.1.4 In order to obtain proper fuse coordination following point must be taken into consideration.

a) All the feeders for DCS shall feed to separate sets of bus bars (line and neutral).

b) All the sets of feeders shall be fully independent and shall not be joined together at any point.

2.14.1.5 Voltmeter and ammeter in each main power feeder entry point inside the power supply distribution board shall be provided.

2.14.1.6 Automatic sequential start-up facility for power supply in the AC distribution board shall be provided. For power supply distribution drawing, details shall be referred in job specification.

2.14.2 DC POWER DISTRIBUTION

2.14.2.1 Main isolators shall be DPST (double pole single throw) type to isolate both lines with HRC fuse on both lines. Likewise individual distribution feeders shall have isolation of DPST type and fuse on both DC lines.

2.14.2.2 Contractor shall provide 20% (minimum quantity at least one) spare power distribution outlet with isolators and fuses for each branch line for all types and quantities used for each category. The charger/rectifier and battery shall be sized to cater for 30% spare feeder as specified above.

2.14.2.3 DC power distribution shall be designed to avoid any common mode failure. Power supply distribution drawing shall be referred form job specifications for details.

2.14.3 230 V AC Non UPS Power Distribution

2.14.3.1 Main and individual distribution feeder shall be provided with switch-fuse assembly or MCB.

2.14.3.2 The contractor to note that 230V AC non-UPS shall be used for panel lighting level gauge illumination, analyzer shelter and cabinet lighting etc. Necessary distributions of the same for the items specified above and supply and laying of the power supply cables from the switchgear to the field shall be by the contractor.

2.15 Alarm Philosophy
a) Adequate alarms shall be provided to give audible and visual warning of any process and machine malfunction in the package.

b) All trips shall have a pre-trip warning alarm in addition to alarm at the trip condition.

c) All package alarms including pre-trip warning alarms’ and trip alarms (shutdown alarms) shall be annunciating on the local panel. First out alarm sequence as per F3A as per ISA shall be provided, whenever required.

d) All rotating equipments shall have the status indication provided on the local panel wherever applicable.

e) Wherever printer is provided, all alarms shall be printed as and when they appear, in the sequence of their occurrence.

f) Common pre-warning alarm and common trip alarm contacts for the sub packages shall be provided for remote annunciation. Additional alarm contacts shall be provided, when specified.

g) 'Fail-safe' type with normally closed alarm contacts shall be used.

2.16 All line or equipment mounted instruments like control 'valves, pressure relief valves, thermowells, orifice flanges, level instruments and analyzer instruments etc., installed on pipes and vessels under ffiR service shall be certified by 'ffiB. or their authorized representative.

2.17 Location of process connections shall be from the side or from the top of the process equipment but not from the bottom. This requirement is applicable to both pipes and vessels. The location of lower side connection when necessary, shall be high enough inside vessel to prevent plugging due to dirt or other suspended solids. In addition, the connections shall be short, vertical or horizontal and without any pockets.

Material of construction of instruments shall be as per the material selection guide lines, provided with this specification. And any specific requirement of material of construction by purchaser/purchaser's representative during detail engineering shall be complied by contractor without any time/cost implications. In any case vendor to ensure that the selected material is consistent with temperature, 'pressure, corrosion conditions and other process requirements.

In case where suitable material of construction is not feasible/possible, diaphragm seal shall be considered.

2.18 All, process switches shall be provided with sealed micro switch contacts rated’ for the specified application. Contacts shall be Single Pole Double Throw (S~on type unless otherwise specified. Contacts used in intrinsically safe applications shall be gold plated.

2.19 Instrument Connections

The connections of instruments installed on vessels, tanks, standpipes and piping shall be as per following Standards, unless otherwise specified in licensor's package.

a) 1071-7-52-0001 - Instrument Connections on Vessels and tanks

b) 1071-7-52-0002 - Instrument connection on Piping.

c) For clad vessel minimum connection size shall be 3"

2.19.2 Pneumatic instrument connections for signal and air supply shall be 1/4" NPT(F).
2.19.3 Electrical cable entry connection shall be 1/2” NPT (F). Suitable cable gland shall be used.

2.19.4 End connections shall meet the following, unless, otherwise specified:
   a) Threaded end connection shall be NPT as per ANSI/ASME B1.20.1.
   b) Flanged end connection shall be as per ANSI/ASME B16.5.
   c) Flange face finish shall be per paragraphs 6.4.4.1, 6.4.4.2 and 6.4.4.3 of ANSI/ASME B 16.5. The face finish wherever specified in data sheets shall have serration as follows:
      
      | Serration as follows | 250 to 500 AARH  |
      | 125 AARH             | 125 to 200 AARH  |
      | 63 AARH              | 32 to 63 AARH    |
   d) Grooves of ring type joint flanges shall be octagonal as per ANSI/ASME B 16.20

2.20 Air supply for the instruments at pressure specified elsewhere shall be made available to the contractor at the battery limit of the unit wherever specified in the job specification. Contractor shall be responsible for further distribution within the unit.

2.21 Interface with Main Control Room

2.21.1 Instrument junction boxes shall be provided as an interface with control rooms. Marshalling details for tubing and cabling shall be shown with corresponding junction box termination number allocated against appropriate instrument tag number. A separate drawing shall be furnished for interface wiring and tubing showing all instrument interface details between purchaser-vendor, wherever applicable. In general, the philosophy outlined in para 2.21.2.3 shall be followed.

2.21.2 Signal Interface Philosophy

2.21.2.1 Direct signals from field to control room
   a) All signals from "field to main control room/Satellite Rack Room (SRR) shall be terminated in the junction boxes located at appropriate locations in the field. Separate junction boxes shall be used for the following type of signals:
      - Intrinsically Safe Analog Inputs/Outputs (4-20 mA)
      - Non Intrinsically Safe Analog Inputs/Outputs (4-20 mA)
      - Intrinsically Safe Thermocouple Inputs
      - Intrinsically Safe RTD Inputs
      - Intrinsically Safe contact Inputs
      - Non Intrinsically Safe contact Inputs.
      - Non Intrinsically Safe contact Outputs.
b) An pulsed signals or serial signals shall be routed directly to control room(s) without tile
Use of intermediate junction boxes, in general. In case, where single cable length is a problem, intermediate junction boxes can be used, however in all such case, same junction box shall not share signals from two or more device.

  c) Whenever multidrop serial communication is adopted, intermediate junction boxes may be used for multidroping purpose only.

2.21.2.2 Signals from contractor's scope to purchaser

  a) Whenever signals are required to be routed for purchaser's use, contractor shall use separate dedicated junction box or terminal strip (in case of control panel/system cabinet) for each type of signal i.e for 4-20 mA 1 alarm / contacts/ temperature element etc.

  b) In case of serial signals, contractor shall provide a separate dedicated port for purchaser's use.

2.21.3 Intrinsically Safe barriers wherever required shall be provided by contractor as part of the control system to which these input / outputs are connected. Generally locating barriers in the local panels shall be avoided. If provided, the arrangement shall be made for proper earthing in the local panel.

2.22 Instrument Cables

Multicables between junction boxes and main control room (MCR) / or satellite room or any other control room shall be as per following philosophy:

  a) Signals (4-20 mA or switch 'contact): 6/12 pair r individually and over all shielded (screened) and armoured, twisted, 0.5 mm² conductor.

  b) Thermocouple: 6/12 pair thermocouple extension cable'(20 AWG)

  c) RID: 8 Triad 1.5 mm² conductor.

  d) Solenoid valves (110 V DC): 6/12 Pair shielded, armoured, , 1.5 mm- conductor.

Higher conductor size shall be selected to limit the voltage drop within the specified limit.

2.22.2 The colour of outer sheath, inner sheath and individual COre for each type of cable shall be as mentioned below:

<table>
<thead>
<tr>
<th>Type of cable</th>
<th>Signal type</th>
<th>Outer sheath</th>
<th>Conductor</th>
<th>Insulation</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

* Triad cable shall have blue, black and brown colour

2.23 Junction Boxes

2.23.1 Junction boxes shall be used for interconnection in the field wherever necessary as per para 2.21.2. Analog signals (4 - 20 mA), switch contacts, temperature elements, LEL detectors, intrinsically
safe, non intrinsically safe and low voltage contact signals shall be segregated in the separate junction boxes. Separate' junction box shall also be used for signals and 'contacts connected to PLC, DCS or and other system.

2.23.2 The junction box shall be suitable for the type of signal and type of multicore cables used as indicated in para 2.21. 7. Unless otherwise specified, contractor must use the following

Type of junction boxes:

- For all intrinsically safe signals: Weatherproof junction boxes
- For all input/output connected: Explosion proof/flameproof to explosion proof/flameproof: junction boxes

instruments

2.23.3 The junction boxes shall have cable entries suitable for the multi -d single cables used. 20 %’addition cable entries must be provided. Unused entries shall be plugged. The junction boxes shall have terminals suitable for the cable wire size and shall preferably be of Phoenix or equivalent make.

All junction boxes used in intrinsically safe service shall be sky blue in colour while those in non-intrinsically safe service shall be painted gray.

2.23.4 The multi cable entry for 6 pair Junction Box (JB) shall be 1’ NPTF and for 12 pair / 8 triad junction box, it shall be 1 1/2I NPTF. Each junction box shall be provided with 2 multicable entries with one plugged with weatherproof, flameproof plug as required. Multicable entries shall be from the bottom whereas 1 pair/triad from the side.

2.24 Philosophy of Junction Box and Cabling

i) Overhead ducts shall be used for routing multicables in the unit and upto control room unless specified-otherwise. This main duct shall be routed over the pipe rack with suitable accessible location.

ii) Contractor shall provide continuous channel for support of the" overhead duct and the same shall be suitable for a load considering 100% filling of the duct by cables." However as a good engineering practice duct shall be sized considering "60% occupancy of the duct by cables. For ladder and angle trays contractor shall" provide support at a minimum interval of 1.5 m.

iii) In duct 4-20 mA signal cables, alarm" cables, thermocouple "cables and RID cables can run together in one compartment. The control and powerful (110 V DC) shall run in other compartment. The middle compartment shall be kept vacant. It shall be used for plant communication cable where specified.

2.25 Multi Cable Transit

2.25.1 The cable entry into the control room, satellite rack rooms, local control rooms, analyser rooms/shelters shall be through Multi Cable Transit Blocks (MCT). The MCT’s shall be sized, supplied and installed at site by contractor. The required cutout sizes and act frames sizes shall be calculated and shall be coordinated with control room contractor.

2.25.2 The MCT frames shall be of Standard RGB type of Brattberg or Roxtec or equivalent and of Steel construction. The maximum height of frame shall not exceed 600 mm, unless otherwise specified. The MCT frames provided shall be suitable to withstand blast intensity for which: blast proof control room
has been designed. The MCT shall be supplied complete with insert blocks, spare blocks, stay plates, end packing etc.

2.25.3 Contractor shall size and provide MCT considering 50% spares for each cable size / cable OD. Intrinsically safe cables, low power cables, non-intrinsically safe cables and power cables for instruments (110 V AC or above) shall be suitably separated from the other / cables within the MCT frame. Separate MCT frame shall be considered for electrical cables. The MCT shall be installed as per the recommended practice of supplier. No spare space shall be left uncovered in the frame and shall be filled with dummy block of suitable size. In addition to the above, contractor shall also supply 30% spare insert blocks in each cable size/cable on as loose supply.

2.26 Repeat Signals from Sub-Package Local Panel

   a) Generally separate ills shall be used for interfacing signals from sub-package to control room.

   b) Where signals as indicated in clause above is less in number and do not justify separate junction boxes, all such signals may be routed via local control panel if supplied by contractor.

   c) All such signals shall be terminated on separate terminal strips in the local control panel. The terminal strips shall be segregated as per para 2.21.2.1(a). The non-intrinsically safe signals shall be provided in certified flame proof junction boxes in local panels.

   d) Intrinsically safe barriers for all intrinsically safe signals, wherever required, shall be provided.

2.27 Requirement for instrument in steam service

2.27.1 All in-line instruments such as control valve, thermowell, orifice flanges, pressure relief valves, all types of level instruments and any other in the instrument shall be provided with IBR form II C certificate.

2.27.2 All pressure relieving devices shall be designed in accordance with ASME code for 'Boilers and Pressure Vessels', API-52! and Indian Boiler Regulations. In case of valves as 'per IBR, the same shall be to regulation no. 294 with 5% over pressure and regulation no. 295 with 5% blow down and shall be provided with the following certificates.

   i) IBR form-me certificate of manufacture and test of boiler mountings and fittings.

   ii) Type test certificate from IBR authority as per regulation no. 293 and Appendix-L of IBR for the valve series supplied.

   iii) Radiography of all castings shall be as per piping material specification.

2.27.3 The discharge capacity of pressure relief valves as in (a) above shall be calculated as per IBR regulation no. 293 a, b and c.

2.27.4 Detailed requirement of Pressure Relief Valve is given else where in this specification.

2.27.5 Installation item like syphon, condensate chambers, impulse pipe and pipe fittings connected with IBR lines shall have IBR form II C certification.

2.28 All instruments shall have internal terminal block for cable termination. Flying leads are not acceptable.
2.29 Diaphragm seal instruments with capillary shall be used for congealing, and various services, where plugging of element may occur or where suitable material is not available. in highly corrosive services. In these cases the flange material shall be in accordance with piping classes. Spacer ring shall be provided along with vent and drawing. Capillary shall be minimum AISI 316 S S with AISI 304 S 5 armouring. Seal fluid shall be suitable for the temperature.

2.30 Temperature extension of suitable length shall be provided in the impulse line of the instrument installation where process fluid temperature is higher than the maximum Withstanding temperature of the instrument.

2.31 The in-line instruments on fully jacketed lines shall also be jacketed.

2.32 Interlock and 'Shutdown System shall be an independent. system with its own dedicated primary element except for flow. In which case common flow element with separate transmitter shall be used. However separate element with trip amplifier shall be used for temperature. In no case the initiating contacts shall be derived from indicators, controllers, recorders, scanners, alarm annunciator or any such instrument.

2.33 The interlock & shutdown system shall be designed fail safe and shall meet the following requirements, as a minimum :

   a) All initiating contacts shall be close under normal conditions and shall open under abnormal conditions.

   b) All relays and solenoid valves shall be energised under normal conditions and shall de- energise under abnormal conditions.

   c) Emergency shut down switch contacts shall be wired in series with the final actuating device to ensure positive shutdown.

   d) If desired, because of operational or maintenance requirements, adequate trip bypass facilities are to be provided with warning lights to indicate that the trip has been bypassed. Trip bypass alarms shall be provided in local on local panel as well as in remote location. All such by-pass switches' shall be key-operated type.

2.34 The interlock & shutdown system shall be designed using electromagnetic relays unless specified otherwise and shall be located locally or remotely as per the operational requirements. The system shall meet the following requirements as a minimum:

   a) The electromagnetic relays shall be low power continuously rated type and shall have LED for status indication.

   b) The relays shall be plug-in-type and their plug-in-bases shall have screwed terminals for interconnection, Lug type soldered’ connection shall not be acceptable.

   c) Each relay shall have three numbers of 'NO'(normally open) and three number of INC (normally closed) contacts, as a minimum-each suitable .to drive the connected load. Out of these, one 'NO' and one 'NC' contacts shall not be used.

   d) Each shutdown/interlock logic shall be individually protected using separate switch- fuse unit and shall have a lamp for indicating power healthy status.

2.35 Each shutdown circuit and solenoid valve shall be provided with a switch-fuse unit separately.
Programmable Logic Controller (P–C) whenever used for interlock and shutdown, shall be located in environmentally controlled remote control room or satellite rack room. This shall meet the following minimum requirements:

a) PLC shall have dual redundant or triple redundant as specified in job specification. Redundancy for Oil/Power Supply/Communication network shall be provided as per selected configuration.

b) The software shall include the operating system and application program. The application program shall include software for performing functions like interlock and shutdown logic, programming/program modification, documentation etc. Two copies of application program and two set of licensed system software shall be supplied.

c) The system shall be supplied with programming tools and related accessories,

d) No two shutdown circuits shall be shared by same I/O module, unless specified otherwise.

e) For detailed DCS / PLC specifications refer standard specification for 1071-6-52-0055 for DCS / PLC.

f) TUV approval, wherever required shall be specified in the job specification.

2.36 All electronics/microprocessor based instruments/systems shall be provided with Y2K compliance certificate as per requirement of BSI DISC PD2000.

2.37 Contractor shall provide four sets of back up configuration in floppy media. The drawings should be in AutoCAD (latest version) and all documents in electronic media in addition to hard copy/ reproducibles as a part of project requirement.

2.38 Unit rate of all items/modules and hardware shall be specified by contractor for any future addition/deletion for system related items. This price shall include all engineering charges, installation, software charges etc. related to the effected addition/deletion.

All necessary furniture required for mounting consoles, printers, CRT's, video copier etc. shall be provided by the contractor.

3. SPARES PHILOSOPHY

3.1 Mandatory Spares

Mandatory spares for instrumentation and control system shall be provided as below unless otherwise specified in the job specification:

a) 5% spare instruments or minimum one of each range, type and material of construction (except for control valves, pressure relief valves, displacer type instruments, level gauges, flow meters, analysers and special instruments)

b) 5% or minimum one module for all control systems (DCS/PLC/PG's/ESD etc.) 2-years operational spares

Unless otherwise specified in the job specifications, all spares for 2 years of operation like gaskets, O-rings, diaphragms etc. as required for all instruments for two years of trouble free operation shall be provided.
3.3 Commissioning spares

Any kind of spares required for start-up & commissioning shall be provided.

3.4 Consumable Spares

Consumable spares for a minimum of one year duration after acceptance and shall include chart paper, printer paper, ink, cartridges, floppies etc required for recorders, printers and hard copier units, unless otherwise specified elsewhere.

4. GENERAL REQUIREMENT OF INSTRUMENTS

4.1 Instrument Concept

Major instrumentation shall be electronic type with final control elements as pneumatic.

4.1 Electronic Instruments

a) All electronic instruments requiring separate power supply, shall generally operate on 110 V 50 Hz. Instruments operating at 24 V DC shall also be acceptable.

b) Electronic transmitters shall generally be two wire type. These shall have transmission/output signal of 4-20 mA DC and shall be capable of delivering rated current into external load of at least 600Ω when powered with 24 V DC nominal voltage.

c) Smart transmitter when selected, shall be used in analog output mode, Digital integration shall be avoided unless specified otherwise.

d) All receiver instruments shall be microprocessor based and shall operate on voltage input of 0.25 to 1.25 V, 1 to 5 V, or 0 to 10 V DC, in general.

e) The design of electronic instruments shall be in compliance with the electromagnetic compatibility requirements as per IEG - 801.

4.1.3 Pneumatic instruments whenever used shall operate on air supply of 1.4 kg/cm²g and shall have transmission and output signal of 0.2 to 1.0 kg/cm²g.

4.1.4 Instrument air quality shall be as per ISA-S7.3 and free from corrosive, hazardous and toxic contaminants.

4.2 Panel Board Instruments:

4.2.1 Panel board instruments shall generally be multibin subminiature 6\" x 3\", except recorders, which shall preferably be 6\" x 6\". Instruments like microprocessor based recorders, temperature scanners etc., shall be as per manufacturer standards.

4.2.2 Panel board instruments shall have the following graduations, in general:

- Differential pressure flow meters: 0 to 10 square root
- Variable area flow meters: 1 to 10 linear
- Pressure: Direct Reading
Level : 0 to 100 Linear

Temperature : Direct Reading

Multiplying factors for flow scales shall be specified on manufacturer’s name plate. Recorder charts shall be dual graduated, in general, in 0 to 10 square root and in 0 to 10 linear.

4.2.3 Subminiature recorders shall have 100. nun s trip chart with chart speed of 25 mm/h. Microprocessor based recorders shall have strip chart 250mm approx, and chart speed of 50 mm/h with a provision to change speed at site.

4.2.4 Annunciators, in general, shall be solid state type with plug in modules, in a cabinet with back lighted engraved windows and integral power supply. Alarm logic module shall be single channel type. In case multi-input alarm module are selected, only one channel shall be used.

Intrinsically safe annunciator circuit, when used, shall have power supply unit in a safe area. Annunciator alarm sequence shall be as per F3A of ISA.

The design of the alarm annunciator system shall be such that transient alarms of less than 330 milliseconds duration shall be automatically rejected.

4.3 Control Panel

4.3.1 All control panels shall be s supplied in pre-tubed/pre-wired conditioned and s hall be completely tested at manufacturer's works prior to despatch.

4.3.2 Control panels shall be free standing type and fabricated preferably from 3 mm thick cold rolled steel-sheet, If the same is not available, 4 mm thick hot rolled steel sheet shall be used. Angle iron frame work shall use a minimum section of 50 x SOx 4 rom angle. The finish shall include sand blasting, grinding, chemical cleaning, surface finishing' by suitable filler and two coats of high grade lacquer with wet sanding between coats. Two coats of paint in panel colour shall be given for non-glossy high stain finish. Panel face final colour can be any of the following shades as per to 1S-5

Opaline green : ISC No.- 275
Light Admiralty Grey : ISC No.- 697
Sky blue : ISC No.- 101

Panel rear surface, frame work and mounting plates shall have a finish colour of pale cream to IS-5 ISC No.- 352 or Beige to 15-5 ISC No.-388. A final coat of paint shall be given at site. Equivalent colour shade according to BS/RAL are also acceptable.

4.3.3 Control panel shall be open back with each section of typically 2100 mm high, 1200 mm wide and 800 mm deep, when mounted inside the control room o~ 100 nun channel base covering wall to wall, else these shall be totally enclosed cubicule type. The panel width may be increased if necessary.

4.3.4 Enclosed cubicule panels shall have removable hinged doors, generally at the Side or back for easy maintenance and accessibility of the instruments. Doors shall 'be' double leaved type with handle and shall be provided with lock and key. Adequate illumination shall be provided inside the panel. All light fittings shall be suitable for 230 V, 50 Hz Ac.

4.3.5 No process fluid of any kind, except instrument air shall enter the control panel. Also power supply greater than 230 V shall not enter the local panel.
4.3.6 All cable entries to the local panel shall be from panel bottom only using cable glands of adequate size. Cable gland plate thickness shall be a minimum of 3 mm cold rolled cold annealed (CRCA) as a minimum. All unused cable entries must be plugged.

4.3.7 Space heater shall be provided where condensation is expected.

4.3.8 The design of control panel shall incorporate provision for expansion by installing adequate spare capacity. Each panel shall be designed to accommodate the following additional equipment, as a minimum:
   a) 20% of panel front/inside mounted instruments including lamps, push buttons, switches, relays etc.
   b) 20% additional power feeders each provided with switch fuse assembly.
   c) 20% additional spare windows in alarm annunciators.
   d) 20% spare cable entry points.

4.3.9 Panel layout shall be designed considering ease of operation. No push button or hand switch shall be located below 600 rom. Instrument Mounting heights,~ general, shall be as follows:-
   a) Miniature and subminiature instruments (3 rows) Bottom row 110mm
      Top row 1600mm
   b) Annunciators - 1950mm
   c) Electric push buttons/
      Switches, lamps etc.

4.3.10 The internal panel layout shall be designed considering proper approach for instruments, terminals and other accessories for maintenance, easy removal-and online calibration. No instrument, terminals, power distribution box etc shall be mounted on- the panel side plates inside the panel.

4.3.11 All lamps, status as well as alarm, shall be provided with lamp test facility. One single lamp test push button shall be used for each panel.

4.3.12 Colour Scheme
   a) Status Lamps
      On/Open/Permissive : Green
      Off/Close/Emergency : Red
   b) Alarms
      Normal/Pre-trip alarms : White
      Shutdown alarms : Red
   c) Push/Pull buttons
4.3.13 Panel Piping and Tubing

4.3.13.1 The instrument air header shall be adequately sized with brass packless isolation valves and shall be complete with suitable dual filter-cum-air reducing station.

4.3.13.2 Panel tubing from the bulk head to the panel instruments and instrument air supply to the panel instruments shall be of 6 mm x 1 mm. polyethylene tubing.

4.3.13.3 The tubing shall be laid in plastic slotted ducts. Panel air header and tube fittings shall be of brass, suitably protected against corrosion.

4.3.13.4 Shut off valves shall be installed in all branch lines taking off the transmission and output signal. Each tube shall be identified at both the terminating ends.

4.3.14 Panel Writing

4.3.14.1 Open terminals shall generally be avoided. Terminal strips shall be of Phoenix/Klippon/Elmex' or equivalent type and shall preferably be mounted in an enclosure. Fused terminal may be used wherever necessary.

4.3.14.2 A Minimum of 1 mms multi stranded PVC insulated copper conductor shall be used in general. All wiring shall be laid in the PVC troughs. No trough shall be more than 70% full.

4.3.14.3 Wires carrying measurement signals associated with thermocouples, resistance thermometers, pH instruments and other low level signals shall be routed in separate troughs/wire ways and not along with power cables. Power wiring and control wiring shall be separated by not less than 150 mm. The crossing, if unavoidable, shall be at right angles as possible.

4.3.14.4 Extension cables/wires shall be used for all thermocouple' inputs. These wires shall be routed in separate troughs/wire ways.

4.3.14.5 All intrinsically safe wires shall be routed in separate wire ways from non-intrinsically safe and power wiring. Intrinsically safe wiring and terminals shall be light blue in colour and shall be separated from non-intrinsically safe terminals at least by 50 mm.

1.3.14.6 All incoming power feeders shall be terminated on separate terminals suitable for the incoming feeder size. These shall be located at the bottom of the panel and shall be suitably covered for protection against accidental shorting and for human safety.

4.3.14.7 Following design philosophy shall be followed, while deciding the internal layout of panels, as a minimum:

   a) Distance between terminal strip and side of the panel upto 50 terminals 100mm (min.) + trough width
### STANDARD SPECIFICATION FOR INSTRUMENTATION WORK

|   |   |
| b) | Distance between two adjacent terminal strips |
|    | 100mm (min.) + trough width |
| c) | Distance between gland plate and bottom of the strip |
|    | 300mm (min.) |
| d) | Distance of terminal strip from instrument/trough/panel top |
|    | 100mm (min.) |

### 4.4 Local Control Panel

Local control panel for the package units shall be installed within the battery limit of the package considering operational and maintenance requirements and accessibility. In case of skid mounted packages, panel all be located away from the skid.

In case local control panel is housed outdoor i.e. not in a local control room, it shall be designed to meet IP-55 requirements. In addition, panel must be provided with a rain cum sun shade canopy/shed.

#### 4.4.2 Local control panel/panels shall be totally enclosed cubicles. Panel sizing shall be carried out

based on equipment being installed keeping in view the maintenance clearances and easiness. Although the panel dimensions shall be guided by the actual requirements typical dimensions of 2100 mm operational (height) x 1200 nun (width) x 1000 mm (depth) shall be kept in mind while finalising the panel size. In any case, vendor shall not proceed with panel manufacturing before getting prior approval from the purchaser.

#### 4.4.3 Local control panels located in the hazardous area shall be either purged type or flameproof Ex’d as specified in the job specification. In case pressurised panels are specified the same shall be purged and pressurised as per NFPA-496 requirements to render space within the panel non hazardous. For panels, located in me Zone 2 hazardous area type Z purging, shall be used with a purge fail alarm in main control room. In case, panels are located in Zone-1, the power shall be cut-off on pressurisation X purge requirement of NFPA-496. An alarm shall be provided on local panel and a contact shall be provided for remote annunciation, whenever the panel pressurisation falls below 2.5 m m of H2O A protective device to protect the panel from over pressure must be provided.

#### 4.4.4 Panel pressurisation with start-up panel purging scheme shall be fully automatic however it shall be started manually from a push button. Solenoid valves and differential pressure switch required for panel purging shall be flameproof, however other items like relays, switches/pushbuttons, timers etc. shall be located in a flameproof housing. Other items like valves, restriction orifice plates, dual filter regulators, pressure gauges, variable area flowmeters etc. required for pressurization, shall also be located in the non-pressurised section of the panel manufacturers suitable for the specified pressure-temperature conditions. The thermowell design shall ensure no air gap between the tip of the element and thermowell to minimise measurement lag.

### c) Contractor shall carry out the vibration analysis of all thermowells as per PTC codes where line velocity exceeds 6 m/s for liquids and 120 m/s for vapours/gases. In case the thermowell design fails vibration analysis, an alternate design may be used by the contractor. All such design along with calculations shall be submitted for purchaser's review.

### d) Immersion length of thermowells shall be selected as follows:
4.6.2 Temperature Gauges

   a) Local temperature gauges shall be liquid/vapour/gas filled type in general and shall be
       manufactured as per relevant SAMA Class. Bimetallic gauges shall be considered if required as per
       licensor package or specified in job specification. The temperature bulb shall be of SS 316 construction
       as a minimum.

   b) All local temperature gauges shall have 150 mm dial size with adjustable head. The
       bulb size shall be selected to suit the thermowell.

   c) All gauges shall be of heavy duty weatherproof construction.

   d) Temperature gauges shall have accuracy of ±1% URV (upper range value)

   e) Bimetallic temperature and direct filled system gauges shall be avoided where
       excessive vibrations are encountered such as compressors. Only filled type with capillary extension shall
       be used in such applications. Capillary tubing shall be minimum of SS304 with stainless steel flexible
       armouring, having PVC covering over armour.

   f) It shall be possible to adjust gauge stem length by using adjustable gland with union. All such
       fittings shall be suitable for 1/2" NPTF connection to suit thermowell.

4.6.3 Temperature Elements

   a) For remote temperature indication/recording/control/switch etc., thermocouples or
       resistance temperature detector (RTD) shall be used depending on the process requirements. Elements
       shall be spring loaded, mineral insulated and shall have SS 316 sheath as minimum.

   b) The design of thermocouple assemblies shall be as per Standard 1071-7-52-0036 i.e.,
       Thermocouple/RTD assembly with thermowell and shall allow online replacement of temperature
       element. The element head shall be screwed-in type and weatherproof to IF-56 as a minimum. For
       thermocouple assembly, the terminals shall be color coded as per element color code.

   c) Thermocouples shall be magnesium oxide (MgO) filled ungrounded type, unless
       specified otherwise, Thermocouple characteristics shall be as per IEC-584-2/IS7358. The type of
thermocouple shall be selected based on operating temperature conditions. Following guidelines shall be followed in general unless specified otherwise:

- Copper-Constantan (ISA-Type-T) : (-) 200 to 200°C
- Chromel-Constantan (ISA-Type-E) : 200 to 600°C
- Chromel-Alumel (ISA-Type-K) : 600 to 1200°C
- Platinum Rhodium-Platinum (ISA Type-S) : 1200 to 1600°C

d) Thermocouple wire size shall be 18 A WG for single and 20 A WG for double thermocouple for most of the applications, in general. However following guidelines shall be followed for selecting single thermocouple wire size as a minimum

<table>

e) The design of thermocouple assemblies shall be such that replacement on line is possible.

f) RTD (Resistance Temperature Detector) shall be platinum element 3 wire type with 100 Ω resistance at 0°C calibrated as per IEC 751/DIN 43760. RTD shall be used within a temperature range of -200 to 650°C.

g) RID shall generally be selected for applications requiring low temperature measurement with comparatively shorter temperature span requiring accuracies of the order of 0.25% or better.

h) Twin element sensors, if used, shall have two separate cable entries.

i) The special thermocouples such as reactor thermocouples, reactor / vessel skin thermocouples etc shall be designed by contractor based on specifications/details provided elsewhere in the contract document.

j) Heater tube skin thermocouple, where applicable, assembly shall meet the heater design requirements and shall be provided with expansion loops. The sheath material shall be selected based on temperature and sulphur content and shall be as per API recommendation.

4.6.4 Temperature Transmitter
a) Unless specified otherwise, temperature transmitters, shall be panel/rack mounted type only and shall be located in control room/satellite rack room. In case, field mounted transmitters are specified, separate field mounted transmitters shall be used, head mounted transmitters shall be avoided.

b) Temperature transmitters shall have a built-in linearising function to produce an output linear to temperature range.

c) Field mounted temperature transmitters shall be smart type with HART protocol having an accuracy of +/- 0.1 % of DRY. The other features of smart transmitters shall be the same as those covered under field transmitters.

d) Burn out protection must be provided with temperature transmitters and other temperature input devices. Upscale or down scale protection shall be decided based on the application to ensure fail safe operation.

4.7 Pressure Instruments

4.7.1 Pressure Gauges

a) Pressure gauge dial shall be white non rusting plastic with black figures. Pointers shall have external micrometer adjustment for gauge zero adjustment.

b) Pressure gauges shall be weatherproof with dial size of 150 mm and shall have features like screwed bezel externally adjustable zero, over range protection and blowout discs. Pressure gauge sensing element shall be of 88316 and movement of 88304, as a minimum. The design of pressure gauges shall confirm to 18-3624.

c) Pressure gauges shall have an accuracy of ±1% of URV as a minimum. Differential pressures gauges may have an accuracy of ±2% of URY.

d) Over range protector and pulsation dampener, whenever used, shall be of 88304, as a minimum. Pulsation dampeners shall be used for all pulsating services. These shall be floating pin type, externally mounted and externally adjustable.

e) All pressure gauges with maximum operating pressure exceeding 60 k g/cm² g and gauges in toxic service shall be solid front type.

f) Process connection shall normally be 1/2” NPTM bottom, except for diaphragm seal where 1½” flanged connection shall be used in general.

g) Cases shall normally be cast aluminium alloy or black phenol and weatherproof to IF-55 as per IEC-529/18-2147. Blow-out discs shall be provided for all gauges.

h) Ranges shall be so specified that the gauge normally operates in the middle third of the scale and shall conform to 18-3624 standard dials, wherever possible.

i) Diaphragm seal pressure gauge with capillary shall be used for congealing and viscous services, i.e. where plugging of the element may occur or where suitable material is not available in highly corrosive service. Direct mounted, filled type gauges or mechanical linked gauges (Schafer diaphragm type) shall be avoided for any mild to heavy vibrating service.

j) Receiver pressure gauges for local transmitter output indication shall have 100 mm dial with stainless steel element and 1/4” NPTM instrument connection,
4.7.2 Pressure Switches

a) Pressure switches shall have either diaphragm or bellow type of process element with SS316 material of construction as a minimum. Switch type shall be sealed micro type with 'contact rating suitable for specific application. Pressure switch design with Reed type switches shall not be selected.

b) Pressure switches shall be blind type with 1/2 NPTF process connection and shall be operative in full specified range, The switch differential shall be selected as per operating conditions, it shall be less than 60% of difference between set value and operating value.

c) Pressure switches shall have repeatability of ±0.5% of URV, as a minimum.

d) Receiver pressure switches shall have SS316 below as measuring element with 1/4" NPTF connection,

e) Over range protection and pulsation damper requirements and design shall be as per above clause.

f) Requirements, design and selection of diaphragm seal (chemical seal) for pressure switches shall be as per clause 4.7.1(f).

4.8 Level Instruments

4.8.1 Level gauges

a) All gauge glasses shall be steel armoured reflex or transparent type with body and cover material of forged carbon steel as a minimum and shall have tempered borosilicate glass with asbestos or other suitable gasket. Transparent type of gauges shall be provided with integral illuminators operating at 230 V 50 Hz supply and suitable for electrical area classification specified. All gauge glasses must have a rating equal to 'or more than the vessel design pressure and temperature.

b) Reflex type shall be used for clean and colourless liquids, for liquid level interface. For low temperature, low boiling point service, large chamber type will be used. Transparent type will be used on acid, caustic, dirty or viscous, coloured liquids and liquid interface. Transparent type with Mica or Kel-F shields shall be used for treated water, boiler and condensate services, and for corrosive liquids which will attack glass. Tubular gauge glasses shall not be used, in general. They may be used for non-hazardous services at ambient temperature and low pressures.

c) Large chamber gauges with frost shields shall be provided for cold services below 0°C. Heating jacket shall be provided for viscous liquids.

d) All gauges shall have top and bottom chamber connections, unless otherwise specified. In addition each gauge shall be provided with ball check valves and pipe union.

e) The visible range of level gauge shall be selected to cover the complete operating level as well as measuring range of the other level instruments provided for the same purpose. In general, the visible length of the level gauges shall be selected from the following:-

<table>
<thead>
<tr>
<th>Visible length, mm.</th>
<th>Centre to Centre Length, mm.</th>
</tr>
</thead>
<tbody>
<tr>
<td>220</td>
<td>470</td>
</tr>
</tbody>
</table>
In any case, the maximum visibility length shall not exceed 1500 rom for a single gauge. Multiple gauges with overlapping range shall be used for such cases.

f) Gauge glass cocks shall be forged off-set type with an integral ball check and back seating stem. Primary isolation valves are normally required in addition to the gauge glass cocks, except on vented tanks containing harmless liquids. Where the process fluid tends to foul the cocks internals and create plugging or where leakage is a problem, gauge valve may be eliminated. On low temperature service, with liquids having very high vapour pressure at ambient temperature safety valve shall be provided at the vent connection of the gauge glass.

g) For level gauging in very viscous liquids, liquids with crystals, sour services and pressure above 600# toxic services, float operated magnetic gauges with 2” flanged end connections shall be used.

h) Bicolor type level gauges shall be used for steam drums.

4.8.2 Level Transmitter

a) External displacer type instruments with side-side connections and rotatable head shall normally be used for level measurement upto 1219 rom. Side-bottom connections are preferred where RJ flanges are required. Internal displacer type of level transmitters shall be avoided unless application necessitates its use.

b) All displacer type of level transmitters shall be of torque tube type with torque tube material of inconel, as a minimum.

c) In general, displacer type instruments shall be used with displacer lengths of 356 mm, 813 mm and 1219 rom. For interface level measurement; ‘displacer type instruments shall only be used.

d) Differential pressure transmitter shall be used for level measurement above 1219 mm, for services requiring purge or where liquid might boil in external portion.

e) Differential Pressure transmitters for use on corrosive or fouling service shall generally be diaphragm wafer with extended filled capillary type. Flush or extended diaphragm type differential pressure transmitter shall be considered for special applications only. Diaphragm material shall normally be stainless steel or any other special alloy.

f) Dip Tube type level transmitters may be used on corrosive, congealing, slurry services where suitable diaphragm seal type transmitter is difficult to obtain.

4.8.3 Level Switch

a) Level switches ‘shall generally be extended float type with flanged head. External displacer type level switches can be considered for lighter fluids where specific gravity is less than 0.5. Internal float / displacer type level switches shall only be used if external ball float / displacer type is not possible, like in viscous services and in underground tanks/vessels.

b) Multi-float / displacer level switches shall be avoided in process service,
c) Switch shall be sealed micro type with contact rating suitable for the specific application. Level switches with Reed switch shall not be used.

d) Level switch shall be furnished with SPDT contacts with adjustable differential, unless otherwise specified.

4.8.4 Tank Level Instruments

a) Mechanical float type gauges shall be used for atmosphere tanks where level measurement accuracy requirement is of the order of ±2% of span. Liquid seal chamber shall be used where tank contents are toxic or tank is blanketed.

b) Servo type gauges shall be used for level measurement of pressurized tanks/vessels/spheres requiring remote signal transmission and better level measurement accuracies. Level data transmission signal to remote control room shall be digital only. Servo type instruments shall have 6” process connection with 12” diameter still well.

c) The tank side indicator for both types of gauges shall have hoisting facility. All tank level gauges shall have side mounted indicator-counter type for mechanical float type and solid state digital for servo controlled level gauge.

d) The wetted material like float, displacer, tape, wire etc. shall generally be SS316.

e) The accessories for servo-controlled level gauge shall include calibration chamber and isolation ball valves for pressurised tanks. Isolation ban valve size shall be same as equipment nozzle size.

4.8.4.2 Whenever specified, averaging tank temperature element shall be provided. The temperature elements shall be RID. Number of temperature elements shall be as per ASTM D 1066. The temperature element shall be connected to corresponding gauge head and shall be intrinsically safe.

4.8.4.3 Radar type tank gauges shall be used for storage tanks handling viscous fluids or as specified in job specification.

4.8.4.4 All tank gauges shall be supplied with power ON-OFF switch mounted at grade level. Separate cable entries shall be provided for signal and power in the gauge head/tank side indicator/ON-OFF switch as applicable.

4.8.4.5 Other Special type of level instruments like radar, ultrasonic, hydrostatic, nucleonic, capacitance, conductivity type shall be used as necessitated by application requirements.

4.8.4.6 For high pressure steam drum application conductivity type (hydrostatic or equivalent) level instrument shall be preferred.

4.8.7 For solid level measurement, type of instrument shall be ultrasonic/radio frequency / electro-mechanical/capacitance/nucleonic. The actual type selection shall be carried out based on the provenness of the selected type for the similar type of application.

4.9 Flow Instruments

4.9.1 Orifice Plates

a) Flow measurement shall normally be carried out using thin square edged concentric orifice plate mounted between a pair of weld neck flanges of minimum 300 # ANSI rating for line size 2” and above. Flange taps shall be used for line sizes upto 14” while D-D/2 taps shall be used for line sizes 20” and above. For smaller line sizes, bypass type orifice meters with differential pressure transmitters may be used.
16" and above. For line sizes 1-112" and below for conical entrance orifices outer taps shall be used. Contractor to check fouling of tapping point with respect to welding of flange. In case of fouling, flange tap shall' only be used. The material of the orifice plates shall be normally SS316, as a minimum.

Quadrant edge or quarter circle orifice plates shall be used when lower Reynolds number does not permit the use of squared edge orifices as per codes. Conical entrance type of orifice plates shall preferably be used for very highly viscous liquids upto throat Reynolds number of 250. These shall be fabricated as per BS 1042 Part 1.

b) Vent and Drain holes shall be provided in orifice plates, wherever necessary.

c) Sizing of orifice plate shall be carried out in accordance with ISO-5167. Other sizing methods-like AGA Report No.3, BS-1042, Flow-measurement-Engineering Handbook' by R.W. Miller shall be used when specified.

d) Orifice plates shall be fabricated in accordance with standard 7-52-0041 'Orifice Plates and Flanges Dimensional Details'.

e) Differential range for orifice meter shall normally be 2500 m m of H2O dry calibration. Other preferred ranges are 500, 1250, 5000 and 10000 mm of H2O. However the selected value shall be less than the' allowable pressure drop mentioned in the process data sheet.

f) Upstream and downstream straight length shall be provided based on maximum d/D ratio of 0.75, in general. Where it is difficult to meet this requirement, the actual d/D ratio can be considered for reducing the straight length as permitted by the codes. The recommended practice shall be as per API-MPMS, Recommended Practices and AGA Report No.3. Flow straighteners should be considered, where straight runs are difficult to achieve otherwise.

g) Meter taps shall be horizontal for liquids, condensable vapours and steam. The taps shall be on top for gas, non-condensable vapour or liquids which boil at or based on the proveness of the 'selected type for the similar type of application below the maximum design ambient temperature at operating pressure, where piping clearances are a factor, taps may be located upto 45 0 above the horizontal centre line for condensable vapour, liquid and steam. The taps may be located upto 60° from vertical for gas and non condensable vapour. For 45° installation both the tappi ng point nipples are 4" long. For horizontal tappings on "liquid condensable vapour and steam service they shall be 4" long for one tapping and 6" long for the other.

h) Atleast one pair of tapping shall be provided for' each orifice flange. Where more than one transmitters are used, separate pair of tappings shall be provided for each orifice flange for each instrument for installation of each instrument separately.

4.9.2 Variable area flow meters shall be as per ISA-RP 16.1,16.2,16.3,16.4,16.5 and 16.6 shall be used for viscous or corrosive services or where rangeability in flow precludes the use of an orifice. Metal tube variable area flow meters shall be used for all process fluids. External devices for indicating or transmitting shall be magnetically coupled to the float or extension.

Glass tube variable area flow meters shall be used for low' pressure utility services for local indication and where line size is 1-112" or less. Glass tube variable area flow meters shall not be used if outlet line is connected to a line or vessel containing hazardous or toxic fluid unless a check valve is installed at the downstream side of variable ,area flow meters.

4.9.3 Turbine and positive displacement meters or mass flow meters shall be used for accurate flow integration for custody transfer etc. Whenever PD meter is selected, these shall be double casing type with inner casing of SS 316 as a minimum.
Whenever turbine meter is selected, it shall have SS 316 turbine with tungsten carbide bearings.

Pulser and the transmitter selected shall be compatible and should have a proven combination reference.

4.9.4 For flow measurement in lines less than 2", integral flow transmitters shall be selected. The integral flow assembly shall be supplied as an integral assembly consisting of upstream and downstream straight pipes, integral orifice of SS 316 (as a minimum) and transmitter installed along with manifold. Material of construction of cl.1 elements except for end flanges which shall be as per piping specifications, upstream and downstream pipes shall be honed from inside to achieve smooth surface.

Integral orifice meters, when used, shall be installed with block and bypass valves. Orifice meters with metering runs may also be used for lines less than 2"

4.9.5 Magnetic type flow meters shall be used for electrically conductive slurry or corrosive services and shall be installed with line size bypass, with block and clean' out valves, at the lowest point in piping to ensure that meter run is always liquid requirement. Grounding range shall be used whenever required.

4.9.6 Target meters shall be considered for highly viscous hydrocarbon streams such as asphalt, tar, polymers etc.

4.9.7 Vortex meter shall be considered where high rangeability is the prime requirement. Ultrasonic flow measurement shall be considered where non-intrusive flow measuring is required.

4.9.8 Averaging pitot tube shall be considered for low pressure loss, high velocity' steam, large diameter lines and air ducts. This shall be installed on 1-112" size nozzle for small lines and 3" for large lines or lines with high velocity. The average pitot tube shall be of SS 316 material as a minimum, shall be provided with end support, whenever required. Retraction arrangement with ball valves shall be provided for each average pitot tube installation.

4.9.9 Differential Pressure type flow transmitter shall meet all the requirements specified for field transmitters in this specification.

4.10 Field Transmitters

4.10.1 Field transmitters for flow, pressure, differential pressure and level applications shall be yoke mounted smart type unless specified otherwise. These transmitters shall be certified intrinsically safe, in general, with 2 wire system having 4 - 20 mA DC output with superimposed digital signal having simultaneous analog and digital communication. Communication protocol shall be HART only.

4.10.2 Transmitters shall be provided with external zero adjustment and shall have integral vent/ drain.

4.10.3 All transmitters shall be provided with integral intrinsically safe output meter. Intrinsically safe remote output meter shall only be provided, if specified in the P&IDs or in the job specifications. All output meters shall provide digital LCD display.

4.10.4 The transmitter shall be microprocessor based and it shall incorporate a non-volatile memory which shall store complete configuration data of transmitter. All necessary signal conversions, including conversion to produce output with the required protocol shall be carried out in the transmitter electronics.
4.10.5 Transmitter shall also run complete diagnostic routine. In the event of detection of failure, the output shall be driven to predefined value.

4.10.6 Temperature sensors shall be provided to compensate for process temperature and ambient temperature variations.

4.10.7 The transmitter shall be able to assure an accuracy of ±0.1% of span for a rangeability of 1:10, unless otherwise specified in the job specification. The accuracy shall include the combined effect of linearity, hysteresis and repeatability.

4.10.8 The response time of smart transmitters shall commensurate with process. It shall be equal or better than the half of the scan time of control loop specified elsewhere in the bid package.

4.10.9 HART protocol of latest version shall be used and shall be suitable for HART maintenance system with corner stone software or equivalent with the following features as minimum:

   a) It shall allow multi masters (two for example, primary and secondary) for configuration, calibration, diagnosis and maintenance. The primary could be control system or host computer and the secondary, could be the hand held communicator or a maintenance computer.

   b) It shall be capable of implementing universal commands. It must be possible to communicate all the commands of HART maintenance system to field transmitters and smart transmitters shall be selected accordingly.

4.10.10 Unless recommended otherwise by compressor manufacturer, field transmitters used in anti-surge control loop shall be non-smart and flameproof type. The flameproof transmitters shall have their calibration adjustment from outside without any, need to remove the cover.

4.10.11 Retrofit type of smart transmitters are not acceptable.

4.10.12 Diaphragm seal element with capillary shall be used for congealing, corrosive and highly viscous services.

4.10.13 Field communicator

   It shall be possible to perform routine configuration, calibration display process variable, diagnostics etc. from a hand held portable calibrator which can be connected at any location in the transmitter loop. It shall be possible to perform all the above functions on line. The loop function shall remain unaffected while communication is going on between transmitter and the field communicator. No output interruption should occur.

   Field communicator shall meet the following requirements.

   a) They shall be battery powered with replaceable and rechargeable batteries. Recharger power supply shall be 230 V AC ± 10 %, 50 Hz ± 3 Hz.

   b) It shall be possible to connect the communicator at any of the following places for purpose of digital communication:

      i) Marshalling cabinet serving the transmitter, 'in safe area, control room.'

      ii) Junction box serving the transmitter,' in hazardous area, field.

      iii) Directly at the transmitter, in hazardous area, field.
Plug in type connections shall be provided with field communicator. Necessary interconnection cable and any other accessories required for connection shall be supplied by vendor.

c) Offered communicator shall be dustproof, certified intrinsically safe and suitable for outdoor location. Carrying case shall be supplied with each communicator.

4.11 Control Valves

4.11.1 Control valves shall normally be globe type, single seated or double seated. Other type of valve like butterfly, ball, rotary plug, angle or 3 way etc., shall be 'selected as per service requirements.

4.11.2 Control valve sizing shall be carried out as per ISA S75-01. In general, control valves shall be sized so that the valve opening is as noted below:

- At max. flow: less than 90% open
- At normal flow about: 75% open
- At minimum flow more than: 20% open.

4.11.3 Unless specified otherwise flanged control valves shall be used. Body material, body rating and flange rating, shall be as per piping specifications, as a minimum.

4.11.4 Minimum control valve body size shall be 1" in general. Reduced trims can also be considered. Body size shall be limited to 1", 1-1/2", 2", 3", 4", 6", 8", 10", 12" and 14". Higher sizes may be used wherever necessary.

4.11.5 Trim characteristics shall be equal percentage type unless required otherwise because of process application. Control valve plugs shall be top and bottom guided for double seated valves and heavy top guided for single seated valves. Cage guided valves shall be selected for control valve size of 2" and above, in general.

4.11.6 Anti-cavitations trim shall be selected wherever cavitations is expected in the valve.

4.11.7 Noise from control valve during operation shall be limited to OSHA specified level or better. The maximum allowable noise is 85 dBA SPL (Sound Pressure Level) at 1 meter distance from the valve body. Source treatment for noise shall be preferred by using special trims like anti-noise trims, in case noise exceeds the allowable level. Path treatment may be adopted over and above source treatment, if necessary.

4.11.8 Valve seat leakage shall be as per ANSI/FCI 70.2 and shall be elected with due consideration to meet the requirement. For shutdown valves leakage class VI shall be considered.

4.11.9 Flanged bolted type gland packing boxes shall be used. Packing shall normally be PTFE on liquid and gas service upto 200°C. PTFE impregnated asbestos shall be used upto 260°C. Graphited asbestos with lubricator; shall be used on steam service and temperature above 260°C. Alternate suitable material is also acceptable.

4.11.10 Bellows seal shall be used where it is required to isolate the packing from the process fluid or where no leakage to phosphate can be tolerated, toxic, explosive and precious fluids.

11 4.11.11 Material used for trim shall be minimum SS316, with guide bushing of hardened stainless steel like 440C, 17-4 PH, upto a pressure drop of 10 kg/cm². For higher drops or erosive and slurry
services and in general for all steam services, flashing services, hard-surfacing of plug seat rings and seating area of inner valve with satellite shall be used. Special cases may require 17-4 PH seat ring and 440 C solid plugs or other materials like Hastelloy, Durimet, Monel etc.

For temperature above 300°C satellite facing shall be used for guide posts. Guide bushing shall always be harder by a minimum of 125 Brinnel than the guide post.

4.11.12 Contractor shall carry out cavitation and flashing checks for valves ill liquid service and select: the valve body and trim accordingly. Whenever the data provided is not adequate to carry out such checks, it shall be contractor's responsibility to evolve such a data and as certain the correctness of the valve sizing/selection.

4.11.13 Unless otherwise specified in P&ID, block and bypass' valves shall be installed for all control valves up to and including 2” size except for butterfly valves, 3 way valves and control valves in slurry and freezing service. Hand wheel shall be provided for all other sizes and services, No by-pass valve or hand wheel shall be used for shutdown valves.

4.11.14 Valve actuator shall be pneumatic spring opposed diaphragm type, in general. Piston type actuators may be used for very high shut off pressure requirements. Additional equipment necessary to meet fail safe condition shall also be included in case double acting piston type actuator is selected. Wherever double acting piston cylinder actuators are used, it shall be provided with complete accessories like volume tank, safety valve, non return valve and pressure gauges etc. The volume tank shall be designed for minimum of 2 full stroke operation of control valves in addition to backup for control valve operation for a preset time as given in job specification. In either case, actuator shall be able to withstand maximum shut-off pressure with the minimum instrument air pressure specified.

4.11.15 Control valve accessories such as positioner, air filter- regulator and solenoid valve shall be properly mounted on the actuator and shall be fully tubed.

4.11.16 Valve positioners wherever used shall be' side mounted force balance pneumatic type. For electronic instrumentation, I/P converter shall be used alongside pneumatic positioners. Separate I/P convertor and positioner shall be used unless specified otherwise. Separate air filter regulator shall be used for each valve positioner. Smart positioner shall be used where specified in job specification.

4.11.17 The I/P convertor shall be intrinsically safe certified and shall be of electronic feedback type. It shall have an integral junction box with 112" NPTF cable entry and be suitable for "2" pipe mounting.

4.11.18 The air filter regulator mesh size shall be suitable for I/P convertor.

4.11.19 Whenever limit switches are specified, as inductive proximity type, these shall meet NAMUR (DIN-I9234) requirements.

4.11.20 Separate limit switches shall be provided for open and close position, where required.

4.11.21 Solenoid valves, wherever used, shall be universal type and shall be continuous rated type with class F coil insulation as per IEC, 85/IS 1271. These shall be of brass body with $S316 trim, as a minimum.

4.11.22 Self actuating' regulators for flow, pressure and temperature shall be, used as indicated in P&ID.

4.11.23 Whenever fire safe requirement is specified for a shutdown valve, the valve body as well as the actuator' shall meet the testing requirements as per API 617 latest revision. In addition to above, air volume tank shall also be provided for a storage of air volume with minimum two full strokes of valves.
All valve accessories like solenoid valve, limit switches and, volume tank etc shall also be enclosed in a certified fireproof enclosure. The cable used for the actuation of the valve shall also be fire resistant (Fire Survival to me 331).

4.11.24 All valves in cryogenic service (i.e. the valves installed in piping classes used for temperature below -29°C>C) shall be designed and tested as per BS-6364.

4.11.25 Control valves/shutdown valves requiring certain specified operating timings; shall be tested before despatch for the specified 'operational time verification. Hook-up drawings along with the timing calculation shall be submitted by contractor for review.

4.12 Pressure Relief Valves and Rupture Discs

4.12.1 Pressure Relief Valves

4.12.1.1 In case, ASME section I valves are supplied, it shall have the certificate from ASME laboratories.

4.12.1.2 Pressure relief valves shall be full nozzle full lift type except for thermal relief valves.

4.12.1.3 Conventional valves shall be specified for constant back 'pressure while bellows seal type valves shall be specified for variable back pressure more than 10% of set pressure. Pilot operated pressure relief valves shall be used for special services and where set pressure is closer than* 10% of the operating pressure, in general.

4.12.1.4 Lifting lever shall be specified for steam and air service. Open bonnet shall be used for steam service.

4.12.1.5 The percentage accumulation in case of pressure relief valves/safety valves shall be as follows

a) Steam Service
   - ASME SEC I 3%
   - IBR (Before steam let-down station) 3%
   - IBR (Distribution & utilities) and 10%
   ASME Section VIII
b) Gas, Vapour or liquid except in (c) & (d) 10%
   below
c) Liquid for thermal Relief 25%
d) Fire exposure on unfired vessels 21%

4.12.1.6 3/411 x 1" threaded (NP'T) modified nozzle type valves with typically 0.38 cm² orifice size shall be specified for thermal relief.

4.12.1.7 The body material shall, as a minimum, be as per piping specifications. Nozzle and disc material, shall be SS316 as a minimum with machined stainless steel guide and spindle.
Whenever semi nozzle designs are unavoidable, body material shall be at least same as nozzle material.

4.12.1.8 The spring material of pressure relief valves shall be as follows unless otherwise necessary because of process conditions:

-29°C to 250°C : Zinc/nickel plated carbon steel.
Above 250°C : Tungsten alloy steel.
Below – 29°C : Stainless steel 316

4.12.1.9 Flanged connection shall be for standard sizes 111 or larger. Minimum flange rating shall be 150 # ANSI.

4.12.1.10 Where permissible, threaded connections shall be used on sizes 3/4” and below.

4.12.1.11 Pilot operated pressure relief valves shall have remote sense facility for pilot valve. Internal sensing for pilot shall be avoided as far as possible.

4.12.1.12 The pressure relief valves shall be type tested for capacity with 5% blow down as per ASME sec VII UG-131 and the actual blowdown of individual valves shall meet the process requirement. Contractor shall furnish the type test certificate for the same.

4.12.1.13 Test gage shall be provided for all pressure relief valves.

4.12.2 Rupture Disc

4.12.2.1 Rupture discs shall be reverse buckling type, in general and shall be supplied in pre torque holder assembly which shall fit inside the inner diameter of the bolt circle of standard ASME flanges. Disc material shall be compatible with the vessel contents and shall be consistent with the bursting requirements.

4.12.2.2 Following shall be taken care when rupture disc is valve:

(a) Derating factor of 0.9 shall be used for capacity rating

(b) A tell-tale assembly consisting of pressure switch, pressure gauge and excess flow check valve shall be provided to indicate leakage/rupture downstream of the rupture disc.

4.12.2.3 Manufacturing tolerance of the rupturedisc shall be decided by contractor based on operating pressures. However when rupture disc is used in combination with pressure relief valve, zero manufacturing range shall be selected.

4.12.2.4 For each rupture disc four(1+3 spare) discs shall be provided.

4.13 Pressure reducing stations & Desuperheaters

4.13.1 The design of the desuperheater shall be based on the capacity and rangeability requirements to meet heat & mass transfer equation. Contractor shall also ensure the following while sizing & designing the system apart from other considerations:

(a) turndown of desuperheaters and coolant

(b) minimum velocity requirements
(c) allowable pressure drop
(d) minimum pipe straight run required, upstream & downstream.
(e) location of temperature sensor at downstream
(f) design of control scheme

4.13.2 The desuperheaters shall be of insertion type design, in general, and shall consists of a coolant injection assembly with sleeve and atomising nozzles inserted perpendicular to the 'process line. Other types including in line mounted desuperheaters 'like variable orifice nozzle etc. shall be used based on process conditions.

4.13.3 Temperature control valve in the coolant line shall be integral to the desuper heater, in general. Whenever separate control valve is necessary, its design, sizing, compatibility and suitability with the desuperheater shall be ensured.

4.13.4 Whenever pressure reduction is also required with desuperheating, integral design of desuperheater with pressure reduction shall be offered unless otherwise specified.

4.13.5 The desuperheater and the pressure reducing control valve's body rating shall be equal to or better than the flange rating as per piping material specification.

4.13.6 The, insertion type desuperheater shall be suitable for mounting on 311 size flanged nozzle.

4.13.7 The material of all wetted parts shall be suitable for the process being handled at its operating, and design flow, pressure and temperature.

4.13.8 The desuperheater shall be sized to maintain temperature at the’ outlet of the desuperheater within ±5 °C in general.

4.13.9 All accessories like positioner, air filter regulator shall be firmly mounted on the actuator and shall be fully tubed. Actuator shall be fully tubed. Actuator shall be pneumatic spring opposed diaphragm type in general. Positioners shall be side mounted force balance type. I/P converters shall be used along with pneumatic position Separate air filter regulator regulator shall be used for each valve positioned.

4.14 Tank Safety System

4.14.1 Tank safety system shall be provided as' per P&ID and shall be designed considering the safety requirements related to over-pressurisation and excessive vacuum generation in the tank because of normal pump in, pump out conditions, fire conditions, sudden depressurization and condensation/contraction of vessel vapours during sudden atmospheric thermal cooling. The system shall consist of tank blanketing equipment, breather valve, emergency vent and flame arrestors as applicable.

4.14.2 The total system design shall take into consideration the blanketing pressure and the tank design pressure/vacuum. The operating margins should, be sufficient for each device to operate independently. Design shall also avoid undesirable operation of breather valve under normal pump in, pump out condition and operation of emergency vent under breather valve operation unless absolute necessary as per process requirements. A minimum gap of 35% should be ensured between set pressure of breather valve and emergency 'vent for proper operation(considering design of breather valve with 20% overpressure).
4.14.3 The blanketing scheme shall be specially designed considering normal and maximum blanketing flow and shall comprise of self actuated control valve (PCV) assembly designed specially for blanketing application. Conventional PCV or set of PCV's shall not be offered as a replacement to blanketing assembly. For the tanks or vessels with higher set pressures alternate scheme of pressure control valve with split range control valve of sufficient size, can also be accepted if specified in the P&ID.

The flow capacities of the blanketing systems shall be established as per procedure defined in API-2000. The blanketing system selected should have published regulating characteristics to establish its suitability for the requirements. Wherever an external pressure sensing is necessary it should be taken directly from tank.

4.14.4 The type of breather valve i.e. close vent or open vent type shall be selected based on the P&ID requirements and shall be sized to consider overpressure and vacuum requirements for which a separate pallet shall be used. The breather valve shall generally be dead weight, soft seated type with teflon diaphragm and shall have self draining body construction.

Spring loaded type can be used where dead weight design is not feasible. The selected valve design shall ensure that seating surface is shielded from direct liquid/condensate flow to prevent tendency of pallet sticking. A test connection below pallet shall be provided for breather valve testing. The breather valve selected shall have certified flow capacity as per API-2000.

4.14.5 The emergency vent shall be hinged cover type with weighed pallet and shall open to atmosphere. Services where ventilator not be discharged freely to atmosphere, spring loaded design also shall be acceptable. The selected vent shall have certified flow capacity as per API-2000.

4.14.6 The type of flame arrester i.e. detonation/deflagration shall be selected as per actual installations requirements and shall meet the requirements of BS-7244. The flanged type of flame arrester shall be selected in general. Whenever end of line flame arrestors are selected it shall always be provided with a free vent having SS316 mesh. The sizing of the flame arrester shall be carried out considering maximum delta pressure drop allowable across the flame arrester flame arrester-vent combined. The flame arrester shall be certified for the capacity as per API-2000 as well as the gas group classified as per BS-7244.

4.14.7 Where no free vent is provided for the valves /flame arrestors installed at the end of line, goose neck vent shall be installed to prevent entry of rainwater/birds, Mesh shall be provided at the end of the goose neck, Compressor Instrumentation

4.15.1 Contractor/compressor vendor shall be completely responsible for providing adequate instrumentation for safe and efficient operation of the machine. The commonly used instruments are being detailed out in the following clauses, however this does not absolve the contractor of providing additional instrumentation, if required.

4.15.2 Anti-surge Control System (ASC)

4.15.2.1 Contractor/compressor vendor shall be fully responsible for the complete design of anti-surge Control system including selection of type of flow element, controller algorithm, type of explosion protection, type and operating timings of final control element. Vendor shall guarantee the performance of machine with the offered ASC System. Whenever required ASC system shall be designed in such a WWJ that it is capable of detecting surge well in advance and correct the compressor operating point accordingly so as to avoid surge in order to protect machine from possible damage, to minimise process upsets and to minimise recirculation.
4.15.2.2 ASC System shall typically consist of but not limited to flow element, flow transmitter differential pressure transmitter, ASC controller, control valve and other accessories as felt necessary by the vendor.

4.15.2.3 Vendor shall supply all hardware and software related to the operation and safety of the compressor. This shall include but not be limited to the following:

a) Design and operation of surge control loop scheme based on offered compressor performance.

b) Supply of all hardware in anti-surge control loop including dedicated controller, transmitters, measuring elements, final control element etc.

c) Fast response transmitter and control valve etc. as required.

d) Algorithm required for Anti Surge Controller.

4.15.2.4 Dual redundant link shall be provided to interface ASC system with DCS 'for all operational data required at DCS.

4.15.6 Vibration and Axial Displacement Monitoring

4.15.6.1 Vibration and axial displacement monitoring system shall be based on non-contacting type sensing probe, unless otherwise specified.

4.16.2 Vibration and displacement monitoring system shall be as per API-670. The extent and type of monitoring shall be as defined elsewhere. However, contractor shall furnish any additional requirements for monitoring deemed essential by them with reasons. Two probes at 90 degrees apart for each location shall be provided and connected to same dual channel monitor for vibration monitoring.

4.16.3 The sensing probe shall be accessible' for adjustment, repair and replacement without dismantling the machine:

4.16.4 Vibration and displacement monitoring system shall be Bently Nevada 3500 series or equivalent. Monitoring instruments shall be located in control room 'unless otherwise specified.

4.16.5 System shall provide continuous 4-20 mA DC isolated output for each channel of measurement for remote indication and potential free contacts for all shutdown setting.

4.16.6 Monitors shall be with maximum four (4) channel type and shall meet the following specifications as a minimum:-

a) Each channel shall have two independent alarm levels one for pre trip alarm and one for each trip, settable continuously over measurement range. Two relay contacts for each pre trip alarm and trip alarm per channel shall be provided.

b) Broken sensor failure detection without causing shut down.

c) LED status indication to show health status of the monitor, bypass status and communication status of the monitor.

4.17 Speed Monitoring

4.17.1 Speed monitoring system shall be based on non-contacting type sensing probe, unless otherwise specified.
4.17.2 Speed monitoring system shall be as per API-670. The extent and type of monitoring shall be as defined elsewhere. However, contractor shall furnish any additional requirements for monitoring deemed essential by them with reasons. Two probes at 90 degrees apart for each location shall be provided and connected to same dual channel monitor for vibration monitoring.

4.17.3 The sensing probe shall be accessible for adjustment, repair and replacement without dismantling the machine.

4.17.4 Speed monitoring system shall be Bently Nevada 3500 series or equivalent. Monitoring instruments shall be located in control room unless otherwise specified.

4.17.5 System shall provide continuous 4-20 mA DC isolated output for each channel of measurement for remote indication and potential free contacts for alarm/shutdown setting.

4.17.6 Monitors shall be with dual channel type and shall meet the following specifications as a minimum :-

   a) Each channel shall have two independent alarm levels one for pre trip alarm and one for each trip, settable continuously over measurement range. Two relay contacts for each pre trip alarm and trip alarm per channel shall be provided.

   b) Broken sensor failure detection without causing shut down.

   c) LED status indication to show how health status of the monitor, bypass status and communication status of the monitor.

4.18 Bearing and Winding Temperature Monitoring

4.18.1 In general, bearing temperature shall be measured at the points which are under maximum loading.

4.18.2 Sensor shall be three wire RTD element of platinum having 100 Ω at 0°C. Calibration shall be to DIN 43760 standards.

4.18.3 The temperature sensor cables, terminal heads, junction boxes etc. should be capable of withstanding the mechanical vibration and environment of a rotating machinery atmosphere.

4.18.4 Bearing and Winding temperature shall be monitored by means of a temperature monitor. The temperature monitors shall be located in control room and shall meet following requirements :-

   a) Accept RTD inputs (platinum, 100Ω at DIC calibrated to DIN 43760 standards).

   b) Continuous six channel monitoring with each channel input from one RID.

   c) Each channel shall have two independent alarm levels one for pre-trip alarm and one for trip alarm, settable continuously over measurement range.

   d) Broken sensor failure detection without causing shut down.

   e) LED status indication to show how health status of the monitor, bypass status and communication status of the monitor.

   f) Analog output 4-20 mA DC isolated signals shall be provided for each channel for remote indication.
4.18.5 Separate temperature monitors shall be provided for motor winding and bearings temperature monitoring.

4.19 Key Phasor

4.19.1 Key phasor systems shall be provided by vendor for performing analysis of vibration signals to determine machine malfunctions. It shall consist of a proximity probe and transmitter, extension cable, mounted etc. and other accessories to make the system complete. Vendor shall provide necessary reference on the shaft to determine one-per-turn occurrence.

4.20 Accumulator of Lube Oil System

4.20.1 If accumulators are used with, nitrogen for lube oil dampening at the desired pressure to meet the system requirement the following instrumentation with the accumulator to be provided by vendor :-

   a) Accumulator shall have charge kit with isolation valves and connection hoses.

   b) Standard Nitrogen cylinders available in India are at pressure of 140 kg/cm² with standard connection sizes. Vendor shall provide the complete regulator System with protection for charging nitrogen from nitrogen cylinder to accumulator at the desired pressure. Regulator shall be suitable for the inlet pressure variation of 140 to 150 kg/cm² while charging with suitable inlet connection to match the Nitrogen cylinder connection. Regulator system shall have pressure indicator, regulator, relief valve, needle valve etc. as "a minimum. Material of construction shall be stainless steel.

4.20.2 The compressor loading-unloading scheme for reciprocating compressors shall be provided as per the minimum requirements specified in the job specifications. Manual as well as automatic schemes shall be provided per steps as per machine requirement.

4.20.3 Emergency switch shall be provided in the local panel/field. All such switches shall have a protective cover to avoid inadvertent shutdown.

4.20.4 Vendor shall provide the following common alarms in control room:

   a) Common machine pre-trip alarms.

   b) Common machine trip alarm.

4.20.5 Vibration, axial displacement, speed, temperature monitoring system shall be provided with serial link output for connectivity to plant DCS. The serial link shall also be provided for machine diagnostic software running on separate whenever specified in job specification.

5. CLOSED CIRCUIT TELEVISION (CCTV) SYSTEM

5.1 Functionally CCTV system is required for the surveillance of the plant and equipment as detailed out in job specification.

5.2 All the cameras shall have Pan and Tilt control. The camera viewing angle can be varied between 70 to 400 and shall have zooming facility.

5.3 The CCTV central unit shall be located in the main control room or satellite rack-room as required. Separate monitors shall be suitably located in console area and keyboard, joystick etc. shall be located on the hardwired console unless otherwise specified in job specification.
5.4 The minimum enclosure protection degree of the system components Shall bem accordance with me 529 as follows:

a) Outdoor IP 65  
b) Indoor IP 42  
c) Panels with open doors IP 20 (live parts shielded)

5.5 Control unit and all peripherals shall be installed in' air conditioned main control room. Cameras shall be installed outdoor in the field. Cameras with its accessories shall be housed in explosion proof certified Ex’d’ housing suitable for gas grouping of the plant.

5.6 The system shall include all hardware, wiring, cabinets, materials and application software for a fully function system. Components shall be for industrial grade.

5.7 Cameras shall be as a minimum, comply with the following specification:

a) Pick up element: ½, 1/3” interlined CCD Colour
b) Picture point: 512 x 582

c) Sampling system: PAL Standard CCIR 625/50 lines per frame
d) Video band with: 5 MHz = -3dB
e) Horizontal resolution: Minimum 450 lines
f) Sensivity: 3 lux for a good picture (@F = 0.95 and 3200 K)
g) Zoom lens: 11-66mm
h) Controls: Zoom, Focus, Iris and external synchronization
i) Signal noise ratio: Approx. 50 dB
j) Gamma: 0.5
k) Automatic light: 1:10

level control

l) Temp. range: 5-80°C
m) Video output 1 V peak: 75 Ω unbalanced to peak
n) Camera identification: Yes

Automatic gain control facility: Yes

The zoom objective shall be equipped with an automatic diaphragm control, auto focus and spot filter.

5.8 The time lapse Video recorder shall be as below unless mentioned otherwise:

a) Cassette Tape: Standard 2 hour ½" S-y VHS E-120 or E-180
b) Record / play back speed : 2, 12, 24 and at least upto 72 hours  
c) Video input / output : 1 V peak to peak 75 Ω unbalanced.

5.9 Movable camera shall have an electric control mechanism (pan and tilt) which shall be controllable through a joystick and the same shall located on the hardwired console. The pan and tilt shall comply with the following:

a) Angular travel : Pan 0-335 degrees, Tilt ± 90 degrees  
b) Stops : Externally adjustable  
c) Speed (no load) : Pan 6 degrees/second, Tilt 3° degrees/second  
d) Loading : Suitable for camera and camera housing

5.10 Outdoor cameras and accessories shall be housed in an Ex'd' and ingress protected (IP 65) housing. Sand protector, wash and spray installation on the lens cover shall be provided. A sun cap shall prevent direct sun radiation into the lens and camera housing. The enclosure shall be epoxy painted.

5.11 Cameras with its accessories shall be installed on steel structure (mounting poles) Mounting pole/structure shall be 10 metre high (minimum and shall be designed for maximum wind velocity of the plant location. The allowable deflection at the top shall be ± 5 mm. The mounting pole/structure shall be supported on a concrete foundation. A ladder shall be provided to access the camera at top for the purpose of installation and maintenance of camera and its accessories. The design, supply, fabrication and erection of poles including its support arrangement shall be in contractor's scope. The structural steel shall be epoxy painted to meet the environment.

5.12 a) From a master control panel (keyboard) it shall be possible to select any camera and display the picture at the monitor:

b) Remote control panels/keyboard shall be programmed for the control of selected cameras with the possibility to call up any camera connected to the system.

c) Commands from the control unit are sent via a data transceiver to the control receiver at the camera side. The control receiver will control the camera lens and pan/tilt functions.

d) Operator shall be able to control all cameras and pan, tilt and zoom functions manually.

e) The Video recorder shall record the activities at all entrances and at locations where alarms have been alerted. The time lapse video recorder(s) shall be able to record up to 72 hours without reloading.

f) It shall be possible to view pictures of four cameras or three cameras and VCR simultaneously on the screen. Suitable quad unit shall be provided.

5.13 Wiring and connection shall be as below unless specified otherwise:

a) All the cables (indoor/outdoor), connectors and plugs shall be supplied. The connectors shall be BNC type.

b) Flexible cables shall only be used for flexible connections.

c) Video signals from cameras to the control unit shall be transmitted via coaxial cables.
d) Camera control signals x-ray be transmitted either via twisted pair or via multicore cables.

e) All interconnection cabling between field mounted cameras to control equipment shall be shielded and armoured. Outdoor cabling between control equipment/ monitor / key board and optical fibre cable shall also be shielded and armoured.

f) Materials shall be of proven design for similar application.

5.14 All the outdoor items shall be tropicalized and epoxy painted. All carbon steel bolting shall be hot dip galvanized or Cadmium plated and bi-chromated, Screws, rivets, brackets and stiffeners shall be stainless steel. Colour of the top coat of panels shall be manufacturer standard.

6. CONTROL ROOM REQUIREMENTS

6.1 The control room required for housing control system and other instrument items shall be designed, constructed totally by contractor. The following shall be considered as minimum for control room.

a) The control room shall be common for all units with respect to consoles, however rack room may be common or segregated as per satellite rack room concept.

b) The control room shall be so designed as to have console area for DCS and hardware consoles fire alarm panel which requires 'direct operation intervention and rack area sharing atleast one of the wall within the console room to house all racks, cabinets etc.

c) A separate room shall be provided for EC (Engineering Consoles) / PLC consoles.

d) The rack room and EC/PLC room shall have connectivity with console room.

e) All the room shall have false flooring and false cing unless otherwise specified.

f) The control room shall be illuminated adequately with glazed lighting arrangement which shall not cause any glare at viewing area. The lighting arrangement shall be approved by Purchaser/purchaser's representative.

g) The console area and rack area shall be separated by solid partition. Painting and finish of floor and colour of consoles/racks shall be aesthetically matched.

h) The main entry to the control room/console area and equipment entry to rack area shall have door opening 2500 mm (W) X 2700 mm (H) (clear space), double door. Escape route for console / rack room shall be provided.

i) The UPS and other electrical equipments shall be housed in UPS room with separate cable entry. In general no electrical equipment shall be placed at rack area.

j) In the console area consoles shall be arranged in an arch form or straight. Ergonomic techniques shall be used in design and layout of the consoles based on the assumption that operators are seated while using the keyboards CRT displays, keyboards HW switches other console equipments. A minimum clearance of 2 metres at the back side wall to console and 3 metres at the front shall be kept.

For arch type console minimum of 2 metres from the tip to the front wall shall be considered on either side.
6.2 For rack room, the layout shall be made considering the following.
   a) Clearance between back and front rows from wall shall be 1.5 m (minimum).
   b) Clearance between 2 rows shall be equal to 1.4 m or DCS vendor's recommendation whichever is higher.
   c) Clearance between all rows from side walls shall be equal, to 1.5 m (minimum)

6.3 The console area shall be sized to accommodate consoles for future units to be installed by owner at a later date if specified in job specification. The channel base shall be provided based on base frame details to be provided during detailed engineering.

   The sizing for rack room shall be made in such a Wtrj that 30% spare cabinet space available for future use.

6.4 All consoles, racks, in control room and E C / PLC room shall be bolted on in to channel bases which is grouted to the floor.

6.5 The printers shall be arranged in console area.

6.6 All cabling inside the control room shall be done through trays below false flooring. No cable shall be left on the floor.

6.7 Contractor shall obtain specific approval on control room equipment layout before proceedings for control room engineering.

7.0 DISTRIBUTED CONTROL SYSTEM

7.1 The Control System (DCS/PLC) shall follow the specifications as per 1071-6-52-0055 Standard Specification for Distributed Control System. the specific requirements given in this specifications and special requirement given under job specification. Plant operational requirements shall be as per P&IDs. Process description and any other requirement as defined in Process package.

7.2 The offered control system shall have complete infrastructure, 'base available' in India for the purpose of maintenance. spare parts supply engineering support, expansion etc.

7.3 If at any point of time during execution of job, DCSI PLC system as being supplied is found inadequate additions/modifications required in software or hardware to meet the requirements shall be carried out by contractor without any time/cost implications.

7.4 Functionally, the plant monitoring, control etc. shall be done through DCS and the interlock/shut down is executed through PLC, in general. Inter mixing and interchanging of functionalities are not allowed.

7.5 For the overall plant operational philosophy, number of control systems, their locations, the Process units under each System, the connectivity between other control systems etc. the system configuration and other requirements given in Job Specifications attached elsewhere shall be referred and met with.

7.6 Process unitwise segregation shall be provided for controller/data acquisition sub-system, PLC, Marshalling/barrier and termination cabinet, relay rack, electrical instrument interface cabinet, power distribution.
7.7 In case of bulk power supply used for powering 2 wire transmitters, barriers etc, the dual redundant power supply shall be provided.

7.8 Control room ergonomics shall be considered while deciding the various operator/engineering interfaces. Unless otherwise specified all operator/engineering interfaces shall be console type. Only single tier shall be considered unless specifically indicated otherwise in the job specifications.

7.9 Controller and data acquisition sub system

7.9.1 i) Unless otherwise specified, plant control and data acquisition functionality shall be carried out in the 32 bit microprocessor based controller. and data acquisition subsystem. A multidrop controller sub-system shall be utilised with 1:1 redundancy including communication sub-system, I/O modules, power supply modules, processor modules etc. within the system

   ii) The controller shall have the following library of algorithms available as their firmware, as a minimum:

   General
   Control Algorithms
   Arithmetic function
   Linearisation
   Linearisation and cold junction" compensation, RTD Linearisation, Polynomial
   Dynamic function
   Limiter function
   Comparison functions
   Selector functions
   Logic functions
   Miscellaneous

   iii) In addition, the controllers and data acquisition sub system shall have the following features:

   a) Output status on controller failure shall flunk/freeze and shall be engineer configurable.

   b) Configuration and tuning shall be from centralised level (operator/Engineer station).

   c) Anti reset wind up feature and reverse/ direct selection.
d) Control modes shall be auto, manual, cascade, computer.

e) It shall support various types of input-output signals which are 4 - 20 mA DC - 2 wire and non 2 wire, 1-5 V DC, thermocouple (all types) grounded or underground as per IEC 584-2, RTD Pt.100, 3 Wire or 2 wire as per DIN 43760, contact (volt free), BCD, pulse etc. inputs. 4-20 mA DC, digital output (volt free contact) or any other output as specified.

All I/O modules shall have galvanised isolation.

f) The memory for configuration shall be resident in controller and data acquisition sub-system itself and shall be retentive. In case the memory is volatile, chargeable battery back up shall be provided for retention of configuration for 72 hours in case of loss of power to the sub-system.

g) The online diagnostic message shall be available at centralised and local level.

h) The switch-over time’ from primary to back up controller and vice-versa shall be of the order of one second. In case of failure of primary controller

i) The system shall be capable of supporting remote I/O's. However, local I/O configuration shall be used, unless specifically indicated otherwise 'in job specifications.

k) Cable loop resistance of 80 0 (which is equivalent to 1000·M of loop resistance of 0.5 mm² cable) shall be considered as default value for deciding interrogation voltage or transmitter power supply.

7.10 COMMUNICATION SUB SYSTEM

7.10.1 The communication sub system which extends outdoor shall be through redundant fiber optic cables. The optical fibre cables or any other system cables shall be of armored type or shall run in GI (galvanised, iron) conduits. Separate duct shall be provided for the data highway and system cables. The redundant cables shall follow separate cable routings. The fiber optic cables shall be provided with wire armouring, If tape armouring is used, it shall be corrugated steel tape armour with double layers of steel tape armouring. The fiber optic data highway cable shall have separate cables for redundancy with numbers of fibres per requirement. Additionally 4 nos. spare fibre shall be provided.

7.11 Operator interface subsystem shall be industrial grade work .station based and' shall be sourced from Original Equipment Manufacturer (OEM).

7.11.2 The system shall be capable of providing the following logging function as minimum for all tags.-

- Alarm History per shift
- Event logging
- Hourly, weekly, daily log reports
- Shutdown reports
- MIS (Management Information System) Reports
- Trip initiated log reports
- Rotary equipment running data etc.

The log formats shall be user definable and shall be finalised during detail engineering.

7.11.3 Operator interface sub system shall be an independent function sub-system and shall not depend on any other node/sub-system including engineering interface sub-system under normal operating condition.

7.11.4 Number of graphic pages per console shall be 300 as a minimum.

7.11.5 Minimum two cursor control devices shall be provided on each CRT one keyboard other touch screen or track ball or any other as specified in job/particular specifications. The touch screen provided shall operate only when the finger (or any other device) touching the screen target is withdrawn: It shall not operate on mere touching.

7.11.6 Window operation

a) The operator interface sub system shall have facility to open multi-corridors on the operator console for the wider look of the plant. It shall be possible to operate the plant through any of these windows.

b) The system shall have capability to provide multi-window display without erasing the current display panel by opening up multiple drag and drop rectangle window on the screen. The following type of window display and function shall be provided.

- Alarm Window
- Face plate window
- Trend window
- Process window
- Graphic window
- Menu window

c) The system software shall restrict operator to open more than four windows at a time.

7.11.7 The system shall have capability to configure 600 graphic pages. However contractor shall include pre-configuration of at least 300 graphic pages unless otherwise specified.

7.11.8 Ergonomic techniques shall be used in the design and layout of the consoles based on the assumption that operates are seated while using the CRT displays, keyboards, hardwired switches and other console equipment. Also, note that there shall be no limitation with respect to specific structural arrangement - semi-circular, horse shoe etc.

7.11.9 Operator consoles shall have non-volatile memory for configuration and storage.

7.11.10 Design of graphic displays shall be as per ANSI/ISA-S5.5 Graphic Symbols for Process Displays" and as per drawings provided by Owner! Owner Representative.

7.11.11 The system status display on each of the consoles shall provide indications for CPU loadings / memory loading, and mass storage devices utilization of each of the subsystems in addition to those specified under 5.3.5 of the Standard Specifications 1071-6-52-0055.
7.11.12 Two audible alarms distinguishable from one another, each having adjustable volume control shall be provided with system. One for selected non-critical alarms and the other for critical alarms. Spare dry contacts shall be wired in parallel with audible alarms. Both the audible alarms and the respective auxiliary contact outputs shall be silenced/acknowledged from any of the operator keyboard assigned for the operation of that unit.

7.11.13 The operator console shall have four (4) alarm priorities. One alarm shall be for events, second for non-critical alarms, a third for critical alarms and a fourth for system alarms. Contractor shall state in their proposal if the offered system has dead band fixed or adjustable, on analog input alarms. The operator should be able to mask or group of alarms. A list of suppressed alarms shall be available to the operator.

7.11.14 One number of engineering keyboard shall be provided for each operator console.

7.11.15 The keyboard security against unauthorized entry with key lock and password shall be provided for each keyboard of separator/engineering consoles.

7.11.16 The following are the maximum number of keystrokes required for accessing a view as per standard display hierarchy:

<table>
<thead>
<tr>
<th>Type of view</th>
<th>No. of key strokes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group view</td>
<td>2</td>
</tr>
<tr>
<td>Loop view</td>
<td>3</td>
</tr>
<tr>
<td>Loop in alarm</td>
<td>2</td>
</tr>
<tr>
<td>Graphic View</td>
<td>2</td>
</tr>
</tbody>
</table>

7.11.17 For CRT display the following additional requirements shall be considered.

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Least</th>
</tr>
</thead>
<tbody>
<tr>
<td>No. of background colour</td>
<td>7</td>
</tr>
<tr>
<td>No. of foreground Color</td>
<td>7</td>
</tr>
<tr>
<td>No. of display characters</td>
<td>80</td>
</tr>
<tr>
<td>No. of character types</td>
<td>Min - 96 ASCII characters</td>
</tr>
<tr>
<td>Characters Construction</td>
<td>Character 5x7 dots Pattern 7x8 dots</td>
</tr>
</tbody>
</table>

7.11.18 Number of trends per display shall be minimum 4.

7.11.19 The system shall be provided with a minimum of 32 user definable function keys to call up the preselected display from each operator station.

7.11.20 Assignable trend recorders shall be provided for each console with the following:

<table>
<thead>
<tr>
<th>Specification</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>No. of points to be recorded</td>
<td>Sixteen (min) user selectable</td>
</tr>
<tr>
<td>No. of pens/ recorder</td>
<td>4 or 6</td>
</tr>
<tr>
<td>Recorder size</td>
<td>6&quot; x 3&quot;</td>
</tr>
<tr>
<td>Chart size f speed</td>
<td>250 mm adjustable set at 50 mm/h.</td>
</tr>
</tbody>
</table>
7.12 Hardware console

7.12.1 a) The layout of the hardwired console shall match with the operator console layout. Any non-DCS CRT required to be placed along with operator console, should be on the hardwired console and shall match with the operator console ergonomics.

b) The plant communication system console, CCTV keyboard/CRT's etc. shall be installed in the hardwired console.

7.12.2 All Hardwired (HW) items like Push buttons, lamp annunciator etc. shall be of miniature type. The emergency Push buttons shall be of mushroom type unless specified otherwise.

7.12.3 All push buttons/selector switches as indicated/required in trip diagrams (manual reset of trip, manual activation of trip, control room reset for solenoid valves etc., auto start/stop logic for pumps and other packages shall be indicated on hardwired consoles(HWC) layout drawing with appropriate tag nos. And legends

7.12.4 For all 2 out of 3 voting logics as indicated in the P&ID and other specification. Contractor shall consider one common hardwired alarm annunciation in the HWC and individual alarm in DCS.

7.12.5 All Hardwired items like push buttons, lamps, annunciator shall be of miniature type.

7.13 HART MAINTENANCE SYSTEM

7.13.1 HART maintenance system shall be supplied by the contractor for smart instrumentation like transmitters, positioners etc. The system shall be located in the control room and shall have compatible software like Cornerstone Asset Management or equivalent.

7.14 Wiring /Termination

All interconnection between field and control room shall be from Marshalling racks only. All interconnection between marshalling racks and system cabinets shall be through prefabricated cables with plug-in-connectors at both ends.

7.14.1 In all analog marshalling cabinets provision shall be kept for mounting a hand held communicator for smart transmitter.

7.14.3 All interconnecting cables between cabinets/printer/console etc. shall be armoured or run through conduits to protect from rodents.

7.14.4 All cabinets, panels, racks must be designed to avoid congestion for ease of maintenance. All spare cores of multicables shall be terminated on the marshalling rack next to the assigned cores.

No cables/cores shall be left un-terminated in the rack/cabinet. Also no terminal or terminal strips shall be located on the side panels of the rack/cabinet.

7.14.5 Rack layout shall ensure clear and adequate segregation between termination panels, I/O modules and cables in the following:

- Analog (non-intrinsically safe)
- Discrete (intrinsically safe)
- Discrete (non-intrinsically safe)
6.74 $1'$5'63(&,),&$7,21)25

INSTRUMENTATION WORK

STD-0099

Rev

SHEET 56 OF 79

- Power supply cables (voltage wise split)
- My signals
- Pulse signals
- RTD signals

7.14.6 Not more that four cabinets shall be combined for wiring. For consoles and cabinets, side cover shall be provided individually.

7.14.7 All wiring shall conform to API-RP-550 Part I section 7 and 12. Different signals level cables shall be routed under false flooring with separation distance as recommended by API-RP-550 section-7.

7.14.8 All wiring inside racks, cabinets and back of the panels shall be housed in covered, non flammable plastic raceways arranged to permit easy accessibility to various instruments for maintenance, repair and removal.

All wiring in the race ways shall be properly clamped. Total wiring cross-sectional area including air gap shall not exceed 50% of the raceway cross-sectional area. Rubber/Plastic grommets shall be used for wire entry into individual instruments 'and entry/exit of wires through raceways. The exposed length of wiring shall be kept minimum.

7.14.9 Separate wiring raceways shall be used for power supply wiring DC and low level signal wiring, and intrinsically safe wiring. Parallel runs and AC and DC wiring, closer than 300 mm shall be avoided.

7.14.10 Wiring termination shall be done using self crimping lugs.

7.14.11 No more than-two wires shall be terminated on one side of single terminal. Such a practice shall be avoided as far as possible. The use of shorting links for looping shall be avoided.

7.14.12 Cable glands shall be provided for all cable entries to the cabinets/racks/consoles.

7.14.13 Terminal housing shall be strictly sized with considerations for accessibility and maintenance. Following points should be considered.

a) Distance between terminal strip and side of the cabinet parallel to the' strip upto terminals shall be equal to 50 mm (min.)

b) Distance between terminal strip and top and bottom of the cabinet shall be equal to 75 mm (min.)

c) Distance between two adjacent terminals shall be equal to 100 mm (min.)

d) Addition distance for each additional terminal shall be equal to 25mm (min.)

e) Distance between cable gland plate and bottom of the strip shall be equal to 300mm (min.)

7.14.14 All terminal strips shall be mounted on suitable anodised metallic or plastic stand off.

7.14.15 No spacing is allowed in between wire/cable straight run.
1.14.16 Terminal strips shall be arranged group wise for incoming and outgoing cables separately. 30% spare terminals shall be provided as a minimum.

7.14.17 Cabinet and rack layout shall be made considering proper accessibility and maintenance, 20% spare accessories like relays, switches, barriers, lamps, fuses etc shall be provided completely wired as a minimum.

7.14.18 Terminal blocks for intrinsically safe wiring shall be separate.

7.14.19 Thermocouple extension cables shall be used for thermocouple signals with in control room.

7.14.20 All trip connected' ferrules in the marshalling racks shall be of red colour. both from the field and to the field.

7.14.21 For internal signals wiring in the cabinets and accessories, flexible stranded, PVC insulated, twin twisted and shielded Copper conductor shall be used. For signal wiring external to the cabinet 1.5 mm² twin twisted individual shielded, overall shielded with overall drain PVC insulated and armoured cables shall be used.

For power supply (UPS), min. x C x 2.5 mm² PVC insulated and armoured Copper conductor shall be used.

7.14.22 All terminals shall be mechanical screw clamp type with pressure plates. Terminations shall be done using self insulating crimping lugs. Wire lugs shall be used for all terminations on terminal blocks, where as forked tongue' type lugs shall be used for termination, on screw terminals such as, a relays, alarm annunciators, push buttons, lamps etc. Terminals shall be suitable to accept conductor size as a minimum

7.14.23 Additional terminals shall be used for looping if necessary. The use of shorting links for looping shall be avoided.

7.14.24 Sockets for all types of power available in the cabinet shall be provided far maintenance, work.

7.14.25 Wiring colour code within the cabinet framework and accessory equipment shall be as follows:

- Power Supply (line) Red
- Power Supply (neutral) Black
- Ground Green
- Alarm System White
- Control and shut down Yellow
- Analog signal intrinsically Light Blue
- Safe wiring Red (Positive)
- DC Wiring Red (Negative)
100 metre length of wires shall be supplied as loose spares for each cabinet column / row used.

7.15 Identification and Marking

a) All electrical termination's and equipment on the cabinet and other accessories shall be identified with appropriate tag, cable marker, etc.

b) All terminals in a terminal strip shall be identified by their individual numbers located integral with the terminal itself.

c) Interconnecting multicables shall be, identified by metal tags as indicated in cable schedules.

d) Wiring at terminals shall be identified by the terminal number and termination service at the other end of the wire. Wiring at instruments and accessories like alarm relays, push buttons etc. shall have ferrules indicating tag number; terminal number and the termination service at the other end of the wire.

e) Looping connections shall be identified by termination services at both ends of the wire.

f) Identification markets as mentioned above shall be repeated in contractor drawings.

g) Sample, identification methods shall be discussed with Owner before finalization.

7.16 Printers and hard copy unit

7.16.1 Logging/Alarm and Event/Configuration and maintenance Printer

a) Type of Printer shall be Line for logging printers and serial for others.

b) Number of character shall be approx. 96 and type shall be ASCII.

c) Printing speed shall be 300 lines per minute for logging printer and m in 120 characters/sec. for others.

d) No. of print columns shall be min. 132 character per line.

e) Paper width is approx. 381mm.

f) Paper type shall be continuous fan fold.

g) Number of copies shall be three.

h) Bi-directional printing feature is required for alarm and event printers and configuration and maintenance printers.

i) Acoustic cover is required for the printers.

j) Paper feed shall preferably be friction feed.

k) Test pattern generation is required.

l) Mounting shall be self contained with integral stand.
m) Noise level while printing at 1 meter distance shall be less than 45 dBA.

n) Identification as alarms and events is required by dual colour for alarm and event printers.

7.16.2 Hard Copy Unit

a) The hard-copier unit shall be electrostatic type or thermal type and shall be able to take coloured copies of any CRT screen either from operator console or from engineering console.

b) No CRT screen shall be locked out while taking copy. In case this is available its should not be more than five seconds maximum.

c) The number of channels shall be selected by contractor as per number of CRTs of operator console and engineering console of the system.

d) The hard copier shall be installed on a self contained integral stand.

e) Where there is a possibility of transfer of high voltage to communication sub-system from video copier, high voltage protection barriers shall be provided.

8. ANALYSER SYSTEM

8.1 This clause specifies the general requirements of process and flue gas analysers Application related specific requirements shall be described in job specification

8.1.1 Process Analysers

8.1.1.1 System Design

The principle of operation shall be simple in design and shall avoid analytical complexity associated with development of information which is extraneous to the application. In general, system shall consists of probe, sample tube, pressure reduction, sample conditioning, fast loop operation, analyser and vent connection to flare.

8.1.1.2 Probe: As recommended by analyser sub-vendor with isolation valve and material suitable for the application.

8.1.1.3 Sample tube: sample tube material shall be suitable for process condition with size as recommended by vendor. The samples consisting of condensable vapour shall be with electricity traced sample tube with temperature control.

8.1.1.4 Sample conditioning system: Generally sample conditioning system shall be as per API, meeting analysis requirement. The pressure reduction where required shall be provided with a safety valve at its down stream. Variable area flow-meters shall be provided for fast loop. For the stream where solid particles are expected, necessary filters shall be used Provision for necessary condensate knockoff system shall be provided, if applicable.

8.1.1.5 Analyser: The type of analyser shall be as per P&ID and process data sheets attached with the process package. The analysers shall be installed in that analyser shelter/room in general. In case where no analyser shelter exists, the analyser- shall be installed in a free standing analyser cabinet. The analyser cabinet shall be provided with a vortex cooler or air conditioning unit suitable for the area classification.
Process stream analysers shall be microprocessor based and their sample handling system shall be designed and fabricated by the analyser vendor only. The analyser vents and drain shall be routed to process or flare as applicable.

8.1.1.6 Enclosure: All the analyser shall be individually certified for area classification and required gas grouping. All electrical components of the analyser system and air conditioner shall be certified for use in IEC Zone-I area of required gas grouping,

8.1.1.7 Calibration gas cylinder/consumables

All calibration cylinders and other necessary items for analyser calibration shall be supplied by the contractor, considering the requirement of start up.z commissioning, Warranty period plus two years normal operation. The cylinders shall be located outside the’ shelter/cabinets and contractor shall provide suitable mounting accessories for the same. Cylinders shall be supplied in two sets, one shall be used and the other for storage and filling. Analysers like pH, Conductivity shall be two wire type and shall be installed outdoor.

8.1.2 Flue Gas Analysers

8.1.2.1 Flue gas monitoring system shall be used for continuous emission of stack and heaters. Typically SOx. NOx, O2, CO and CO2 analysers are required for stack and heater analysers.

O2 Analysers: Zirconia type (unless paramagnetic type required for process condition)
SO2/NO2/CO/ CO2: Dilution type for ~Ox and NOx and hot tap. extraction type for CO/C02 with principle to meet the required specification and performance unless otherwise specified in job specification.

8.1.2.2 Probe: Probe shall be provided with necessary filter and material suitable for the t temperature and process condition. The dilution shall take place near the probe where dilution type is specified.

8: 1.2.3 Sample tubing: Minimum S5 for dilution type. Teflon tube electrically heat traced and armoured for extraction type. Automatic temperature control shall be provided for the tubes.

8.1.2.4 Sample conditioning: Pressure reduction, heating/cooling flow meters etc along with other system components as per API and as recommended by vendor. Provision of first loop, condensate knock off shall be provided.

8.1.2.5 Analysers: Analysers shall be electronic microprocessor based with full diagnostic facility.

The analysers shall be located in prefabricated shelter.

8.1.2.6 Analyst shelter

i) The flue gas analysers shall be located in a prefabricated analyser shelter. Minimum width of the analyser shall be 3 m. The design and construction of the shelter shall be self supporting type and it shall be capable of housing required analysers, sample handling system and other accessories. All the air conditioner, all electrical component shall 'be certified flame proof Ex'd' of required gas grouping.

ii) The structure of shelter shall be constructed by suitable size ISMC (150/125)/ISMB(100) welded properly and adequately sized to ensure structural rigidity and to prevent
deformation during loading / unloading of the shelter. The floor shall be constructed from anti slip sheet plates strong enough to withstand load of all the equipments and atleast three maintenance personnel.

iii) External side walls and internal side walls shall be adequately strong and galvanized sheet of thickness 18 gauge with 45 mm x 60 mm x 45 mm x 3 mm thick MS U profile.

iv) The shelter roof shall be adequately strong and sealed to prevent entry of rain and jet water.

v) The shelter shall be provided with main door an emergency door opposite to main door. Both doors shall be opening outwards, provided with safety glass window and automatic spring door closer.

vi) Extension roof provided along the two longer sides shall be hanged at least 1000 mm outside the analyser shelter.

vii) The tag numbers of analysers shall be fixed near the main door. The tag number of each analyser shall be fixed near the respective items. Inlet/outlet pipes, electrical wires inside the junction box and cables shall be identified.

viii) Provision shall be made for keeping all the fast loop devices outside the shelter.

ix) Shelter shall have inside temperature of 24 0 C ±1- 2% with humidity less than 50% to obtain repeatability and reliability of the analysers.

x) Each shelter shall be provided with two no. LEL detectors.

8.1.2.7 Auto and span control: Contractor shall provide all hardware 'and software required for auto' zero and span calibration.

8.1.2.8 Calibration Gas Cylinder/Consumables

All calibration cylinders and other necessary items for analyser calibration shall be supplied by the contractor, considering the requirement of start up / c ommisioning warranty period plus two years normal operation. The cylinders shall be located outside the cabinets and contractor shall provide suitable mounting accessories for the, same; Cylinders shall be supplied in two sets, one shall be used and the other for storage and filling. Flue gas analysers fur emission monitoring (i.e sax. NOx, CO, COx, O2 ) shall meet the requirements of EPA, USA regulations.

9.0 Gas Detection System

9.1 LEL Detectors

Electrochemical type catalytic combustion type as specified' in job specifications. Material of construction shall be SS304. Accuracy shall be +/- 2%URY. LEL detectors shall be 3 wire type. Detectors shall be weather proof to 'IP 55 and flameproof Ex'd' suitable for indicated area classification. Necessary rain guard and dust shield shall be provided. Cable distance limitation between LEL detectors and control room 'shall be reviewed for' various vendors based on detectors voltage drop and current consumption. 'Necessary Calibration kit with gases for minimum 2 years operation after warranty period shall be provided. Portable LEL gas detectors (1 no.) shall be provided Separate gases shall be provided for warranty period.
The LEL monitors shall be installed on a panel to be installed in control room. LEL group alarms shall be provided in DCS.

9.2 \( \text{H}_2\text{S} \) Detectors

\( \text{H}_2\text{S} \) detectors shall be electrochemical type. Material of construction shall be SS304. Accuracy shall be +/- 3% URV. \( \text{H}_2\text{S} \) detectors shall be 3 wire type. Detectors shall be weather proof to IP 55 and flame proof Ex'd' suitable for indicated area classification. Necessary rain guard and dust shield shall be provided. Cable distance limitation between \( \text{H}_2\text{S} \) detectors and control room shall be reviewed for various vendors based on voltage drop and current consumption of detectors. Necessary calibration kit with gases for minimum 2 years operation after warranty period shall be provided.

Separate gases shall be provided for warranty period. Portable \( \text{H}_2\text{S} \) detectors (1 no.) shall be provided. The \( \text{H}_2\text{S} \) detector system shall be installed on a panel to be installed in control room. \( \text{H}_2\text{S} \) group alarms shall be provided in DCS.

10.0 Material Selection Guide Line

The material requirement of instrumentation item shall be governed by service conditions and process requirement. In general, Piping Material Specification (PMS) shall be used as a guide line of selection of material of instrumentation which shall include material its composition and other requirements. It is selector's responsibility to select the material which is suitable for pressure, temperature corrosion, erosion etc. For the instrument connected directly in line or through impulse line shall directly be governed by the respective piping class whereas for instrument mounted on equipment, 'vessel,' calms, reactors, etc, equivalent piping class shall be derived based on the lines connected to the respective equipment, vessel, column, reactor, etc, nozzle flange rating. In general, the following shall be considered as guidelines:

i) For all instruments in sour service, all materials of construction shall meet the requirements specified in NACE MR 01-75 latest editions. In addition, any other requirements if specified in respective piping class shall also be complied.

ii) Impulse pipe material shall be as per the corresponding piping class. However, for impulse tubing, material shall be SS 316, as aminimum. Better material shall be selected wherever required as per PMS and if SS 316 is not suitable.

iii) Valve body material of PMS to be considered for body material of control valve, self actuated pressure, control valve, field instrument, body bonnet of pressure relief valve, cage / chamber of all level instrument, chamber of senior orifice assembly and body of all other instruments.

iv) Trim material of valves as per PMS shall be considered. for the wetted parts of all instruments apart from body / bonnet / cage / chamber: and flange shall be as per trim material.

For piping class A1A, A6A, A8A, AIGA, A14A, A19A, B1A, B6A, B9A, B13A, DIA, EIA, FIA, A5A, B5A, D5A, A3A, A1A, B2A and D2A, S8 316 shall be used as trim material instead of trim material specified in the PMS. However stellitizing shall be provided " in steam cases and where dictated by specification. For piping classes A4F, A3F, B4F, A4G, B4G and D4G, monel shall be used for field transmitters, pressure / differential pressure gauges for body / socket / sensor / diaphragm upto the maximum specified temperature of 200°C. All flanges shall be as per PMS. The torque tube material of displacer instrument shall be inconel as minimum.

11.0 Inspection and testing requirement
11.1 Requirements of non destructive testing like, radiography, magnetic particle test, hardness test, hydrotest for items such as control valves, safety valves, orifice flange assembly, level gauges etc., shall be carried out strictly as per respective piping class.

For all instruments, welding and testing shall be carried out as per piping specifications.

Post weld heat treatment shall be carried out for all weldings of instrument as required in accordance with the requirements of piping material specifications.

11.2 For items use control valves, shutdown valves, pressure refer valves specification etc. radiography procedure and area of casting to be radiographed shall be as per ANSI B16.34 and acceptance criteria shall be as per ANSI B16.34 Annexure B, in general. However areas of casting to be radiographed for type of valves/desuperheaters not covered in ANSI B16.34 shall be in line with ANSI B16.34.

100 % radiography shall be done on the following areas of each item requiring radiography:

- inlet flange neck
- outlet flange neck
- cast nozzle (in case of safety, valves)
- all weld joints

Two shots shall be taken for each area to be radiographed, as a minimum.

11.3 Following test shall be carried out by contractor at his vendor's works and test certificate shall be furnished.

i) Material test certificate including NACE requirements for all instruments.

ii)* Calibration/ test certificates for all* instruments including control valves, safety valves.

iii)* Seat leakage test for control valves and safety valves.

iv)* Helium leakage test .for control valves and pressure relief :valves in H2, service.

v)* Test certificate for' safety valve set pressure and reseat pressure:

vi)* Hydrotest certificate for all inline instruments, pipes, tubes, fittings etc.

vii)* Radiography of control valve and pressure relief valves of rating ANSI 600# or above.

viii) Conformity certificate from sub-vendor.

ix) Capacity certificate duly approved by third party.

x) NACE compliance certificate.

All tests prefixed by (*) shall be witnessed by owner/owner representative /third party

The above is minimum requirement. Inspection agency engaged for the job shall detail out inspection and detailed testing procedure for individual items after contract is awarded.
11.4 Functional and simulation tests for all instruments supplied by the contractor shall be carried out at sub-vendor's works and witnessed by Purchaser/purchaser's representative's representative.

11.5 Refer to the standard specification 1071 6-52 0055 for inspection and testing requirements of DCS and PLC.

11.6 CCTV System

i) All material/equipment / integrated system shall be tested at the manufacturers workshop and witnessed by PDIL, and / or owner's representative prior to shipment of materials. A prefactory acceptance test shall be carried out prior to the system is available for testing in presence of PDIL, and / or owner's representative.

ii) After installation completion, field test shall be performed and control function shall be programmed in accordance with the functional requirements. Tests shall include functional tests of all input, output and alarm functions.

11.7 Analyser System

Each component and the system shall be tested separately at the vendor's works and the test certificates like material test certificate for all wetted parts and certificates from statutory bodies for use in area classification indicated in data sheet to be provided to /owner. After installation of the analyser system at site, demonstration of the tests carried out at vendor's works shall be explained to EIL./owner.

11.8 Specialty Service

Contractor shall engage specialty services from the sub-suppliers for special instruments and systems. This shall include engagement of qualified engineers and technicians from suppliers for following items for engineering, installation, field testing and commissioning

- all type of analysers
- all type of compressor instrumentation
- DCS/PLC
- CCTV
- Machine Monitoring System
- FGS

12.0 Installation Materials

12.1 Contractor shall ensure and supply all erection hardware required for the installation of complete instrumentation which form a part of the package unit. This includes items like cables, cable glands, junction boxes, instrument valves and manifolds, mounting accessories, impulse piping/tubing, pipe/tube fittings, pneumatic signal tubes, air line pipes and fittings, filter regulators, steam/electrical tracing, insulation materials, cable duct and trays, conduits, identification tags, structural material required for instrument supports and trays etc.
12.2 Clause 12.1 above broadly covers the items required for any typical plant, however the contractor shall supply all necessary items to make the installation and commissioning work complete in all respects, irrespective of whether these have been explicitly included in their scope or not.

12.3 Salient features and minimum requirements for some of the main installation materials is being described in the following paragraphs. For items for which no specification have been provided, vendor may follow their own specifications and prevailing international standards.

12.4 Cables

12.4.1 All cables shall have PVC insulated primary insulation of 85°C PVC as per IS-583(Type C/IEC 502). Inner and outer jacket shall be made of extruded flame retardant 90 ac PVC to IS-5831 Type ST-2 I mc 502. Oxygen index of PVC shall be over 30% and temperature index shall be over 250°C.

12.4.2 All cables shall be fire retardant as per standard IEC 332-3 Part 3 Cat. A. Fire resistance cables whenever specified shall be as per me 331 Cat. A.

12.4.3 The insulation grade shall be 600 V /1000 V as a minimum arid shall meet insulation resistance, voltage and spark test requirements as per BS-5308 Part-2.

12.4.4 All cables shall be armoured. Armour over inner jacket shall be of galvanised steel wire/flat as per IS-1554 part I / IEC 502. All the cores of single pair or multi-pair shall be twisted and numbers of twist shall not be less than 10 per metre.

12.4.5 For signal and control cables, inner jacket colour shall be black. Outer jacket colour shall be light blue, for intrinsically safe application and black for others. -For thermocouple extension cables the inner and outer jacket colour shall be as per IS-8784.

12.4.6 Maximum DC resistance of the conductor of the completed cable shall not exceed the following:

   a)  12.3 Ω/km at 20°C for cables with 1.5 mm² conductor.
   b)  39.7 Ω/km at 20°C for cables ‘with 0.5 mm² conductor.

12.4.7 The mutual capacitance of the pair or’ adjacent cores shall not exceed 250 pF/m at a frequency of 1kHz. The capacitance between any core and screen shall not exceed 400 µF/m at a frequency of 1 kHz.

12.4.8 L/R ratio of adjacent cores shall not exceed 40 µH / 0 for cables with 1.5 mm² conductor and .25 mH / 0 for cables with 0.5 mm² conductor.

12.4.9 The drain wire resistance including shield shall not exceed 30 Ω/km. Electrostatic noise rejection ‘ratio shall be over 76 dB.

12.4.10 A pair of communication wire shall be provided for multipair/multi triad cables », Each wire shall be 0.5 mm² of plain annealed single or multi-strand copper conductor with 0.4 mm thick 85°C PVC insulation. Insulation shall be green and red colour coded.

12.4.11 Contractor shall ensure a minimum of 20% of quantity of each type of cables supplied as spare including any special cable. ~d in each multipair cables 20% pairs shall be kept as spare.
12.4.12 Running length of the cable shall be printed at least at every 5 metre interval. For multipair/multitriad cables, a pair identification shall be provided with numbers at interval of pot more than 250mm as per vendor's standard.

12.4.13 Signal Cables

a) Single pair shielded signal/alarm cables shall be used between field instruments switches and junction boxes/local control panels.

b) Multipair individually and overall shielded signal/alarm cables shall be used between junction boxes/local control panels and control room / satellite rack room as the case, in general.

c) The single pair/triad cables shall be 1.5 m ms conductor size made of annealed electrolytic copper conductor of 7 strands with each strand of 0.53 mm diameter. Multipair cables with 0.5 mms conductor size shall have 7 strands of annealed electrolytic grade copper conductor with each strand of 0.3 mm diameter. Multi triad cable or multi pair cable with 1.5 mm² conductor shall have 7 strand with each strand of 0.53 mm diameter. Colour of core insulation shall be black blue in pair and black, blue and brown in a triad.

d) Shield shall be aluminium backed mylar/polyester tape bonded together with the metallic side down helically applied with either side having 25% overlap and 100% coverage. The minimum shield thickness shall be 0.05 m m in case of single pair/triad and 0.075 nun in case of multipair/triad cable.

e) Drain wire shall be provided for individual pair and overall shield which shall be 0.5mm² multi stranded bare tinned annealed copper conductor. The drain wire shall be in continuous contact with aluminium side of the shield.

f) All multi pair cables shall have 6 pair/12 pairs only while multitriad cable shall have 6 triads/8 triads only.

12.4.14 Control Cables

a) Single pair control cables shall be used between field mounted solenoid valves and junction boxes/local control panels and shall meet the requirements specified in para 12.4.13 above.

b) Multipair control cables shall be used between junction boxes /local control panel and control room mounted devices in general. These cables shall have only overall shielding.

c) These control cables shall have 1.5 mms conductor size with 7 stranded conductors of annealed electrolytic grade copper, with each strand of 0.53 nun diameter as minimum.

12.4.15 Thermocouple Extension Cables

a) Single pair shielded thermocouple extension cables shall be used between thermocouple head and junction boxes transmitters/local control panel mounted instruments.

b) Multipair individually and overall shielded thermocouple extension cables shall be used between junction boxes and control room mounted devices.

c) The type of thermocouple extension cables shall-be compatible with thermocouple used. In addition the colour coding of the primary insulation shall be as per IEC 60584-3.

d) The cable shall have 16 AWG and 20 AWG solid conductors for single and multipairs respectively.
e) All thermocouple extension cable shall be matched and calibrated in accordance with IEC-584-2.

t) Shield shall be aluminium backed by mylar/polyester tape bonded together helically applied with the metallic side down with either side having 25% overlap and 100% coverage. Minimum shield thickness shall be 0.05 mm for single pair and 0.075 mm for multipair cable. Drain wire shall be 0.5 mm2 multistrand bar-tinned annealed copper conductor. The drain wire shall be in continuos contact with the aluminium side of the shield.

g) Core inductance, shall not exceed 4. mH/km. However for I-type thermocouple inductance could be 8 mH/km.

h) All multi-pair cables shall have 6 pairs/12 pairs only.

i) For units with Gr.II C hazardous area classification of gas grouping polyethylene insulated cables with 70°C Polyethylene (FE) as 'per IS 64.74 or equivalent international standard shall be used in general with all other specification same as (a) to (h).

12.4.16 Power Supply And Other Cables

a) All power supply cables shall be as per IS-1554 Part I and shall have copper/aluminium conductors depending on conductor size. Minimum conductor size shall be 2.5 mm2 of copper conductor. For higher sizes, aluminium conductor can be considered. All these cables shall be PVC insulated and armoured.

b) Any other special cable required for instruments shall also be supplied as per requirements. Vendor shall ensure that these cables are armoured type and shall meet all other requirements specified in para 12.4.1 through 12.4.12, as applicable.

c) Refer electrical sec. specification for details.

12.5 Cable Glands

a) Contractor shall supply all cable glands required for glancing the above mentioned cables both at field instrument and local control panel side, junction boxes side and at control room side.

b) All cables glands shall be of nickel-plated brass and they shall be double compression type suitable for armoured cables.

c) Flame proof glands wherever required 'shall be supplied with EX'~ certification.

d) Vendor shall supply a minimum of 20% of cable glands as spare.

e) All cable glands shall be weather proof to IP-55.

f) Cable glands shall be NPT for all field items and junction boxes where as ET thread - with 'check nuts for control room end.

12.6 Junction Boxes

a) Contractor shall supply junction boxes as per the cables selected, wherever required. These shall be of die cast aluminium alloy (LM-6) body and shall be weather proof to- IP 55, as a minimum.
b) These boxes shall have terminals suitable for minimum or 4 mm" or less cable termination mounted on rails. 20% spare terminals shall be supplied in each junction box.

c) Telephone sockets and plugs shall be provided "in junction boxes

d) Flame proof junction boxes wherever required shall be supplied with Ex'd' certification. All such boxes shall be weatherproof to IF 55 also

e) Each junction box shall have a minimum of 2 Nos. for 6P/12C and 4 numbers for 12P124C spare entries. All spare entries shall be provided with plugs certified Ex'd' for flameproof junction boxes.

12.7 Instrument Valves and Manifolds

a) Contractor shall supply instrument valves (miniature type) and valve manifolds wherever required.

b) Body rating shall be as per piping class or better. All valves and manifolds shall be forged type only.

c) Valve body and trim material shall be SS 316 unless otherwise specified. Superior trim material shall be selected as requirement by process conditions. Packing material in general shall be of PTFE

d) For instrument air isolation valves, body material shall be nickel or cadmium paired carbon steel.

e) Vendor shall supply a minimum of 20% instrument valves and manifolds as spare.

12.8 Impulse Piping / Tubing

12.8.1 Tubing

a) Contractor shall supply 1/211OD x 0.049" thick ASTM A 269 TP 316 stainless steel fully annealed, cold drawn and seamless tubes as a minimum for impulse lines upto 600 # class. Higher thickness according to pressure rating shall be considered for higher pipe classes.

b) Monel or any other tubing shall be 'used where 5S316 is not suitable for the service.

c) The hardness of SS tubes shall be Rockwell RB 70-79

d) Steam tracing shall be 10 mm OD soft annealed copper tubes of electrolytic grade copper with wall thickness of 1 mm as per ASTM B 68M copper no. C 12200.

e) Instrument air distribution shall be with 6 nsn soft annealed copper, 1 mm thick PVC coated as per ASTM B 68M copper no. C 12200

f) Vendor shall supply a minimum of 20% of pipe/tubes as spare.

12.8.1 Piping

a) All piping shall be 1/2" NB with material and class as per piping class of the pipe on which the instrument is connected. The piping shall also be 3/4" NB, 11(2)" NB as the case may be. In case of vessel / equipment / reactor piping shall be corresponding equivalent piping class.
12.8.2 Pipes and Tube Fittings

12.9.1 Tube Fittings

a) Contractor shall supply flareless compression type of tube fitting and of three piece construction with design similar to Swagelok/Parker Hannifen/Ermeto etc.

b) The fitting/ferrule hardness shall be in the range of R.B’ 85-90.80 as to ensure a minimum hardness difference of 5 to 10 between tube and fittings. The ferrule shall be of stainless steel material, in general

c) Socket-weld type forged pipe fittings of suitable material and rating shall be supplied for pipe fittings. The minimum rating shall be 3000#. Weld neck fittings shall be used where socket weld type are not allowed by piping class.

d) Instrument air brass fittings shall be suitable for use on copper tubes conforming to ASTM B 68/B 68 M hardness not exceeding RB 50. All fitting parts shall be manufactured from Brass as per IS-319 bar stock or equivalent and shall be nickel

e) All threaded fittings shall have NPT threads as per ANSI/ASME B16.11 only

f) Vendor shall supply a minimum of 20% of each type of pipe/tube fittings as spare.

12.9.2 Pipe Fittings

All pipe fittings shall be according to piping material specification as per piping class of the pipe on which instrument is connected. In case of vessel/equipment / reactor, PMS of equivalent piping class shall be considered.

12.10 Pneumatic Signal Tubes

a) Contractor shall supply 6 mm OD x 1 nun thick PVC covered fully annealed electrolytic grade copper tubes as per ASTM B68.74A Cu. No.122 (DR) for pneumatic signal tubes.

b) Contractor shall avoid use of intermediate connections and shall estimate single length for each instrument location.

c) Contractor shall supply a minimum of 20% length of these tubes as spares.

12.11 Instrument Air Lines Fittings and Valves

a) Seamless galvanised, inside and outside, carbon steel pipes used for instrument air distribution shall be as per IS 1239 J3A pipe class.

b) Galvanised forged screwed carbon steel screwed fittings of 2000# rating fittings shall be used.

c) Isolation valves on instrument air service shall be packless gland type full bore ball valves.

d) Vendor shall supply a minimum of 20% of air pipe, fittings and valves as spare.

12.12 Air Filter Regulators

a) Instrument air filter regulator of suitable size, range and capacity shall be supplied for each pneumatic instrument.
b) The body of the filter shall be anodised aluminium.

c) The filter shall have 25 μm sintered bronze/ceramic filter element as a minimum and shall be provided with manual drain and 211 nominal size pressure gauge. Other filter size shall be considered based on recommendation, of I/P transducer vendor.

d) Contractor shall supply a minimum of 20% of air filter regulators of each size and range as spare.

12.13 Cable Trays and Cable Ducts

a) All cables on the main and sub pipe rack shall be laid in cable, duct. Cable ducts shall be fabricated as per 'Duct Fabrication Details' standard No. 1071-7-52-0254.

b) All branch cables/tubes shall run on cable trays.

c) These cable trays shall be made out of M.S steel sheets of 2.5 mm thickness unless galvanised mild steel is specified. Ladder trays shall be of mild structural steel and shall be painted with red-oxide primer. 50mm x 50mm angle shall be used as a minimum.

d) The width shall be so selected that 50% of tray space is available for future use.

e) Suitable cable clamps shall be supplied for binding the cables/tubes at every 500 mm.

12.14 Instrument Support/Structural Steel

a) Contractor shall supply instrument stands, stancheons and other structural steel material required for supporting the cable trays, impulse lines and instruments.

13.0 Installation

13.1 Contractor shall be responsible for installation of all the items in their scope of supply including supply, fabrication and erection of all installation / erection material. The scope of installation shall include all field instruments and control systems like field instruments, analyser system, gas detector systems, control system equipments' L~ DCS, PLC, Hart maintenance' system in main control room /satellite rack room/local control room etc. local and remote panels including supply fabrication / erection / installation of all erection material i.e cables, cable glands, junction boxes, cable ducts, trays, conduits, instrument supports, trenches, instrument road crossing as required to complete the job in all respect.

13.2 Contractor's scope shall include installation of CCTV system, wherever required including cameras along with accessories and mounting pole, cabling and control room mounted items including supply and installation of all erection material.

13.3 Supply/ fabrication and installation of instrument mounting posts, support stands / frames, fittings, brackets and other consumables for mounting and supporting all instruments, instrument system components and fixing the same.

13.4 Whenever installation is beyond the scope of contractor, purchaser or its authorised representative shall install the instruments as per the drawing /document / details provided by the contractor. However, in such a case it must be ensured that complete installation materials shall be supplied.
13.5 Any panel or instrument which has been disconnected or removed for transportation shall be replaced or reconnected where necessary.

13.6 Installation of any underground cables shall include excavation, cable segregation, support, back filling with grades of sands, tiling, trench makers etc.' In case of underground cables are required to be in RCC trenches, all installation shall be carried out except excavation. Suitable cable markers made of aluminium shall be provided for all underground cabling.

13.7 Installation of above ground cables includes identification suitable supports, angle/perforated / ladder tray due fixing and fire proof (if required as per job specification).

13.8 Installation of cable tray/ ladder tray, ducts and miscellaneous support materials, clips as required for supporting aboveground instrument cable, tube etc.

13.9 Installation of suitable cable clamps / tray on multicore cables just before termination into the junction box or panel such that the weight of cables is not supported by the cable glands.

13.10 Mark off, gland and connect all instrument cables, supply and install markers / ferniles etc for cable identification in accordance with the specification.

13.11 All, instruments including direct mounted instruments like thermocouples, thermowells, temperature gauges, pressure’ gauges, pressure switches etc. ‘shall be installed in such a Way that they ‘have good readability and accessibility. Platforms and l adders shall be pr ovided to meet this requirement, if necessary.

13.12 The capillary of all capillary type instruments shall be supported properly and shall be protected against mechanical damage.

13.13 All pressure/differential pressure instruments shall be provided with block and bleed/bypass, drain/vent valves etc as per the installation standards, and shall have accessibility.

13.14 All primary piping/tubing (impulse lines) shall have a slope of 1 in 12 on the horizontal run.

13.15 All welding shall be carried out as per the relevant codes with proper electrodes. Any testing (non destructive) like D.P. test and radiography on root held ‘and final weld shall be carried out as per PMS. All consumables shall be part of contractor's scope of supply. Any pre/post weld treatment as required by the relevant codes and piping material specification shall be carried out. All non destructive tests shall be carried out as per piping material specification.

13.16 All threaded joints shall be joined by PTFE tapes only.

13.17 All impulse lines shall be supported at regular intervals.

13.18 Instrument drain/vent connections shall be piped to safe area like oily water sewer or above pipe racks to avoid accumulation of hazardous fluid in the plant atmosphere, For hydrogen and Lethal services like CO etc all vent / drains shall be’ connected to closed system even it is not shown in the P&IDs.

13.19 Steam tracing wherever required shall be carried out by 10 mm OD x 1 mm thick copper tubes and condensate traps shall be provided to collect all ‘the condensate and shall be piped to the nearest pipe drain funnels.
13.20 All tubes/cables shall be properly laid on cable trays which shall be supported at regular intervals.

13.21 Separate routing or physical separation and maintained between signal cables, shut down and power cables.

13.22 Wherever intrinsically safe system cabling is employed, the minimum separation of 150 mm shall be adhered between IS (intrinsically safe) and non IS signal cables.

13.23 The cases of instruments shall be earthed by earthing wire to the nearest earth bus bar for safety reasons.

13.24 Painting of cable trays/ducts, mild steel cable trays, angle trays, instrument supports and all structural supports shall be painted as under :-

   a) The surface to be painted shall be thoroughly cleaned with brush sand paper to remove all scales. After cleaning, one coat of red oxide zinc chromate primer shall be given conforming to IS-2074 and allowed to dry. One coat of final when paint shall be applied:

      Second and final coats of paint of final colour shall be given before handing over the plant/commissioning.

   b) Instrument impulse lines shall be painted as per painting requirements of main pipe and equivalent pipes in case of vessel / equivalent / reactor.

13.25 For the purpose of installation planning and scheduling shall be made on daily and entire installation period with other disciplines co-ordination shall be done with other EPCC contractors for common area of work.

13.26 Mounting of instrument / junction boxes shall be at a height of 1.3 metre from grade level / finish floor level.

13.27 Temperature extension of suitable length shall be provided in the impulse line of the instrument installation where process fluid temperature is higher than the maximum withstanding temperature of the instrument.

14.0 Impulse line requirements

14.1 All instrument impulse shall be provided with the following:

   i) Piping or tubing or combination of piping and tubing shall be as per requirement of job specification or licencor's requirements.

   ii) All instruments shall be provided with isolation, drain and/ or vent valves with vent/drain end duly capped. This isolation valve shall be in addition to the first isolation /root valve provided on the pipe or vessel at instrument take off.

   iii) For flow transmitters integral 3 valve manifold shall be provided.

   iv) For remote installation of instrument minimum one pair of break flanges shall be provided.
v) For impulse line with viscous / congealing services a tee off with blind flanged shall be provided for cleaning near to first isolation valve.

vi) For diaphragm seal type instruments, spacer ring with vent and drain connection along with vent / drain valve with end capped.

vii) For instrument flushing/purging line additionally check valve, rotameter, DP regulator, restriction orifice with isolation valves shall be provided.

viii) All the valves used for impulse line shall be globe type.

ix) Contractor to study all the installations and meters shall be provided above the tapping for all types of condensable vapour service.

x) Syphon shall be used for steam service.

xi) Extension in the impulse piping / tubing of suitable length may have to be provided for those instrument installations where process fluid temperature is higher than the maximum withstanding temperature of the instrument / diaphragm.

14.2 Piping standard shall be used for all installation where specified in job specification. For rating upto 600 #, the connection to the transmitters shall be with a male connector and tubing 1/2" OD. For rating higher than 600 #, no tubing shall be used. The connection to the transmitters shall be with 1/2" piping with flanges in between piping standard, all pipes shall be 1/2" NB unless higher sizes required to meet the requirements, with all fittings suitable for the piping. All the joints shall be welded or flanged as required. For instrument end connection i.e root valve of orifices and other items, level gauges vent and "drain connection, seal welding shall be provided. For non diaphragm seal instruments and instruments where provided with threaded connection, no welding is required at instrument end.

14.3 Tubing standard shall be used upto 600 # only where the same is required as per job specification. For rating above 600 # and hydrogen/lethal service, only piping standard shall be used. The tubing shall be 1/2" OD tube with all fittings suitable for the same. Valves used shall be threaded. At the first isolation / root valve end suitable pipe tag to tubing conversion fittings shall be used. For remote installation suitable unions / couplings shall be used.

14.4 Based on above guideline, contractor shall prepare, develop installation standards and indicate bill of material for each installation.

14.5 Steam, tracing of all instruments shall be considered on steam traced Process lines as per P&ID and other documents. For steam tracing of instruments copper tube & brass fittings shall be used, Tube fittings shall be double ferrule type. For each instruments steam trace bore shall be provided with steam trap duly connected to plant.

14.6 Use of standpipe for level instruments shall be as per job specification. The representation on the P&IDs for level instrument connections is somatic only.

14.7 Standpipe shall always be taken from the side.

14.8 Installation of Systems (DCS, PLC, Analysers etc.)

14.8.1 The system shall be installed by the system vendor who would be responsible for installation and termination of interconnecting cables in the system racks / cabinets. Refer to standard specification of DCS 1071-6-52-0055 for detailed requirements. All interconnecting cables shall be identified and the
14.8.2 All system communication cables shall be layed in covered GI (galvenised iron) trays away from power cables. Prefabricated cables shall be avoided for interconnection if these are to be routed out side the cabinets. If unavoidable these should be layed in covered GI trays.

14.8.3 All panels/cabinets shall be properly levelled and secured firmly with the base supporting structure. However, the consoles and printer stands need not be secured to base structure.

14.8.4 Grounding

   a) Each cabinet, console and other equipment supplied as a part’ of system shall have earthing lugs which shall be secured to the AC mains earthing bus

   b) All circuit grounds, shields and drain wires shall be connected to the system ground' bus which is isolated from AC mains earth'. This bus shall typically be 25 mm wide and 6 mm thick of copper

   The total resistance of system ground shall be less than 5 0 unless otherwise recommended by system manufacturer.

   c) Safety barriers, if used, shall be secured to 'Safety ground' which shall have typically ground resistance of less than 1 Ω. The bus shall be designed considering a fault level of 0.5 A at 250 V r.m.s. per barrier.

14.8.5 All other installation guidelines as recommended by system manufacturer ~hall be followed.

15.0 SITE TESTING AND CALIBRATION

15.1 All impulse lines shall be tested hydrostatically at 1.5 times' the maximum operating pressure. Ensure that instrument and vessel/piping is isolated during this test.

15.2 In case of special instruments/items where hydrotesting is not permitted due to service conditions, the impulse lines testing shall be carried out by using air or nitrogen.

15.3 All external cage type level instruments shall be tested upto 1.5 times operating pressure by using nitrogen only.

15.4 After pressure testing, all these impulse lines shall be drained and dried with dry air to remove any traces of moisture, oil and dust.

15.5 Instrument air lines shall be duly tested for any leak after pressurising and isolating the main root valve by soap solution. After isolation, the rate of fall in pressure shall be less than 1 kPa for every 4.4 metre (1 psi for each 100 feet) of copper tubing for a test period of 2 minutes.

15.6 Pneumatic signal tubes shall be flushed and tested with instrument air for any leak at a pressure of 1.5 k g/cm²g. After pressurising the line, the source of pressure is cut off and rate of fall in pressure shall be less than 1 kPa for every 4.4 metre (1 psi for each 100 feet) of tubing for a period of 2 minutes.

15.7 All instrument cables shall be tested for continuity and insulation. While meggering the cables for insulation testing, ensure that all instruments and barriers are isolated at both ends.

15.8 All instruments supplied by the vendor shall be calibrated usingproper test equipment.
All instruments shall be calibrated for 0%, 25%, 50%, 75%, 100% and vice versa.

All temperature gauges shall be calibrated using temperature baths.

All thermocouple activated instruments shall be calibrated by generating millivolts by a potentiometer.

All transmitters shall be calibrated as per instrument ranges.

All displacer type level transmitters shall be calibrated with Water or suitable, fluids' and corrected for specific gravity.

All alarm and trip switches shall be calibrated over the entire range and finally set and checked for alarm/trip points and reset points as per the alarm/trip set point schedule. After setting, these shall be sealed.

All control valves, prior to stroke checking, shall be externally cleaned thoroughly. The full stroke of valve shall be checked for opening and closing. Any adjustment required for obtaining full stroke and reducing hysteresis shall be carried out. The hysteresis shall not be more than 1% URV (upper range value) with positioners and 5% DRV without positioners.

Bubble tight shut-off control valves and shut down valves shall be checked for seat leak test and gland leak test.

Solenoid valve shall be checked functionally for its operation.

Safety valves and relief valves shall be set/tested by using dry air/nitrogen. Leakage if any shall be removed by proper lapping of seat and disc.

All electronic/pneumatic receiver instruments shall be calibrated as per the manufacturer's instructions. Controllers shall be aligned properly.

All special instruments like analyzer shall be checked and calibrated as per manufacturer's instructions. Prior to testing, all analyzer’ sample lines shall be thoroughly cleaned by carbon tetra Chloride or any other cleaning liquid. Air cleaning, these lines shall be thoroughly purged with dry nitrogen.

No oil should be used in oxygen and chlorine service lines.

The accuracy of overall loop shall be. within ± 1% for electronic and ± 15% for pneumatic loops.

After performing the calibration of all instruments, the entire loop shall be checked for proper operation.

The entire shutdown scheme shall be simulated from the process trip switches and the scheme shall be tested for its proper operation prior to start up of the unit.

If no instrument air is available vendor shall provide necessary nitrogen cylinder~ to carry out the above activity.

Testing of Systems
15.26.1 All the system functions shall be checked thoroughly for proper functioning. These shall include but not limited to the following tests :-

a) Visual and mechanical.
b) Complete system configuration loading.

c) Demonstration of all system functions.
d) Checking of all systems displays.
e) Checking of correct functioning of all keyboards.
f) Demonstration of all system diagnostics.
g) Checking of proper functioning of all printers, hardcopy unit, and printing of reports.
h) Checking of all disc drives.
i) Complete checking of logic system, loading of user's program and checkout of results.
j) Checking of correct change-over of the back-up/redundant units in case of failure of main units.

15.26.2 The input signals shall be simulated by disconnecting the field wires for all inputs Wherever control room mounted Transmitters/Converters/Receiver switches are used, the functioning of same shall also be checked.

15.26.3 Requirements of para 15.26 shall be read ill conjunction with 1071-6-52:-005-5.

15.27 Loop Checking

15.27.1 Contractor is totally responsible for all work related to loop checking including cable laying, dressing, identification, ferruling, calibrations; loop testing in coordination with Control system vendor.

15.26.2 The procedure outlined in section 1.4 Part II of 1071-6-25-0055 (testing, installation, commissioning and acceptance of DCS system) shall be followed for loop checking. However the division of scope of work related to loop checking between various sub contractors shall be decided by contractor.

15.27.3 Before proceeding for loop checking the calibration results of individual elements shall be recorded on the contractor supplied proforma which shall be approved by I' owner for correctness of installation/ measurements and calibration results.

15.27.4 For calibration of special instruments and loop checking and for 'loop checking of sub vendor packages contractor shall do necessary coordination with sub supplied. The contractor shall carryout the necessary loop checking to the satisfaction of Purchaser/purchaser's representative which shall be part of contractor's scope of work.

a) For special instruments like analysers the contractor shall ensure the presence of supplier's, technical personnel during field testing/ loop checking and during commissioning to assist above-activities.
b) Loop testing for all control loops shall be generally by simulating process conditions for at least 0%, 25%, 50%, 75% & 100% full scale inputs. Detailed procedure shall be submitted to Purchaser/purchaser’s representative for approval before proceeding with loop checking.

c) In case of shut down systems, field/receiver switches are simulated for abnormality by disconnecting the wires at terminal points. Function of all associated systems are checked including performance of solenoid valves, on/off control shut down valves including proper functioning of limit switches and other accessories. Adjustments of limit switches wherever necessary also from part of checking of loop performance.

d) Performance of individual loops shall be accepted for an overall accuracy of + 1.0%. Where deviation is found to exist more than specified limit bidden shall re-calibrate the instruments which shall also form part of loop testing at no extra cost, time implications.

e) Contractor shall complete all the entries in the loop sheet related to field instrumentation as well as the control system side with acceptance of loops and hand over the sheets to / owner for final acceptance

16.0 COMMISSIONING

16.1 This activity shall be carried out in a systematic manner so as to avoid any accident to plant and operating personnel

16.2 During the plant start up all the instruments calibration, controller alignment, trip point settings shall be trimmed so as to meet the operation requirements

16.3 Prior to guarantee run of any unit, the vital instruments as/required by vendor have to be recalibrated and the results recorded.

16.4 As built drawings shall be prepared after installation and commissioning is over.

17.0 Training

Unless specified otherwise the following shall be provided by contractor for system training for owner.

Contractor shall arrange training for Owner's personnel. Different type of courses shall be offered for operation! process engineers and operators, instrument maintenance engineers and technician. Contractor shall indicate a detailed proposal for training in the offer. Travel and living expenses of the owner's personnel shall be borne by the Owner. Apart from the hardware and software maintenance training and site training as specified in 1071-6-52-0055, contractor shall also offer operation training basically meant for operating personnel. The various facilities available in the system for operation, actions required during emergencies and identifying the various diagnostic messages shall be main contents of the operation training.

Hardware and software maintenance training - At system vendor's work.

Operation Training - At system vendor's work

Site Training - Operation and maintenance

18.0 POST WARRANTY MAINTENANCE FOR SYSTEMS

Refer Document 1071-AMC-01.
The requirement of post warranty maintenance for all system oriented items shall be as follows:

a) In the event of any malfunction of the system hardware/ system software, experienced, service engineer shall be made available at site within 24 hours on the receipt of such information from owner.

b) The contract shall include detailed proposal related to supply of maintenance spares, tools and tackles as required, travel, boarding and lodging of service engineer to site on short notice.

c) EPCC contractor after completion of warranty shall transfer the contract of system vendor to owner for direct interaction between owner and system vendor.

d) The services under Post Warranty Maintenance Contract including supply of spare parts and services shall broadly encompass the following:

- **Preventive Maintenance**
  Once in a year, involving complete overhaul of the system, inspection of hardware and software, fault prediction, inspection of power supply quality, environmental and operating condition checks, calibration checks, major repairs/replacements and detailed reporting.

- **Periodic Maintenance**
  Site visits, minimum four-six times in a year, inspection of general healthiness of the system, study and advice on daily maintenance, inspection of hardware and software, if any problem is reported, running of test programmes, on-line servicing and solving reported problems. Checks shall be conducted on running system i.e (a) Online sub-systems, (b) Power supply checks, (c) C– (d) printer, (e) Any Other vendor recommended service. Complete scope of work involved under each category must be outlined by the system vendor.

- **Software maintenance**
  Maintain existing software to improve and utilise existing application and improve performance of the system. Minor modification of the software shall also be covered under this scope.

- **Emergency Service**
  Any failure shall be on system suppliers account The Engineer must report at site within 24 hours of report of failure; with necessary spares. The system must be brought back within 24 hours after reporting at site.

- **Software Updates**
  All future updates on the system hardware/software supplied shall be made available to the owner as and when available. The installation charges as applicable shall be included.

STANDARD SPECIFICATION

FOR

INSTRUMENT TUBE FITTINGS
1.0 GENERAL

1.1 Scope

1.1.1 This standard specification, together with the data sheets attached herewith, covers the Requirements for the design, materials, inspection, testing and shipping of instrument tube fittings which includes the following types:

   a) Stainless steel compression fittings (for stainless steel tube)
   b) Brass compression fittings (for copper tube)

1.1.2 The related standards referred to herein and mentioned below shall be of the latest Editions prior to the date of the purchaser's enquiry:

   ANSI/ASME American National Standards Institute/American Society of Mechanical Engineers

   B 1.20.1 Pipe Threads General Purpose (Inch).

   B 16.11 Forged Steel Fittings - Socket Welding and Threaded.

   BS-4368 Carbon and Stainless Steel Compression Couplings for Tubes.

   EN 10204 Inspection Documents For Metallic Products.

   IS-319 Specification for free cutting Brass Bars, Rods and Sections.

   ISA Instrumentation, Systems and Automation Society.

   RP 42.1 Nomenclature for Instrument Tube Fittings.

1.1.3 In the event of any conflict between this standard specification, data sheets, statutory regulations, related standards, codes etc., the following order of priority shall govern:

   a) Statutory Regulations

   b) Data Sheets

   c) Standard Specification

   d) Codes and Standards

1.2 Bids

1.2.1 Vendor's quotation shall be strictly as per the bidding instructions to the vendor attached along with the material requisition.

1.2.2 Whenever a detailed technical offer IS required, vendor's quotation shall include the Following:
a) Compliance to the specifications.

b) Whenever specifically indicated, detailed specification sheet for each item, which shall provide the information regarding type, size, material of construction etc. of the items. The material specifications and units of measurement for various items in vendor's specification sheets shall be to the same standard as those indicated in purchaser's data sheet.

c) Deviations on technical requirements shall not be entertained. In case vendor has any valid technical reason to deviate, they must include a list of deviations item wise summing up all the deviation from the purchaser's data sheets and other technical specification along with technical reasons for each of these deviations.

d) Catalogues giving detailed technical specifications, model decoding details and other information for each type of instrument tube fitting covered in the bid.

1.2.3 All documentation submitted by vendor including their quotation, catalogues, drawings, installation, operation and maintenance manuals etc., shall be in English language only.

2.0 DESIGN AND CONSTRUCTION

2.1 Stainless Steel Tube Fittings

2.1.1 Nomenclature of all tube fittings shall be as per ISA RP 42.1.

2.1.2 Fittings shall be of flare less compression type having four-piece (for double compression type) construction consisting of two ferrules, nut and body or three piece (compression type construction consisting of single ferrule, nut and body suitable for use on tubes of specified material for example stainless steel tubes conforming to ASTM A269 TP 316L with hardness in the range of HRB 70 to 79.

2.1.3 All parts of the tube fittings shall be of 316 Stainless Steel unless specified otherwise.

2.1.4 Hardness of the ferrules shall be in the range of HRB 85-90 so as to ensure a hardness difference of the order of 5 to 10 between tube and fittings for better sealing.

2.1.5 Nuts and ferrules of a particular size shall be interchangeable for each type.

2.1.6 Spanner hold shall be metric.

2.1.7 Threaded ends of fittings shall be NPT as per ANSI B 1.20.1.

2.1.8 Specific techniques like silver plating shall be used over threading in order to avoid jamming and galling.

2.1.9 Ferrule finish and fitting finish shall be such that there is no abrasion/galling when the nut
is tightened.

2.1.10 All instrument tube fittings in oxygen and chlorine service shall be thoroughly degreased using reagents like trichloro-ethylene or carbon tetrachloride. End connection shall be plugged after degreasing process in order to avoid entrance of grease or oil particles.

2.2 Copper Tube Fittings

2.2.1 Nomenclature of all tube fittings shall be as per ISA RP 42.1. Fittings shall be of flare less compression type and of three-piece construction consisting of ferrule, nut and body Suitable for use on copper tubes conforming to ASTM B68 1B68M, hardness not exceeding HRB 50.

2.2.3 All parts shall be manufactured from brass as per IS 319 bar stock and nickel plated.

2.2.4 For better grip, vendor shall maintain hardness difference between tube and ferrule and indicate the same along with the offer.

2.2.5 Threaded ends of fittings shall be NPT as per ANSI B 1.20.1.

2.2.6 Spanner hold shall be metric.

3.0 NAMEPLATE

3.1 No separate nameplates are required on the fittings. However, manufacturer's name/trademark should be punched on a visible place on the body of each fitting for easy identification.

4.0 INSPECTION AND TESTING

4.1 Unless otherwise specified, purchaser reserves the right to test and inspect all items at vendor's works, inline with the inspection test plan for instrument tube fittings.

4.2 Vendor shall submit following test certificates and test reports for purchaser's review:

4.2.1 Type test reports for following tests in accordance with BS-4368 Part IV:

   a) Hydrostatic proof pressure test.
   b) Minimum hydrostatic burst pressure test.
   c) Disassembly and reassembly test.
   d) Minimum static gas pressure (vacuum) test.
   e) Maximum static gas pressure test.
   f) Hydraulic impulse and vibration test.

4.2.2 Material test certificates as per clause 3.1 B of EN 10204.

4.2.3 Routine test reports for following tests:

  a) Hydrostatic Test

     Instrument tube fittings shall be hydrostatically tested at ambient temperature at test pressures given in Annexure I of this specification. During and after the hydrostatic test, the tube fittings shall not show any leakage or rupture.
b) Pneumatic pressure test: The fittings shall be tested at 7 kg/c mg of dry air. There shall not be any visible leakage when immersed in water or coated with a leak detection solution.

c) Disassembly and reassembly test.

d) Hardness verification:
   Hardness test shall be carried out on each rod used for machining ferrules. Vendor shall ensure that after machining, the finished ferrules shall meet the required hardness given in the specification.

d) Dimensional test report

4.3 Witness Inspection

4.3.1 All fittings shall be offered for pre-dispatch inspection for the following as a minimum:

   a) Physical dimensional verification and workmanship on representative samples.
   b) Hydrostatic and pneumatic tests as per clause 4.2.3 of this specification on representative samples.
   c) Hardness verification as per clause 4.2.3 of this specification.
   d) Disassembly and reassembly test on representative samples.
   e) Review of all certificates and test reports as indicated in clause 4.2 of this specification.

4.3.2 In the event when no witness inspection is carried out by purchaser, vendor shall any way complete the tests and test reports for the same shall be submitted to purchaser for scrutiny.

5.0 SHIPPING

5.1 All threads/ends shall be protected with plastic caps to prevent damage/entry of foreign matter.

5.2 All the fittings in oxygen and chlorine service shall be separately packed along with a certificate indicating ‘SUITABLE FOR OXYGEN/CHLORINE SERVICE’, as applicable.

6.0 REJECTION

6.1 Vendor shall prepare their offer strictly as per clause 1.2 of this specification and shall attach only those documents, which are specifically indicated in the material requisition.

6.2 Any offer not conforming to the above requirements, shall be summarily rejected.

ANNEXURE S:

ANNEXURE - 1: MAXIMUM WORKING PRESSURE AND HYDROSTATIC TEST PRESSURES FOR INSTRUMENT TUBING
1.0 GENERAL

1.1 Scope

1.1.1 This standard specification, together with the data sheets attached herewith, covers the requirements for the design, materials, inspection, testing and shipping of Instrument Tubing which includes the following types:

a) Stainless steel tubes
b) Copper tubes

1.1.2 The related standards referred to herein and mentioned below shall be of the latest edition prior to the date of purchaser's enquiry;

ASTM

B 251 Specification for general requirements for wrought seamless copper and copper alloy tube.

B 251M Specification for general requirements for wrought seamless copper and copper alloy tube (Metric)

B 68 Specification for seamless copper tube, bright annealed.

B 68 M Specification for seamless copper tube, bright annealed. (Metric)

E 243 Standard Practice for Electromagnetic (Eddy - Current) Examination of Copper and Copper - Alloy Tubes

EN 10204 Inspection Documents for Metallic Products

1.1.3 In the event of any conflict between this standard specification, job specification/data sheets, statutory regulations, related standards, codes etc. the following order of priority shall govern:

a) Statutory regulations
b) Job specification
c) Standard specification
d) Codes and standards

1.2 Bids
1.2.1 Vendor's quotation shall be strictly as per the bidding instructions to vendor attached with the material requisition.

1.2.2 Whenever a detailed technical offer is required, vendor's quotation shall include the following:

   a) Compliance to the specifications.

   b) Whenever the requirement of a detailed specification sheet, is specifically indicated, the specification sheet shall provide information regarding size, length, construction, materials etc. of the Item s. The material specifications and units of measurement for various items in vendor's specification sheets shall be to the same standards as those indicated in purchaser's data sheet.

   c) Overall dimensions in mm/inch as per purchaser's specification.

   d) Deviations on technical requirements shall not be entertained. In case vendor has any valid technical reason to deviate, the must include a list of deviations item wise. Summing up all the deviations from the purchaser's data sheet and other technical specification along with the technical reasons for each of these deviations.

   e) Catalogues giving detailed technical specifications; model decoding details and other related information for each item covered in the bid,

1.2.3 All documentation submitted by the vendor including their quotation, catalogues, drawings, installation and maintenance manuals shall be in English language only.

1.3 Drawings and Data

1.3.1 Detailed drawings, data, catalogues and manuals required from the vendor are indicated by the purchaser in vendor data requirement sheets. The required number of reproducible, prints and soft copies shall be dispatched to the address mentioned adhering to the time limits indicated.

1.3.2 Final documentation consisting of design data by the vendor or after placement of purchase order shall include the following as a minimum;

   a) Specification sheet for each type of tube.

   b) Copy of test certificates of all tests indicated in clause 4.0 of this specification.

2.0 DESIGN AND CONSTRUCTION

2.1 Stainless Steel Tubes

2.1.1 The tubes shall be 316L Stainless Steel fully annealed, seamless and cold drawn as per ASTM A 269.

2.1.2 The hardness of the tubes shall be limited to HRB 70-79. Equivalent hardness as Rockwell superficial scale (30T/15T) or Vicker's hardness scale shall also be acceptable.

2.1.3 Tubes shall have good surface finish and shall be free from scratches burrs etc. and
suitable for bending.

2.1.4 Maximum working pressure shall be as per Annexure - I attached with this specification.

2.1.5 Tubes shall preferably be supplied in length of 5 to 6 metres without welding in between. Tube length less than 5 meters shall be rejected.

2.1.6 All tubes in oxygen and chlorine service shall be thoroughly degreased using reagents like trichloro-ethylene or carbon tetrachloride and tube ends shall be plugged after degreasing process in order to avoid entrance of grease or oil particles.

2.2 Copper Tubes

2.2.1 Copper Tubes (PVC Jacketed)

a) The tube shall be soft annealed copper with 6mm OD and a wall thickness of 1.0mm as per ASTM B 68M copper No. C 12200.

b) The tube shall be jacketed with black PVC. The jacket thickness shall be 1.6mm. The PVC jacket shall confirm to ASTM D-1047.

c) The tube ends shall be plugged prior to transportation.

d) The tube shall be continuous length without any brazing in between.

e) The length of single tube shall preferably be100 metres. However any tube length less than 70 meters shall be rejected unless specifically required otherwise in job specification.

f) The dimensional tolerances shall be as per ASTM B 251M.

2.2.2 Bare Copper Tubes (For Steam Tracing)

a) The tube shall be soft annealed copper with 3/8" (10mm) OD with wall thickness of 0.049" or 6mm OD with wall thickness of 1.0mm as per ASTM B6&.copper No.C12200.

b) The tube ends shall be plugged prior to transportation.

c) The tube shall be continuous length without any brazing in between.

d) The length of single tube shall preferably be 100 metres. However any tube length less than 70 meters shall be rejected unless specifically required otherwise in job specification.

e) The dimensional tolerances shall be as per ASTM B 251.

f) Maximum working pressure shall be 53.0 kg/cm²g at 38°C unless specified otherwise.

3.0 NAME PLATE

3.1 The following information shall he marked on the stainless steel tubes:
a) Name of manufacturer
b) Type and material grade of tube
c) Tube outer diameter and wall thickness.

4.0 INSPECTION AND TESTING

4.1 Unless otherwise specified, purchaser reserves the right to test and inspect all the items at vendor's works, in line with the inspection test plan for instrument tubing.

4.2 Vendor shall submit following test certificates and test reports for purchasers review:

a) Material test certificates as per clause 3.1B of EN 10204.

b) Hydrostatic test for stainless steel tube and bare copper tubes as per clause 4.3 of this specification.

c) Pneumatic test for PVC jacketed copper tubes as per clause 4.4 of this specification.

d) Hardness / tension test for stainless steel tubes as per clause 4.5 of this specification.

e) Ball test for copper tubes as per clause 4.6 of this specification.

f) Eddy current examination of copper tubes as per ASTM E-243

g) Dimensional test report.

4.3 Hydrostatic test

4.3.1 Stainless steel and bare copper tube shall be hydrostatically tested at ambient temperature at test pressures given in Annexure - 1 attached with this specification. During and after the hydraulic test, the tubes shall not show any leaks or rupture.

4.4 Pneumatic test

PVC jacketed copper tubes shall be tested at 7.0 kg/cm² of dry air. During and after the test, tubes shall not show any leak or rupture.

4.5 Hardness/Tension Test

All mother tubes shall be hardness tested for each heat prior to drawing for proper quality control. The hardness of the drawn tubes shall be checked by Rockwell Hardness Test. Following shall apply;

a) For tubing less than 0.6Sin (1.6Smm) in wall thickness, Rockwell superficial hardness test on 30T / 1ST scale or Vicker's scale shall be equivalent to HRB 70 - 79.

b) Hardness test is not required for tubes smal1er than 1/4in (6.4mm) inside diameter or tubes having a wall thickness thinner than 0.020in (0.51mm). These tubes shall be tension tested in accordance with ASTM A632.
4.6 Ball Test

4.6.1 Ball test shall be carried on all copper tubes to ensure clear opening of the tube. The OD of the ball shall be minimum 1.0 mm for 6.0mm 00 tube and 2.0 mm for 3/8" (10mm) OD tube.

4.7 Witness Inspection

4.7.1 All tubes shall be offered for pre-dispatch inspection for the following, as a minimum;

   a) Physical dimensional verification and workmanship.

   b) Hardness / tension test for stainless steel tubes.

   c) Hydrostatic and pneumatic tests on representative samples.

   d) Ball test on copper tubes on representative samples.

   c) Eddy current examination of copper tubes on representative samples.

   f) Review of all certificates and test reports as indicated in clause 4.2 of this specification.

4.7.2 In the event that the witness inspection is not carried out by purchaser, vendor shall anyway complete the tests and test reports for the same shall be submitted to purchaser for scrutiny.

5.0 SHIPPING

5.1 The tube shall be plugged at both ends to prevent entry of foreign matter.

5.2 The tubes shall be packed carefully so as to avoid damage during transport.

5.3 All tubes III oxygen and chlorine service shall be separately packed along with a certificate indicating ‘SUITEABLE FOR OXYGEN/ CHLORINE SERVICE’, as applicable.

6.0 REJECTION

6.1 Vendor shall prepare their offer strictly as per clause 1.2 of this specification and shall attach only those documents and information which is specifically indicated in the material requisition.

6.2 Any offer not conforming to above requirements, shall summarily be rejected.

ANNEXURE
ANNEXURE - 1: HYDROSTATIC TEST PRESSURES FOR INSTRUMENT VALVES AND MANIFOLDS.
1.0 General

This standard specification shall be used for Instrument Valves and Manifolds.

2.0 DESIGN AND CONSTRUCTION

2.5 The finishing and tolerances of parts like stem, piston, stem threading etc. of the offered Valves and manifolds shall be properly machined to avoid problems like galling.

2.6 The hand wheel material for all valves and manifolds shall be zinc/nickel plated carbon steel. Any other material, if provided as per standard vendor design, shall also be acceptable.

2.7 Instrument Valves (Miniature)

2.7.1 The instrument valves shall be of globe pattern needle valves forged! bar stock with inside screwed bonnet, with back-seated blowout proof system.

2.7.2 Body material shall be 316 Stainless Steel unless otherwise specified.

2.7.3 The minimum cold working pressure (CWP) rating of the valve shall be as per Annexure 1 of this specification, unless otherwise specified.

2.7.4 The end connection shall be 1/2” NPTF to ANSI B1.20.1, unless otherwise specified.

2.7.5 Flow direction shall be marked on the body.

2.7.6 The valve dimensions shall be as follows:
   a) End to end dimensions 76mm (approximately).
   b) Height in fully open condition - 135mm maximum.
   These dimensions are indicative only.

2.8 Valve Manifolds

2.8.1 3-Valve and 5-Valve manifolds:

2.8.1.1 3-Valve manifold
   a) 3-Valve manifold shall be designed for direct coupling to differential pressure Transmitters having 2 bolt flanges with 54mm (2-118") centre-to-centre connections and 41.3mm (1-5/8") bolt-to-bolt distance.

   b) 3-Valve manifold shall contain two main line block valves and an equalizing by pass valve. The valves shall be needle type. They shall use self-aligning 316 Stainless Steel ball seats, unless otherwise specified.

2.8.1.2 5-Valve manifold
   a) 5-Valve manifold shall be designed for direct coupling to differential pressure
Transmitters having 2 bolt flanges with 54mm (2-1/8") centre-to-centre connections and 41.3mm (1-5/8") bolt-to-bolt distance.

b) 5-Valve manifold shall contain two main line block valves and a combination Double block and bleed for the bypass line The valve shall of needle type or special ball With bleed hole.

2.8.1.3 The flanges shall be integral part of manifold block.

2.8.1.4 The material of construction shall be 316 Stainless Steel, unless otherwise specified.
2.8.1.5 The minimum cold working pressure (CWP) rating of manifolds shall be as per Annexure 1 of this specification, unless otherwise specified.

2.8.1.6 The process connection shall be 1/2"NPTF to ANSI B 1.20.1.

2.8.1.7 Wherever the manifolds are specified for stanchion mounting, these shall be supplied along with mounting accessories. The bolts and nuts shall be alloy steel as per ASTM A 193 Gr B7 and ASTM A194 Gr. 2H (Hot dip galvanized or zinc plated) respectively. Other accessories shall be zinc plated.

2.8.2 3 way 2 valve manifolds for pressure gauges

2.8.2.1 The manifold shall be designed for use with pressure gauges with block and bleed valves. The manifold body shall be either straight or angle type as specified in the data sheet.

2.8.2.2 The valve shall be a needle type.

2.8.2.3 The body material shall be 316 Stainless Steel, unless otherwise specified.

2.8.2.4 The minimum cold working pressure rating of the manifold shall be as per Annexure 1 of this specification, unless otherwise specified.

2.8.2.5 The manifold shall have the following connections:

a) The inlet connection shall be %” plain ends with a minimum of 100mm nipple Extension suitable for socket weld or butt weld as per B16.11/ B16.9 as Specified in the job specifications

b) The gauge connection shall be with union nut and tail piece threaded to ½” NPTF.

c) The drain connection shall be ½” NPTF.

2.9 Instrument Air Valves

2.9.1 Instrument Air Isolation Valves (Miniature)

2.9.1.1 The valves shall be full-bore ball type with forged body.

2.9.1.2 Body material shall be 316 Stainless Steel.
2.9.1.3 The minimum cold working pressure rating of instrument air isolation valves shall be as Per Annexure 1 of this specification, unless specified otherwise.

2.9.1.4 The end connection shall be 1/4" NPTF to ANSI B 1.20.1, unless otherwise specified.

2.9.1.5 End to end dimensions shall be 70mm (approximately).

2.9.2 Instrument Air Needle Valves (Miniature)
2.9.2.1 The instrument valves shall be globe pattern-needle valves forged/bar stock with inside Screwed bonnet.

2.9.2.2 Body material shall be 316 Stainless Steel.
2.9.2.3 The minimum cold working pressure of Instrument Air Needle valves shall be per Annexure I of this specification. Unless otherwise specified.
2.9.2.4 The end connection shall be 1/4" NPTF to ANSI B1.20.1, unless otherwise specified.
2.9.2.5 Flow direction shall be marked on the body.

2.9.2.6 The valve dimensions shall be as follows:

a) End to end dimensions - 54 mm (approximately).

b) Height in fully open condition - 49 mm maximum.

These dimensions are tentative only.

2.10 All instrument valves in oxygen and chloride service shall be thoroughly degreased using reagents like trichloroethylene or carbon tetrachloride. End connection shall be plugged after degreasing process in order to avoid entrance of grease or oil particles.

3.0 NAME PLATE

Following information shall be punched on the body of each of these items;

a) Material of construction to the same standards as in purchaser's data sheets.
b) Cold working pressure of each item to the same standards as in purchaser's data sheets.
c) Manufacturer's identification and model number.
d) Flow direction (if applicable)
e) Material of construction.

4.0 INSPECTION AND TESTING

4.1 Unless otherwise specified, purchaser reserves the right to test and inspect all the items at vendor's works, in line with the inspection test plan for instrument valve and manifolds.

4.2 Vendor shall submit following test certificates and test reports for purchaser's review:

a) Material test certificates as per clause 3.1B of EN 10204 for body and bonnet and as per clause 2.2 for other parts.
b) Dimensional test report.
c) Pressure test report as per clause 4.3 of this specification.
4.3 Pressure Test Requirements

4.3.1 Each valve and manifold shall be subjected to hydrostatic pressure test at ambient temperature for both seat and shell leakage at test pressures given in Annexure-I of this specification. During and after the hydrostatic test there shall not be any visible leakage.

4.3.2 Pneumatic Test

Each valve and manifold shall be subjected to pneumatic test for both shell and seat leakage at 7.0 kg/cm-g with testing medium as air at ambient temperature. There shall not be any visible leakage when immersed in water or coated with a leak detection solution.

4.4 Witness Inspection

4.4.1 All valves and manifolds shall be offered for pre-dispatch inspection for following, as a Minimum:

a) Physical dimensional verification and workmanship.

b) Pressure test as per clause 4.3 of this specification on representative samples.

c) Review of all certificates and test reports as indicated in clause 4.2 of this specification.

4.4.2 In the event, when witness inspection is not carried out by purchaser, the tests shall anyway be completed by the vendor and documents for the same shall be submitted to purchaser for scrutiny.

5.0 SHIPPING

5.1 The threads/ends shall be protected with plastic caps to prevent damage/entry of foreign matter.

5.2 All instrument valves and manifolds in oxygen and chloride service shall be separately packed along with a certificated indicating 'CERTIFIED FOR OXYGEN/CHLORINE SERVICE' as applicable.

6.0 REJECTION

6.1 Vendor shall prepare their offer strictly as per this specification and shall attach only those documents and information, which is specifically indicated in the material requisition.

6.2 Any offer not conforming to above requirements, shall be summarily rejected.
## Annexure-I

STANDARD SPECIFICATION

FOR

JUNCTION BOXES AND CABLE GLANDS
CONTENTS

1.0  GENERAL

2.0  DESIGNS AND CONSTRUCTION

3.0  NAME PLATE

4.0  INSPECTION AND TESTING

5.0  SHIPPING

6.0  REJECTION
1.0 GENERAL

1.1 Scope

1.1.1 This standard specification, together with the data sheets attached herewith, covers the requirements for design, materials, nameplate marking, testing and shipping of junction boxes and cable glands which include the following types:

a) Electrical junction boxes
b) Pneumatic junction boxes
c) Cable glands (whenever specified)

1.1.2 The related standards referred to herein and mentioned below shall be of the latest editions prior to the purchaser's enquiry;

- **ANSI/ASME** American National Standards Institute / American Society of Mechanical Engineers.
- **B 1.20.1** Pipe Threads, General Purpose (Inch).
- **EN 10204** Inspection Documents for Metallic Products
- **IEC-60079** Electrical Apparatus for Explosive Gas Atmosphere
- **IEC-60529** Degrees of Protection Provided by Enclosures. (IP Code)
- **IS-5** Colours for ready mixed paints and enamels.
- **IS-13947** Specification for Low Voltage Switchgear and Control gear.
- **IS-2148** Electrical Apparatus for Explosive Gas Atmospheres - Flame proof Enclosures 'd'.

1.1.3 In the event of any conflict between this specification, data sheets, related standards, codes etc., the following order of priority shall govern:

a) Statutory Regulations
b) Data Sheets
c) Standard Specification
d) Codes and Standards

1.2 Bids

1.2.1 Vendor's quotation shall be strictly as per the bidding instructions to vendor attached alongwith the material requisition.

1.2.2 Deviation on technical requirements shall not be entertained.

1.2.3 Whenever a detailed technical offer is required, vendor's quotation shall include the following;

a) Compliance to the specifications.

b) Whenever the requirement of a detailed specification sheet for each item is specifically indicated, the specification sheet shall provide information regarding type, construction
material. Size and number of cable entries etc. The material specifications and unit of measurement for various parts in vendor's specification sheets shall be to the same standards as those indicated in purchaser's data sheets.

c) Drawing for each type of junction box with dimensional details (in millimetres) showing the terminal, entries arrangement, mounting details etc.

d) Proven references for each offered model in line with clause 1.2.4 of this specification whenever specifically indicated in purchaser's specification.

e) Copy of certificate for approval of flameproof junction boxes, adapter, plug and cable glands from local statutory authority as applicable such as Chief Controller of Explosive (CCE), Nagpur or Director General Mines Safety in India along with:

i) Test certificate from recognised testing house like CMRI/ERTL etc. as per relevant Indian Standard for all Indian manufactured items or items requiring DGMS approval.

ii) Certificate of conformity from agencies like LICE, BASEEI::A, PTB, CSA, UL etc. for compliance to ATEX or any recognised standard for items manufactured outside India.

f) Catalogues in English giving detailed technical specifications, model decoding details and other related information for each type of junction box and cable gland covered in the bid.

1.2.4 All items, as offered, shall be field proven and should have been operating satisfactorily individually for a period of minimum 4000 hours on the bid due date in the process conditions similar to those as specified in the purchaser's data sheet. Items with prototype design or items not meeting provenness criteria specified above shall not be offered.

1.2.5 All documentation submitted by the vendor including their drawings, installation manual etc shall be in English language only.

1.3 Drawings and Data

1.3.1 Detailed drawings, data, catalogues and manuals required from the vendor are indicated by the purchaser in vendor data requirement sheets. The required number of reproducible, prints and soft copies, shall be sent to the address mentioned, adhering to the time limits indicated.

1.3.2 Final documentation consisting of design data and installation manual submitted by the vendor after placement of purchase order shall include the following, as a minimum;

a) Specification sheet for each junction box and its accessories like cable glands etc.

b) Certified drawing sheets for each junction box and its accessories, which shall provide dimensional details, internal constructional details (general arrangement details) and material of construction.

c) Copy of type test certificates.

d) Copy of test certificates for all the tests indicated in clause 4.0 of this specification.

e) Installation procedure for junction boxes and its accessories
2.0 DESIGN AND CONSTRUCTION

2.1 Junction Boxes

2.1.1 Junction boxes shall be either of the following type as specified in data sheets.

a) Weather proof junction boxes.
b) Weather proof and flame proof junction boxes.

No other type of junction boxes shall be offered, / supplied unless specifically indicated otherwise.

2.1.2 Unless otherwise specified, the enclosure shall conform to the following standards:

Weatherproof housing : IP 55 to IEC-60529/IS-13947
Flameproof housing : Flameproof IEx (d) as per IEC-60079/IS-2148.

2.1.3 Number of entries and their location shall be as per data sheets. Junction boxes with top entries shall not be offered. The size of cable entries shall be as per the cable sizes indicated in the data sheet.

2.1.4 Multi-pair junction boxes shall be provided with telephone sockets and plugs for connection of hand-powered telephone set.

2.1.5 Electrical Junction Boxes

a) The material of construction of electrical junction boxes shall be die-cast aluminium of minimum 5 mm thick (LM-6 alloy). with anti corrosive paint
b) Weather proof junction box shall have hinged type door with neoprene gasket, which shall be fixed to the box by plated countersunk screws.
c) Flameproof junction box shall have detachable cover, which shall be fixed to the box by means of cadmium plated triangular head/hexagonal head screws.
d) Flameproof junction boxes for signal, alarm and control shall have the following warning engraved/integrally cast on the cover; "Isolate power supply elsewhere before opening"
e) Power junction boxes (junction boxes for power supply cable / distribution) shall have either the warning cast or shall have warning plate with following marking;

"Isolate power supply elsewhere before opening".

Unless otherwise indicated in the job specification, power junction boxes shall be suitable for incoming armoured power cable up to 150 sq.mm conductor size.
f) Terminals shall be spring loaded, vibration proof, clip-on type, mounted on nickel plated steel rails complete with end cover and clamps for each row.

g) All terminals used in signal, alarm and control junction boxes shall be suitable for accepting minimum 2.5 sq.mm copper conductor, in general.

h) Terminal used in power junction boxes / power supply distribution box shall be suitable for accepting conductor size of 4 Sq. mm to up to 120 sq. mm. Exact requirement shall be specified in job specification. Higher size of terminals shall be provided when indicated. Bus bar terminals shall be provided for conductor size 50 sq.mm and above. Suitable size of lugs shall be provided to suit conductor size specified.

i) Each junction shall have minimum of 30% spare terminal of those actually required to be utilised. Unless higher number of terminal are specified in the purchaser's data sheet, the number of terminals for various types of junction boxes shall be as follows;

- 24 Nos for 6 pair junction box.
- 48 Nos. for 12 pair junction box
- 36 Nos for 6 triad junction box.
- 48 Nos. for 8 triad junction box.

j) Terminals shall be identified as per the type of input signal indicated in data sheets e.g all terminals for intrinsically safe inputs shall be blue while others shall be grey in colour.

k) Junction boxes shall be provided with external earthing lugs.

l) Sizing shall be done with due consideration for accessibility and maintenance in accordance with the following guidelines;

i) 50 to 60 mm gap between terminals and sides of box parallel to terminal strip for up to 50 terminals and additional 25 mm for each additional 25 terminals.

ii) 100 to 120 mm between two terminal strips for upto 50 terminals and additional 25 mm for each additional 25 terminals.

iii) Bottom/top of terminal shall not be less than 100 mm from bottom / top of the junction box.

2.1.6 Pneumatic Junction Boxes

a) Pneumatic junction boxes shall be made of 3 mm thick hot rolled steel, They shall have necessary neoprene gasket between door and body. Door shall be flush with the box and shall be hinged type and provided with wing nuts.

b) Single tube entries shall be suitable for 6 mm 0.0 copper tube with bulk head fittings. Multi tube bundle entry shall be suitable for the data furnished in data sheets.

2.1.7 Painting
a) Surface shall be prepared for painting. It shall be smooth and devoid of rust and scale.

b) Two coats or lead-free base primer and two final coats of lead free epoxy based paint shall be applied both for interior and exterior surfaces.

c) The colour shall be as specified in data sheets. However, following philosophy shall be followed, in general:

(i) Light blue for all intrinsically safe junction boxes.

(ii) Light grey for all others

2.2 **Cable glands, Plugs and Reducers/Adaptors**

2.2.1 Cable glands shall be supplied by vendor whenever specified.

2.2.2 Cable glands shall be double compression type for use with armoured cables.

2.2.3 The cable glands shall be of SS316, as minimum.

2.2.4 The cable glands shall be weatherproof. Whenever specified they shall also be flameproof and certificate for the specified electrical area classification specified in the data sheets.

2.2.5 Cable glands shall be supplied to suit the cable dimensions indicated along with tolerances in data sheets. Various components like rubber ring, metallic ring, metallic cone and the outer / inner nuts etc. shall be capable of adjusting to the indicated tolerances of cable dimensions.

2.2.6 Reducers / adapter s shall be supplied as per details indicated in data sheets. They shall be nickel plated brass, as a minimum. These shall also be weatherproof and / or flame proof wherever specified and certified for the electrical area classification specified in the data sheets.

2.2.7 Plugs shall be provided wherever specified. They shall be SS316, All JB extra entries shall be plugged

2.2.8 All Plugs shall be SS316, certified flameproof when used with flameproof junction boxes.

3.0 **NAMEPLATE**

3.1 Each junction box shall have an anodised aluminium nameplate permanently fixed to it at a visible place furnishing the following information;

a) Tag number as per purchaser’s data sheet.

b) Manufacturer's serial number and model number.

c) Manufacturer's name / trade mark.

d) Stamp of certifying agency with certificate number.

e) Electrical area classification.
4.0 INSPECTION AND TESTING

4.1 Unless otherwise specified, purchaser reserves the right to test and inspect all the items at the vendor's works in line with inspection test plan for junction boxes and cable glands.

4.2 Vendor shall submit following test certificates and test reports for purchaser's review:
   a) Material test certificates as per clause 2.2 of EN 10204
   b) Pressure test on castings for £1amproofjunction boxes.
   c) Dimensional test report.
   d) High voltage and msulation resistance test report.
   e) Air leak test report on pneumatic junction boxes.
   f) Certificate from statutory body for suitability to install in specified hazardous area.

4.3 Witness Inspection

4.3.1 All Junction boxes, cable glands and other accessories shall be offered for pre-dispatch inspection for the following. as a minimum:
   a) Physical dimensional verification and workmanship on representative samples.
   b) High voltage and Insulation resistance test on representative samples.
   c) Air leak test report on representative samples of pneumatic junction boxes.
   d) Review of all certificates and test reports as indicated in clause 4.2 of this specification.

4.3.2 In the event when witness inspection is not carried out by purchaser, the tests shall anyway be completed by the vendor and documents for the same shall be submitted for scrutiny of purchaser.

5.0 SHIPPING

5.1 All threaded openings shall be suitably protected to prevent entry of foreign material.

5.2 All threaded components shall be protected with plastic caps to prevent damage of threads.

6.0 REJECTION

6.1 Vendor shall prepare their offer strictly as per clause 1.2 of this specification and shall attach only those documents, which are specifically indicated in the material requisition.

6.2 Any offer not conforming to above requirements, shall be summarily rejected.

1.00 GENERAL

1.01 This general specification together with the Instrument specification attached herewith define the technical requirement for the supply of Motorised gate valve, its spares, documentation and testing.

1.02 In the event of any conflict between general specification and Instrument specification the later shall prevail.

2.00 CODES AND INDUSTRY STANDARDS

The design shall be made in accordance with latest Codes & Standards and statutory requirements.

AMERICAN PETROLEUM INSTITUTE (API)
API 600 Steel Valves - Flanged & Buttwelding Ends
API 6D Specification for Pipeline Valves (Gate, Plug, Ball and Check Valves)
API 598 Valve Inspection & Testing

AMERICAN SOCIETY OF MECHANICAL ENGINEERS (ASME)
ASME Boiler and Pressure Vessel Code, including all mandatory addenda
Section VIII, "Pressure Vessels - Division 1"
ASME B2.1, "Screw Threads - Pipe Threads, General Purpose (Inch)"
ASME B16.5, "Pipe Flanges and Flanged Fittings NPS 1/2 Through NPS 24"
ASME B16.11, "Forged Steel Fittings, Socket-Welding and Threaded"
ASME B16.20, "Metallic Gaskets for Pipe Flanges - Ring-Joint, Spiral-Wound, and Jacketed"
ASME B16.25, "Buttwelding Ends"
ASME B16.34, "Valves – Flanged, Threaded and Welding End"
ASME B16.47, "Large Diameter Steel Flanges NPS 26 Through NPS 60"

AMERICAN SOCIETY FOR TESTING AND MATERIALS (ASTM)
ASTM A193/A193M, "Alloy Steel and Stainless Steel Bolting Materials for High-Temperature Service"
ASTM A194/A194M, "Carbon and Alloy Steel Nuts for Bolts for High-Pressure or High-Temperature Service or Both"
ASTM A320/A320M, "Alloy-Steel Bolting Materials for Low-Temperature Service"
ASTM A350/A350M, "Carbon and Low-Alloy Steel Forgings, Requiring Notch Toughness Testing for Piping Components"
ASTM A352/A352M, "Steel Castings Ferritic and Martensitic for Pressure-Containing Parts Suitable for Low-Temperature Service"

AMERICAN WELDING SOCIETY (AWS)
AWS A5.13, "Solid Surfacing Welding Rods and Electrodes"

FLUID CONTROL INSTITUTE (FCI)
FCI 70-2, "Control Valve Seat Leakage"

INTERNATIONAL ELECTROTECHNICAL COMMISSION (IEC)
IEC 60079, "Electrical Apparatus For Explosive Atmospheres"
3.01 Motorised Actuator

The motor shall be conforming to Ex"d", Gas group IIC, T3.

The design, manufacture and performance of equipment covered by this specification shall conform to the relevant Indian/ International standards and codes. In particular the equipment offered shall conform to the following standards with latest revision.

3.02.01 The following devices shall be supplied as integral part of the actuator:

- Electrical drive motor

3.02.011 Electrical drive motor

3.02.012 All the accessories required for safe operation and control of actuators shall be included in the scope of supply but not limited to the following:

- Electrically and mechanically interlocked contractors for opening and closing direction.
- Fuses and thermal overload relay for protection of motor and control transformer.
- Push buttons for opening/ closing and stopping of valve operation.
- Thermostat/ thermister with electronic controller for protection of motor.
- Separate torque and travel limit switches for both Open and Close positions.
- Incoming power supply isolating switch.
- Indicating lamps for valve fully open, fully closed and ‘in-travel’ condition.
- Space heater preferably with control thermostat.
- Local continuous position indicator.
- Terminal block fully pre-wired upto contacts on individual devices.
- Control transformer
- 2 nos. earthing terminals.
- Hand wheel for manual operation, suitably interlocked to prevent simultaneous manual and electrical operation.

3.02.02 The housing material for actuator shall be anodised aluminium alloy and shall be epoxy painted. Vendor to furnish the thickness and type of paint.

3.02.03 The motor shall be electrical three-phase squirrel cage induction type. The motor enclosure shall be flame proof as per specification sheets and shall conform to IP – 68 or better. The motor design & construction shall be robust, long maintenance free service life. The motor shall be rated for short time duty 5-15 minutes. Motor shall be able to operate the actuator at 75% of the specified voltage. Motor shall have F class insulation (Temperature rise class B) and winding shall be resistant to corrosive agents such as NH₃, CO₂ and moisture. Fuses and thermal overload relay shall be provided for protection of motor and control transformer. Electrical and
mechanical disconnection of the motor should be possible without draining the lubricant from the actuator gearcase.

The motor shall be suitable for the following conditions -

a) Minimum 3 numbers of consecutive starts in hot condition.

b) Minimum 8 no. of starts in time span of 15 minutes.

3.02.04 Push buttons for opening/ closing/ stopping the valve action in the field to be provided. Contact for push buttons shall be "Normally open" type.

3.02.05 Lockable selector switch for “local/off/remote” operation of the valve shall be provided as follows:

1. Position local : The actuator can be operated locally.

2 Position off : The actuator is completely off and cannot be operated either from local control switch or from remote control switch.

3 Position remote : The actuator can be operated only from remote control point. It is not possible to operate it from local control switch.

3.02.06 Torque switches shall be provided for opening and closing direction.

3.02.07 Local indicating lamps for valve fully open (green) and fully closed (red) condition to be provided.

3.02.08 Space heater with thermostat shall be provided.

3.02.09 Control transformer shall be supplied.

3.02.10 Actuator shall have three cable entries :

(i) For Power supply (1 1/2"NPT)

(ii) For remote operation & position indication (1"NPT)

(iii) Spare (1" NPT plugged).

Cable glands shall be double compression, flame proof type of SS material.

3.02.11 Actuator shall be flame proof confirming to Exd IIC T3 as per IEC with environmental protection of IP 65 or better. All the bolts and nuts used in the actuator, bonnet and other parts of the valve body shall be made of stainless steel. The actuator shall be oversized to at least 25% of sizing.

3.02.12 Actuator shall be provided with following control status indicated on DCS/ PLC:

- Valve opening, closing or moving
- Valve full open
- Valve full close
- Valve position at intermediate
- Motor tripped on torque in mid travel, motor stalled
- Remote selected
- Actuator being open by handwheel

3.02.13 The actuator shall include a digital position indicator with a display from fully open to fully closed in 1% increment. Provision shall be made to orientate the display through increment of 90%. Provision shall be made in design for the addition of a contactless transmitter to give a 4-20 mA analog signal corresponding to valve travel for remote indication when required and actuator output torque for remote indication when required.
3.03 Accessories

3.03.01 Limit switches shall be weatherproof IP-65 or better. Limit switches shall be supplied for valve open and close positions suitable for low current intrinsically safe applications (gold plated contacts of 24V DC 1 A rating).

3.03.02 wherever handwheel has been specified, the same shall be side mounted type and engaged when the motor is declutched by a lever or similar means, the drive being restored to power automatically by starting the motor. The handwheel or selection lever shall not move on restoration of motor drive. Provision shall be made for the hand/ auto selection lever to locked in both hand and auto position. While the hand/ auto selection lever is locked in auto mode, without damage to the actuator motor it should be possible for hand operation while the motor actuator is in running condition or in starting condition. The handwheel drive must be mechanically independent of the motor drive and any handwheel gearing should be such as to permit emergency manual operation in a reasonable time. Clockwise operation of the handwheel shall give closing movement of the valve unless otherwise started. Neutral position of the handwheel shall be clearly indicated.

3.03.03 The actuator shall be furnished with a drive bushing easily detachable for machining to suit the valve stem or gearbox input shaft. Normally the drive bush shall be positioned in a detachable base of the actuator. Thrust bearing, when housed in a separate thrust base should be of the sealed for life type.

3.03.04 The reversing starter, control transformer and local control shall be integral with the valve actuator suitably housed to prevent breathing and condensation. The starter shall be suitable for 60 starts per hour and of rating appropriate to motor size. The starter contactors shall be protected from excessive current surge during travel reversal by an automatic time delay on energization of contactor coils. The controls supply transformer shall be fed from two of the incoming three phase and incorporate overload protection. It shall have the necessary tapping and be adequately rated to provide power for the following functions: -
   - Energization of contactor coils
   - 24 VDC output where required for remote controls
   - Supply for all the internal electric circuits

3.04 Fugitive Emissions Considerations

Packing shall limit fugitive emissions. Fugitive emissions of any substance containing more than 5% by weight of volatile hazardous air pollutant as defined in the National Emissions Standard for Organic Hazardous Air Pollutants (NESHAP) shall be limited in accordance with the applicable local regulation or to a maximum of 500 parts per million, whichever is more stringent.

4.00 INSPECTION, FACTORY TESTS AND APPROVAL

4.01 All instruments and accessories shall be inspected & tested to ascertain that the supply is in accordance with approved specification. The inspections & tests shall not relieve the supplier/ manufacturer from his responsibilities for materials and the performance of the instrument supplied.
Within two weeks of receipt of the Letter Of Intent (LOI) /order, vendor must contact the Inspection Agency specified in the order and finalise with them the Quality Assurance Plan (QAP) for carrying out Inspection and test.

In absence of any Inspection Agency the vendor must submit the Quality Assurance Plan for principal’s approval. All tests, in such cases, shall be conducted by manufacturer’s quality department and the results of tests shall be forwarded alongwith the supply.

Procedure and extent of tests shall be governed by QAP mutually agreed between the vendor and principal’s inspection authority.

No instrument / accessory shall be shipped until all the required tests are successfully completed and certified “Cleared for despatch” by the inspection authority.

4.02 The following physical checks, routine tests, as a minimum shall be witnessed by Principal’s inspection authority.

1. Physical Check

a) Physical conformity of the motorised gate valve and its accessories with order specifications including dimensions check -
   - Markings
   - Overall dimensions
   - Face to face body dimension
   - Flanges
   - Thickness check
   - Check for accessories, connections & installations.
   - Test of electrical parts & verifications of hazardous area

In order to check the internal parts the inspector shall have the right to disassemble one valve per type.

2. (i) Routine test for valve

a) Valve inspection and testing shall be in accordance with API 598
b) Hydrostatic testing shall be done in accordance with API 6D, in not it will be tested as per ANSI B 31.3. Unless otherwise stated on the data sheet, component testing of the pressure boundary parts is permitted; provided the valve body assembly is subsequently tested to verify the pressure sealing integrity of gaskets..

c) Seat leakage test with leakage rate conforming to FCI 70.2.

d) Functional tests : If applicable
   - Valve position on energy failure
   - Limit switches
   - Electric actuator
   - Handwheel

e) The following checks shall be carried out on the valves successfully tested :
   - Rust proof painting (except for SS)
   - Cleaning of internal parts of body
   - Protective plugs against infiltration of foreign materials
   - Protection against possible impacts
   - Valve tag plates

f) Fire safe testing as per API 6FA
g) Radiography/ultrasonic test shall be carried out for all valves of rating above 600#. In addition butt weld ends of all butt welded valves for all pressure ratings shall be subjected to radiography/ultrasonic tests.

h) Magnetic Particle or Die Penetrate test for castings and forging shall be carried out as required.

i) Checking of material composition & test.

j) An alloy verification plan will be issued on projects where alloy verification is required in accordance with General Engineering Procedures. This plan will include instrument items to be alloy verified (with verification class defined), required methods of verification and when and where these test are to be performed. Alloy verification requirements will be noted on each valve data sheet (example: “CLASS I ALLOY VERIFICATION REQUIRED”). Supplier shall perform all required tests to meet the stated requirements.

k) Valve shall be subjected to 10% hardness test for hard facing.

2 (ii) Routine test for actuator
Each actuator must be performance tested and individual test certificates shall be furnished. The test equipment should simulate a typical valve load, and the following parameters should be recorded.
(a) Current at max. torque setting
(b) Torque at max. torque setting
(c) Flash test voltage
(d) Actuator output speed or operating time

In addition the test certificate should record details of specifications such as gear ratios for both manual & automatic, drive closing direction, wiring diagram code number etc.

5.00 PACKAGING

Requirement of packaging stated elsewhere in the bid document. Vendor should furnish storage requirement of the valves like Valve should be stored open or close? Does the valve need to be stroked if stored for an extended period? Other requirements.

6.00 IDENTIFICATION AND MARKING

6.01 Self adhesive tapes or signs are not permissible for permanent marking of any instrument.

6.02 Each gate valve shall be fitted with a SS tag plate and shall contain the following information:
- Tag no.
- Manufacturer’s name, Serial No. and Model
- Body and trim material and sizes
- Body rating and end connection
- Fall action

Each motorised actuator shall be fitted with a SS tag plate and shall contain the following information:
- Tag no.
- Torque rating
- Power rating
- Power supply

A durable terminal identification card showing plan of terminals shall be provided and attached to the inside of terminal box cover indicating wiring diagram number terminal layout.

Besides the above each instrument shall have a separate circular tag number plate in stainless steel with engraved tag number and range and attached securely to the instrument with a soft stainless wire. The size of letters and figures shall be minimum 4mm and the plate should be 25mm diameter with 1-2 mm thick. Also each instrument shall have lamicoid nameplate with 6 mm minimum size black letters on white background and identified with their relevant loop number.

6.03 All spare parts shall be fitted with identification plate with the following data clearly printed and easily readable.
- Spare parts name/model no. as per purchaser's Instrument specification sheet
- Serial no.

7.00 SPARES

Spare shall be as per enclosed spares list.

8.00 DOCUMENTATION

1 Technical documentation

1.1 General

All the documentation such as graphic drawings and technical specifications shall be sent to the Contractor who will reserve to approve it within 15 days; after this period, the documents have to be retained approved. The Contractor's approval will not relieve the Vendor of his responsibility for the final performance of the supply. Final issue of Project Documents shall be supplied in electronic format as specified hereunder. All the other Vendor documentation, such as Manual, Catalogues, etc. shall be supplied on paper.

1.2 Title block and heading

Each document originated by the Vendor shall be numbered according to Vendor procedure.

1.3 Specification, Data Sheet and other documents.

All shall be produced with Microsoft Office products as Word, Excel or PowerPoint access. The files shall be delivered in a “workable stand-alone” format, without any special features (links to other files, special fonts, macros, etc.), which may affect the possibility of viewing and editing.

1.4 Drawings

Drawings will be made using AutoCAD version 12 or 14 or Latest. Vendors are permitted to utilise other CAD software, but the produced files are to be converted in AutoCAD format prior the delivery to Contractor. Drawings files shall be delivered as “single complete file”, without any reference attached, except when not practicable due to the dimension of referenced files. In this case together with the reference files also the information necessary to manage the files shall be given.
Together with the drawings files also the relevant files for plotting format HPGL or HPGL2 are to be delivered.

1.5 Scanned documents

The format of scanned documents shall be CCITT Group IV TIFF or Adobe PDF Acrobat. Quality control on file of scanned documents will be completed prior to delivery, including:
Deskew
Despeckle
Hole Fill.
Resolution below 200 Dpi is not acceptable.
The following documents (Technical) are required to be submitted by the vendor along with bid, after placement of order for approval purposes and final documentation before despatch of consignment.

NOTES
1. (A) for Approval (I) for information only
2. Sl. No. 1 to 12 shall be forwarded to Owner as per details outlined in enquiry /order.
3. Sl. No. 13 shall be mutually finalised with Inspection Authority specified in the order as per clause no.4.01.
4. Number of sets shall be as stipulated elsewhere in the bid document. Final documentations shall be supplied in hard copies as well as soft copies in CD formats. Applicable software are MS Office 2000, Word, Access, Excel. Documentation language shall be English.
9.0 METHOD OF TENDERING

General

The Bidder shall present a list of previous applications (References) for equipment similar to the equipment proposed.

Technical information

The equipment offered as a basis shall be of standard production type it shall be based on modern technology, be of a proven and referenced type and designed for continuous operation under the specified operating conditions.

The Bidder shall quote for the materials requested according to the requirements of this specification and of the individual job specifications. With bid shall be supplied the technical documentation.

Deviations

The tender shall be in strict accordance with Purchaser's specifications.

However, the Vendor may quote, in addition and as an alternative, different materials from those required in the specifications, provided these materials are suitable for the process conditions specified in the individual job specifications.

Any deviation from the requirements listed in the general specification and in the individual job specifications shall be clearly highlighted.

If no exceptions are listed, the tender - and the possible supply - shall be regarded as being in full conformity with the Purchaser's requirements, and will be accepted after the tests and checks have confirmed that the performance complies with the requirements of the tender documents and order specifications.
Annexure – I Actuator torque Specification

Note: - Vendor to fill the table for all the tags.

1
STANDARD SPECIFICATION

FOR

GAS DETECTORS
CONTENTS

1. GENERAL 03
2. CODES & STANDARDS 03
3. ENVIRONMENT CONDITIONS 03
4. TECHNICAL REQUIREMENTS 04
5. INSPECTION AND TESTS 10
6. SPARE PARTS AND CONSUMABLES 10
7. PROVEN TRACK RECORD 10
1. GENERAL

(1) This specification covers the common and minimum requirements for design and manufacturing of the Gas Detectors.

(2) The design and manufacturing shall be carried out in accordance with this specification together with Codes and Standards to the extent described in this specification.

(3) In case there is any conflict among the requirements, the following priority shall govern.
   1\textsuperscript{ST} Data Sheets
   2\textsuperscript{ND} This Specification
   3\textsuperscript{RD} Codes and Standards

Vendor to bring to the notice of owner/purchaser of any conflict on above documents before proceeding with procurement engineering. If no information is highlighted by vendor during quotation stage it will be presumed by owner purchaser that the vendor is in full compliance to purchaser specification.

(4) The instruments selected for the units shall be rugged in design and must be well proven in the hydrocarbon industry. Prototype design or equipment of experimental nature or design undergoing testing etc. shall not be selected and supplied.

(5) The instruments as being offered supplied should have been operating satisfactorily in a hydrocarbon industry like Refinery, Petrochemical and Gas Processing Plant under similar process conditions for atleast 4000 hours from the bid opening date.

2. CODES AND STANDARDS

(1) ANSI 61.20.1 Pipe threads General Purpose (Inch)
(2) IEC International Electrochemical Commission
(3) NEC National Electric Code
(4) 6SEN5004 Electric Gas Detector for combustible gases.
(5) IEC79 Electrical Apparatus for Explosive Gas Atmosphere.
(6) CSA Standard, C22.2No152, Combustible Gas detection Instruments.

3. ENVIRONMENT CONDITION

The equipment supplied shall be suitable for the ambient temperature which may rise to 45°C with corresponding humidity of 100%

The vendor shall supply Gas Detectors with protective measures (If any) against the climatic condition indicated below.
Barometric Pressure, mbar : Refer document no 1075-0000-0790

Temperature (Design conditions) : Max.45°C  
Min  5°C  
35°C for process calculation

Relative Humidity (RH %) : Refer document no 1075-0000-0790

Rainfall : Refer document no 1075-0000-0790

Wind data : Refer document no 1075-0000-0790

Elevation above mean Sea level. : Refer document no 1075-0000-0790

4. TECHNICAL REQUIREMENTS:

4.1 Catalytic Combustion Type H2 Gas Detectors

4.1.1 Type of Sensor

In general, Catalytic combustion type sensor for combustible gas shall be used.

4.1.2 H2 gases shall be continuously detected by catalytic combustion type Gas detectors.

4.1.2 Electrical Requirement

(A)Transmitter Output :- (x) 4-20mA, 3 WireType.

(B)Range of Instrument: - 0-100% LEL

(C)Operating Voltage: (x) 24VDC  
( ) 110VAC  
( ) 230VAc

(D)Response Time:- Less than 10 Sec for 90% of Full scale

(E) Display: - (x) Required  
( ) Not Required

4.1.4 Enclosure

(1) Materials  (x) Die Cast Aluminum  ( ) Manufacturer Standard

(2) Enclosure class: 

STANDARD SPECIFICATION FOR

GAS DETECTORS

( ) Weatherproof ( ) General purpose
(x) Explosion proof
- Class: ( ) As spec in Instrument Data/ Schedule sheets
- Suitable for IEC Zone 2 Group II A + IIB + H2,
- Authority's certificate: (x) Yes ( ) No

(x) All gas detectors shall be certified to the specified hazardous area by a statutory body like CSA, BASEEEFA, PTB, LCIE, UL, and etc. for compliance to ATEX directives or other equivalent standards for all equipments manufactured outside India.

(x) CCOE (Chief Controller of Explosives)

(3) Weather hood: (x) Yes ( ) No

(x) For rain
(x) For dust
( )

(4) Cable Entry:
    (x) WNPT (F)
    ( ) G1/2 in.

4.1.5 Mounting:
    (x) 2 in. pipe mounted
    ( ) Mounting stand

4.1.6 Accessories:- 2" Pipe Mounting Accessories, Cable Glands & plugs.

All ex-proof components /instruments should have Chief Control of Explosives (CCOE)- Nagpur certification.
All sensors shall be resistant to sulphur poisoning & withstand salt laden amb. Condition for the specified life period.

4.2 Infrared type HC gas detector

4.2.1 Type of Sensor

Infrared type sensor for hydrocarbon gas shall be used.

4.2.2 Hydrocarbon (HC) gases shall be continuously detected by Infrared type gas detectors

4.2.3 Electrical Requirement

(A) Transmitter Output:- (x) 4-20 mA, 3 Wire type
(B) Range of Instrument:- 0-100% LEL
(C) Operating Voltage: (x) 24VDC
    ( ) 110VAC
    ( ) 230VAC

(D) Response Time:- Less than 5 sec.
(E) Display:- (x) Required
4.2.4 Enclosure

(1) Materials  (x) Die cast aluminum epoxy coated ( ) Manufacturer std.

(2) Enclosure Class
   ( ) Weatherproof  ( ) General purpose
   (x) Explosion proof (Ex’d’)
      - Class: ( ) As spec in Instrument Data/ Schedule sheets
        (x) Suitable for IEC Zone 2 Group IIA +IIIB+H2,
        - Authority's certificate: (x) Yes ( ) No

   (x) All gas detectors shall be certified to the specified hazardous area by a statutory body like CSA, BASEEFA, PTB, LICE, UL, and etc. for compliance to ATEX directives or other equivalent standards for all equipments manufactured outside India.

   (x) CCOE (Chief Controller of Explosives)

(3) Weather hood: (x) Yes ( ) No
   (x) For rain
   (x) For dust
   ( ) __________

(4) Cable Entry:  (x) WNPT (F)
   ( ) G1/2 in

4.2.5 Mounting:
   (x) 2 in. pipe mounted
   ( ) Mounting stand

   All sensors shall be resistant to sulphur poisoning & withstand salt laden amb. Condition for the specified life period

4.2.6 Accessories: - 2" Pipe Mounting Accessories, Cable Glands & plugs.

4.3 Electrochemical Gas Detectors

4.3.1 Type of Sensor

   Electrochemical gas sensor for Co gas shall be used.

4.3.2 CO gases shall be continuously detected by electrochemical type Gas detectors.

4.3.3 Electrical Requirement:
STANDARD SPECIFICATION FOR
GAS DETECTORS

(A) Transmitter Output:-(x) 4-20 mA, 3 Wire type
(B) Range of Instrument:-(x) 0-100 ppm
(C) Operating Voltage:-(x) 24VDC
(L ) 110VAC
(L ) 230VAC
(D) Response Time:-Less than 30 sec for 50% full scale.
(E) Display:-(x) Required
( ) Not Required

4.3.4 Enclosure

(1) Materials -(x) Die cast aluminum epoxy coated ( ) Manufacturer std.

(2) Enclosure Class:
( ) Weatherproof ( ) General purpose

(x) Explosion proof (EEx’d’)
-Class: ( ) As spec in Instrument Data/ Schedule sheets
(x) Suitable for IEC Zone 2 Group IIA +IIB+H2,
- Authority's certificate: (x) Yes ( ) No

(x) All gas detectors shall be certified to the specified hazardous area by a statutory body like CSA, BASEEFA, PTB, LCIE, UL, and etc. for compliance to ATEX directives or other equivalent standards for all equipments manufactured outside India.

(3) Weather hood: (x) Yes ( ) No
(x) For rain
(x) For dust
( )

(4) Cable Entry: (x) WNPT (F)
( ) G1/2 in

4.3.5 Mounting:

(x) 2 in. pipe mounted
( ) Mounting stand.

4.3.6 Accessories:- 2” Pipe Mounting Accessories.

All sensors shall be resistant to sulphur poisoning & withstand salt laden amb. Condition for the specified life period.

4.4 Catalytic type gas detectors

4.4.1 Type of Sensor

Catalytic type gas sensor for ammonia gas shall be used.
4.4.2 Ammonia gases shall be continuously detected by Catalytic type Gas detectors.

4.4.3 Electrical Requirement:

(A) Transmitter Output: (x) 4-20 mA, 3 Wire type
(B) Range of Instrument:- 0-100 ppm
(C) Operating Voltage: (x) 24VDC
                          ( ) 110VAC
                          ( ) 230VAC
(D) Response Time: Less than 60 sec with splash guard & dust guard.
(E) Display:  (x) Required
           ( ) Not Required

4.4.4 Enclosure

(3) Materials (x) Die cast aluminum epoxy coated ( ) Manufacturer std.

(4) Enclosure Class:
   ( ) Weatherproof ( ) General purpose

(x) Explosion proof (EEx’d’)
   - Class: ( ) As spec in Instrument Data/ Schedule sheets
     (x) Suitable for IEC Zone 2 Group IIA +II B+H2,
     - Authority’s certificate: (x) Yes ( ) No

(x) All gas detectors shall be certified to the specified hazardous area by a statutory body like CSA, BASEEFA, PTB, LCIE, UL, and etc. for compliance to ATEX directives or other equivalent standards for all equipments manufactured outside India.

(3) Weather hood: (x) Yes ( ) No

   (x) For rain
   (x) For dust
   ( )

(4) Cable Entry: (x) WNPT (F)
                ( ) G1/2 in

4.4.5 Mounting:

   (x) 2 in. pipe mounted
   ( ) Mounting stand.

4.4.6 Accessories: - 2” Pipe Mounting Accessories.

   All sensors shall be resistant to sulphur poisoning & withstand salt laden amb. Condition for the specified life period.

4.5 HOOTERS

1) The Hooters shall be of electric type.
2) The Hooter shall be pre-assembled with SOV & AFR.
3) The SOV shall confirm to the below requirements.
   a) The SOV shall be suitable for locating in Zone2, Gr IIA+ IIB+ H2 hazardous area.
   b) The SOV shall be intrinsically safe, the intrinsically safe enclosures shall be certified
to the specified hazardous area by a statutory body like CSA, BASEEFA, PTB, LCIE, 
FM, UL, and etc. for compliance to ATEX directives or other equivalent standards for
all equipments manufactured outside India. In addition to this for instruments installed
in hazardous area, CCOE (Chief Controller of Explosives), Nagpur certification shall
be required.
   c) The solenoid valve shall be direct acting type, three-way, Universal type, shall be
continuous rated type with class H insulation as per IEC60085/1S1271.
   d) The body shall be of SS with SS316 trim as minimum, and be operated on 24 VDC.
   The SOV vent shall have bug screens.
   e) SOV shall have integral junction box with WNPT (F) cable entry. Flying leads are not
acceptable.
   f) The SOV shall be SIL-2 certified.
4) The AFR shall confirm to the below requirements.
   a) Filter mesh shall have 5 micron sintered bronze 1 ceramic filter element and shall be
provided with manual drain.
   b) The AFR shall have a 2" pressure gauge; the pressure gauge shall be of SS
material.
   c) The connection size for instrument air on AFR shall be clearly indicated.
5) Suitable wall mounting assembly shall be provided with the Hooter.

4.6 BEACONS

1) The beacons shall be of flashing type.
2) The beacons shall be Ex-proof Ex'd' suitable for locating in Zone2, Gr.II A + IIB+H2, hazardous area.
3) The beacons shall be certified to the specified hazardous area by a statutory body like CSA, 
BASEEFA, PTB, LCIE, UL, and etc. for compliance to ATEX directives or other equivalent 
standards for all equipments manufactured outside India. In addition to this for instruments installed 
in hazardous area, CCOE (Chief Controller of Explosives), Nagpur certification shall be required.
4) The beacons shall operate on 24VDC power supply.
5) The cable entry shall be WNPT (F).
6) Suitable wall mounting assembly shall be provided with the Beacon.

4.7 CALIBRATION ACCESSORIES

Vendor to provide following accessories:
   (a) Calibration gases shall be provided for warranty period.

4.8 MARKING

Each gas detector shall be marked according to MSS-SP-25. The material of the name plate
shall be of SS316 & fully insulated. A name plate engraved with following shall permanently be
affixed on each detector.

Tag Number
Manufacturer's Name
Model Number
Serial Number
4.9 Portable gas detector shall be supplied, one no. each for HC application.

5 INSPECTION AND TESTING:

(1) The testing and acceptance shall be carried out on the mutually agreed procedures and criteria based on this specification and vendor’s standard procedures.

(2) The Owner/Purchaser shall be free to request any specific test on any equipment considered necessary by him although not listed in this specification, including proper workmanship & materials, as a part of approval of testing procedure. The cost of performing all tests shall be borne by the vendor, without affecting the overall delivery schedule.

(3) Vendor to note that acceptance of any equipment or the exemption of inspection or testing shall in no way absolve the vendor of the responsibility for delivering the equipment meeting all the requirements specified in Material Requisition. It shall be vendor’s responsibility to modify and/or replace any hardware if the specified functions are not completely achieved satisfactorily during Inspection and Testing.

(4) Vendor shall make available all consumable instruments & equipments necessary for testing & calibration during all tests. These instruments/equipments shall be of standard make with accuracy better than the accuracy expected from the calibrated/tested instruments & certified by National Physical Laboratory or other equivalent agencies.

(5) Inspection and testing shall be as per attached Inspection and Test Plan (ITP).

6 PROVEN TRACK RECORD

Vendor to provide Proven Track Record (PTR) for the offered gas detectors in similar applications with the quotation.

GENERAL

1.1 SCOPE

1.1.1 This specification, together with the data sheets attached herewith defines the minimum functional requirements for the design; hardware, software and firmware specifications, nameplate marking, testing and shipping of Distributed Control System designed for reliable effective and optimum control and monitoring of a process plant.

1.1.2 The related standards referred to herein and mentioned below shall be of the latest editions prior to the date of the purchaser’s enquiry:-

AG-181 Foundation Fieldbus System Engineering Guidelines
EN 10204 Inspection Documents for Metallic Products.
EN 50039 Intrinsically Safe Electrical System
IEC 60079 Electrical Apparatus for Explosive Gas Atmosphere.
IEC 60529 Degree of Production Provided by Enclosures.
IEC 60617 Graphic Symbols for Electronic Diagram
IEE 4 Guidelines for Documentation of Computer Software for Real time and Interactive Systems

FF – 569 Foundation Fieldbus Host interoperability support test procedure
FF – 816 Foundation Fieldbus Specification 31.25 Kbits/s Physical Layer Profile
FF – 890–894 Foundation Fieldbus Specification Function Block Application process

ANSI / ISA Security Technologies for Manufacturing and control system
TR 99.00.01

ANSI / ISA Integrating Electronic Security into the manufacturing and control systems environment
TR 99.00.02

EEMUA 191 Alarm System, a guide to design, management and procurement
IS-3043 Code of Practice for Earthing

IS 13947 Degree of Protection provided by Enclosures for low voltage switchgear and control gear

IS 13948 Flameproof Enclosures of Electrical Apparatus

ISA S 71.01 Environmental Conditions for process Management and Control System: Temperature and Humidity

S 71.04 Environmental Conditions for Process Measurement and control System: Airborne Contaminants

S 5.2 Binary Logic Diagrams for Process Operations
S 5.3 Graphic Symbols for Distributed Control System Display Instrumentation, Logic and Computer System.

S 5.4 Instrument Loop Diagram

S 5.5 Graphic Symbols for Process Display

S 18.1 Annunciator Sequences and Specifications

S 50.2 Fieldbus Standard for use in Industrial Control System

IEC-61000-4-4 Electromagnetic Capability (EMC) – Testing and measurement techniques – Electrical fast transients / burst immunity test

IEC-61000-4-5 Electromagnetic Compatibility (EMC) – Testing and Measurement techniques – Surge immunity test

IEC-61000-6-2 Electromagnetic Compatibility (EMC) – Generic Standards – Immunity for Industrial Environments

IEEE 472 Electrical Surge protection

IEC-60584 Thermocouple (Tolerances)

IEC-60751 Industrial Platinum Resistance Temperature Sensors

ANSI MC 96.1 Temperature Measurement Thermocouples

IEC 61131 Programmable Controllers

IEC 61511 Functional Safety – Instrumented System for Process Industry Sector

IEC 61158 Fieldbus Standard for use in Industrial Control Systems.

1.1.3 In the event of any conflict existing between this specification, data sheets, statutory regulations, related standards, codes etc., the following order of priority shall govern:

a) Design Basis / Statutory regulations

b) Data Sheets

c) Standard specifications
d) Codes and standards

1.1.4 In addition to meeting purchaser’s specifications in totality, vendor’s extent of responsibility shall also include the following:

a) Purchaser’s data sheet specify the minimum acceptable functional requirements for the control system. It shall be vendor’s responsibility to select proper hardware, software and firmware to meet the specified functional requirements.

b) Purchaser’s data sheets specify the scan time / cycle time / response time / macro cycle time and loading requirements. Vendor shall be responsible for sizing and selecting their standard product i.e. hardware, software and firmware to meet the requirements specified in the purchaser’s data sheets.

c) Selection of proper and adequate hardware, software and firmware to meet architectural requirements specified in the purchaser’s specifications, keeping the integrity of functional blocks specified in the configuration diagram attached with the material requisition.

d) Segment design based on requirements specified in the job specifications and its validation during site testing and pre-commissioning.

e) Adequacy of Bill of material selected to meet purchaser’s requirements. Vendor to note that bill of material shall not be verified by the purchaser during evaluation stage. Any hardware, software and firmware required to meet the purchaser’s specified requirements shall be provided by the vendor without any implication.

f) Providing adequate mandatory spares including consumable spares as specified in the purchaser’s specifications. Vendor shall be responsible to meet mandatory spare requirements specified by the purchaser.

1.2 Bids

1.2.1 Vendor’s quotation shall be strictly as per the bidding instructions to vendor attached with the material requisition.

1.2.2 Whenever a detailed technical offer is required, vendor’s quotation shall include the following:

a) Compliance to the specifications.

b) Detailed specification sheets for each sub-system. The specification sheet shall provide information regarding hardware specifications, software specifications, redundancy requirements, capacity, power consumption etc. of the distributed control system and its accessories. The material specifications and unit of measurement for various items in vendor’s specification sheets shall be to the same standards as those indicated in purchaser’s data sheets.

c) System security features and design details
d) Proven references for each offered model in line with clause 1.2.4 of this specification whenever specifically indicated in the purchaser’s specifications.

e) A copy of approval for flameproof enclosure, intrinsic safety etc whenever specified, from local statutory authority, as applicable, like Petroleum and Explosive Safety Organisation (PESO) / Chief Controller of Explosives (CCE), Nagpur or Director General of Mines Safety (DGMS) in India along with;

   i) Test certificate from recognised house CIMFR (Central Institute of Mines & Fuel Research) / ERTL (Electronics Research and Test Laboratory) etc. for specified protection class as per relevant Indian Standard for all Indian manufactured equipments or for equipments requiring DGMS approval.

   ii) Certificate of conformity from agencies like LCIE, BASEAFA, PTB, CSA, UL etc., for compliance to ATEX or other recognised standards for all equipments manufactured outside India.

f) Deviations on technical requirements shall not be entertained. In case vendor has any valid technical reason to deviate from the specified requirement, they must include a list of deviations item wise, summing up all the deviations from the purchaser’s data sheets and other technical specification along with the technical reasons for each of these deviations.

g) FMEDA report and calculations for probability of failure on demand to meet specified SIL requirements (e.g. SIL3).

h) Catalogues giving detailed technical specifications, model decoding details and other related information for each item / sub-system covered in the bid.

1.2.3 Vendor shall offer only their standard proven product i.e. hardware, system software and firmware, which shall be configured to meet the functional requirements specified in the material requisition. Whenever any bought out item is offered to meet the configurational requirements specified in the material requisition, it shall also meet the functional requirements. Moreover, the equipment being offered / supplied shall be of latest proven version available in the current manufacturing range and meeting the requirements specified in clause 1.2.4 of this standard specification.

1.2.4 The system hardware, software and firmware as offered, shall be field proven and should have been operating satisfactorily for a period of minimum 4000 hours continuously on the bid due date in the validly similar size and application specified in the purchaser’s data sheet. Items with prototype design or items not meeting provenness criteria specified above shall not be offered or supplied.
1.2.5 The detailed scope of work, specific job requirements, exclusions, deviations, additions etc. shall be indicated in the job specifications which shall be part of material requisition.

1.2.6 Whenever specified, vendor shall furnish tested values of failure rates, probability of failure on demand and test intervals for safety integrity level analysis.

1.2.7 All documentation submitted by the vendor including their quotation, catalogues, drawings, installation, operation and maintenance manuals shall be in English language only.

1.2.8 Vendor shall also quote for the following;

   a) Two year’s operational spares for each sub-system and their accessories which shall include the following as a minimum;
      i) All type of electronic modules e.g I/O modules, processor modules, communication modules, memory modules, disc controller module, power supply modules etc.
      ii) All type of auxiliary items e.g. barriers / isolators, hardwired instruments, annunciator modules, receiver switches, trip amplifiers, temperature element converters etc.
      iii) Switches, lamps, fuses, connectors, terminals, pre-fabricated cables, circuit breaker, relays etc.
      iv) Video display units, keyboards, disc drives, PC’s, network items (e.g. switches, hubs etc.) etc.

   b) Any special tools and test equipments needed for the maintenance of DCS, PLC’s and other items being offered by vendor. This shall also include test equipments for fieldbus testing and configuration like fieldbus tester, fieldbus configurator etc. wherever specified in the data sheets. Vendor must confirm in their offer if no special tools or test equipments are needed for maintenance other than those specifically indicated in purchaser's data sheet.

1.3 **Drawing and Data**

1.3.1 Detailed drawings, data, catalogues and manuals required from the vendor are indicated by the purchaser in vendor data requirement sheets. The required number of producibles, prints and soft copies shall be dispatched to the address mentioned, adhering to the time limits indicated.

1.3.2 Final documentation consisting of design manuals, installation manual, operation and maintenance manual etc., submitted by the vendor after placement of purchase order shall include the following, as a minimum:
a) Specification sheet for each sub-system, auxiliary instrument and bought out item.
b) Certified drawings for complete system including:
   i) GA drawings for panels, cabinets, marshalling racks, hardwired consoles, operator / engineering console etc with complete dimensions details, internal construction and weight in kilograms.
   ii) Control room e.g. console room, rack room and engineering room layout with all dimensions in millimeters.
   iii) Channel base drawing for console room, rack room and engineering room.
   iv) Input / output assignment
   v) Fieldbus segment drawing
   vi) Loop wiring diagram
   vii) Power supply distribution single line diagram
   viii) Dynamic graphic diagrams
   ix) System grounding drawing
c) Design manuals and functional design specifications which shall include hardware design manual, software design manual and special software specifications.
d) Copy of type test certificates.
e) Copy of test certificates for all tests indicated in Part II of this specification.
f) Installation manual containing installation procedure for distributed control system and other items covered in the material requisition.
g) Power-on, start-up and internal testing procedures.
h) Software debugging and system configuration procedures
i) Calibration and maintenance manual containing maintenance procedures including replacement of parts, application modification etc.
j) Any other drawings and documents specifically indicated in job vendor data requirement enclosed with the material requisition.
2.0 DEFINITIONS

The various terms used in this specification are defined as follows:

2.1 Distributed control system

The class of control systems which in addition to maintaining and managing data bases in distributed fashion also executes the stated control functions and permits transmission of control, measurement and operating information to and from a single or a plurality of user specified locations connected via a communication sub-system.

2.2 Programmable Logic Controller

The class of control systems which can be programmed to execute plant shutdown and / or interlock / sequence logics to the specified safety integrity levels.

2.3 Accessible

A system feature that is viewable by and interactive with the operator and allows the operator to perform user permissible control action e.g. set point change, auto-manual transfers or on-off actions.

2.4 Assignable

A system feature that permits an operator to direct a signal from one device to another without the need for change in wiring, either by means of switches or via other data entry devices like key board commands to the system.

2.5 Configurable

A system feature that permits selection through entry of key board commands or commands from other data entry devices of basic structure and characteristics of a device or system, such as control algorithm, display format or I/O termination.

2.6 I/O

Input / Output with respect to process / operator.

2.7 Fieldbus

Fieldbus is a digital two-way multi drop communications link among intelligent measurement and control devices.

2.8 System Size

System size shall be defined as maximum number of process inputs or tags those can be connected to the system and viewable from any one of the VDUs of an operating console in all hierarchical displays without changing the configuration or without operator interaction considering;

a) all inputs as close loops
b) all inputs as open loops

2.9 Operator console

Operator console is the operator’s main plant interface device via which operator can view, monitor and control the plant and can give instructions to peripherals to execute commands, and shall have protective access to configure and maintain the system.

2.10 Engineering console

Engineering console shall be the engineer’s main interface device via which engineer can configure and maintain the system, and shall have protective access to monitor and control the plant, give instructions to peripherals to execute commands.

2.11 Local Level

All those sub-systems, which directly interface with field devices shall be referred to as local level.

2.12 Central Level

Operator consoles and Engineering Console, which present data acquired from local level devices shall be referred as Central Level.

2.13 Database

Database shall be defined as the information stored temporarily or permanently in the system which can be accessed by various programs to meet all its functional requirements.

2.14 Global Database

Global database is defined as the database that can be accessed by two or more non-nested modules of a program without being explicitly passed as parameters between the modules.

2.15 Loop integrity

A system shall be said to have loop integrity if the failure of one component in the system/ sub-system does not affect more than one loop.

2.16 Interchangeability

System/sub-systems shall be said to have full interchangeability if the functions and information available on one system/sub-system shall also be available on the other in totality.

2.17 System Loading
System loading for a sub-station is defined as the percentage of time a sub-system spends in carrying out various activities referred to the use of memory, CPU time and communication capacity in the worst case of high sub-system operation out of the designed / designated cycle time of the sub-system.

2.18 **Bus-degradation**

Bus-degradation shall be defined as a change in the system performance from the specified one measured in terms of display update rate while loading the communication sub-system from 10 through 100 percent.

2.19 **Redundancy**

A system component shall be termed as redundant if it takes over automatically the operation in the event of the failure of the main component without causing any interruption in the system and upsetting the process. The repaired or replaced device shall be brought in-line only through operator action without upsetting system operation.

2.20 **Switchover Time**

Time required for a back up instrument / system to come on-line automatically in case of the failure of the main instrument / system.

2.21 **Processor Cycle Time (Tpc)**

Processor cycle time is the measure of the processing speed of a processor and is user selectable from the pre-defined discrete values. Processor cycle time for a sub-systems shall be defined as follows:-

a) **Controller Sub-system**

Processor cycle time for controller sub-system shall be defined as the total time taken by the control processor to read inputs supplied by input module, execute control algorithm and write the outputs for the output module.

b) **Data acquisition sub-system**

Processor cycle time for data acquisition sub-system shall be defined as the total time taken by the processor to read inputs supplied by input processor, perform calculations for all the open loops configured within the data acquisition sub-system and make data available to the communication sub-system.

c) **Programmable logic controller**
Processor cycle time for programmable logic controller shall be defined as the total time taken by the processor to read input supplied by input module, execute all computations (analog as well as logic as configured) and write the outputs for the output module.

2.22 Scan time (ts)
Scan time is the end-to-end response time of a sub-system and shall be defined as follows:
For fieldbus based system refer clause 2.25 for close loop response time.

a) Close-Loops
Scan time for a close-loop shall be defined as the total time taken by a sub-system e.g. controller and data acquisition sub-system to read inputs from the input terminal, process input, perform control algorithms, update control output and write output at the output terminal for all the loops configured within the sub-system.

b) Open-Loops
Scan time for an open loop shall be defined as the total time taken by a sub-system e.g. controller and data acquisition sub-system to read input from input terminal, process input, perform calculations and write output for communication sub-system to pick-up the same for all the open loops configured within the sub-system e.g. controller and data acquisition sub-system.

c) Logic Loops
The scan time for a logic loop shall be defined as the total time taken by a sub-system e.g. programmable logic controller to read input from the input terminal, process input, execute logic, updating logic output and write output at the output terminal for all the logics configured within the subsystem.

2.23 Control Cycle time
Control cycle time is defined as the total cycle time taken by the supervisory computer to read data from control system, perform calculations and update the set point of a regulatory loop configured in the control system e.g. controller and data acquisition sub-system.

2.24 Macro Cycle
Macro cycle is defined as a single iteration of a schedule within a fieldbus device.

2.25 Macro Cycle Time
Macro Cycle time or execution time is defined as the amount of time taken by a fieldbus device to complete the macro cycle. Macro cycle time can refer to a single field device, the LAS or a complete segment made up of multiple devices.
2.26 Loop Response Time

Loop response time for fieldbus based system shall be defined as the total time required to perform the following functions in each of the specified loop configuration;

a) Control function in transmitter

Execute the analog input and control (PID) function block in transmitter, publish the output on the fieldbus, receive the controller out value and perform analog output function block in final control element.

b) Control function in final control element

Execute the analog input function block in the transmitter, publish the process variable on the fieldbus, receive the process variable and execute the control algorithm (PID) and analog output function block in the final control element.

c) Control Function in DCS

Execute the analog input function block in the transmitter, publish the process variable at DCS, execute the control algorithm (PID) in DCS, publish the controller output value on the fieldbus and execute the analog output function block in the final control element.

2.27 Display update rate

Display update rate shall be defined as the time taken by the system to display the information present at the system input terminals updated on the current display on the VDU of an operator console.

2.28 Call-up time

Call up time shall be defined as the time taken by the system to display a particular display/data on the VDU after getting the corresponding command from the operator.

2.29 User’s memory

Free memory space available after utilisation of memory required for system operation, configuration and implementation of application and other system related functions for implementation of user defined specific programs such as plant calculations, process optimization or MIS (like free formatting of certain logs). The programs shall either be written in high level language or system specific language.

2.30 Event
An event shall be defined as any action taken by the operator via operator keyboard or switches on hardwired console like change of set point, change of control mode, start/stop of motor, open/close of shut down valves, alarm acknowledge etc.

2.31 Sequence of Event (SOE)
Arranging events in the sequence of their occurrence in time with a specified time resolution by a program is defined as sequence of event.

2.32 Sequence of Event Recorder (SOR)
System of sub-system which presents and / or records the events in the sequence of their occurrence in time with a specified time resolution utilizing its hardware and software capabilities is termed as sequence of event recorder.

2.33 Real time trend
Real time trend shall be defined as a continuously progressing graphical record showing continuously updated parameter with most recent value and a past record of minimum of 10 minutes without depressing any additional key for moving backward in time.

2.34 Windowing
Ability of software program to break the console screen i.e. video display unit into simultaneous or overlapping zones with separate presentations at the same time.

2.35 Interoperability
Interoperability is the capability to substitute a device from one manufacturer with that of another manufacturer as a fieldbus network without loss of any functionality or degree of integration.

2.36 Acyclic Period
Acyclic period is defined as the portion of communication cycle time during which information other than publish / subscribe data is transmitted.

2.37 Capabilities File
A capabilities file describes the communication objects in a fieldbus device. A configuration file can use DD files and capabilities files to configure a fieldbus system without having the fieldbus device active.

2.38 Link Active Scheduler (LAS)
LAS is defined as a deterministic centralised bus scheduler that maintains a list of transmission times for all data buffers in all devices that need to be cyclically transmitted.
2.39 Link Master
Any device containing the link active scheduler personality that can control communication of a H1 fieldbus segment is designated as link master.

2.40 Segment
Segment is defined as a network or part of network that serves as the primary communication highway for the connected field-bus devices.

2.41 Resource Block (RB)
Resource block describes the characteristics of a fieldbus device such as device name, manufacturer and its serial number. Resource block is unique for a device.

2.42 Vertical Communication Relationship (VCR)
VCR is defined as the pre-configured application layer channels which provide the data transfer between applications. Publisher – subscriber, client – server and report distribution are three VCRs in foundation fieldbus.

2.43 Link Objects
Link object contains information to link function block input / output parameters in the same device and between different devices.

2.44 Plant Control Network
Communication network within a plant that has control information circulating between various plant units or processing locations.

2.45 Plant Information Network
High-level communication network which serves various user’s within a plant and transfer information for the purpose of unit / plant monitoring. This network is different than control network and is generally realised using open communication protocol network e.g. OPC etc.

2.46 OPC node
OPC node is any node in the network that provides OPC interfaces consistent with OPC data access, OPC alarm and event and OPC historical data access interface specifications certified against OPC compliance and interoperability test specification.

2.47 Computer Integrated Manufacturing (CIM)
Computer integrated manufacturing shall be defined as the integration of process, plant and business operations made possible through information network.

3.0 SPARES PHILOSOPHY
3.1 The system including programmable logic controller, alarm information management system, sequence of event recorder, hardwired instruments etc. shall meet the following spare philosophy. Th is
philosophy shall also be applicable for items like field-bus accessories, barriers, relays, terminals, lamps, push buttons etc.

3.1.1 Mandatory Spares

Vendor shall include following mandatory spares in their scope of supply;

3.1.1.1 Installed Engineering Spares

Installed engineering spares shall be provided in each sub-system for each type of module to enhance the specified system functional requirements by 20%. The basic of offering installed engineering spares shall include;

a) For a system with conventional and / or smart input / output, 20% spare input / output of each type shall be considered for calculating I/O modules and all other related accessories.

b) For a system with fieldbus input / output, 20% spare segments of each type of field-bus type (foundation fieldbus, profibus etc.) shall be considered for calculating I/O modules, power supply modules and all other related accessories. When only input / outputs are indicated instead of field-bus segments, the installed spare philosophy as specified in 3.1.1.1 (a) shall be followed.

c) For all serial input / outputs to the system 20% spare serial I/O channels of each type of serial input / output shall be provided.

d) A minimum of one spare I/O module of each type as offered to meet type of inputs / outputs specified in the material requisition.

e) 20% spare accessories like relays, switches, lamps, fuses, circuit breakers, barriers, isolators, terminals etc.

f) A minimum of one number of input / output module and accessories of, each type such as analog input / output, discrete (contact) input / output, pulse input, serial input / output, foundation fieldbus / profibus PA input / output modules (in case of fieldbus based system) temperature input shall be provided irrespective of those required as per 3.1.1.1(d) as engineering spare.

g) The engineering spares shall be wired up to the field cable interface and shall be in ready-to-operate condition when field cable is connected to spare assigned terminals.

h) Spare pairs of the incoming cables shall be terminated on spare terminals in the marshalling / barrier cabinets as applicable.

i) The system shall be fully engineered considering 20% installed engineering spares
including processor loading.

3.1.1.2 **Spare Space Requirement**

In addition to installed engineering spares specified in Clause 3.1.1.1 of this specification, the system shall be provided with following spare space;

a) The controller and data acquisition racks shall have 10% usable spare space for installing additional I/O and field-bus segment modules in future. However, the control and data acquisition processor shall have additional 10% capacity to handle these I/O’s and field-bus segment. In addition, internal wiring for the same shall be completed up to I/O terminals.

b) Each operator console shall contain 10% usable spare group and related display capability in addition to as specified in para 3.1.1.1 of this specification.

c) The system shall have capability to extend its historical trending, logging and user’s memory by 20% to meet future expansion with/without adding additional memory modules.

d) I/O racks of programmable logic controller shall have 10% usable spare space for installing additional I/O cards of each type in future. However internal wiring for the same shall be connected up to the I/O terminals.

e) Processor system of programmable logic controller shall have capability to execute additional 20% logics.

f) The communication sub-system shall have sufficient capacity to handle additional data contributed by addition of 20% I/O / segments over and above installed engineering spares.

g) Usable spare space in panels and cabinets to install 10% spare hardwired items like barriers, trip amplifiers, receiver switches, panel mounted instrument, relays etc. in future.

3.1.1.3 **Spare Memory Requirement**

a) The system shall be provided with a minimum of 40% spare memory capacity, as required for application program and data base to meet specified functional requirements.

b) For field-bus based system, spare memory capacity (and CPU loading) shall be calculated considering all control algorithms being configured in the system and executed at the scan time equal to the specified control loop response time.

c) It shall be possible to extend the memory by at least 20% over and above the actual requirement at a later date.

3.1.1.4 **Spare Software Capability**
a) Sufficient additional software capacity shall be available in the system to take care of spares requirement as specified in para 3.1.1.1 and 3.1.1.2(a) to (f) of this specification to meet all functional requirements as per para 5.0 of this specification.

b) Unless specifically indicated otherwise, the offered system shall have software licenses to cover all the tag numbers indicated in the material requisition, including installed engineering spares and spare space indicated in clause 3.1.1.1 and 3.1.1.2 of this specification.

3.1.1.5 Predefined Mandatory Spares

a) Mandatory spares shall be ware house spares and shall be supplied as loose items.

b) Mandatory spare module of 5% or one module of each type, whichever is higher, must be supplied for each type of modules being used including in consoles.

e) For items like hardwired instruments, assignable recorders, Personnel computers, VDU / video screens, keyboards, disc drives, RAID controller, lamps, network components, barriers, fuses and circuit breakers complete item limited to 5% or minimum one of each type shall be supplied as predefined mandatory spare. But this shall not include hardware like discs, terminals, switches, telephone sets etc.

d) Items like personnel computers, operator consoles servers, engineering consoles etc. where complete item needs replacement instead of individual modules, complete unit shall be supplied as mandatory spares in line with clause 3.1.1.5(b).

e) Software which need to be separately loaded in the items specified in clause 3.1.1.5(d) above to define the items personality and can't be uploaded from engineering console or any other network device shall be supplied along with additional software.

3.1.1.6 Consumable Spares

Any paper, ribbon, printer heads and ink required for printers, assignable recorders, video copier or any other consumable item shall be supplied along with system required for minimum of six months duration after system acceptance.

3.1.1.7 Commissioning Spares

Unless otherwise specified, vendor shall be responsible to supply all spares which are found necessary to replace failed modules, failed sub-systems, or corrupted / faulty softwares while performing pre-commissioning and commissioning activities.

3.1.2 Two years operational spares
Two years operational spares shall be as per Clause 1.2.8(a) of this specification and shall be quoted separately.

4.0  SYSTEM CONFIGURATION

The system configuration shall consist of the following major sub-systems:-

4.1  Controller and Data acquisition sub-system

Controller and data acquisition sub-system is the main field interface sub-system and is capable of performing control and data acquisition functions as an integrated sub-system.

Controller and data acquisition sub-system shall interface with field instrumentation like transmitters, process switches and final control elements to monitor and/or control process parameters like flow, temperature, level etc. The sub-system shall include a comprehensive set of control algorithms and auxiliaries to provide close loop control and data monitoring capability of the system.

4.2  Operator interface sub-system

Operator interface sub-system shall consist of one or more operator consoles for monitoring and controlling process parameters and performing other process related functions.

4.3  Communication sub-system

Communication sub-system interconnects various sub-systems over which they can communicate with each other to meet all functional requirements.

4.4  Engineer interface sub-system

Engineer interface sub-system shall consist of an engineering console primarily for tuning, configuring and maintaining the system.

4.5  Supervisory computer sub-system

Supervisory computer, when specified, shall be employed for providing supervisory level plant control, plant and unit optimization and other computer based plant management capabilities. For the Integrated network, each node where history resides should be minimum RAID-5 configuration to ensure maximum availability of history or otherwise separate redundant Servers in RAID-5 configuration and redundant power supply configuration should be provided.

4.6  Programmable Logic Controller

Plant start up and safety shut-downs shall be performed by separate programmable logic controller which shall communicate with other sub-systems over the communication sub-system.
4.7 Foreign Device Interface

Foreign Device like programmable logic controllers, gas chromatographs, analyzer systems, gas turbine systems etc. when specified shall communicate with other subsystems over the communication sub-system for plant monitoring and control using foreign device interface. The foreign device interface shall be either dedicated or shall be part of controller data acquisition sub-system as specified in the job requirements.

4.8 OPC Server

OPC Server when specified in this specification is used as synonymous with any server entity on the communication sub-system network which shall allow the user to implement applications, within or outside the system, without providing any special drivers or custom interfaces. OPC server, when specified, shall be used to transfer / receive data to / from applications run in other systems.

4.9 Unit History Node

4.9.1 Unit history node, when specified, shall store the long term historical data of the complete unit and shall interact with central computer system over plant wide network. In addition every history residing node should be minimum RAID-5 configuration.

4.9.2 Unit history modem, when specified shall be a dedicated node and shall be in addition to historical data required for normal plant operation (specified as part of operating interface sub-system).

4.10 Sequence of Event Recorder (SER)

Sequence of event recorder, when specified, shall be a dedicated equipment which shall identify, store and print alarms with the specified time resolution. SER may also transfer data to operator sub-system over communication sub-system.

4.11 Documentation node (DON)

Documentation node, when specified, shall be a node on the information network sub-system and shall store unit documentation.

4.12 Alarm Information and Management Sub-system (AIMS)
Alarm information and management sub-system when specified, shall be a alarm management package which shall gather alarm information from various sub-systems and shall present the desired meaningful analysed data for information and further analysis.

4.13 Instrument Asset Management System (IAMS)
Instrument asset management sub-system shall acquire store, analysed and present meaningful diagnostic and maintenance related data of field devices for efficient plant maintenance.

4.14 Large Display System (LDS)
Large Display System, when specified, shall consist of one or more large video screens which shall display either operator selected operator console screen or any pre-selected screen on a back projected large video screens as real time basis.

4.15 Hardwired Instrumentation
Hardwired instrumentation shall be provided as a back up to the distributed control system for critical process parameters when specified in the job specification.

4.16 Information Network Sub-system
4.16.1 Information network when specified shall interconnect with various plant wide systems like distributed control system/systems, mainframe computers, personal computers, laboratory information and management system (LIMS) etc over which any information can be exchanged without affecting and disturbing the plant control and operations.

5.0 DESIGN AND CONSTRUCTION

5.1 Design Requirements
5.1.1 The system shall be microprocessor based having functional distribution and data base distribution sub-system wise. The system design shall ensure that;
   a) All the functions defined in this specifications are performed in an integrated manner
   b) The access to the distributed data base is available system-wide.

This system shall also have networking capability with other systems distributed geographically in the various units of a plant, over a plant wide information network such as Ethernet or other industrially recognised open networks.

5.1.2 The system shall be of modular construction and expandable in future by adding additional modules. The type of modules shall be kept to the minimum possible in order to have interchangeability and low inventory.
5.1.3 System Availability
a) The system shall be designed ‘fault avoidant’ as a minimum by selecting high grade components of proven quality and proper design of system electronics.
   Redundancy shall be provided, as per this specification as a minimum, to improve the system availability and reliability. Due considerations shall be given to the environmental conditions particularly for field mounted sub-system, if specified in job specifications, during system design.
b) The system shall have a high MTBF value and shall have well proven record of operating in hydrocarbon plants.
c) The system shall be designed with 99.995% or greater availability. The availability shall be defined as follows;

   \[
   \text{Availability} = \frac{\text{Meantime Between Failure (MTTF)}}{\text{MTTF} + \text{Mean time to repair (MTTR)}}
   \]

   For the purpose of calculations, consider mean time between repairs as four (4) hours unless the manufacturer recommends higher value for MTTR. It is therefore necessary that;

   i) Vendor covers all necessary spare parts in 2 years recommended operational spares which shall be necessary to meet specified MTTR time.

   ii) Vendor provides adequate training to owner's personnel and cover all necessary maintenance related topics in their training programmes to ensure specified MTTR time.

5.1.4 Operating Environmental Conditions
5.1.4.1 Environmentally controlled location installation
a) All subsystem of Distributed Control System located in control room, Local Control Room or in Satellite Rack room shall be able to operate satisfactorily from 15°C to 30°C and 20% to 80% non condensing humidity.
b) In addition to above, all such sub-systems shall also be able to operate satisfactorily in case of air conditioning failure with ambient temperature of 50°C and 90% non-condensing humidity until the system safe operating limits are exceeded. The minimum period of continuous operation shall be 48 hours at least once in a month without any damage or degradation of system performance. Vendor, therefore, shall provide continuous temperature monitoring for each enclosed cabinet housing items / equipments generating heat, such as system cabinets, barrier cabinets, relay cabinets etc and also provide alarm for operator
alert in case the safe operating temperature limits are exceeded. Alarm in the operator consoles shall be available for each cabinet while group alarms shall be provided on hard-wired annunciator located on hardware console.

c) Chemical filters have been provided in the incoming air conditioning air to limit the concentration of contaminants below following limits

<table>
<thead>
<tr>
<th>Contaminants (Corrosive Gases)</th>
<th>Concentration</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOx</td>
<td>&lt;10ppb</td>
</tr>
<tr>
<td>Nox</td>
<td>&lt;5ppb</td>
</tr>
<tr>
<td>H2S</td>
<td>&lt;5ppb</td>
</tr>
<tr>
<td>Cl2</td>
<td>&lt;10ppb</td>
</tr>
<tr>
<td>SPM</td>
<td>&lt;0.2gm/m3</td>
</tr>
</tbody>
</table>

All sub-systems and system components shall be suitable for operating continuously in the above mentioned corrosive environments.

d) Vendor shall provide continuous corrosion monitoring system consisting of transmitter with 4 – 20mA output and switch unit with setting as per contaminant level exceeding limits specified in clause 5.1.4.1(c) of this specification. Unless otherwise specified the number of corrosion monitors shall be as follows;

<table>
<thead>
<tr>
<th>Equipment Type</th>
<th>Room Type</th>
<th>Quantity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Corrosion Transmitter</td>
<td>Rack Room / Satellite</td>
<td>1 No.</td>
</tr>
<tr>
<td></td>
<td>Rack Room</td>
<td></td>
</tr>
<tr>
<td>Corrosion Switch Unit</td>
<td>Rack Room / Satellite</td>
<td>3 Nos.</td>
</tr>
<tr>
<td></td>
<td>Rack Room</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Console Room</td>
<td>1 No.</td>
</tr>
<tr>
<td></td>
<td>Engineering Room</td>
<td>1 No.</td>
</tr>
</tbody>
</table>

Continuous corrosion monitoring trend and alarms shall be provided on the operator console while one group alarm shall be provided on the hard-wired annunciator located on the hard-wired console.

5.1.4.2 Outdoor Installations

a) Sub-systems or system components which are installed outdoor shall be able to continuously operate at ambient temperature of 50°C and non-condensing humidity of 90%.
b) Unless otherwise specified, all sub-systems or system components installed outdoor shall have corrosive environmental protection coating meeting the environmental classification class G3 as per ISA-S71.04.

5.1.5 Transient, Static and EMI / RFI Protection

5.1.5.1 The system shall be internally protected against system errors and hard ware damage resulting from:

a) Electrical transients on power wiring
b) Electrical transients on signal wiring
c) Connecting and disconnecting devices or removing or inserting printed circuit boards in the Distributed Control System(DCS) and Programmable Logic Controller (PLC).

5.1.5.2 All sub-systems and system components shall be capable of accepting various signal inputs for its direct use while preventing noise errors due to electromagnetic interference (EMI) or radio frequency interference (RFI) including nearby radio stations, hand held two way radios, electrical storms, solenoids, relays or contactors carrying heavy currents as per levels of Environmental electromagnetic phenomenon defined in IEC-61000-6-2. The system shall have total noise immunity from UHF / VHF radio communication equipments (RFI) and (EMI) noise generating equipments as per IEC-61000-4. The surge withstand capability for input/output modules shall be as per IEEE standard 472.

5.1.5.3 System cables for interplant, inter unit, and others routed in the field, the level of surge immunity required for equipment signal ports shall be increased to level 4 as defined in IEC-61000-4-5 and the system shall operate according to performance criterion B as defined in IEC-61000-6-2.

5.1.6 On-line replacement

5.1.6.1 On-line replacement of electronic module shall be possible in such a way that removal and addition of an I/O module shall be possible and safe without de-energising the system. Furthermore, there shall not be any interruption of the system while replacing a faulty module wherever redundant modules are provided.

5.1.6.2 Apart from system modules, power supply units shall be replaceable on-line without disrupting the process and without effecting the system redundancies.

5.1.7 Electrical Isolation

Galvanic or optical isolation shall be provided for all field signals. The isolation levels shall be as follows;

| Analog I/o channel to system ground | : 1500 VAC |
| Discrete I/o channel to system ground | : 500 VAC |

All rights reserved
Isolation shall also be provided between Engineering / operator console/PLC programming terminal and related sub-systems connected to it if there is any possibility of high voltage being transmitted to the sub-systems.

5.1.8 Design Requirements of Equipments in Hazardous Area

5.1.8.1 Unless specifically indicated, the field devices are beyond the scope of this specification. However vendor shall be fully responsible for integrating these devices with their system including compiling and maintaining the engineering data base of these devices and incorporating the data base into the Asset Management System.

5.1.8.2 General Requirements

a) Unless otherwise specified, all instruments in hazardous area shall be intrinsically safe type. Other concepts shall be used when specified.

b) For conventional instrumentation, entity concept shall be used for selecting proper barriers / isolators.

c) Fieldbus segment in classified area may consist only of the type and number of devices which will not cause the segment current draw to exceed the rated barrier / isolator parameters.

5.1.8.3 Fieldbus design in Hazardous Area

The segment design and equipment solution shall be based on the classified area concept used. The functions and entity / safety parameters of power conditioner, safety barriers / isolator, terminators and field devices shall be considered to verify the compliance to the requirements applicable for the specified concept. Following concepts shall be used depending upon the one specified in the job specifications;

a) Entity Concept

Certified entity / safety parameters of each device shall be used to match the entity parameters on entity concept.

b) FISCO

Certified FISCO parameters shall be used and shall be matched like entity parameters. All elements in the hazardous area and their interface module shall be certified FISCO.

c) FNICO

Certified FNICO parameters and equipment shall be used to design loop on the basis of FNICO.

d) Multi barriers

The safety barriers / isolators shall be installed in the field in an increased safety enclosure. The enclosure shall be metallic either of SS or of anodised alluminium. The entity / safety parameters shall be matched as in case of entity concept. Vendor's scope shall include barriers duly installed in the box / junction box.
5.1.9 Repeat Signals

5.1.9.1 Unless otherwise specified in the job specifications, following philosophy shall be followed for repeat signals;

a) Whenever repeat contact outputs are required as per job specifications following philosophy shall be followed;

i) For intrinsically safe input contacts, isolating barrier with dual contact output shall be utilized.

ii) For all other contact inputs, repeat contact shall be provided using electro magnetic relays.

b) Whenever repeat analogue outputs are required as per job specifications, following philosophy shall be followed;

i) For intrinsically safe analogue inputs, isolating barrier with dual analogue outputs shall be utilized.

ii) For all other analogue inputs, repeat analogue outputs shall be provided using signal isolators with dual output.

5.1.10 System Integration

The distributed control system shall be a fully integrated control system, also the BMS system, STG PLC, MMS system and the Fire and Gas system should be fully integrated with the control system. Shut Down system and Fire and Gas system should not be integrated with the control system as or with serial/Foreign/third party device card, however engineering database and engineering tool of all the above three system should be separate, dedicated and independent of each other. Foreign devices like analyser system, third party equipment, (like compressors etc) etc. shall be functionally integrated with the distributed control system. Functionally integrated system shall meet the following requirements, as a minimum;

a) The foreign devices shall either be configurable from DCS engineering consoles or from the dedicated engineering consoles of each foreign device.

b) Unless specifically indicated otherwise, each foreign device shall be integrated with DCS through MODBUS (RTU) protocol using redundant interface unit.

c) Operator console shall display information in the similar fashion irrespective of source of information. Source of information shall be transparent to the operator.
d) The process alarms and diagnostic alarms shall be presented on the operator console in the similar fashion as DCS alarms.

e) Whenever specifically indicated, the time of all foreign devices shall be synchronized with DCS clock or GPS, as specified in the job specification.

f) The data transfer to and fro from other distributed control systems or supervisory computers through information network shall utilize OPC protocol with adequate security.

5.1.11 Surge Protection

5.1.11.1 Surge protection devices (SPD’s) shall be provided on the system to limit the surge voltages reaching beyond the safe limits, under normal, abnormal or lightening strike condition. Unless otherwise specified, SPD's shall be provided at least at the following locations;

a) All serial signal cables (UTP / STP / coaxial and not fibre optical) going from or to control system and from one location to another outside the control building at both ends.

b) All fieldbus segments at control system end.

c) All power incoming cable (220 V AC) UPS or non UPS, at the power supply distribution cabinet.

5.1.11.2 The selection of type and rating of SPD shall be selected such that the introduction of this device shall not change the characteristics or reliability of an application, whether it is for the protection of power system, signal such as fieldbus or analog or communication signal, as applicable.

In case of fieldbus system, the SPR shall be selected such that its inclusion in the segment shall not degrade the fieldbus signal, maximum length of the segment and/or number of devices on a segment significantly.

5.1.12 System Securities

5.1.12.1 The system shall have incorporated a fool proof system security feature in its design which would protect its database and functioning against viruses, trojans and works through integrated anti virus, fire wall and intrusion detection for the system.

5.1.12.2 All devices and/or servers which interface and interact with external application must be supplied with hardware and software firewalls.

5.1.12.3 All the security protections, hardware or software, as offered shall provide protection against all sort of threats and vulnerabilities which include;

a) Positive user authentication and login privileges.

b) Prevention of importation of viruses.

c) Packet filtering, content filtering, URL filtering protocol filtering and application level filtering to accept only intended data.

d) Strict Access controls like password hash files, cryptographic material used in confidentiality etc.
e) Hardening of operating system.

f) Firewall proxy.

g) Network sniffer and file integrity checkers

h) Scanning, enumeration and vulnerability scanning tools.

i) Log file analysis tools.

The functionalities indicated above are the indicative security features and shall be provided within and where data import / export utilities apply.

5.1.13 System Software

5.1.13.1 The system software shall be governed by the operating system running in a real time mode and shall be able to meet all functional requirements specified in clause 5.2 of this specification as a minimum. Any other standard/special software package, if available, shall also be offered describing the full capabilities.

5.1.13.2 The operating system and other standard softwares (e.g. OPC foundation fieldbus etc.) shall be of latest version.

5.1.14 The system shall have the capability of detecting the open sensors and short sensor. The sensor status reading on failure either upscale or downscale shall be field configurable.

5.1.15 Emergency Switches (ESD Switches)

5.1.15.1 All Emergency (ESD) switches shall be hardwired and shall preferably pull type with red coloured knob. Control room mounted ESD switches shall be installed on hardwired console.

5.1.15.2 ESD switches shall directly trip the final ESD element without any intermediate device. Where multiplication of ESD switch contacts is necessary fail safe relays shall be utilized (SIL3).

5.1.15.3 In addition to utilizing contacts for direct shutdown, the contacts shall also be used in ESD system (PLC etc) for logic implementation and event history.

5.1.16 Alarm by-pass Switches

5.1.16.1 Startup by-pass (SBS) switches

a) Unless otherwise specified, all SBS's shall be configured in the BMS system (i.e. PLC) and shall be operable from DCS operator console and PLC operator console when specified. All such by-pass switches shall be alarmed and shall have audit trail.

5.1.16.2 Maintenance by-pass switches (MBS's)

Unless otherwise specified, following philosophy shall be utilized for MBS's;
a) All process inputs shall have miniature back lighted MBS (else shall have LED to show by-pass status).

b) MBS shall be installed in a cabinet which can be physically lockable. The by-pass status shall also be available in operator console with a common flashing message always appearing on operator server whenever an MBS is operated. All MBS's shall have audit trail.

c) Logic-wise common alarm shall also be available on the hardwired console.

5.1.17 Interface with Electrical Input / Outputs

5.1.17.1 All contact input and output contacts from electrical switch gear panels (MCC / PCC etc.) shall be terminated in a dedicated 'Electrical Interface marshalling cabinet' located in control room. All such I/O's shall have intermediate relays.

5.1.17.2 Remote I/O rack shall be provided in sub-station for non-shutdown related data, when specifically indicated in the material requisition.

5.1.17.3 All serial I/O cables from sub-station to control room shall be redundant including remote I/O cable.

5.1.18 Automatic Loop Tuning Software Package

5.1.18.1 It shall be possible to tune a control loop or group of control loops on selective basis at a time automatically unless otherwise specified. Tuning parameters computed by the system shall either be loaded automatically or manually by operator.

5.1.18.2 The automatic loop tuning software shall be used to tune PID control loops. The auto tuning technology used shall utilize principles like Ziegler – Nichols, Cohen – coon or Internal Model Control (IMC).

5.1.18.3 The software package for loop tuning may reside / run on any system hardware including controller sub system, console sub system, engineering sub system, supervisory computer etc. The tuning software must ensure that the process is not disturbed whenever a loop is being tuned.

5.1.18.4 Automatic loop tuning package shall be able to study the dynamics of control loops and shall be able to compute response time, dead time, lead or lag time etc. directly from Engineering / operator console.

5.1.19 The system shall be suitable for power supply as specified in para 6.2 of this specification. Suitable battery back-up shall be provided for volatile memory protection only.

5.1.20 System Upgrade Capability

5.1.20.1 System shall be scalable and upgradeable by adding additional hardware, over and above the spares specified, without rendering the initial hardware and software investment obsolete within the capability of the system.

5.1.20.2 This is in addition to the system upgrades, hardware and software, available from vendor as standard from time to time.
5.1.21 Noise Level

5.1.21.1 Noise level generated by any equipment shall not exceed the following limits;

a) Noise level shall not exceed 55dBA for equipments installed in console room, engineering room and computer room.

b) Noise level shall not exceed 65dBA for equipments installed in rack room and satellite rack room (SRR).

c) For control rooms where consoles and cabinets are installed in the same room, the noise level generated by any equipment shall not exceed 55dBA.

5.1.21.2 The noise level shall be measured in dBA at a distance of 1 metre from the equipment generating noise.

5.1.22 Equipment Identification

Unless otherwise specified, all equipments shall be identified by tag numbers indicated in the data sheet / summary sheet attached with the material requisition. The tag number shall be inscribed on a nameplate which shall be fixed with screws. The nameplate shall be black laminated plastic with core i.e. black with white characters. The size and description shall be subject to purchaser's approval.

5.1.23 System Furniture

All system furniture required for mounting and operation of the system including mounting of tabletop equipments shall be supplied. Furniture for operating personnel shall be as defined in job specifications.

5.2 Functional requirements

5.2.1 The system, as a minimum, shall meet the following requirements without the supervisory computer:

a) Control
b) Data acquisition & monitoring
c) Alarming
d) Logging & report generation
e) Historical data storage
f) Trending
g) System shall have some free memory space available for the user and CPU shall have the additional capability to perform advance control functions, process optimization programs or
generate management reports as specified in job specification in addition to space requirements as per para 3.0 of this specification. The availability of process control language shall be preferred.

h) System shall support functionalities like remote calibration, remote diagnostics and asset management in case of smart or field-bus based instruments.

5.2.2 In addition to above, following functional requirements shall also be complied, when specifically indicated in the job specifications;

a) Sequence of event function.
b) Alarm management
c) Long term historisation
d) Open system connectivity

5.2.3 The system when specified with Programmable Logic Controller (PLC) either as integral part of system or as separate third party device it shall perform follow functions;

a) Process interlocks
b) Plant safety shutdown
c) Monitoring the sequence control units, when specified

Plant process and safety shutdown shall be independently performed by programmable logic controller. (PLC shall be communicating with other sub-systems via communication sub-system).

5.2.4 The system when specified along with a supervisory computer, shall meet the following requirements in addition to as specified in para 5.2.1 of this specification.

a) Advanced Control
b) Unit and plant optimization
c) Management information service reports.

5.2.5 Whenever information network along with plant wide interconnectivity is specified, the system shall meet any or all of the following requirements in addition to those specified in para 5.2.1 of this specification as specified in the material requisition:-

a) Centralised information system
b) Statistical process control/statistical quality control.
c) Plant optimization, data reconciliation, overall mass balance, etc.

d) Plant planning and scheduling.
e) Computer integrated manufacturing with information transfer to achieve functions like production and preventive maintenance scheduling and plant wide coordination etc.
5.2.6 The system as offered shall be fully and functionally integrated meeting the requirements specified above. In addition, the system shall also have capability and capacity to interact with smart and field-bus instrumentation simultaneously. The system shall also be capable of accepting signals from different type of field-buses in the same controller and data acquisition sub-system.

5.3 Controller and data acquisition sub-system (CDAS)

5.3.1 Controller and data acquisition sub-system shall primarily be used for plant control and data acquisition and shall interface with physical inputs and outputs from the plant and third party devices.

5.3.2 CDAS shall be microprocessor based and fully programmable sub-system which shall be capable of processing the acquired data from input / output devices utilizing a set of algorithms within its defined processing cycle. The microprocessors utilized in controller and data acquisition sub-system shall generally be of latest generation.

5.3.3 CDAS shall have a multi-processor architecture with each processor responsible to carryout predefined functions like Input / Output processing, control processing, internal communication, external interfaces etc.

5.3.4 The hardware and software capability of this sub-system shall primarily be exploited for processing regulatory close loop and open loop control functions only. Sequencing and interlocking capability shall be utilized whenever specified in job specifications.

5.3.5 CDAS shall be capable of accepting signals from various process sensors and devices with linear, non-linear and serial outputs preferably without requiring external or auxiliary signal conditioning devices and processing signals. Typically the inputs shall include 4-20mA DC (both conventional and HART), 1-5VDC, milli volt signal from thermocouples, resistance from resistance temperature detectors (RTD's), pulse input, field-bus (foundation field-bus, profibus PA etc.), serial inputs (MODBUS) and discrete contacts (powered or potential free), as a minimum. System shall also accept other inputs when specified in job specifications.

System shall be able to accept 2-wire, 3-wire and 4-wire signal inputs without any change in the I/O module.

5.3.6 The system shall have capability to generate analog 4-20mA DC (conventional or HART) current signal, 1-5VDC voltage signal, field-bus output signal, potential free contacts for discrete outputs and serial (MODBUS) outputs, as a minimum, apart from others specified in the job specifications.

5.3.7 The output from the system shall be capable of driving following loads;
a) Analog outputs shall be able to drive loads of output devices such as I/P converters, smart positioners, recorders / indicators etc. In general, it should have load driving capabilities up to 750 ohms.

b) Contact outputs suitable for driving alarm annunciations, status lamps, relays, converters, solenoid valves, contactors / breakers of motor control etc. In general, contacts rating shall as follows;

<table>
<thead>
<tr>
<th>Load Type</th>
<th>Rating</th>
</tr>
</thead>
<tbody>
<tr>
<td>Intrinsically safe load</td>
<td>30V 0.5 Ampere</td>
</tr>
<tr>
<td>AC powered loads</td>
<td>230 V 5 Ampere</td>
</tr>
<tr>
<td>DC powered loads</td>
<td>110V 0.5 Ampere</td>
</tr>
<tr>
<td>DC powered loads</td>
<td>220V 0.2 Ampere</td>
</tr>
</tbody>
</table>

5.3.8 The system shall be capable of differentiating between out of range measurement (Bad process value) and a failed transmitter signal. In conventional 4-20mA output transmitter this shall be identified by setting bad quality data flags while for smart (HART) and field-bus transmitters data quality indicator from the device shall be utilized.

The detection of device failure alarm and driving output to a pre-defined value shall be configurable within this sub-system.

5.3.9 It shall be possible to override or force an input measurement or an output in the system while testing or on failure of an input.

5.3.10 Controller and data acquisition sub-system shall have an on-volatile memory for storing configurational data. In case vendor's standard product supports only volatile memory, battery back-up shall be provided to store the data for a period of 72 hours, as a minimum. A battery drain indication along with a potential free contact shall be provided to alert the operator.

5.3.11 The sub-system shall have sufficient memory to store the program instructions, CDAS data base, data required for real time trending and point trend and any other data required to be stored to meet specified functional requirements.

5.3.12 The sub-system shall incorporate a hardware or software based watch dog timer to monitor the healthiness of the CDAS processor-health.

5.3.13 Each controller and data acquisition unit shall have its own dual redundant power supply which can be replaced online. Separate dual redundant power supply unit shall be provided for powering field devices.
5.3.14 Controller and data acquisition sub-system shall be modular in construction with rack mounted modules in general. Input / Output modules shall be either rack mounted or DIN Rail mounted type.

5.3.15 Input / Output Modules

5.3.15.1 General

a) I/O modules shall communicate with processor modules serially either through back-plane or through I/O communication network. I/O network shall always be redundant. Data transferring through hardwired connections shall not be acceptable.

b) Analog to digit converters for analog 4-20MA / 1-5VDC modules shall meet the following requirements;

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>A/D Resolution</td>
<td>12 bits</td>
</tr>
<tr>
<td>Repeatability</td>
<td>± ½ LSB</td>
</tr>
<tr>
<td>Accuracy</td>
<td>± 0.1% of full scale</td>
</tr>
<tr>
<td>Common mode Rejection</td>
<td>60dB at 50Hz</td>
</tr>
<tr>
<td>Normal mode Rejection</td>
<td>55dB at 50Hz</td>
</tr>
</tbody>
</table>

c) Digital to analog converters for output module shall meet the following requirements;

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>D/A Resolution</td>
<td>10 bits (min.)</td>
</tr>
<tr>
<td>Repeatability</td>
<td>± 1 LSB</td>
</tr>
<tr>
<td>Accuracy</td>
<td>± 0.25% of full scale</td>
</tr>
</tbody>
</table>

d) Each output channel must maintain its own – failure mode value, which is automatically executed upon detection of a communication failure between process and output module.

e) Unless I/O module has universal design it shall have unique keyed facility to prevent faulty operation and termination.

In addition I/O modules shall also meet the specific requirements specified in clause 5.3.15.2 through 5.3.15.7.

5.3.15.2 Analogue Input / Output modules (conventional / smart)

The input module shall meet the following requirements;

a) It shall accept 4-20mA isolated input with maximum input resistance of 250 ohms or 1-5VDC isolated input with input resistance more than 500k ohms.

b) The input module shall support field powered transmitter i.e 2-wire, 3-wire or 4 wire system.
c) Input faults such as open circuit, short circuit and earth fault shall be detected by I/O module.

d) The output module shall provide 4-20mA output driving up to 600ohms of total loop resistance at 24V DC.

e) The system shall provide 24V DC for loop powered 2-wire transmitter and shall also loop power the 2-wire outputs.

f) Input / Output module shall not have more than 16 inputs or outputs.

5.3.15.3 Analogue Input / Output module with HART

a) The Analogue Input / output modules for HART signal shall meet all requirements specified in clause 5.3.15.2 above.

b) Input / Output shall fully support the HART communication signal i.e. the American Bell 202 standard frequency shift keeping signal superimposed at a low level on analogue measurement signal.

5.3.15.4 Foundation Fieldbus (H1) Interface Module

a) Foundation fieldbus H1 interface module shall be capable of supporting multiple segments and able to operate in full redundancy mode.

b) Foundation fieldbus H1 interface module shall always be provided in redundant configuration with Link Active Schedulers (LAS) configured in primary and back-up H1 interface modules respectively to ensure that failure of primary LAS shall not cause failure of H1 bus communication. Power for H1 segment shall be provided by power conditioner module which shall be separate from H1 interface module to ensure that failure or removal of H1 interface module does not affect the supply of power to the segment.

c) H1 interface module shall be supplied with link active scheduler (LAS) capability and running foundation fieldbus (FF) function blocks which include PID, PD, Bias, Gain, calculations etc. These function blocks shall be code identical to FB code provided in the field devices. The manufacturer shall guarantee the interoperability of H1 interface module with any function box residing in the field device.
d) Foundation fieldbus HI interface card shall utilize a fieldbus Foundation Registered mark.

e) The sub-system shall accept all the dynamic variables transmitted by the field-bus-device.

5.3.15.5 Temperature Input Module

a) The thermocouple input module shall accept grounded or ungrounded inputs from various thermocouple types i.e. T, E, J, K, R, S and B. The module shall be capable of linearising the thermocouple inputs and provide cold junction compensation.

b) The module shall have 12 bit resolution with digital accuracy of ±1°C

c) The RTD input module shall accept 100ohm platinum resistance temperature detector (Pt 100) in 3-wire or 4-wire configuration.

d) The module shall be capable of linearising the RTD input.

e) The module shall have 12 bit resolution with digital accuracy of ±0.28°C

5.3.15.6 Serial Interface Modules

a) Serial Interface modules shall be capable of communicating with RS232C, RS422 or RS485 signals.

b) Unless otherwise specified, all serial interface modules shall be configured in redundant configuration.

5.3.15.7 Discrete Digital Input / Output Module

a) Digital input module shall be capable of detecting close or open status of powered or potential free contacts. The interrogation voltage of the contacts shall be 24VDC or as per selected barrier for barrier powered contacts.

b) The input module shall also be suitable to accept inputs from proximity switches or from open collector output from proximity input barrier.

c) The digital output module shall provide output contact rated for 220V AC 10 Ampere 110V AC 5 Ampere or 110V DC 0.3 Ampere.

d) The type of contact output i.e. normally open or normally closed shall be user selectable.

e) Maximum number of inputs or outputs shall not exceed 32.
5.3.16 Fieldbus Segment Power supply and terminators

5.3.16.1 The power supply used for powering fieldbus segment shall have a impedance matching network, preferably part of power supply unit.

5.3.16.2 Short-circuit at spur level shall not lead to failure of any fieldbus segment except the short-circuited spur.

5.3.16.3 Unless otherwise specified, fieldbus power supply / conditioner shall meet the requirement of type selected instruments and shall be as per;

   a) Foundation fieldbus power supply Type 131 non – IS power supply intended for feeding IS barriers.

   b) Foundation fieldbus type 133 IS power supply compliant with IS parameters.

   c) For Non-Intrinsically safe segment, the power conditioner shall be capable of each drawing 20mA current supplying power to at least sixteen field devices including a segment terminator.

   d) For intrinsically safe segment, the power conditioner shall comply with FISCO or entity concept requirements as specified in purchaser's specifications.

   e) For a segment designed with Non-insendive concept, the power conditioner shall meet the requirements of FNICO.

5.3.16.4 Each foundation fieldbus power supply shall have redundant power conditioners (unless limited by concept design), current limited outputs to all foundation fieldbus segment and surge protection as applicable.

5.3.16.5 Individual power conditioners and input power supplies can be replaced without interrupting power or communication fieldbus segment.

5.3.16.6 Terminators

Terminators shall be provided by vendor at both ends of a foundation fieldbus segment. The terminator at DCS side shall be incorporated into the foundation fieldbus power supply / conditioner while field side terminator shall be installed in the junction box.

5.3.17 Control functions and algorithms

Controller and data acquisition sub-system shall have capability to perform conventional and advanced control algorithms for implementation of regulatory and advanced control strategies. This sub-system shall have real time computational capability and shall be able to perform following algorithms and computations in addition to those specified in job specifications;

   a) Control algorithms

       Proportional (P), Proportional – Integral (PI), Proportional – integral – derivative (PID), adaptive gain, feed forward, cascade, split-range etc.
b) Dynamic Functions
   Lead-lag, dead time, timers, counters etc.

c) Signal Selector
   High selector, low selector, high-low selector.

d) Calculation Blocks
   Linearisation, pressure-temperature compensation, polynomial, multiplication / division / addition / subtraction etc.

e) Signal Limiters
   Low limiter, high limiter, high-low limiter etc.

f) Logic Blocks
   Logic 'GATES' (OR, AND, NOR, NOT NAND etc), Flip-flops etc.

5.3.18 Controller shall be able to operate in either manual, auto, cascade or computer mode. Mode changeover in either direction shall be procedure-less and bump-less. Following functional capability shall necessarily be possible;

   a) In cascade loops, the primary controller shall be able to track the set point of the secondary controller when the secondary controller is not operating in cascade mode.

   b) In computer mode, controller shall be able to track computer generated set point and shall hold the last generated value in case of computer failure. In such case, controller shall fall back on auto-mode and continue to operate at the last received set point, in general. Other options like pre-defined set point operation and fail safe condition shall also be possible. On the resumption of computer set point again, the controller shall not return to the computer mode automatically.

   Computer failure indicator shall be provided at central and local level.

5.3.19 Controller shall accept the change in set point command from central level (as operator interface function) and take action accordingly. It shall have facility for slow and fast ramping of set point as well as output. In addition, it shall have anti-reset wind-up feature as standard.

   In addition to above, it shall also be possible to change set point, tuning constant, operating mode, controller configuration from the central level i.e. operator’s interface keyboard and engineer’s interface keyboard.

5.3.20 Loop Integrity
5.3.20.1 Loop integrity shall be maintained in controller functionality in such a way that the single component failure in the sub-system shall not effect more than one control loop (single loop integrity). This shall be achieved in offered sub-system architecture in one of the following ways;

a) By providing one to one controller back-up. In case failure is detected in the active controller all the loops of the failed controller shall be transferred to the back-up controller.

b) Where single loop controller is specified in the purchase specifications, no controller back-up shall be necessary provided no input other than that required for the specified loop is connected to the controller.

5.3.20.2 Loop integrity shall be maintained for the data acquisition functionality i.e openloop processing including processor such that a single component failure shall not effect more than 16 analog inputs or 32 discrete inputs.

5.3.20.3 Loop integrity shall also be applicable to I/O modules, power supply modules, communication modules and other associated devices as per the philosophy explained in clause 5.3.20.1 and 5.3.20.2 of this specification.

5.3.21 Sub-system Redundancy

5.3.21.1 In case of redundant configuration (where back-up components are provided), the design shall incorporate a fail-safe automatic control transfer switching mechanism which shall transfer the entire configuration, data base and loop control of the failed controller to the back-up controller. Design must also ensure that data integrity is maintained during switchover and no portion of data to be transferred is corrupted or lost before and during switch over to the redundant (back-up) controller. The indication of the failed controller / component shall be displayed at the level as well as on the central level.

5.3.21.2 The switchover from primary to back-up component / device shall be bumpless and transparent to the operator i.e. the outputs shall be held at the last value during switchover to avoid any process upset. The switchover time shall be of the order of one (1) second.

In case of redundant HI modules, the back-up module shall maintain connectivity with all publishers and shall subscribe to all publishers to minimise switchover time.

5.3.22 Sub-system configuration and on-line modifications

5.3.22.1 Controller and data acquisition sub-system shall be configured from the central level i.e. through engineers interface sub-system under password or hardwired key lock protection. Single loop controller when specified shall be configured from the local level.
5.3.22.2 Sub-system shall allow following configurational functions to be performed for each loop;
   a) Control function parameters
   b) Processor cycle time for each loop tagwise.
   d) Macro-cycle time for foundation fieldbus HI segment as per segment loading.
   d) Output status of each control loop in case of processor failure.

5.3.22.3 It shall be possible to carryout online modifications or perform back-up without interrupting the central
software of preventing the operator commands. Such modifications shall be possible without any plant
upset or process interruption.

5.3.22.4 Downloading of modifications to the respective controller and data acquisition sub-system shall be
possible in running condition.

5.3.22.5 Sub-system shall perform saving and back-up of data base as per changes made automatically.

5.3.23 System Diagnostics

5.3.23.1 Each module shall have a board diagnostic with on board LED for indicating status of the module at
local level.

5.3.23.2 All diagnostic subroutines shall carryout various diagnostic tests to check the healthiness. The test
shall include memory test (RAM and ROM), on-board processor test and back-up module
communication healthiness test etc. Failure of any of the tests shall be alarmed as module failure.

5.3.24 Sub-System Performance

The sub-system response time shall be the indicator for the performance of the sub-system. The
control system shall be able to perform control algorithm, calculation function etc. for each loop within
the specified response time unless specified otherwise in the purchaser's data sheets, the system
response time (scan time) and loop response time as defined in clause 2.22 and clause 2.26 (for
fieldbus based system) respectively of this specification shall be as follows;

- For flow and pressure close-loops - 500mS
- For temperature and level close-loops - 1000mS
- For analyser close-loops - 1000mS
- For all open loops - 1000mS
- For Interlock related inputs - 500mS
The processor cycle time shall be set to achieve the scan time and loop response time values specified above.

Scan time of multi-variable advanced control loops when implemented in controller and data acquisition sub-system shall be specified in purchaser's data sheets.

5.3.25 Controller & data acquisition subsystem loading

The system loading for controller and data acquisition subsystem shall not exceed 60%. The loading as indicated here is the worst case of high system activity referred to the use of memory, CPU time and communication capacity for this sub-system.

5.3.26 Sub-system Sizing

5.3.26.1 Sizing of controller and data acquisition sub-system shall be carried out considering the following parameters, as a minimum;

a) Unit-wise segregation of CADS as specified in the job specification.

b) Number and type of inputs / outputs specified in each unit in the job specifications e.g. analogue I/Os (conventional / smart (HART), Fieldbus I/Os, discrete I/Os etc.

c) Intrinsically safe and non-intrinsically safe I/Os.

d) Spares philosophy.

e) Distribution of spare I/O's in I/O modules

f) Scan time (Response time) and loop response time specified for each type of I/O.

g) Segment design criteria

h) Worst-case processor loading specified in the specifications.

i) Calculation blocks specified in the job specification. Following philosophy shall be followed for computing calculation blocks in addition to those indicated;

<table>
<thead>
<tr>
<th>PID Blocks</th>
<th>Calculation Blocks</th>
<th>Logic Blocks</th>
<th>Advanced blocks</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>No of outputs</td>
<td>50% of PID Blocks or 130% of specified calculation Blocks whichever is higher.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>150% of specified blocks or 100% of specified Discrete outputs whichever is higher.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>150% of actual numbers specified.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For the purpose of block calculation, consider actual I/O's along with installed engineering spares. Also consider clause 5.3.26.2 (e) for fieldbus based system.

j) Serial interface modules in redundant and single configuration as specified.
k) Any parameter not specified above but required to be considered for size because of vendors standard sizing methodology.

Processor loading factor / calculation available in standard product guide for sizing shall be utilised else vendor shall reduce the sub-system block handling capability by a factor of loading.

5.3.26.2 In addition to relevant requirements specified in Clause No.5.3.26.1, following process control functionalities and requirement must be considered for fieldbus segment design;

a) The sensor device and the corresponding actuator in a control loop shall be on the same fieldbus segment.

b) Control loop that include a cascade type controller, the primary and secondary loop measurement as well as final control element shall be on the same fieldbus segment.

c) Split range measurement and final control element shall be on the same fieldbus segment.

d) Discrete fieldbus device used in an interlock alongwith a control loop, discrete device shall preferably be on the same fieldbus segment. Discrete device here means fieldbus converter.

e) The default configuration shall be for control (except high level calculations) to reside in fieldbus device. System shall be configured for control to fail over to CDAS

f) Type of hazardous area philosophy i.e entity concept, FISCO, FNICO or high power trunk.

g) Length of each segment with respect to the physical distance between control system (host) and field devices.

h) Loop response time or macro cycle time as specified.

i) Sufficient unscheduled time must be kept in each cycle to transmit a cycle information within defined loop response time. This shall be 50% of the specified loop response time.

5.4 Operator interface sub-system

5.4.1 General

5.4.1.1 The operator interface sub-system shall provide the centralized information to the plant operator/Engineer in the following fields:

a) Indication of all analog and digital process variables of control loops, open loops and all loop related parameters
b) Manipulation of control loops including changing set point, mode, output, configuration, tuning, and computational constants.

c) Alarm displays and annunciation.

d) Graphic displays and status indication.

e) Logging and trending including historical trend recording.

f) Trend recording on assignable trend recorders.

g) Self diagnostic messages.

5.4.1.2 The operator interface sub-system shall consist of a single or multiple operator consoles (VDU's driven by console electronics) and hardwired consoles. The number of consoles for a unit shall depend upon the size and operating philosophy of the plant. The number of console shall be specified in the job specifications.

5.4.1.3 The operator interface subsystem shall have either single tier construction or stacked construction. The type of construction shall be specified in the material requisition.

5.4.1.4 The operator station shall comply with ISO 9241-5 'Workstation layout and postural requirements' and ISO 9241-7 'Display requirements with reflections'. The layout of the operator interface sub-system shall be as indicated in the material requisition. The consoles required to meet the shape and symmetry indicated shall be supplied by the vendor.

5.4.1.5 Unless otherwise specified in job specifications, each VDU shall be a 459.7mm active matrix TFT type LCD display unit and shall have native resolution of 1280 x 1060 pixels, as a minimum, with a 160° wide viewing angle.

5.4.2 Operator Consoles

5.4.2.1 Each operator console shall consist of the following;

a) Single tier construction shall have three (3) VDU screens with its own dedicated keyboards (a total of three keyboards) each driven by an independent electronics.

b) Stacked construction shall have the two stacks of VDU's with four VDU's (2VDU's / stack) and two sets of keyboards (one keyboard / stack) each stack driven by an independent electronics.

c) Each operator video screen or 2 VDUs of stacked construction shall be driven by a dedicated driver electronics which also keeps the desired data base for various functions defined and termed as
workstation. All the three operator workstations shall be operationally interchangeable in such a way that all the three workstations have similar data base and functionalities.

d) The operator console shall also have a logging printer, a alarm and event printer and a hard copy unit, unless otherwise specified in job specifications.

5.4.2.2 Hardware Configuration

The operator console shall meet any one of the following configuration options;

5.4.2.2.1 Option I

Each operator video screen shall be driven by a dedicated driver electronics which also keeps the desired data base for various functions defined and termed as workstation in this case each as has data stored in it should be minimum RAID-5 configuration to ensure maximum availability of history/data. All the three operator workstations shall be operationally interchangeable in such a way that all the three workstations have similar data base and functionalities.

5.4.2.2.2 Option II

One or more number of operator console (consisting of three video screens and dedicated keyboards) are driven by a common redundant server machine storing a common database for all the three video screens (three video screens may work like clients to this server). Server shall be a multifunction higher end server grade machine which may support functionalities such as;

a) Data connectivity between CDAS and other sub-systems (i.e. operator sub-system, engineering sub-system, IAMS etc.)

b) Database storage and engineering functionality as per Clause 5.4.2.3 of this specification.

c) Historisation of data related to associated operator consoles.

This server can also be used for functions like;

a) Plant history (UHN)

b) Connectivity to information network or OPC node.

c) Running specific applications like generating advance controls, MIS reports, IAMS, AIMS etc.

5.4.2.2.3 Option III

a) Two parallel servers (each containing same data base, each driving), two of the operator console VDU’s are driven by a server which stores complete data base for the units being assigned. In this case, operator console shall have four operator console VDU’s (instead of three specified as operator console). Similar philosophy shall apply in case of stacked VDUs operator console.

b) In case, multiple servers are used to support different functions like data connectivity, data base storage and historian function, similar philosophy as 5.4.2.2.3(a) may be followed.
5.4.2.3 The system shall have global data available at each operator console electronics and all the functions explained in Clause 5.4 shall be available / executed at operator console. However, in case functionalities are distributed in various intelligent hardwares / softwares or in case of distributed database / console functions is supported by the standard system architecture, each data base electronics / functionality shall be RAID 5 configuration dual redundant. Further any change made in the data base of one operator console shall automatically update the data base of other operator consoles if configured identically. Following shall apply;

a) history function, for the units monitored and controlled from the operator console, shall be RAID 5 configuration dual redundant with each node have dual disc drives dedicated for history storage.

b) Data base storage function for the units being monitored and controlled by the unit shall be RAID 5 dual redundant and shall have dual disc drive configuration.

c) All stations used for data storage and such functionalities shall have RAID5 configuration.

5.4.2.4 The operator, as a minimum, shall have access to the following through the operator key board at all times:

a) Selection of all the displays including the direct selection of loop in alarm, page turning facility, overview, group view and loop view selection etc.

b) Selection of loop for operation.

c) To acknowledge alarms as and when they are annunciuated on the operator console.

d) Facility to enter any changed parameter like setpoint, manipulated variable, digital commands and to cancel any wrong entry while making such change.

f) Facility for easy positioning of cursor for the selection of any parameter.

g) Selection of hardcopy printout, logging printout, alarm history printout and assignable trend recorder points.

h) Auto/manual/cascade/computer mode changeover of each controller.

5.4.2.5 In addition the Engineering keyboard shall have the following capabilities for restricted user/engineer through a key-lock or with password protection;

a) Data base configuration including overview, group, loop, multi-loop and multi-variable control configuration.

b) Group or multi-group alarm inhibit from a plant under maintenance.
c) Reconfiguration of alarm settings and their values, addition and deletion of components in a loop.

d) Tuning of control loops including change of P, I, D and dead-time contacts

e) On-line compilation of graphic displays using standard user defined symbols.

f) Changing of parameters to be logged.

g) Setting of real time clock.

h) Assigning of parameters for historical trending.

i) To call detailed self-diagnostic for maintenance.

Any change made for any parameter for an input from any display shall be automatically updated on all displays configured for that input.

5.4.2.6 Operational Protection

A key-lock switch or software password shall be provided for operational protection. Following minimum level of access and authorisation shall be available;

- Operator Level: Authorises all commands for plant operation.
- Engineers level: Authorises all commands for plant operation and system engineering.
- Management Level: Authorises all operational data and reports to be viewed.

Other levels of key-lock / password protections if available as standard with the system shall also be offered.

5.4.2.7 It shall not be possible to override any process variable or digital status from operator keyboard.

5.4.2.8 Each keyboard either integral or as a separate attachment shall have a set of dual function user configurable keys. These keys shall be configured to access important pages in single keystroke. These keys shall have LEDs which flash on pre-configured alarm conditions. A minimum of 32 number of such keys shall be offered with each keyboard. Systems, which do not support dual function keys with their standard keyboard shall offer either;

- i) a dedicated VDU and keyboard with each operator console configured with an intelligent graphic which would replicate the functionality of dual function keys.
- ii) a dedicated keyboard with dual function keys alongwith each standard keyboard.

5.4.3 Process displays
5.4.3.1 Process information and operational aids shall be presented to the operator in the form of display. These displays shall cover all points related to tag numbers built within the system. The process displays shall include different type of displays and the functionalities associated with each of these displays. Various types of process displays, as envisaged, are detailed out in the clauses to follow. The details provided herein are typical and explain only the functional requirements. The systems as offered must provide displays which meet these functional requirements.

5.4.3.2 Overview display

5.4.3.2.1 Overview display shall present the overall status of a unit or large segment of the process plant. The analysed data and alarm conditions are displayed with colour changes.

5.4.3.2.2 Overview display shall incorporate a minimum of 128 analog or discrete inputs which can be monitored simultaneously on the VDU screen (Referred as page). Each page shall be organized into a suitable number of groups. Each group shall be identified separately. Each group shall further incorporate suitable number of inputs (Referred as tags). Suitable identification and description shall be shown for each group on the overview display to relate it to a group or loop display.

5.4.3.2.3 All analog points in the overview shall be represented as variable lengths indicating deviation above or below the normal operating value or set point.

5.4.3.2.4 Alarms shall be displayed in change of colour against each variable if the variable crosses a set value. Control loops operating in manual mode shall be indicated.

5.4.3.2.5 An input in alarm condition shall be identified by flashing.

5.4.3.2.6 In case, any hard wired instrumentation backup is provided, overview pages shall be assigned indicating the tag number and type of hardwired instrument.

5.4.3.2.7 The operator shall be able to call directly any group display or loop display or any predetermined displays covered in the overview display.

5.4.3.2.8 It shall not be possible to acknowledge alarms directly from the overview display.

5.4.3.3 Group Display

5.4.3.3.1 Group display shall be limited to the group of inputs as displayed in the overview display. Each group shall preferably include eight (8) number of inputs.

5.4.3.3.2 Each input in the group shall be identified by the tag number, unit of measurement and process description which shall be displayed on the VDU screen.
5.4.3.3 Display, as a minimum, shall show following degree of details:

   a) Process variable in analog form shall show, as a percentage of the transmitter span on a linear scale bar graph of 0-100% or engineering units and in digital form as alphanumeric display in engineering units.

   b) Set point value in analog form as a percentage of the transmitter span on linear scale bar graph of 0-100% engineering units and in digital form as alpha-numeric display in engineering units.

   c) Output value in analog form as a percentage of linear scale bar graph of 0-100% and digital form as percentage.

   d) Controller mode i.e. auto, manual, cascade, computer.

   e) Process alarm on process variable, deviation or velocity.

   f) Selected loop within the group shall be identified by cursor marking or similar identification.

   g) Control valve failure position.

   h) The contact input / output shall be represented by simulated graphic lamps and configurable alphanumeric status description.

5.4.3.4 It shall be possible to control the process from group views. Following control actions shall be possible;

   a) Increase / decrease of set point value either slow or fast.

   b) Change of controller mode i.e. Auto/manual transfer.

   c) Changing output to the final control element.

   d) For digital points, start/stop or open/close command.

5.4.3.5 It shall be possible to repeat any tag number in more than one group/console. However it shall be possible to control or change configuration from only pre-assigned group/console.

5.4.3.4 Loop Display

5.4.3.4.1 Loop display shall provide a separate detailed display for each of the process inputs. The graphic representation of analog and digital points shall be similar to group display. However in addition following information shall also be presented in alphanumeric form as a minimum

   a) Controller tuning constants.

   b) Process variable zero and span values.
c) Alarm set point on various parameters.

d) Limits on set point, output, velocity etc.

e) Controller action (direction/reverse).

f) Failure position of final control element.

g) Computational constants like ratio or bias.

h) Integrated value.

i) Output to the final control element.

j) Engineering units.

5.4.3.4.2 It shall be possible to change the following through the keyboard of operator console:

a) Tuning constants.

b) Scale, zero and span.

c) Limits on set point, output, velocity etc.

d) Configuration of any loop.

e) Alarm set points.

f) Control mode.

g) Output to the final control element.

h) For digital points, it shall be possible to issue start/stop or open/close command.

5.4.3.4.3 Loop control parameters changes as specified in para 5.4.3.4.2 (a) to (e) shall be restricted by a key lock control or password.

5.4.3.4.4 The loop display shall also contain a trend displaying process variable, set point and output with a sample interval time of maximum 1 second and full scale time base of minimum 60 seconds for tuning the process control loops.

5.4.3.5 Graphic display

5.4.3.5.1 It shall be possible to display dynamic graphic of different sections of plant on the operator console VDU screens. Graphic displays shall be field configurable only through engineering key-board with standard / user defined graphic symbols. Dynamic graphic displays if different sections of the plant shall be displayed on different pages.

5.4.3.5.2 The system shall have graphic symbol library as per ISA-5.1 and 5.3. In addition standard industrial symbols like distillation columns, heat exchangers, pumps, compressors, tanks etc. shall also be provided as a standard.
5.4.3.5.3 Graphic displays shall be interactive type through which it shall be possible to control the process. It shall also be possible to send motor start/stop and shutdown valve open/close commands, as specified in job specifications, from this display.

5.4.3.5.4 It shall be possible to view the process variable and alarm points and view and change set point value, manipulated variable, controller mode etc. from the graphic display. Also rotating machinery (i.e. compressor / pump) status and valve status shall be displayed on the graphic display with different colours.

5.4.3.5.5 Various colours used in the generation of graphics like colour of the process lines, utility lines, Instrument signal lines and event modifier conditions shall be finalised during detailed engineering. The colours used to identify event modified conditions shall generally be as follows unless otherwise indicated during detailed engineering.

<table>
<thead>
<tr>
<th>Colour</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red</td>
<td>All points alarm</td>
</tr>
<tr>
<td>Blue</td>
<td>Valve open, pump running.</td>
</tr>
<tr>
<td>Green</td>
<td>Valve closed, pump stopped.</td>
</tr>
<tr>
<td>Flashing green</td>
<td>Shut down valve transition state.</td>
</tr>
</tbody>
</table>

5.4.3.5.6 It shall be possible to go from any graphic page to related graphic pages or any group view or alarm summary in single key stroke using soft key function.

5.4.3.6 Trend Display

5.4.3.6.1 The system shall be capable of displaying the following trends:

a) Real time trends for the parameters specified in job specifications displaying current data for a period of minimum one (1) hour as defined in clause 2.33 of this specification. However it shall be possible to assign any parameter for real time trend.

b) Historical trend for number of parameters as specified in the job specification for a period of 30 days with sampling rate of 10 minutes. However, it shall be possible to assign any parameter for historical trending.

5.4.3.6.2 Historical data shall be stored on the nonvolatile memory device like hard disc in such a way that such historical data can be utilized for archival storage and subsequent recall.

5.4.3.6.3 Real time and historical trend shall be possible on any parameter or variable like measured variable, set point, output, calculated variable etc.
5.4.3.6.4 It shall be possible to sample and store data of instantaneous and average value at the intervals mentioned below. However it shall be possible to display by scrolling or expanding the time base for all the trends.

a) At intervals 1 second or higher for the real time trend.

b) At 1 minute, 10 minute & 1 hour interval for historical trend.

Historical data trends shall be displayed for a period of minimum up to 72 hours for a data sampling rate of 1 minute.

5.4.3.6.5 The requirement of fast trend (trends with sample time faster than Real time trend) if any, shall be specified in the job specification. This shall be in addition to tuning trend requirement specified in this specification.

5.4.3.6.6 Selection of the tag number and sampling time for real time and historical trending shall be possible from operator keyboard.

5.4.3.6.7 The system shall also have a multi trend capability in such a way that it shall be able to display set point, measured variable and output on the same display, the trend of either the same process variable or any other process variable.

5.4.3.6.8 Trend display shall be single line type or bar graph type with additional information like loop tag number, engineering units, span, present value of the trended point, alarm status etc displayed.

5.4.3.7 Closed Circuit Television Window display

It shall be possible to display close circuit television (CCTV) video monitor image on the operator console as a CCTV window. A function key on the operator keyboard shall be assigned to select the desired CCTV monitor window. The CCTV window on the operator console video shall always be on-top.

5.4.3.8 Alarm Monitoring and display

5.4.3.8.1 Alarm Management

a) It shall be possible to display process as well as system alarms on the operator console for operator’s attention and action. Alarms shall appear immediately on the operator console as and when they occur on priority basis.

b) It shall be possible to set process alarm limits from the engineering keyboard i.e. alarm limits on absolute value of measured variable; rate of change of measured variable; high and low deviation set points; high, extra-high, low and extra-low points on process variable and output etc.
addition, it shall be possible to derive alarm conditions on the basis of few calculations performed by the system.

c) Alarm messages shall be displayed by flashing the page and group number of the input under alarm irrespective of type of display. It shall be possible to access the group or tag in alarm condition with a maximum of two key-strokes of operator’s console keyboard. The plant overview display, in addition to display alarm message, shall also be able to provide warning by changing colour of excessive deviation of process variable from their set value.

d) All alarms shall be displayed as and when they occur or generated with change in the colour of display in the following sequence, activating an audio signal:

Continuous flashing : Un-acknowledged alarm
Steady display : Acknowledged alarm

e) The system shall not put off the audio alarm and visual flashing even after the condition returns to normal unless it is acknowledged by the operator.

f) In order to provide immediate attention to critical alarms, alarms shall be classified in the priority of their criticality.

g) In addition to alarms appearing on the different displays as mentioned in para 5.4.3.1 to 5.4.3.5 of this specification, the system shall also be able to display alarm summary and alarm history as per para 5.4.3.8.2 and 5.4.3.8.3 of this specification.

5.4.3.8.2 Alarm summary display

a) It shall be possible to display summary of all alarms in the sequence of their occurrence and shall disappear from display only when they are acknowledged and cleared. The alarm display shall list the following for each alarm as a minimum:-

i) The date and time of occurrence.
ii) Point identification (i.e. Tag number)
iii) Point description.
iv) Type of alarm (absolute value or deviation.)
v) Serial number of alarm in the sequence of its occurrence.

b) The system shall be able to display on alarm summary a minimum of 100 alarms.

c) Alarms shall preferably be listed in the form of alarm list like current, List I, List II etc. The minimum number of alarms per list shall be 25. Alternately system may provide a common list of alarms in the sequence of their occurrence (with respect to time).

5.4.3.8.3 Alarm history
a) The history of alarm conditions shall be maintained in the database for alarm history display and printed on shift-wise basis for the parameters specified in the job specifications. The alarm display and print out shall list the following for each alarm as a minimum:-
   i) The data and time of occurrence.
   ii) Point identification (i.e. Tag number)
   iii) Point description.
   iv) Type of alarm (absolute value or deviation.)
   v) Time of acknowledgement.
   vi) Time of return to normal.
   vii) Serial number of alarm in the sequence of occurrence.

b) The system shall be able to display and print out the alarm history of minimum of 300 alarms.

c) Alarms shall be listed in the form of alarm lists like List I, List II, List III etc. The minimum number of alarm points per list shall be 25. Alternately system may provide a common list of alarm in the sequence of their occurrence.

5.4.3.8.4 System alarm

a) System shall have capability of on-line self diagnostics as mentioned in para 5.4.5 of this specification.

b) Any abnormal conditions in and sub-system or any other functional device shall be displayed as system alarm message on the operator console irrespective of the display selected.

5.4.3.9 Configuration display

5.4.3.9.1 Configuration display shall provide a separate detailed display for each loop indicating the configuration of that loop. When control requires more than one loop, all interrelated loops shall also be displayed. Following information is required to be available on configuration display.

a) Loop configuration giving designation of each block.

b) Control block interconnection showing soft-wiring or hardwiring.

c) Value of each block parameter like P.I.D., ratio, bias, dead-time, lead- time etc.

5.4.3.9.2 It shall be possible to configure & reconfigure the loops from this view using user friendly software.

5.4.4 Logging and Report Generation function

5.4.4.1 It shall be possible to log all real time data, historical data, computed parameters, operator actions, alarms and events etc from operator consoles irrespective of data source connected to communication sub-system. In general, the data type shall include;

a) All measured and manipulated variables (inputs as well as output data)
b) System calculated variables

c) Historical data values

d) Alarm and event data

e) Operator data entry and operator actions

f) Equipment status data

g) Data through serial links

h) Data through OPC server

i) Batch related data

j) System clock time

k) System diagnostic data

5.4.4.2 The system shall have a report builder and report scheduler which shall have following capabilities;

a) The system shall be able to generate reports on hourly basis, shiftly basis (8 hourly), daily basis and in some cases weekly or monthly basis, as specified in job specifications.

b) The system shall be able to generate reports as per operator command either on-demand or on predefined time.

c) In general, the type of reports shall be;
   - On demand report initiated by operator action
   - Predefined time initiated report e.g. hourly, shiftly, daily etc.
   - Event driven report
   - Shutdown driven report
   - Equipment runtime status report

d) The generation of on demand report shall not affect any scheduled report.

e) These reports shall be stored in separate files independent from historical and trend data files.

5.4.4.3 All parameters required for logging shall be stored in the system memory as per data base update rate. The system shall be able to perform following functions on all such stored data prior to logging as per the requirement of the report;
a) Basic arithmetic calculations such as averaging, summing, multiplication, division etc.

b) Advanced calculations like efficiency calculations, conditional calculations etc.

c) Extended log reports such as weekly and monthly reports.

d) Batch Reports

5.4.4 The formats used to generate log reports shall be user definable, in general. Typical log formats for hourly, shiftly and daily reports have been attached alongwith (Refer Annexure 1) for reference. System shall have a user friendly structured programming language suitable to generate and access various reports. System may utilize high level language for generating reports with advanced calculations. High level language compiler software shall be supplied as part of standard system function.

5.4.5 Number of log reports generated for a project shall be governed by the number and type of log formats defined for a project like hourly report format, daily report format, shutdown report format etc. Number of pages in each log report shall be sufficient to accommodate all the parameters defined in the job specifications.

5.4.6 In addition to the real time and historical data, the report builder programme shall incorporate report title, sub-headings, notes and messages.

5.4.7 Hourly report shall be printed only as and when initiated on demand by the operator and shall not be printed automatically after the end of the hour. All other reports shall be printed automatically at the end of the pre-defined time as well as on demand by the operator. The maximum storage time for a log information shall be 15 minutes after the pre-defined print out time for a format, within which time log report must be printed. In case report could not be printed within the scheduled defined time, data shall remain stored till the report is finally printed.

5.4.8 Logging hardware

Data required to be logged shall be finalised during log report finalisation stage. However, typically following shall apply;

a) All tag numbers, analogs as well as digitals, shall be available for hourly log.

b) All flow tag numbers and other selective tag numbers shall be available for daily log report.

c) Only selective tag numbers shall be available for weekly and monthly report.
d) Average (over the defined period) for flow and instantaneous shall be used for log printing with maximum and minimum value as defined in log formats.

5.4.4.9 Logging Hardware and Software

5.4.4.9.1 The system shall be supplied with all hardware and software necessary to meet functional requirements specified in Clause 5.4.4.7 of this specification. Log reports shall be generated, compiled and printed using system standard hardware and software. No separate computer / server shall be used.

Separate server, if necessary, may be utilised, to generate extended logs or reports requiring advanced calculation.

5.4.4.9.2 It shall be possible to archive log reports on an external computer. Facility shall also be available to retrieve these reports as a magnetic tape or a disc for future reference.

5.4.4.9.3 In the event of printer failure, the system shall maintain the data in the point buffer memory of the report originating device buffer with a printer failure alarm.

It shall also be possible to print the report at an alternate printer without any data loss, whenever necessary.

5.4.4.9.4 System Printers

a) In addition to configuration and maintenance (C&M) printing, printers shall be used for printing reports like log reports and alarm and event reports.

C&M printers shall be dedicated for each machine whenever such a function is required.

b) All printers shall be low noise industrial type and shall be suitable for continuous duty.

c) Logging printer

Logging printer shall be A3 size colour laser printer and shall be able to meet the following requirements;

i) Logging printer shall be able to print the following reports;
   - Printing of hourly, shift-wise, daily and weekly log.
   - Shut down report printing.
   - Any other report defined in the job specification.
ii) In addition to above, logging printer shall also be used for printing hard copy of any video screen, whenever necessary.

d) Alarm and event printer

Alarm and event printer shall be low speed dot matrix printers capable of meeting the following requirements;

i) Alarm and Event printer shall be able to print out following reports;

- Log the process and system alarm messages with a time stamp as and when they occur
- Print the alarm history for every shift of operation or on demand from operator console.

- Log events such as operator actions as defined in para 2.30 of this specification, as and when they are initiated.
- System alarms as per self-diagnostic reported alarms.

ii) Alarms and Events shall be clearly distinguishable on the report, preferably by colour.

iii) Print out shall show as a minimum the tag number, description, date and time of occurrence, time of acknowledgement and time of return to normal.

iv) The time stamp shall include month, day, hour and minute.

e) Multifunction printer

Multifunction printer be a colour laser printer which shall be able to print out log reports as well as alarm and event reports. Multifunction shall be specified either common for a unit or a group of units. The functionality of multifunction printer shall be same as (a) through (d) specified in clause 5.4.4.9.4 of this specification.

The command for printing of any report shall be generated from any operator and / or engineering console. The reports shall be generated in the priority of which shall be as per request time for printing report.

f) Hard-copier

i) Hard-copier shall preferably be a coloured heavy duty laser printer. The command for copying shall be initiated from any operator console.
ii) The screen display may be changed on the console after the copy command is initiated for any screen. This video copier shall have buffer memory storage for at least two screen pages.

5.4.5 Self diagnostics

5.4.5.1 The self diagnostic message for a subsystem failure shall appear on the operator console irrespective of display selected. The choice of the detailed self diagnostic displays shall be made by a key-lock switch.

5.4.5.2 The system shall have an extensive set of self-diagnostic routines which shall locate and identify the system failure at least up to module level including redundant components.

5.4.5.3 At the local level, failure of a module in a sub-system shall be identified by an individual LED display.

5.4.5.4 Failure of a subsystem shall be annunciated with the change in colour. To aid system maintenance and for effective fault location, following displays shall be provided as a minimum.

5.4.5.4.1 Communication system status display.

The display shall show an overview of different sub-systems connected over the communication sub-system showing status of each sub-system. When a failure is detected by the system self diagnostic routine, the display shall indicate the location and nature of malfunction. Display shall as a minimum have
- Type of sub-system.
- Failure of communication bus/link with the sub-system.

5.4.5.4.2 Sub-system diagnostic display

One display page shall be available for each sub-system on the communication sub-system which can be called on demand.

The display as a minimum shall contain:
- Sub-system number and type
- Error code and description
- Details of failed module

5.4.6 Data Storage, Archival and Retrieval

5.4.6.1 **Historical data shall be stored on a non-volatile memory device like hard disc which can be subsequently recalled by operator on any screen. System must support multiple historical data discs in order to avoid data loss in case of disc crash.**
5.4.6.2 It shall also be possible to store and retrieve this data on removable mass storage media like floppy disc, cartridge or tape etc.

5.4.7 Assignable Trend Recorder

5.4.7.1 It shall be possible to provide real-time trend on the assignable recorders for any process or calculated variable. The variable shall be assigned through the keyboard of operator console on any point and any recorder connected to that console.

5.4.7.2 Assignable trend recorders shall be located on the hard wired console. Each recorder shall have four pens.

5.4.8 Hard copy unit

5.4.8.1 Hard copy unit shall be used to make permanent copy of any VDU page when demanded through the operator console/Engineer console.

5.4.8.2 VDU page shall not be locked for more than 5 seconds while taking the video-copy.

5.4.8.3 Copies of display shall be in full colour.

5.4.9 System Servers sizing criteria

5.4.9.1 The servers provided as part of standard system architecture shall have fault tolerant architecture with a minimum availability of 99.999%. The design requirements of each server shall be dependent on its functional requirements such as;

a) Guaranteed throughput performance.

b) Continuous and consistent data connectivity even during fault.

c) Continuous and consistent processing of data even during fault.

d) Fault tolerant operating system.

The fault tolerant configuration of server shall include synchronised redundant processors such that failure, if any, is transparent to the user and server applications.

Transparent to the user implies that the data display on the graphic of any VDU shall not be lost for more than three (3) seconds in case of failure of the main server.

5.4.9.2 In case if redundant server configuration, the maximum switchover time shall not exceed ten (20) seconds.

System servers which have switchover time exceed 3 seconds, shall ensure that real time data is available on at least two of the three operator console VDU’s even during switch over.
5.4.9.3 All machines that are used for data is storage shall be high end server grade machine with minimum RAID – 5 configuration. General purpose servers below RAID 5 configuration shall not be acceptable.

5.4.9.4 Server Sizing

5.4.9.4.1 Unless otherwise specified, following criteria shall be considered while sizing the server/ servers used for driving operator console (for configurations where data is not stored in the operator station);

a) Number of operator workstation (clients)

   Consider 1.2 times the specified number of operator workstations rounded to next higher whole number for each type.

b) Number of Engineering workstations (clients)

   Consider 1.2 times the specified number of engineering stations rounded to next higher whole number.

c) Number of Controller and data acquisition nodes

   Consider 1.4 times the specified number of CDAS nodes.

d) Maximum number of nodes/sub-systems on the network should be less than 60% of the system capacity specified in the standard printed catalogues of manufacturers.

e) Maximum history storage tag numbers per second

   Consider 1.4 times the specified number of tag points in the material requisition with storage rate of 1 second.

f) Maximum number of trends

   Consider 1.4 times the specified number of trend points. Where no separate trend points are indicated consider all analog inputs and outputs as required trend points.

g) Maximum number of Reports

   Maximum number of log reports (formats) shall be 50 with 1000 points in each log report.

h) Maximum number of Tag data

   Consider 1.4 times the total number of tags and associated parameters i.e. process variable, set point, manipulated variable, auto-manual-computer status, alarm values, diagnostic data from field devices, serial data (process and diagnostics) from third party devices SOE data etc.

i) Maximum number of process alarms, operator events and operator messages

   Consider 1.4 times the maximum specified parameters. Where no operator-events or operator messages are indicated in material requisition, consider a total of 1000 points for sizing.
j) Number of Peripheral devices
   Consider 1.4 times the maximum number of peripheral devices specified in the configuration diagram.

k) Maximum number of fieldbus segments
   Consider 1.4 times the maximum number of fieldbus segments specified or computed by the vendor, as applicable.

l) Maximum number of data for UHN and OPC node (If applicable)
   Consider 1.4 times the maximum number of tag data specified in the job specification. Where no separate data is given in the job specification consider through put requirements specified for UHN and OPC node sizing in this specification. The polling rate shall be considered as 1000 tags per second.

m) Maximum amount of Asset Management data
   Consider 1.4 times the maximum data available from field devices for asset management.

5.4.9.4.2 While sizing the server / system consider the following operational features;

   a) Number of Operator Console VDU (WS) with over view display: 33% of 'A'
   b) Number of operator console VDU’s (WS) with trend displays: 33% of 'A'
   c) Number of operator console VDU’s (WS) with graphic displays: 33% of 'A'

   Consider 'A' as number of workstations specified in clause 5.4.9.4.1(a) of this specification.

5.4.10 System Operational Response Time

   The system shall meet the following response times beyond which the delay may have detrimental effect on the operator's performance;

   System activation or Logging-on of a terminal: 1 sec.
   Display call-up time
     - Simple pages like menu display: 0.5 sec.
     - Graphic page: 1 sec.
   Command execution response: 4 sec
   Data entry error reporting: 1 sec.
   Response to mouse / keyboard commands: 0.5 sec.

5.5 Engineer interface sub-system
5.5.1 Engineer interface sub-system shall be primarily an engineer's interface which shall normally be used for configuring, tuning and maintenance of the Distributed Control System. This sub-system shall also be used as operator console whenever necessary (e.g. during start-up etc).

5.5.2 It shall consist of an Engineering console which shall be able to perform all engineering functions related to each operator console and other sub-systems e.g. controller and data acquisition sub-system, interface devices etc (except PLC for which dedicated engineering console shall be provided). It shall also be possible to configure field-bus function blocks on any segment from engineering console.

5.5.3 Each Engineering console shall consist of single or multiple colour 459.7mm active matrix TFT LCD video screens with full integrated audio capability and shall have an integral USB hub. The video screen shall have a native resolution of 1280 x 1024 pixels with wide viewing angle. Each engineering video screen shall be provided with one operator key-board and one engineering keyboard. This, as a minimum shall also have one configuration and maintenance printer.

5.5.4 Engineering console shall also have, the capability of an operator console. However, the operation of the plant shall be restricted from this console. All the operator console displays as specified under clause 5.4.3 of this specification shall also be available on Engineering console.

5.5.5 Engineering console like any other sub-system shall be capable of communicating with all other sub-systems over the communication sub-system.

5.5.6 Engineering console shall have individual dedicated electronics with RAID 5 disk configuration.

5.5.7 It shall be possible to perform all system configuration functions and configuration modification functions from the Engineering console typically;

a) Data base configuration including overview, group view, loop view, trend view, sequential programming, multi-loop multi-variable control configuration for connection, smart and field-bus based inputs.

b) Group or multi group alarm inhibit from the plant under maintenance.

c) Configuration or re-configuration of alarm settings, their values, addition or deletion of any control block or component in a loop.

d) Compilation of graphic displays.

e) Setting of real time clock.

f) Compilation of logs/reports/historical trend points.
5.5.8 Configuration Requirements

5.5.8.1 It shall be possible to configure conventional, smart (HART) and fieldbus I/O's and control strategies the same way. The device configuration application for HART and fieldbus devices shall utilize EDDL or FDT / DTM as specified in data sheet. It shall include the following:
   a) Capability to display all device parameters directly from the device itself.
   b) Modify and download device configuration directly to device.
   c) Separate display of process values and device alarms.
   d) Capability to modify multi-device and download all at the same time.

5.5.8.2 Fieldbus HI interface configuration
   a) The configuration software shall have capability to configure all HI fieldbus interfaces such as;
      - LAS assignment and management
      - LAS scheduling
      - Macro cycle time calculations / optimisation
   b) Interface configuration software shall support multiple LAS as a segment. Graphical tool shall be provided which shall provide sequence of execution, execution time of each fieldbus device and overall macro-cycle time.

5.5.8.3 Fieldbus Function blocks
   a) The configuration software shall be able to configure all fieldbus functional blocks available in fieldbus devices.
   b) Function block configuration shall be downloaded from engineering console to field devices on line.
   c) Downloads that will result in change in segment macro-cycle shall proceed with a positive confirmation before the download is allowed.

5.5.8.4 Segment Scheduling
   a) The engineering software shall have capability to carryout segment scheduling against the scheduling constraints such as number of parameters which LAS can transmit during the single cycle.
   b) Response time for an HI segment shall be from 32μ seconds to 2.2milliseconds.

5.5.8.5 Automation configuration tool

5.5.8.5.1 The configuration software shall be capable of auto-detection of following I/O devices;
   a) Identification of I/O ports and all types of I/O modules with software configuration defined. If mismatch is detected, an alarm message shall be generated.
b) Function block configuration tool shall be capable of identifying the installed field devices. An alarm message shall be generated in case of mismatch.

c) Automatic address and tag name assignment for fieldbus devices. These capabilities shall also include handling of any foundation fieldbus registered device using the device DD and CFF files.

5.5.8.5.2 The system shall be pre-configured to identify the attributes of all I/O interface ports and general characteristics of any connected field device, which comply with FDDL (of latest version) or FDT / DTM as specified.

5.5.9 Tuning of a control loop shall be possible from Engineering as well as from operator console, the location for tuning shall be selected by the operator.

5.5.10 On-line Configuration
The system shall have the capability to copy, store, modify and restore the configuration data on-line without shutting the system partly or completely. The system shall be capable of downloading controller configuration from engineering console without taking controller off-line.

5.5.11 Off-line Configuration
5.5.11.1 It shall be possible to generate system configuration i.e. controller and data acquisition sub-system and display configuration including graphics from an independent PC with windows software loaded. System engineering features like continuous control, advanced controls, displays, alarm, historical functions, logging functions etc. shall be configurable from above station. The configuration shall be possible without the availability of actual engineering station. Configuration generated off-line shall be loaded on to engineering station without any limitation.

5.5.11.2 Fieldbus engineering software tool shall be able to perform offline fieldbus engineering by accessing CFF and DD files of field devices without connecting the field devices.

5.5.12 During the normal operation, the Engineering console, in no case, shall interfere with the process operation or system software. However any change in the configuration shall be down loaded into the system with proper knowledge of the operator.

5.5.13 All detailed diagnostics of the system shall appear on the Engineering console with a print out on the Configuration and Maintenance (C & M) printer. A common diagnostic message on the operator console shall indicate the need of the maintenance.

5.5.14 To aid the system maintenance and effective fault identification, following displays shall appear on the engineering console;

a) Communication system status display
b) Device diagnostic display and System diagnostics upto module level should be possible from the diagnostic software. The details of system diagnostics are described under para 5.4.5 of this specification.

5.5.15 Any special diagnostic package, in addition to as mentioned under para 5.4.5 of this specification, if available with the system shall also be offered. Detailed description and capability of this package shall be supplied.

5.5.16 C&M Printer shall be used for printing the configuration or configuration changes, printing system alarms as and when they appear and to print out any engineers command from Engineering console. Hard copy unit, when specified, shall be used to take hard copy of the engineers console screen.

5.5.17 The system shall have adequate security features to secure plant operation and DCS data base. Engineering console shall have the following security features, as a minimum;

a) Key-lock or password protection for accessing operator functions and engineering functions.

b) Redundant disc and RAID-5 controller configuration

c) Disc interface to enable 'disc down loading' / database or configuration data back-up.

d) Defuncting / inhibiting all functions other than those functions which are required for engineering and operation as defined above.

5.5.18 System Back-up and Re-initialization

a) The entire control software including control database (application program), system software, source code, schematics etc shall be backed up on system hard disc automatically at a regular interval.

b) It shall be possible to have a complete back-up of system including the historical data on-demand without interrupting the system normal function.

c) It shall be possible to have back-ups on remarkable media like CD-RW, DVD-RAM or DVD-RW.

d) The maximum time acceptable for reloading a device like console is five (5) minutes.

5.5.19 Global database Management and Configuration

5.5.19.1 System configuration software shall provide a common database configuration environment and shall support the following data management facilities, as a minimum;

a) System design shall follow the data centric approach and shall manage entire system data in global manner. Paths and connections between data objects shall be automatically maintained when configuration is changed.
b) Whenever the offered system maintains multiple data bases, the design must ensure a close coordination between these data bases such as management of cross reference table and data reconciliation algorithms.

c) Configuration of operator graphics including management of change tools so that the changes made in graphics are updated uniformly throughout the system.

d) All control historical trend function configuration and interconnection between data elements in the system without any need to maintain user based cross references.

5.6 Communication sub-system

5.6.1 The communication shall be a digital communication network bus, that provides a high speed data transfer rapidly and reliably between the operator consoles, process I/O devices, process computer and other devices connected to it. Each network node shall be capable of communicating with other nodes over the communication network.

5.6.2 The Communication network topology shall preferably be bus structure. Other vendor standard topologies shall also be acceptable provided these meet all the functional requirements specified in this specifications and in the material requisition.

5.6.3 The communication over the communication network shall not be affected even if a node connected to network is powered down or fails to respond. It shall be possible to connect or disconnect a device from the system without disturbing the operation.

5.6.4 The communication sub-system shall be dual redundant, consisting of two separate communication networks and two separate communication system interfaces for each device. The systems requiring traffic directors shall be avoided. However, if unavoidable, dual redundant traffic directors shall be provided.

5.6.5 Design shall ensure that there is no cause of common mode failure in communication sub-system.

In general, both the communication networks / devices shall be active at all the times in such a way that either they shall take the communication data load or switch the communication path at regular interval whenever vendor standard data transfer technique allows data transfer to one network while redundant network takes control on the failure of the main network fails. Vendor shall ensure that there shall not be any system degradation or data loss before, during and after the changeover.

Redundant communication network and communication components / modules shall be continuously checked for their availability and healthiness. In case of main bus failure or any communication device failure, the transfer to the back-up device or bus shall be automatic without interrupting the system.
operation and without any operator's intervention. Information about the failed device / bus shall be displayed on the operator console.

5.6.6 Communication network protocol used within the system shall safeguard against false date transfer and allow error detection, recovery failure detection and initiatives of switchover to the redundant network / network component / module.

5.6.7 In addition to automatic switchover of communication network on detection of failure of active / one of the network / network device, it shall be possible to switch over the communication from main bus to the redundant bus manually without disturbing the system operation. Manual switchover shall be effected whenever the network integrity and switchover is to be verified during testing.

5.6.8 The mechanism used by the communication system for error check, parity error, over-run error etc and other advanced codes.

5.6.9 In general, the transmitting message shall identify the transmitting the receiving device. The transmitting device shall receive a reply from the receiving device on the receipt of correct message. Lack of response shall be considered as a receiver failure. These shall be positive acknowledgement of all messages transmitted over the communication network.

5.6.10 Communication speed on the communication bus shall be sufficient to update the operator console data base once in every second. The overall system performance shall not be degraded whether communication sub-system is 10% loaded or 100% loaded. Degradation of communication bus shall be as defined under para 2.18 of this specification. Failure of one or more nodes shall not degrade the communication performance in any way.

5.6.11 Network Diagnostics

5.6.11.1 Network management software shall be resident on all the network modules in order to ensure reporting of node status to other network nodes and reporting node failure alarm within one second.

5.6.11.2 Communication network diagnostics shall run continuously so that the failure of any network / network component / communication module is alarmed without any delay.

The diagnostics sub-routines shall detect and isolate faulty network component and noisy network cables. Communication shall automatically transfer to the redundant component/ module / network whenever the failure is detailed without interruption of system operation and loss of data.

5.6.11.3 Diagnostic sub routines shall be available to monitor the network performance and generate an on-demand report of all the accumulated number of errors over a specified time period.
5.6.12 Network Components and their Requirements

5.6.12.1 All hardware like network cables, connectors, media converters, network switches and hubs and fibre-optic patch-cards required for completing communication network shall be supplied by the vendor.

5.6.12.2 Network can be either screened twisted pair copper and / or fibre optic cable. All network cables shall be armoured type. Fibre optic cable in addition shall be jelly filled for protection against ingress of moisture.

5.6.12.3 Communication network if routed outside the control room shall be fibre optic type only and shall support the use of media converters for fibre optic network. The system design shall allow the use of unequal network lengths in case of redundant network configuration to make-up for the difference in routing lengths.

5.6.12.4 Type and specifications of the fibre-optic cable shall be decided by vendor based on the distance, bandwidth required for data transfer and allowable signal attention. Minimum two number of spare fibres shall be provided in fibre optic cable.

5.6.12.5 Fibre optic cable shall always be routed in enclosed HDPE conduit with matching fittings. HDPE conduit shall be as per IS-4984 or as per equivalent IEC code. The outer sheath colour of HDPE conduits shall be orange with black for the fittings throughout the fibre optic cable run.

5.6.12.6 The network devices such as network switches, media converters, connectors etc, utilized in communication sub-system shall be of industrial grade type and of rugged design. These components shall be selected as per the make and model number listed in the vendor standard product guide.

5.6.12.7 The network switches used shall have multiple speed ports (10/100/1000 MBPS) and shall have;

a) Multi-processor design for high performance operation.

b) Routine diagnostics to detect and isolate noisy cables and jabbering nodes.

5.6.13 Network Loading and OPC Server

Worst-case network loading for the systems supporting determinable protocol shall not exceed 50% while for non-determinable protocol shall not exceed 15%.

5.7 Open System Connectivity

5.7.1 The system shall be capable of interacting with other plant systems and computers over a well established communication network like ethernet (HSE) conforming to IEEE 802.3. This connectivity with the other systems shall always be made via a firewall.
5.7.2 The system software shall be support industry standards like Windows, OSF/MOTIF, TCP/IP etc. as applicable.

5.7.3 The method of data access by any user on this network shall be by I/O Tag name and not by any physical or logical address.

5.7.4 Whenever the communication network is required to connect to any other system network or to plant information network, fire-wall (hardware and software) and routers shall be used.

5.7.5 The system shall be capable of acting as a Dynamic data Exchange (DDE) or OPC client or server to exchange real time data with DDC or OPC compliant application.

5.7.6 When OPC is used for interfacing, system shall exchange the data with any client's application in the standard OPC format. Design shall ensure that OPC connectivity tools are fully integrated within the standard product providing seamless integration. Following shall be ensured;

a) System shall provide alarm and event information with no point building from other OPC alarm and event server directly into DCS system alarm summary.

b) Allows OPC data access clients to view DCS system data, hierarchical area, point and parameter structure.

c) Allows access to historical data from DCS.

d) Allows third party OPC server information to be mapped, displayed, alarmed, get historical data and controller data into the system server.

e) Integrates supervisory monitoring, alarming and control data between two or more OPC servers.

f) All graphic applications and all control function blocks supported by operator console software shall have direct access to data integrated with DCS via OPC.

5.7.7 OPC Server

5.7.7.1 Vendor shall offer integrated or dedicated OPC server in a high grade minimum RAID 5 Configuration only. This node in no way restricts the data transfer. In any case, the device shall be intelligent with adequate memory and software capabilities.
5.7.7.2  OPC Data Access (DA) Server

a)  OPC data access server functionality shall allow bi-directional data transfer between multiple OPC data access servers for monitoring, alarming and control. DA server shall read and write process data using item ID as identifier.

b)  Rate of data transfer in case of DA server is typically 1000 tags per second.

5.7.7.2.2  OPC Historical data access (HDA) Server

a)  OPC client shall access DCS data by connecting to HDA server. It shall also automatically save instantaneous data acquired from DA server and A&E server to be a historical database in HDA server.

b)  HDA server shall be able to receive and publish data timely and efficiently whether online or from archived source. System shall be able to read raw data at the rate of 1000 tags per second and read manipulated data at the rate of 100 data per second.

5.7.7.2.3  OPC Alarm and Event (A&E) Server

a)  OPC A&E server shall publish DCS alarm and events to OPC clients. The server shall support event types such as conditions, tracking and simple events (e.g. component failure). It shall also publish DCS alarm and event such as process alarms, alerts, messages, event, sequence of events and operator changes.

b)  OPC A&E server shall write the following messages to DCS, as a minimum;
   i)  System and process alarm messages
   ii) Mode change and status change message
   iii) Sequence message
   iv)  Operator guide message
   v)   OPC server alarms and errors
   vi)  Engineering maintenance messages

c)  The maximum number of alarms and events received by OPC A&E server shall be of the order of 1 A&E per second.

5.7.7.2.4  OPC Batch Server

OPC batch server shall read and write the batch related data and information of DCS.

5.7.7.3  The OPC server software shall have the following features, as a minimum;

a)  It shall meet support standard OPC standard interface functions such as DA, A&E, HDA, Batch and security as specified by OPC foundation.

b)  The software shall be able to interact with another OPC compliant software loaded in another Third party server machine associated with different make of DCS or control system without the need of any additional hardware or / and software.
c) The software shall support automatic data back-up in such a way that process data acquired by DA/A&E server are automatically saved as back-up data on a disc without client having requested to save the data by server.
d) The software shall allow viewing of contents of OPC server from OPC client.
e) The software shall have capability to restrict the access of OPC server to its client to avoid exceeding the maximum accessible data to avoid load concentration which may slow down the data access.

5.7.7.4 System Sizing

Following criteria shall be followed for sizing OPC notes;
a) Number of third party OPC servers / nodes (This shall include UHN connected to other DCS systems) shall be minimum 10. Ten (10) concurrent licenses shall be supplied as part of OPC node.
b) In addition to third party servers, consider the following;
   Number of client per OPC node : 10
   Number of third party OPC devices : 10 (when specified)
   Such as RTU’s
c) Follow up rate of data read / write shall be considered for sizing;
   OPC client data read (cache read) : 1000 per second
   OPC client data read access (Device) : 500 per second
   OPC client write : 500 per second
d) Maximum number read and write data for OPC node : 2000 data points (unless otherwise specified)

One data point shall include PV, MV, SP for analog control loop.

5.7.7.5 System performance

OPC node shall meet the following performance requirements;
Data read and write on client machine : max. 5 seconds
(This includes data display update for real time data)
Data read and write on server machine : max. 5 seconds
Maximum server loading : 50%

5.7.7.6 OPC node configuration shall be minimul RAID -5

5.7.7.6.2 OPC node shall be supplied with operating system and other softwares to meet functional requirements specified herein.
5.7.7.6.3 Whenever OPC node is provided with historisation or dedicated, it shall have RAID 5 configuration.

5.7.7.6.4 The system when specified, shall offer a standalone software application that provides OPC server redundancy by transparently redirecting client requests to secondary OPC server when primary OPC server is unavailable or fails.

5.8 Time Synchronization

5.8.1 The system shall have capability to synchronize the time of all the sub-systems within the system either by internal or external clock as specified in the job specification.

5.8.2 Time Synchronization with Internal clock

Unless specified otherwise, all the sub-system node clocks shall be synchronized with designated system master clock. Master clock shall either be assigned automatically by system or assigned manually during system configuration. In both the above cases, whenever the master clock node fails, an alternate sub-system clock assumes the charge of time synchronization. In no case, the system shall operate without time synchronization.

5.8.3 Time Synchronisation with External Clock

a) When specifically indicated, the time shall be synchronised with external time reference eg GPS. This shall ensure that data acquired by all sub-systems will have the same and common global time reference. All hardware and/or software required to meet this requirement shall be supplied by the vendor.
